Reduction : Introduction of hydrogen or removal of oxygen from the molecule using hydrogen liberated by the action of acid and metal.

Sulphonation : Introduction of sulpha group in the. molecule using sulphuric acid or oleum or chlorosulphonic acid.

Some hazardous unit processes are given in Table ton

Table 18.7 : Unit Processes with examples

	Unit processes	**Process Hazard**	**Application**
1	Alkylation Ex – Butylene + isobutene iso-octane	Exothermic, side reactions	Petro and organic chemical.
2	Animation by aminolysis Ex – EDC + Ammonia Ethylene diamine	Gas phase pressure reaction, Exothermic	Dyes, organic chemicals, synthetic fibres
3	Ammoxidation Ex- Propylene + ammonia + air acrylonitrile	Exothermic, toxic effect	Plastics, synthetic fibres
4	Carbonilation Ex – Methanol + CO acetic acid	Exothermic, toxic effect	Organic chemicals
5	Condensation Ex – Phthalic anhydride + benzene anthraquinone	Exothermic	Dye intermediates
6	Diazotisation & coupling Ex – Amine + HCl + O_2 Diazonium chloride	Exothermic	Dyes
7	Halogenation Ex – Ethylene + chlorine Ethylene dichloride	Highly exothermic	Organic chemicals
8	Hydrogenation Ex – Olefin + H_2 Paraffin	Exothermic	Fats, waxes, coal processing, petrochemicals
9	Hydrolysis Ex – Chlorobenzene + Water phenol	Exothermic	Organic chemicals
10	Nitration Ex – Benzene + Nitric acid Nitrobenzene	Highly exothermic, Explosive	Explosives, dyes, organic chemicals
11	Oxidation Ex – Alcohol + O_2 aldehyde + carboxylic acid	Highly exothermic, Explosive	Organic chemicals
12	Polymerisation Ex – Ethylene monomer + dimmer polyethylene	Exothermic	Petrochemicals, estomers, synthetic fibres
13	Sulphonation Ex – Benzene + H_2SO_4 Benzene sulphonic acid	Exothermic, Highly corrosive	Dyes, surface active agents

Some other unit processes are Acylation, alcoholysis, aromatisation or cyclization, calcination, carboxylation, causticization, combustion, dehydration, dehydrogenation, double decomposition, electrolysis, esterification, fermentation, Fischer-Tropsch reaction, Friedel-Crafts reaction, hydroformylation (oxo), hydration, ion-exchange, isomerisation, neutralisation, pyrolysis or cracking, reduction, saponification etc.

Hazards associated with unit processes/ operations are:

1. Mechanical hazards e.g. pressure release, leaks, burns, noise, .equipment or utility failure.
2. Reaction hazards due to failure to control exotherms, incompatible materials, side reactions, feed ratio or rate variation etc.
3. Environmental hazards such as air pollution, odour problems, spills etc.

Toxicity and health effects Flammability hazards due to explosive mixture, static charge, autoignition etc.

9.1.2 Unit Operations

In such operations, there is no chemical reaction to form a new product. It indicates no chemical change but mechanical or physical change like distillation, cutting, heating, cooling, drying, mixing, grinding, washing, packing, transferring, filtering, handling, radiation etc.

Some general operations in a sequence are as follows -
Steam distillation : Live steam is passed in the still to recover the solvent. Vapours of solvent and water are passed in a shell-tube type condenser and cooler. Then the cooled distillate are taken in a separator where solvent and water separate out and are diverted to respective storage. .

Heating : Heating operation can be done either directly or indirectly. In direct heating, steam is passed in the material directly to heat the material. In indirect heating, heating media (e.g. steam, hot oil, hot flue gases etc.) are passed in jacket / coil of the vessel.

Cooling : It can be done directly or indirectly. In direct cooling, ice or cooled water is added to the material directly. In indirect cooling, cooling media (raw water, chilled brine, cold oil etc.) are passed in jacket / coil of the vessel.

Drowning means transferring reaction mass from the reaction vessel to a tank which is containing water or other medium (e.g. dilute acid, dilute alkali etc.) Filtration : This operation is for separating solids and liquids. The conventional items used for this operation are press, nutch, centrifuge. The filtration can be done either under vacuum or pressure or at atmospheric pressure.

Pulverisation : This operation is done to reduce size of the material. Usually crushers, pulverises, ST mill are used.

Blending : This operation is done in a blender to mix thoroughly two or more dried products.

Washing : This operation is done in presses, nutches or centrifuge to remove soluble impurities and acid/alkali from the product.

Packing is filling up of finished product in the containers.

Storing of liquid raw materials : Bulk liquid raw materials which are received in tanker loads are emptied out in storage provided for this purpose.

Unit operations are classified as under :

1. **Mechanical unit operations -** (1) Size reduction (2) Size enlargement, mixing, agitation, blending and kneading and (3) Separations e.g. gravity settling, filtration, centrifugal, impingement, screening, jigging, magnetic, electrostatic, hydro and flotation.

2. **Mass transfer operations** - evaporation, distillation, absorption, humidification, extraction, leaching, crystallisation, ion exchange, adsorption, drying.
3. **Heat transfer operations** - conduction, convection, radiation.
4. **Material handling, transportation & conveyance** - pumping, compression, fluidisation and containerisation (solid filling).

Controls : Distillation operation needs trip and alarm device to stop heating as soon as cooling stops. In addition, the vessel should have a safety valve to discharge any accidental pressure. In centrifuging, blending, grinding, crushing, pulverising or sieving of any flammable or explosive substance, inert blanketing, earthing and avoidance of sources of ignition are essential. Where stirring and heating both are going on, stirrer failure alarm and a device to cut heat source, are necessary.

9.1.3 Other Processes and Operations

It is utmost important to understand chemical processes before understanding their safety aspects. Therefore some such processor are explained below in brief.

Absorption of gases : The solution of gases in liquids or absorption of gases by solids through the whole body. It is penetration or consumption of one substance by another e.g. scrubbing.

Adsorption : The adherence of a substance on a surface, the substance that adsorbs is adsorbent and that is adsorbed is adsorbate. It is relatively a slow penetration or consumption of gas or liquid particles through the surface of another substance mostly solid or liquid. It is used to remove colours, odours and water vapours through activated carbon, activated alumina, silica gel etc.

Bromination : A reaction in which -one or more bromine atoms are substituted for hydrogen atoms in an organic molecule.

Calcination : Strong heating, conversion of metals into their oxides by heating in air.

Carbonation : Treatment with carbon dioxide. Usually for formation of carbonates.

Catalysis and Catalyst : The alteration of the rate of chemical reaction, by the introduction of a substance (catalyst) that remains unchanged at the end of the reaction. Small quantities of the catalyst are usually sufficient to bring the action about or to increase its rate substantially.

Chain reaction : Any self-sustaining molecular or nuclear reaction, the products of which contribute to the propagation of the reaction, viz. nuclear fission.

Decomposition : The breaking up of chemical compounds under various influences e.g. by chemical action, by heat (pyrolysis), by an electric current (electrolysis), by biological agents (biodegradation) etc.

Distillation : The process of converting liquid into vapour, condensing the vapour and collecting liquid or distillate. Used for separating mixtures of liquids of different boiling points or for separating a pure liquid from a non-volatile constituent.

Electrostatic precipitation : A widely used method of controlling the pollution of air (or other gases). The gas, containing solid or liquid particles suspended in it, so that the particles are attracted to and deposited upon, the positive electrode.

Endothermic process : A process accompanied by the absorption of heat.

Evaporation : The conversion of a liquid into vapour, without necessarily reaching the boiling point, used in concentrating solutions by evaporating off the solvent.

Exothermic process : A process in which energy in the form of heat is released.

Extraction : The process of separating a desired constituent from a mixture by means of selective solubility in an appropriate solvent. Also used to describe any process by which a pure metal is obtained from ore.

Fermentation : A chemical change, brought about in organic substances by living organism (yeast, bacteria, etc.) as a result of their enzyme action.

Fractionating column : A long vertical column, containing rings, plates or bubble caps, that is attached to a still. As a result of internal reflux a gradual separation takes place between high and low boiling 'fractions' of a liquid mixture.

Freezing : Change of state from liquid to solid, it takes place at a constant temperature (freezing point) for any given substance under a given pressure (normally standard atmospheric-pressure).

Fumigation : The destruction of bacteria, insects and other pests by exposure to poisonous gas or smoke.

Hydrogenation : Subjecting to the chemical action of or causing to combine with hydrogen.

Leaching : Washing out a soluble constituent.

Neutralisation : The addition of acid to alkali, or vice versa, till neither is in excess and the solution is neutral.

Photochemical reactions : Chemical reactions initiated, assisted or accelerated by exposure to light.

Pyrolysis : Chemical decomposition by the action of heat.

Radiation hazard : The potential danger to health resulting from exposure to ionising radiation or the consumption of radioactive substance.

Stabilisation : The prevention of chemical decomposition of a substance by the addition of a 'stabiliser' or negative catalyst. 'Stable' means which cannot readily decompose.

Sublimation : The conversion of a solid direct into vapour, and subsequent condensation without melting.

Tanning : The conversion of raw animal hide into leather by the action of substances containing tannin, tannic acid, or other agents.

Vacuum distillation : The process of distillation carried out at a reduced pressure and boiling point. Vacuum lowers boiling point. It is useful for distilling high boiling and heat sensitive materials such as heavy distillates in petroleum, fatty acids, vitamins etc.

9.1.4 Exothermic Reactions

In exothermic reactions, heat is given out as reaction proceeds. This release of heat raises the temperature of reaction mass. Approximately for every 10°C rise in temperature, reaction rate doubles. Thus with increase in temperature, reaction proceeds faster and still more heat is given out. This chain of operations makes the reaction uncontrollable unless adequate arrangement for removing heat or pressure are provided in the reaction vessel. The reaction rate has to be gradually increased so that reaction does not reach runaway stage.

Examples of exothermic reactions are nitration, halogenation, amination, alkylation, oxidation, condensation; polymerisation, neutralisation, sulphonation, hydrogenation, hydrolysis, aromatisation and isomerisation.

Vessels of such reactions should be regularly tested by a competent person.

For highly exothermic reactions since temperature has to be increased very gradually, automatic programmes are provided which maintain a predetermined rate of rise in temperature and thus prevent the reaction from reaching runaway stage. In addition to safety valve, a rupture disc with drowining i.e. dump or surge vessel is provided to receive the entire reaction mass in case of overpressure and bursting of the rupture -disc. The pressure gauge, temperature gauge, high pressure/temperature alarm and heat source cut off device, quenching or process killing device, safety valve, rupture disc, drowning tank, cooling device, agitator, feed control, pressure controller, drain valve etc., should be regularly checked and properly maintained. Alternate water, power and pumps are required to maintain the necessary cooling system.

9.1.5 Pressure and Vacuum Reactions

Any vessel maintained at a pressure above I atmosphere is a pressure vessel. Suitable means of pressure release such as safety valve and/or rupture disc should be provided. Gases released from safety valve, if poisonous, should be scrubbed before venting to atmosphere. Flammable gases should be safely contained and cooled. Emphasis should be laid on proper design, maintenance and testing of pressure vessels. Their thickness should be periodically checked for corrosion, pitting etc., as laid down in Rule 61 of the Gujarat Factories Rules, 1963. Pressure gauge, temperature gauge, temperature regulator, safety valve, rupture disc, pressure reducing valve or regulator, drowning tank, drain valve, feed control, temperature control (heating, cooling control), agitator control and stoppage alarm, high pressure alarm, gas leakage alarm, safe vent after safety valve, flame trap, non return valve, excess flow valve or flow controller, quenching or reaction killing device, purging valve, drain pipe, by-pass pipe with valve, manhole, inspection window, level indicator, earthing, flame arrester, safe and sound jacket, water cooling of gland packing, cooling interruption alarm, automatic heat or feed cut off and regulating devices, remote control etc. should be provided as per requirement.

Pressure vessels should be designed as per standard code (e.g. IS:2825) and periodically tested by a competent person. In a solvent vacuum distillation, if vacuum breaks, outside air can enter and make explosive air mixture in the vessel. This may cause fire or explosion. To avoid this a vacuum failure alarm and at that time inert gas purging (device) is necessary.

On distillation vessel also, an alarm and safety valve are required to indicate any choking and release of any pressure.

See subsequent Part 15.4 for pressure vessels and their safety aspects.

9.1.6 Flammable/Explosive Reactions and Distillations :

Utmost care should be taken during storage, transport, handling and reaction of explosive and flammable materials. Bulk storage of these chemicals come under purview of Chief Controller of Explosives. Free fall of flammable liquids should be avoided. Suitable dip pipes should be provided. All lines carrying flammable materials must be bonded by copper clamps and earthed. Continuity should be periodically checked and resistance to earth should be less than I Ohm. Pumps handling these chemicals should have brass or non-metal impeller to avoid sparks due to friction. Flow velocity should not exceed 6 m/sec in pipeline to avoid static charge accumulation. Reaction of flammable chemicals including solvent distillation should be carried out at low pressure or under vacuum or inert blanketing. Even on distillation vessel, a safety valve or explosion vent should be provided to take care of any accidental pressure. Flare, condenser, vent gas condenser or incinerator should be provided if required.

Another danger to flammable solvents come from smoking and electric sparks. All electric fitting should be flameproof including lighting. During maintenance, use of ferrous tools should be avoided as it can give rise to sparks. Flame arrester and smoke detector should be provided. Fire extinguishers should be kept ready.

As far as possible flammable substances should be processed at low temperature (below flash point) and pressure. Dip feed pipe, slow and controlled addition (e.g. niddle valve), inert blanketing, vacuum, spark/flame avoidance, spark/flame detectors with alarm, no-smoking habit, good ventilation and training to workers are necessary.

9.1.7 Toxic Reactions

For handling acid, alkali and other toxic chemicals, workers must be provided with suitable protective appliances such as rubber or PVC hand gloves, gum-boots, safety goggles, apron etc. Suitable posters showing dangerous properties of these chemicals and safe working procedure should be prominently displayed. Arrangement for combating spills of these chemicals such as water shower or pipe for covering up should be available nearby. The workers should be trained in the use of these chemicals and safety equipment before giving responsible job independently. Suitable scrubbers, absorbers or neutralisers for inorganic gas or vapour and condenser for organic vapour should be provided and well maintained.

See Table-18.4 of this Chapter and Table-17 of Chapter-32 for scrubbers.

Scrubber line should be always open. If it is provided with a valve, the reactor should have safety valve to take care of any pressure built-up due to closer of the scrubber line valve or any choking" in that line. Interlocking of a scrubber line valve with the addition valve is necessary so that no addition of any hazardous chemical can be started in the reactor unless the scrubber line valve is open. Concentration of scrubbing media should be checked and always maintained. If scrubber stops, alarm should be available and the process should also be stopped. Leak detector with alarm, ventilation according to the vapour density of the material, open working space, local exhaust ventilation on toxic (e.g. pesticide) fumes and dusts, wind velocity and speed indicators, safety showers and eye washers, cautionary notices and medical examinations of workers are necessary.

The modern instrumentation and control devices, interlocks, trips and alarms, auto controllers, automatic process correction device, computer controls, DCS system, direct reading, display and correction system etc. should be provided as per process requirement.

For handling poisonous gases such as chlorine, ammonia, sulphur dioxide, phosgene, phosphine etc., workers must be trained before assigning them responsible jobs. They should be provided with suitable respiratory protection. Arrangement for good ventilation such as suction hood with scrubbing arrangement should be provided in the plant.

A chemical can enter our body through injection, inhalation or skin contact. Lead, mercury, aromatic solvents, nitro and amino aromatic compounds, benzene, toluene, chlorine, chromium etc., are a few examples which can find entry into human body through various routes. The workers must be suitably protected from exposure to such chemicals. Efficient exhaust system, scrubbers and suitable protective appliances to avoid body contact should be provided. Skin absorption is the most important route and least understood by the average worker. Worker education plays an important role in the proper use of PPE. Workers should be trained to wear proper PPE. After handling of dangerous chemicals, workers must change their clothing followed by bath with soap and water. Provision of safety shower within easy reach is essential.

Periodic medical examination of workers exposed to hazardous chemicals should be carried out. If worker shows any indication of poisoning due to chemical, suitable preventive measures should be taken.

9.2 Operational Deviations :

Working parameters of process materials or utilities should not be deviated. Sudden changes in pressure, temperature, flow, control system etc. or exceeding safe operating limit (e.g. pressure vessel) or permissible exposure limit (e.g. toxic release, noise, radiation etc.) can result in accidents. Sometimes low level (e.g. water level in boilers, oil level in heaters) is also hazardous. Sudden opening of valves cause surges, fluctuations and vibrations. Increased addition rate of nitric acid has caused many accidents.

If pump or compressor stops, temperature increases or decreases, cooling or scrubbing stops, material expands or contracts or runaway reaction takes place, then because of change in pressure, temperature, flow and level are also changing.

If heating or cooling stops, heat exchanger stops, charging system changes, stirring delays in starting or restarts after closure, it errs in adding material or catalyst is overheated, then because of change in temperature, pressure, flow and reaction rate are affected.

If feed material stops, vapour affects, pump stops, impurities settle, material freezes or polymerises, ambient temperature goes down or control valve block<s, then because of change in flow, pressure, temperature and level are also changing. If flow stops, reduces or leaks, accident can occur. Therefore pipelines and valves should be kept clean and without choking. Steam tracing (indirect heating) lines should be provided on pipelines carrying material which can freeze and result in no flow.

If flow changes, pump stops, vapour or blockage takes place, vacuum fails or by surging, foaming, heat expansion, siphoning, stirring or vibration level changes and because of change in level, pressure, weight and measure also change. Measuring tank, day-tank, flow control meter, feed control valve, level indicator and level alarm are useful in controlling level.

Because of errors, faults or lags in measurement, design, operating valve or seeing or recording process parameters or in instruments indicating pressure, temperature, level, flow etc. or in their settings or by stoppage of utilities, control systems change resulting in change in parameters. Testing .and monitoring of instruments/equipment and training of workers can reduce such 'errors.

Failure of vessel, jacket, pipe, joint, pump, gasket, blower, compressor, stirrer, controllers, computers, pressure relief devices, flare, scrubber, welding etc., can cause major or minor accidents. These can be reduced by good design and maintenance.

To prevent operational deviations as stated above, it is most important to pay attention on safety and control devices such as pressure relief devices, level and flow controllers, temperature controls, alarms/trips and interlocks, leak detectors, spark or flame arresters, flameproof fittings where necessary, slow and safe charging and stirring, slow heating and monitoring, dumping or emergency by pass system, fire detection and control system, preventive and rapid corrective maintenance, education and training etc.

Emergency Shutdown : Because of operational deviations as discussed above or any other reason or failure of safety and control device when emergency arises and the situation seems to be out of control or aggravating, it becomes necessary to shutdown the plant or part thereof. Following procedures are adopted for this purpose :

1. Cutting of heat source or starting of cooling.
2. Stoppage of adding new material.
3. Stoppage of mixing.
4. Dilution of internal substance or reaction mass.
5. Flooding by water if it is effective.
6. Inert gas (N_2) purging.
7. Emergency by pass (transferring the material).
8. Inactivating the catalyst.

The most suitable, effective and safe procedure should be selected depending on process.

9.3 Use of Vessels, Equipments & Control Room

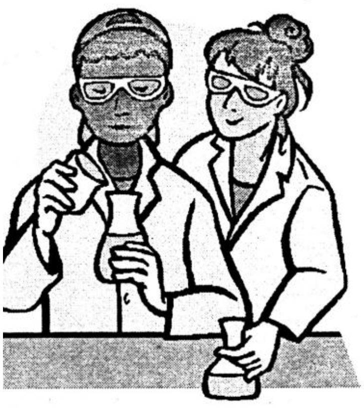
Many vessels and equipments are used in chemical processes. Storage vessels, reactors, distillation vessels, transfer vessels, holding *vessels, measuring vessels, open or closed vessels, pipelines and a variety of equipments are used as per design and need. Their material of construction (MOC) should be studied as stated in Part 8.1 for safety point of view. They should be used in enclosed manner as far as possible. Acids, alkali, solvents and dangerous chemicals should not be handled in open bucket or container. Schedule 19, Chemical Works, GFR should be strictly followed. Necessary PPE should be used.

Operation of valves and other control devices should be done carefully and as per guidelines and training. SOP should be followed.

Where automatic chemical processes are designed, a control room is provided. DCS and other fully or partially computerised systems are provided there. Training is necessary to operate such systems in the control room. Knowledge of different trips and alarms, interlocks, audio-visual indications and control of flow, pressure, temperature, etc. is necessary. Method of emergency shut down and emergency transfer should be known and safely followed. Vessels should not be subjected to over pressure, temperature, speed etc. Any abnormal deviation should be understood quickly and remedial measures should be applied in time.

9.4 Safety in Laboratory

Laboratory is used for testing of raw materials, intermediates and finished products. It is also used for research purpose. Glass vessels and other small vessels are used to handle small quantities of materials. Hazard of glass breakage should be understood and handle such vessels carefully. Screen and other guard should be provided. Rubber and flexible tubes should be checked frequently and replaced periodically. Their connections should be checked and kept leak proof. Laboratory vessels and reactors should never be subjected to over pressure, temperature, speed etc. Necessary PPE and apron should be used. Safety showers and wash basins should be provided for washing hands etc.



Fuming cupboards are provided for venting out fumes, gas etc. Their doors (shutter) should be kept closed up to the specified height. More opening will make the suction weak and gas/vapour may also come out.

Gas cylinders should be kept upright and tied with a chain for preventing their fall. Their valves and regulators should be properly used.

Waste collection bins or trolleys should be used to clean and collect wastes from the floor.

Batch sheets should be used for recording of the process and necessary instructions should be mentioned for the next shift worker if the process is to continue in the next shift.

Room exhaust and process exhaust systems should be provided and run efficiently.

Cupboards, shelves and racks are used to put small bottles, equipment etc. Necessary stool or support should be used while working with them. Laboratory should be kept clean, attractive and without any smell, dust or dirtiness

Safety and Emergency Equipment forth Laboratory

The following are checklists for safety an emergency equipment for the laboratory:

Personal Protective Equipment
1. Chemical splash goggles
2. Face shields
3. Lab coat
4. Lab apron
5. Gloves (selected based on the material being handled and the particular hazards involved)

Safety and Emergency Equipment
1. Hand-free eye-wash stations (not eye-wash bottles).
2. Deluge safety showers.
3. Safety shields with heavy base
4. Fire extinguishers (dry chemical and carbon dioxide extinguishers).
5. Sand bucket.
6. Fire blankets.
7. Emergency lights.
8. Emergency signs and placards.
9. Fire detection or alarm system with pull stations.
10. First-aid kits.

11. Spill control kit (absorbent and neutralizing agents).
12. Chemical storage cabinets (preferably with an explosion proof ventilation system).
13. Gallon-size carrying buckets for chemical bottles.
14. Laboratory chemical hood (60-100 ft/minute capture velocity, vented outside).
15. Ground-fault interrupter electrical outlets.
16. Container for broken glass and sharps.
17. Material Safety Data Sheets.
18. Emergency Action Plan for the institution.

General Rules for Chemical Storage

First, identify any specific requirements regarding the storage of chemicals from (1) local. State, and Central regulations and (2) insurance carriers.

Criteria for Storage Area

1. Store chemicals inside a closeable cabinet or on a sturdy shelf with a front-edge lip to prevent accidents and chemicals spills; a ¾ - inch front edge lip is recommended.
2. Secure shelving to the wall or floor.
3. Ensure that all storage areas have doors with locks.
4. Keep chemical storage areas off limits to all persons.
5. Ventilate storage area adequately.

Organization

1. Organize chemicals first by compatibility - not alphabetic succession.
2. Store alphabetically within compatible groups.

Chemical Segregation

1. Store acids in a dedicated acid cabinet. Nitric acid should be stored alone unless the cabinet. provides a separate compartment for nitric acid storage.
2. Store highly toxic chemicals in a dedicated, lockable poison cabinet that has been labeled with a highly visible sign.
3. Store volatile and odoriferous chemicals in a ventilated cabinet.
4. Store flammables in an approved flammable liquid storage cabinet.
5. Store water sensitive chemicals in a watertight cabinet in a cool and dry location segregated from all other chemicals in the laboratory.

Storage Don'ts

1. Do not place heavy materials, liquid chemicals, and large containers on high shelves.
2. Do not store chemicals on top of cabinets.
3. Do not store chemicals on the floor, even temporarily.
4. Do not store items on bench tops and in laboratory chemical hoods, except when in use.
5. Do not store chemicals on shelves above eye level.
6. Do not store chemicals with food and drink.
7. Do not store chemicals in personal staff refrigerators, even temporarily.
8. Do not expose stored chemicals to direct heat or sunlight, or highly variable temperatures.

Proper Use of chemical Storage containers

1. Never use food containers for chemical storage.
2. Make sure all containers are properly closed.
3. After each use, carefully wipe down the outside of the container with a paper towel before returning it to the storage area. Properly dispose of the paper towel after use.

10 UTILITY HAZARDS AND CONTROLS

Water, air, power, thermic fluid, fuel, steam/ heating media, brine/cooling media, inert gas/purging media, also need attention from safety point of view. Their failure creates immediate danger which requires similar immediate controls. Therefore compressors, condensers, emergency services, stand-by equipment etc., should be kept ready for immediate use.

Hazards of such utilities are not only because of their sudden failure, but also due to their working parameters like pressure, temperature, flow, leakage, dripping, toxicity, flammability and hazards of the vessels, piping, equipment and instruments through which they pass. Uncontrolled process or fire water may corrode the things, air pressure can burst a vessel or throw dust, thermic fluid leakage can cause fire or explosion, inert gas diminishes oxygen level for breathing and electric power and steam has, already caused many accidents. Refrigerant gas freon causes ozone depletion and thousands of tonnes of hydrocarbons and carbon dioxide emitted by fuel combustion, pollute the environment. Noise and vibration due to high flow of steam or air and other health hazards due to misuse of air, water, steam, electricity and nitrogen are also not uncommon.

In distillation column-condenser when cooling water stops, due to heat rise, pressure increases and bursts the condenser or sometimes causes back pressure in distillation vessel itself and bursts it. Pressure relief devices on such vessels, condensers and even on receivers are therefore necessary. High pressure/ temperature alarms interlocked with heat source to cut off the heat supply at predetermined pressure or temperature can work as safety devices. For quick cooling water supply, stand-by pump-motor set, DG set or overhead water tank to get water by static head only, are also necessary.

If there is a common water reservoir for process and fire water both, the suction pipe of the fire water pump should be deeper than that of the process water pump to allow a reserved stock of fire water for emergency.

Kettles, stills, jacketed vessels, evaporating pans and steam heaters where normally steam is utilised in jacket or heating coil, should be treated as pressure vessels for the purpose of safety. Their pressure parts should be provided with safety valve, pressure gauge and PRV. They should be tested by NDT and hydraulic testing and its records be maintained.

When a steam-jacketed vessel is completely valved off (vented), it should be protected with a vacuum breaker to stop collapsing. Where air is not desirable, N,, injection device should be provided. Before opening the vessel, first the jacket should be completely drained to make its pressure zero, and then the whole vessel should be allowed to cool. The jacket should be thoroughly drained before admitting steam into it because water in steam space may cause serious damage.

Autoclaves, vulcanisers, retorts, digesters etc. should not be opened before depressurising them. Their door should therefore be interlocked with the pressure.

In cold vessels, steam should be admitted slowly for slow and uniform heating and expansion of all parts. Steam valves should be opened slowly.

Where heating coils are used to heat water, oil or material, they should be kept submerged, the minimum liquid level should be maintained (by level gauge or low level alarm and automatic addition of the liquid) and the coil should be kept open at other end or be provided with a safety valve and steam-trap and should be checked for any choking.

Steam pipes should be insulated and claded. Steam leak can also cause static charge because of its jet action, therefore where steam is used to heat flammable material, steam pipes should be properly earthed and bonded.

For air cooling, heat exchangers and compressors mid for brine cooling and refrigeration, chilling plant mid insulation should lye properly provided.

Air being supplied to pneumatic equipment and respirators should be clean, dry, without dust, water or oil and at bearable pressure. Therefore air filter, pressure cut off switch, safety valve, pressure gauge and pressure regulator are necessary. Air receiver tanks should be tested hydraulically and their safety devices (SV, PG & PR) should be maintained properly.

Thermic Fluid Heaters : They are used to heat thermic fluid which is circulated in a closed loop through textile machines or chemical vessels requiring heat. Instead of steam, this oil is used because it can be heated to higher temperature and circulated at less pressure. It is less compressed and therefore stores less energy at the same temperature. Its main hazard is fire or explosion and can also cause hot burns if splashed. For statutory provisions see Rule 61D of the Gujarat Factories Rules

Coal, lignite, wood, furnace oil, diesel oil, LSHS, LPG, natural gas (LNG)etc. are used as conventional fuels. After combustion coal, lignite and wood (solid material) result in ashes and fly ash and dust particles cause health hazards and air pollution. They need costly control measures. To suppress coal dust and fly ash, water should be sprayed over them.

Some people burn rubber, plastic, paper and similar solid wastes (non conventional fuels) in boilers or furnaces. This is highly objectionable as it emits black smoke and carbon particles in surrounding, affecting neighbouring industries and public. In addition, it pollutes the environment. LPG or natural gas are clean fuels, give good thermal energy and less pollute the environment. Therefore their use should be preferred. LSHS, furnace oil and diesel oil stand in between. Economy and availability of fuel may have influence on selection, but however looking to the increasing air pollution, only eco-friendly fuels should be preferred. Storage tanks of fuels should be protected by safety devices discussed in foregoing Part 8.2.

Pipelines for steam, oil, water, air, fuel and chemicals should be arranged and protected properly. They should not cause any obstruction. Their supporting structure position and height should be safe and without risk. They should be painted with colours for protection and identification of hazards. Direction of flow should be indicated. Earthing, bonding, insulation, fittings (valves, regulators, gauges etc.) and joints should be as per requirement.

Electrical cables should be laid in trenches and in safe position i.e. away from furnaces, molten metal, chemicals, steam, water, hot oil or their splashes. Loose or hanging wiring must be avoided, joints if any, should be safe and sound so that they cannot be pulled out. Three pin top in plug, double earthing, charging of earthing pit, ELCB in power lines of portable tools, fuses of safe amperage and all electrical materials and fittings conforming IS mark are the basic requirements. For details see Chapter II.

Mixing of Utilities can cause hazards. Wrong operation of electric switch has caused fatal accidents. Mixing of steam or water in the jacket with reaction mass in the vessel, mixing of air with flammable material or mixing of toxic material with air or water arc all hazardous. Mixing of water in molten metal (e.g. induction furnace) or in reaction mass above 100 °C has caused serious accidents. Splashes of molten metal on electric cables has caused great fire resulting in damage of lacs of rupees. At very low temperatures (near "C or below), water .can freeze in pipelines and block it. Cyanides or pesticides mixed and drained with water can kill animals. Inert gas nitrogen has caused accidents. Playing with pressurised air, exposure to sudden splashes of steam, hot water or oil can also cause accidents. Therefore pipelines of utilities need sometimes double isolation or double block and bleed valves.

11 POLLUTION HAZARDS AND CONTROLS

Chemical industry discharges solid, liquid or gaseous wastes as a result of manufacturing process. Such wastes may be toxic, flammable, corrosive, radioactive, non-biodegradable or hazardous in nature and if it is not properly treated, it pollutes land, water, air and overall environment.

Water, soil/land, and air pollution create many problems and need efficient control. Effluent treatment plants and appropriate scrubbers, exhausts, flare, incineration and other neutralising or inactivating devices are most desirable. They must work for all working hours and in effective manner.

For environmental laws see part 10 of Chapter 28

12 INSTRUMENTATION FOR SAFE PLANT OPERATIONS

After understanding various types of chemical hazards in foregoing parts, we should proceed to know the instruments, equipment and other control measures.

To maintain, control, measure, alarm and record process parameters, various industrial instruments and safety devices are used. Their proper selection, application and maintenance are most important. Some basic instruments are mentioned below :

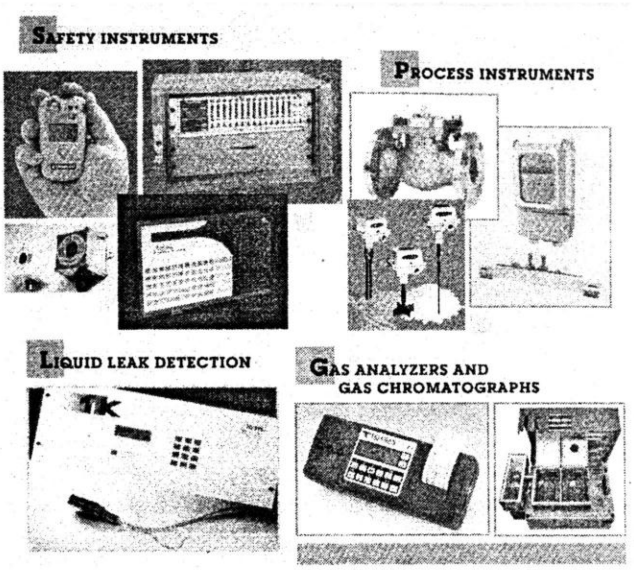
12.1 Basic Instruments

Anemometer	:	Instrument for measuring the speed of wind or any other moving gas.
Atmometer	:	Evaporimeter. An instrument for measuring the rate of evaporation of water.
Barometer	:	For measuring atmospheric pressure.
Barograph	:	Used in meteorology for recording on paper the variations in atmospheric pressure over a period of time.
Bolometer	:	An extremely sensitive instrument for measuring heat radiation.
Bomb calorimeter	:	A strong metal vessel used for measuring heats of reaction, especially heats of combustion, e.g. for determining the calorific value of a fuel.
Bourdon Gauge	:	A pressure gauge for steam boilers etc.
Calorimeter	:	For determining quantities of heat evolved, absorbed or transferred.
Cryometer	:	A thermometer especially designed for measuring low temperatures.
Dasymeter	:	An instrument for determining the density of a gas.
Dilatometer	:	An apparatus used for measuring volume changes of substances.
Hydrometer	:	For measuring the density or relative density of liquids.
Hygrometer	:	For measuring the relative humidity of the atmosphere.
Manometer	:	For measuring gaseous pressure.
Pyknometer	:	An apparatus for determining the density and co-efficient of expansion of a liquid.

Pyrometer	:	For measuring high temperatures.
Rotameter	:	A device to measure the rate of flow of fluids.
Salinometer	:	A type of hydrometer used for determining the concentration of salt solutions by measuring their density.
Seismograph	:	For recording earthquakes and phenomena associated with them.
Spectro Photometer	:	A photometer for comparing two light radiation wavelength by wavelength.
Spherometer	:	For accurate measurement of small thickness, or curvature of spherical surfaces..
Tensimeter	:	For measuring vapour pressures.
Tensiometer	:	An apparatus for measuring the (1) surface tension of a liquid .(2) moisture content of soil or (3) tension in a wire, fibre or beam.
Thermo barograph	:	For measuring and recording atmospheric temperature and pressure, consisting of a thermograph and barograph.
Thermocouple	:	For measurement of temperature.
Thermograph	:	A self-registering thermometer to record temperature variations during a period of time on a graph.
Thermometer	:	For measurement of temperature viz. mercury thermometer, gas thermometer, pyrometer, resistance thermometer, thermocouple, Beckman thermometer, thermometer clinical,, thermometer-maximum and minimum.
Thermopile	:	For detecting and measuring heat radiation.
Thermostat	:	For maintaining a constant temperature by the use of a device that cuts of the supply of heat when the required temperature is exceeded and automatically restores the supply when the temperature falls below that required.
Viscometer	:	For the measurement of viscosity.

12.2 Specific Instruments

Some special instruments available are as follows:



Gas/Fume/Vapour Detector & Alarm (Gas Leakage Warning Instrument) : This is an electronic instrument having a sensor and audible alarm to give warning when pre-set air-gas (toxic or explosive) mixture exceeds the set TLV or LEL/UEL limit. It detects flue gases, LPG, smoke, petrol vapours, paraffin fumes, hydrocarbons, ammonia, freon, hexane, acetone, benzene, chloroform fumes, CO, HS, methane, solvent vapours and many poisonous/explosive gases. Various types of gas detector hand models are also available.

Metal Detector : It detects the metallic objects of ferrous and non-ferrous materials hidden in the pocket/bag etc. and can locate the concealed conducts or cables etc., from a close distance. It is like torch and has piezo alarm.

Electronic Flasher : A built-in solid state electronic flasher which can flash mains bulb or series lamps on mains at adjustable flashing rate. It can be used as danger indicator or attracting attention etc.

Electronic Aircleaner : For indoor use up to an area of 25 sq. meters for pollution free clean atmosphere and wherever bad odour is a problem. It also deactivates dust particles suspended in air, reduces effects of secondary smoking and controls virus and retards growth of bacteria.

Alcohol detecting instruments : With electronic alarm to warn before drivers sit behind the wheels or workers on the machines, thus prevent them from alcohol consumption when they are on duty.

Similar other instruments : Explosimeter, Clap switch, LPG level alarm. Gas level indicator. Smoke detector. Insect killer. Proximity switches. Remote controls. Breath analyser, CO/methane detector. Touch switch. Electronic siren. Loud hailer cum siren, Multipoint gas detection (alarm) system, NH, detector, C1, detector. Flammable gas detector. Digital in/out indicator. Burglar alarm. Heat sensor. Manual fire alarm switch. Control cum power unit. Static charge detector. Hand-dryer, Timer, Hooter, 2 wire ionisation smoke detector. Heat detector for locations subject to rapid temperature fluctuations, Halon-1301 fire extinguishing system, CO_2 extinguishing system, Dragger tubes and air pump for contaminated air sampling (different tubes for different gases). Gas chromatography. Solid state potentiometric recorders, Combustion gas detector. Explosive gas detector with personal monitor. Infra-red gas analyser for the measurement of CO, CO_2, CH_3 and other constituents in theppm and percentage range. Dragger polymeter to determine mean value of gas concentrations in air over a period of several hours by means of special gas detector tubes e.g. for CO, NH_3, benzene, vinyl chloride etc. Oxygen detection system for O_2 measurement with audible alarm and fail-safe monitoring. Tunnel control laser. Portable anemometer giving direct reading of wind velocity, Velometers, Noise dosimeter. Noise meters. Calibrators and filters. Temperature data logger, Dust sampler for taking dust samples for gravimetric, chemical and mineralogical analysis, Hilgers i.e. oil and water remover, 1ST (International Sensor Technology of USA) sensor to measure CO, NO_x, NH_3 SO_2, H_2 hydrocarbons, vinyl chloride, acrylonitrile etc., in ppm or percentage level. High pressure liquid chromatography for degassing of solvents not necessary. Refractive index detector. Fluorescence detector. Autosampler, Microprocessor based system controller. Flame arresters (or flame traps) to ensure safety from explosions due to flammable gases, vapours or dusts etc.

Flameproof equipment : Switch gears, lighting fitting, cable/conductor, cable glands, and accessories viz. switch socket, limit switches, rotary cam operated switches or isolators, fuse unit with HRC fuse links, bell, tubelight fixture, glass lighting fitting, flood light, control gear box, bulkhead fittings, handlamp, vessel lamp, safety torch, indicating lamp, ammeter, circuit breaker, distribution board, control station, remote control panels, junction boxes-round and square, flameproof and explosion proof electric motors of type 'd', type ‘e’ (increased safety), type 'n' (non-sparking)" and type 'p' (pressurised) are to be selected for use in hazardous areas. Various Indian Standards viz.: 5571, 8240 etc., are also prescribed.

See Part 1.6.5 of Chapter-24 and Part 8 of Chapter25 for environment monitoring equipment.

12.3 Process Control Instruments

For temperatures : Thermocouples, radiation pyrometers, optical pyrometers, resistance thermometer, all glass thermometers, electronic potentiometer, multipoint potentiometer, automatic electronic balanced bridge, ratio meter, automatic miliameters, liquid type manometric temperature measuring instrument and direct acting temperature controller.

For pressure : Strain gauges, pressure transducers, pressure gauge, vacuum gauge, compound pressure and vacuum gauge, pressure (head) gauge, draft gauge, compound pressure and draft gauge, automatic pressure regulator, viz. gas pressure regulator, fuel oil pressure regulator, direct acting recorders, diaphragm type breathing valve.

High vacuum measurement : Bodurn gauge, Bellos gauge, diaphragm gauge, Mcleod gauge, Knudsen gauge, thermal conductivity gauge, rotating viscometer gauge, heat filament ionisation gauge, Philips cold cathode ionisation gauge.

For level : Liquid level detector, viz. float gauges, mercury manometers, aneroid manometer, liquid level measuring instrument, remote liquid level indicator with continuous type, fixed point indicating device, fluidised solid level detector.

For flow : Liquid filled manometer, float type manometer, head flow meter, belt type meter, wet balance type meter, Bellos meter, force balance meter, integrators, area flow meter, e.g. general, rotameters, piston type area meter, positive displacement meter, weirs, mass and magnetic flow meter, densito-meter, turbine velocity meter, volumetric flow meter, gasoline flow meter, gas flow controller, air flow controller, differential pressure gauges for measuring flow rates.

Quality analysers : Commercial automatic analysers installed on process plant, chromatography apparatus, photoelectric colorimetric gas analyser, gas/ vapour monitor alarm devices and viscoci meter.

For centralised control computers : Digital computers, automatic petroleum processing control system, automatic air operated centralised monitoring and control system, electronic instrumentation system.

Revolution meters : Tachometer, governor, air velocity meter, accelerometer.

Density and specific gravity meters : Psychrometer, hygrometers, dew point meters, viscometer, velocity measuring device, consistency measuring device, densitometer.

See Part 1.6.5 of Chapter 24 for Air Sampling Instruments.

12.4 Process and Control System Characteristics

Chemical processes and operations need efficient process and control system and a variety of instruments for them. Instrumentation and Control (IC) has developed as a special branch of engineering. Exclusive IC department and IC engineers are employed for this specific purpose. Types of instruments - manual, mechanical, pneumatic, hydraulic, electrical, electronic and computer aided, their quality and sophistication are day by day improving. Their design, erection and maintenance certainly need qualified and experienced personnel. When the safety, productivity and control systems are governed by such instrumentation, it occupies due importance and place in modern industry.

Process control system can be classified machine, reactor or parameterwise such as printing or painting machine control, turbine or compressor control, reactor or vessel control; pressure, temperature or flow control, speed control and instrument control. It can also be classified as manual control, autocontrol, semi-auto . control, analogue control and computer control. Classification also exists as mechanical control, pneumatic (air) control, hydraulic (water or oil) control, electronic control etc.

Main functions (objectives) of control system are to collect information, to measure and display it, to control normal working and to detect fault and correct it. The control system depends on process characteristics. Therefore they are discussed first.

Process Characteristics, as mentioned by P.P. Lees, include many things as under :

1. Process characteristics which tend to make feedback control more difficult are measurement problem, dead time, recycle, very short or long time constants, nonlinearity, limit cycles, strong interactions, high sensitivity, high penalties and changes in parameters or constraint.
2. The process disturbances include quality and availability of raw materials, product, services, plant equipment and environmental conditions. These disturbances may be due to malfunction of plant equipment or control system, process materials behaviour, drifting and decaying factors and links with other plants.
3. Function wise they require monitoring, optimisation, scheduling, process investigation, plant commissioning, feed forward control etc.
4. Sequential control characteristics include batch or continuous operation, plant start-up or shutdown, changes in equipment, product quality or throughput, and mechanical handling operations.

Control System Characteristics include manual, analogue and computer control.

Manual control system includes instruments for whole range of chemical and physical properties and a wide range of displays such as panel board displays, computer graphics and displays of flow, current measurement, alarms, sequential control, maloperation, command etc.

Analogue control equipment are used for measurement, information reduction and sequential control. They include data loggers, alarm scanners and trip systems. Trips may be used for safety shutdown function also.

Computer controls include direct digital control (DDC), programmable logic control (PLC), distribution control system (DCS) and supervisory control.

Present trend in control systems is to increase degree of automation and a change in operator's role from control to monitoring.

12.5 Instrument System for Safety

Use of instrumentation for safety is equally important. Process parameters are well known because of the fixed objectives and therefore instrument system for process control developed first. Instrument system for safety developed at a later stage based on learning from accidents and thinking of remedial measures.

Types of instrument systems for safety include fail-safe design, trips, alarms, interlocks; gas, smoke and fire detectors, toxic detectors, reaction runaway detectors, logic systems like PLC, DCS etc.

Some basic principles for safety instrumentation are as under :

1. Instead of providing elaborate or complex instrument system, the hazard should be reduced
2. HAZOP study should be conducted to asses' potential hazards, operating difficulties and instrumentation necessary.
3. The measurement should be of direct variable and at direct location.
4. While designing alarms/other factors like instrument failure, operator confidence, his information load etc. should also be considered.
5. As far as possible instrument design should be fail-safe.
6. Range of the instrument should be sufficient so that even low input can be measured.
7. Control system should be capable of dealing with normal and abnormal conditions e.g. start-up and shutdown.
8. In case of failure of auto-controls, manual controls should also be provided for safety.
9. Fault finding instrument should not be disturbed by the fault itself.
10. Service instruments (e.g. for air, power, inert gas) should have high integrity.
11. Instrument should be checked regularly and repaired quickly.
12. Instrument design should be such that it should indicate its fault easily. The process operator should be trained to find such fault as a part of his duty.
13. Test should correspond as nearly as possible to the expected plant conditions. It may pass a workshop test, but may not perform satisfactorily on the plant.
14. Valves may stick or jam. Jamming in the open position is dangerous. More positive isolation may require double block and bleed valves.
15. Human errors should be fully considered. Ergonomic principles should be applied to reduce human error as far as possible.

12.6 Safety Aspects of Instruments

Instruments failure can also cause accidents. Therefore while designing and manufacturing, it is necessary to consider safety features of instruments also. For examples, ordinary glass or plastic parts may not withstand high pressure or temperature, corrosive metal parts are not suitable for corrosive chemicals, teflon coating with stainless steel is required for material like oleum, lead is preferred to make film badges for shielding against ionising radiation, electrical parts must conform to Indian Standard for better performance and special alloys are required for special purposes. F.P. Lees has listed following features:

1. Instrument may fail due to a functional fault or loss of containment from the instrument.
2. Slight glasses or rotameters, made of glass, can break and leak. If leaks are dangerous, glass should be avoided.
3. Material of construction should be proper. After considering the properties of the material to be handled and working parameters, material for instrument should be selected.
4. Pressure transmitters and regulators can be damaged by overpressure. If they break, their pressure should be safely released.
5. Protection against corrosive fluid is necessary, e.g. use of inert liquid in impulse lines on pressure transmitters or of chemical diaphragm seals on pressure gauges.
6. Sampling and impulse lines should be checked for blockage. Steam tracing is useful against freezing (e.g. Phthalic anhydride).
7. A thermowell to hold thermometer should be carefully designed to take into account corrosion/ erosion effect.
8. Pulsating flow in flowmeters can cause inaccuracies. Design of orifice plate should consider this factor.

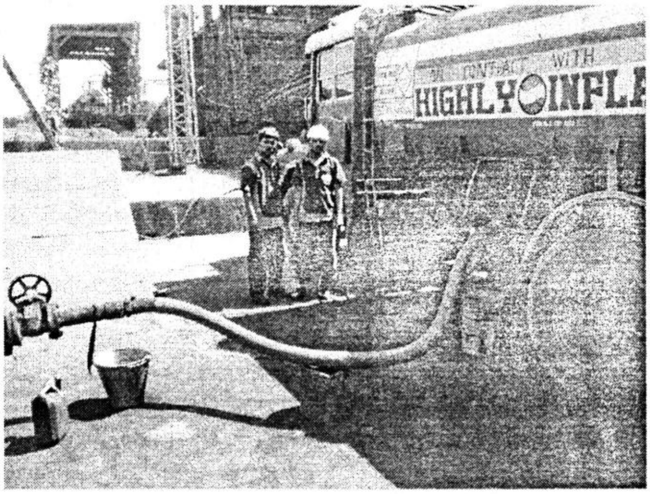
9. Complex instruments like analysers, speed controllers, vibration monitors and solids weighers are generally less reliable. Consequences of their failure should be carefully analysed.
10. Out of different types of pressure regulators (e.g. PRV, NRV, EFV, SV,RD), the right one should be selected at right place. No bypass should be provided between pressure regulators.
11. A control valve should be selected properly. Nominal capacity, range ability, control characteristics, flow limit when fully open, cooling fins for temperature protection, bellows seals to prevent leaks and mechanical balancing (capacity) against process pressure are the factors to be considered for selection.
12. Instruments should not become a source of ignition. Electrical area classification should be considered. They should be flameproof as per requirement.

13 SAFE TRANSFER OF CHEMICALS

Chemicals are transfer by pipelines and also by different types of containers. Their Safety aspects are stated below.

13.1 Pipeline Transfer :

See Part 3.2 (Rules 87 to 101) of Chapter-28 for transportation of petroleum through pipelines.



Pipelines are required to carry a variety of materials such as water, steam, air, oil, gas (inert or toxic, vapour or compressed), brine, solvent and other liquid and gaseous chemicals. From storage tanks to process vessels, from process vessels to product tanks and from there to filling (loading) points, pipelines are required. They may be above ground, underground or as per requirement. Some 20 to 30% costing is estimated in pipelines and their fittings like flanges, valves, gauges, nipples, glands, bends, elbows, plugs, reducers, joints, couplings, ferules, vents, drains etc. Pipework may be of cast iron, mild steel, stainless steel, lead, copper, plastic i.e. PVC, PP, HDPE, rubber, canvas, glass, FRP, glasslined, rubber lined, teflon coated, asbestos cement, RCC, stone, ceramic etc. '

(1) Criteria for Piping Installation :

Main factors are - material of construction, design and layout, supports and clamps, welding or flange joints, packing and gaskets, valves and other fittings, easy approach and working platform and testing and maintenance.

Material of construction is selected depending on nature (corrosivity, toxicity, flammability etc.), quantity (weight, flow, pressure) and other parameters like temperature, viscosity, colour, expansion etc. Thickness of pipe, its quality, welding pattern, flanging are to be considered while selecting for high pressure and temperature. For extremely hazardous chemicals, pipes are tested for inter granular corrosion and certified before used. Insulation is applied .to preserve heat and tracing (contact tubing) for supplying heat to the inner material.

Various Codes like Indian Standards (hundreds of Indian Standards are prescribed for variety of pipes, their fittings, couplings, threads, colour-code etc., see BIS Handbook), ASME (American Code), British Standards (e.g. BS 1710, 1319, 537, 4159). and International Standards ISO R 508 for colours for pipes for inland installations and on board ship. Indian Boiler Regulations also provide details for pipe selection, design, fabrication and testing for boiler purposes.

(2) Safety Aspects of Pipe work :

Generally probability of leakage from pipelines is proportional to the length of pipelines, number of joints, valves, vents, bleeds, drains etc. and complexity such as number of pump connections, recycle streams, hours of working, etc. Therefore it is advisable to

1. Minimise pipe length, branches and joints, and flanges on vacuum lines.
2. Provide welding joints for highly flammable or toxic chemical, good gaskets and gland packing, flange guard to deflect leak downward, flexibility to allow thermal expansion, bellows subjected to axial movement, drains and traps at visible places, removable plugs on sample points, adequate pipe supports, walkways, platforms or working place, proper slopping for draining, overhead clearance for vehicle movement (about 6 m), ergonomic design for valves to be operated and gauges to be seen, earthing and bonding to remove static charge due to flow, overflow return from measuring vessel to a storage tanks, painting with colour coding (IS:2379) and cathodic protection where required.

More pipework in dyke is not desirable, particularly with hazardous chemical, as it may be trapped in fire in the dyke. Similarly pipelines of flammable or toxic chemical should not be laid in tunnel, as its leak may spread from one area to another. Electric cables or hot lines and flammable gas or liquid lines should not run side by side. Solvent line should not be laid below the corrosive line. Seam joints of rubber lined pipes should be kept upward.

Piping arrangement should be such that in case of failure at any point, the system can be quickly isolated by closing valves, without disturbing the rest of the system. Flushing arrangement should be provided for easy start up and maintenance. Pipe alleys should not run over the walking alleys, normal layout should be near the walls or in sides. To allow for thermal expansion special joints or loops should be provided.

Emergency control valves should be easily accessible. By-pass valves should be within easy reach. Autocontrol valve should have bypass or manual valve which may be required in the event of failure of autocontrol valve. Particularly at the outlet of bulk storage of hazardous chemicals, manual and remotely controlled auto isolation valve both should be provided as near as possible to the outlet. Pressure relief device, liquid seal, manual vent valve etc. should be provided to depressurise the system where necessary.

Many different types of valve exist. It is essential to choose the type best suited for the particular operation it has to perform. For instance, if ball valves are to be fitted in a high pressure position, they should be trunnion mounted. Where positive segregation of products is required, say at a multi-product manifold, it is essential to provide block and bleed valves for continuous monitoring of valve seats and seals. For positive isolation some form of soft .seat with a wedge gate action is desirable.

Pumps must be designed not only to suit the immediate pipeline requirements, but should take into account future developments. Thus, it may be necessary to stipulate a pump casing pressure much higher than the pump can generate, if series or boosting pumping is envisaged. Care should be taken to ensure that additional or larger impellers can be fitted as the system demand grows. The maximum operating pressure for the pump mechanical seals should match the pump capabilities. It may be necessary to provide product filtration to protect the minimum clearance of the pump moving parts, particularly on modern high efficiency pumps.

Flexible pipes, joints and hoses should be safe, sound and properly tested. Bolted clips are preferred to jubilee clips. Proper supports or hangers are necessary.

Glass piping, equipment or gauge needs external protection to protect against external impact or internal bursting and flying fragments coming out.

Layout drawings of piping and fittings should be maintained and corrected when any changes are incorporated.

Use of plastic piping is increasing. When it is used for hazardous gas like hydrogen, LPG, chlorine etc., utmost care is required to ensure safe joint. Normally metal compression fittings (rings and nuts) are used. Softer ring is preferred over hard compression ring. Nut should not be loosened. It should be frequently checked for leakage. When any leakage is noticed, first the supply cylinder valve should be closed instead of operating any electric switch or spark generating device.

Semi-conductive material for hoses preferred over non-conductive or good conductive material to avoid static electricity. The conductance should be between in 10^{-4} to 10^{-8} mho.

Failure of packing in valves, stems or flange gaskets, opening the wrong valve or failure to depressurise the system before opening the joint and un insulated steam or hot lines can cause accidents. Remedial measures are splash guard, replacement of gasket, tagging and work permit procedure, colour coding and proper training and supervision.

In above ground pipe work which remains isolated during normal operations, thermal relief system should be provided to protect against increasing ambient temperature.

(3) Underground Pipelines:

Petroleum products, crude oil, and natural gases are some of the more important products transported by underground pipelines. The size may vary anywhere up to 50" diameter and pressure up to 1200 psi. Pipelines are laid for long distances, often across national boundaries. Booster stations are largely automatic stations requiring very fail-safe devices. The pipelines are usually buried about 1 meter underground and must be protected against corrosion. Leakage are likely -to occur. The pipelines have to be checked constantly. The biggest danger to pipeline come from outside sources like unauthorised digging and from corrosion.

Pipelines should be given special additional protection at various points along the route as road and river crossings. Generally, they may be placed at a greater depth beneath rivers and ditches to allow for dredging or ditch deepening. Concrete protection slabs may be placed above the pipe to warn anyone who may excavate in the area. If the ground is particularly stony or rock filled, sand may be imported to cover the pipeline or a special protective wrap may be used.

During construction of a pipeline, all welds are visually examined. Generally, a percentage are radio graphed to ensure that there is no cracking or undue slag intrusion and that there is suitable fusion between the weld and the parent metal. The pipeline is wrapped to protect it against corrosion once it is buried. The wrapping is normally tested by a 15,000 volt pressure test to ensure there are no holes in it. Additionally, an impressed current cathodic protection system is superimposed to protect against subsequent wrapping damage due to stones, roots, etc.

Pipeline control systems should be capable of recognising and measuring leak conditions and initiating the appropriate action to shut down the system and minimise the amount of product leaked.

(4) Colour Code for Pipelines :

Requirement for Indian Standard 2379 is given in Table 18.8.

Table 18.8 : Identification of Pipelines

	Service	Ground colour	1st band	2nd band
1	Cooling water	Sea Green	French blue	-
2	Boiler feed water	``	Gulf red	-
3	Condensate	``	Light Brown	-
4	Hot water	``	Light grey	-
5	Drinking water	``	French blue	Signal red
6	Treated water	``	Light orange	-
7	Cold water	``	French blue	Canary yellow
8	Untreated water	``	White	-
9	Compressed air	Sky blue	-	-
10	Vacuum	``	Black	-
11	Steam	Aluminium IS : 2339	-	-
12	Diesel	Light brown	Brilliant green	-
13	Lubricating oil	``	Light grey	-
14	Drainage	Black	-	-
15	Ammonia Cl2, HCl, SO_2	Canary yellow	Dark violet	-
16	Acids	Dark violet	Different colour for different acids	
17	Brine	Black	White	
18	Caustic solution	Smoke grey	Light orange	
19	CS_2	Black	Light orange	
20	Air	Sky blue	White	Black
21	O_2	Canary yellow	White	
22	CO_2	``	Light grey	
23	Ethylene	``	Dark yellow	Signal red
24	Ethylene oxide	``	``	Brilliant green
25	N_2	``	Black	

Colour code is also given for many other materials. For colour shade see IS 217, 166, 410, 537, 101, 309, 628, 221, 631 and 437. See also Part 7.3.2 of Chapter 9 for colour coding.

Identification of pipelines is necessary to avoid any mistake while operating any valve, taking connection or opening the line for repair c maintenance. For outside servicemen it is most useful.

Colour bands are superimposed on the ground colour. Minimum width of colour band is 25 mn Width ratio of first band to second band should be 4:1 Size of lettering should be as under :

Outer Dia of Pipe Covering (mm)	Letter size (mm)
20 to 30	10
30 to 50	20
50 to 80	30
80 to 150	40 etc.

Where flow direction is to be indicated, arrows or letters are painted near valves, junctions etc. and at suitable intervals along the pipe.

(5) Precautions in Breaking Pipelines :

Following precautions are necessary while opening or breaking any pipeline :

1. Prepare work permit. Tag the joint or portion to be broken.
2. Close or lock the isolation valves to stop flow in the line to be opened. Isolate the area.
3. Stop pump and motor. Remove fuse so that motor cannot be started.
4. Drain, vent and cool the line completely. See that the pressure is zero and the pipe is cool.
5. Wear PPE like hand gloves, face shield, apron, respirator etc. depending on chemical . Keep fire extinguishers ready.
6. Support the line on both the sides of joint. If it can fall, hold it by a lifting machine. Flange nuts and bolts should be opened slowly. A temporary flange guard should be put so as to protect from splashes or dripping. First the farthest nut-bolt should be loosened so that splash if any, may not come toward the body. Dripping, if any, should be allowed fully. Then the adjacent nut bolts should be opened. To separate flanges, a metal wedge may be used if necessary. Final bolt will be opened only after completion of dripping. Spark should be avoided.
7. After removing choking by scrapping, digging or drilling, the removed section of the line, valve etc. should be decontaminated by water, air or purging inert gas. If this is not possible, it should be tagged with warning, indicating the contaminant.
8. Use stable platform. Working by sitting on other pipelines, ladder or structure is risky.
9. Safety shower, running water hose, fire extinguisher, absorbent etc. should be kept ready for. use.
10. More precautions should be taken while opening dead lines or pipes whose content is not known.
11. Direct cutting by hacksaw or gas flame without knowing the content is hazardous. Flammable, corrosive or toxic content must always be removed first.

13.2 In-Plant Transfer :

From storage at production place, chemicals are transferred or transported to an user place or another storage place. It. may be from one place to another outside place or within the factory premises.

Chemicals are transferred in solid, liquid or gaseous forms. Solids are transferred in lumps or powder form and may generate dust, for which dust compression or extraction system is necessary.

Liquids are transferred by gravity, pumping or by water, air or inert gas pressure. Splashes from vessels, pipes, joints, pumps, glands, valves and cracks are possible. Control • of flow rate, safety showers, absorbents and personal protective equipment become necessary. Gases can leak through cylinders, valves, pipes, joints, vessels, gauges etc. Flow rate control, scrubber, condenser, venting and safe discharge are essential.

(1) **Through pipelines :** Most plants have a system of storage tanks for liquids or even materials which can be easily melted. The liquids are pumped to measuring tanks from where they are charged to the reactors.

Safe practice is to pump to the measuring tank and an overflow line returning to the tank.

The pipelines can be of various materials, depending upon the nature of chemicals handled-steel, stainless steel, polythene, polypropylene, PVC, glass, lead, glass lined, rubber lined. The pipelines should be well laid, giving adequate support, provision for maintenance, and painted for correct identification, as per IS : 2379. Pipelines carrying LPG and flammable material should be properly bonded and earthed Isolation valves should be provided for easy control in case of breakage and maintenance.

(2) **Drums :** While handing liquids from drums, the material can be emptied by sucking into a measuring vessel or by pumping out, using a small pump that could go into the bung opening; or by a gear pump. Air pressure should not be used, more so with toxic or corrosive liquids. Transfer by vacuum and using necessary PPE is the best procedure.

Solids can be discharged into reactors by drum titters or emptied onto specially designed screw conveyor. Cut drums should not be invariably used. They can cause plenty of accidents, as workers are not careful to hammer down the sharp edges. Partially used drums must be covered, special protection should be taken to preserve the chemical and the product identified.

Empty drums are not really empty, if they have been used for solvents unless specially cleaned.

Dangerous chemicals like dimethyl sulphate, benzoyl chloride, etc. require elaborate cleaning to really wash out the traces of harmful ingredients.

(3) **Naked carboys and glass bottles** should never be transported. They should be transported in wooden crates or cases, properly closed and handled to avoid damage to the container.

(4) **Plastic Carboys** are very easy to handle and sturdy. Special spouts are usually provided to prevent spillage.

(5) **Conveyor belts** are frequently employed for handling large quantities of chemicals. When dealing with organic powders, steps should be taken to see that static charge is not generated.

(6) **Pneumatic conveyors** are increasingly used for transportation from one place to another within the plant.

(7) **Gas cylinders** should be handled with the right type of tackle, trolley and certainly not thrown down. They should be protected against the heat and impact. When kept vertical, they should be clamped or tied to prevent fall. See Part 8.4 also.

14 SAFE TRANSPORTATION OF CHEMICALS

Transportation is by road, rail, water or air. Containers are mostly standardised to ensure safety during transit. When a truck or tanker meets with accidents or leaks on the way, ft creates problem. Fire or explosion can cause harm to public or property. Corrosive or toxic chemical can cause harm to public, animals, birds and environment. Sometimes grave emergency is created. Warning to public, speedy rescue operation, evacuation and calling helping hands may become necessary.

While considering transportation of chemicals one has to consider the physical and chemical properties of the product being handled, whether it is a solid, a powder, a liquid or a gas under pressure; the type of packing, hazards, and the mode of transport available.

See Part 6.2 of Chapter-28 for Statutory Provisions for transport of hazardous goods

Before transfer or transportation of chemicals, their modes of packaging should be considered.

14.1 Modes of Packaging

(1) Glass bottles and carboys are some of the oldest packaging available for corrosive liquids, solvents etc. Some of the bulk industrial materials still being transported in bottles are Bromine, Mercury etc. The laboratory reagents and pure grade chemicals are also transported in glass bottles of various sizes. Many corrosive chemicals like Nitric acid, Sulphurylchloride, Thionylchloride etc., are transported in glass carboys holding 25-50 kg of the material. These glass bottles and carboys have to be properly protected against shocks. Wooden crates for carboys, plastic or paper packing for bottles is usual. Dangerous chemicals are further protected by packing in clay or other absorbent material so that in case the bottle breaks, the chemical is absorbed and causes least damage.

Flame Retardant Chemical Resistant

(2) Plastic bottles, jars, carboys and drums : These could be constructed out of polythene either of low density or high density, PVC or other materials. Quite a lot of chemicals ranging from laboratory chemicals to industrial raw material are being packed and transported in plastic containers. These containers may be further protected by wooden cases. The material must be correctly chosen. Several tragedies have occurred because, on long storage the plastic containers became brittle and the chemical leaked out.

(3) Steel drums in various sizes have been used for storage and transportation of solvents and chemicals. Even corrosive chemicals like chlorosulphonic acid are shipped in steel containers. This is quite a common packing for chemicals of all description; and quite economical too. Recently polythene and PVC liners, as well as polythene lined drums, have been made available and these are used for packing even highly corrosive materials like hydrochloric acid. Proper sealing of the drums is essential.

(4) Bags of various types: Jute bags and paper bags are used for the innocuous chemicals like Soda ash, Salt, Kieselguhr, etc. Polythene lined jute bags have been used for the materials which need to be protected against moisture. Woven high density polythene bags are being used for packing corrosive and water sensitive materials like Caustic Soda and. Caustic Potash. Obviously this packing cannot stand piercing and must be well protected and handled such that the bags are not damaged. In transport, the bags must be properly stacked and secured.

(5) Gases under pressure in cylinders : Quite a few gases like Chlorine, Sulphur dioxide. Ammonia, Ethylene oxide. Oxygen etc., are sold in cylinders containing quantities ranging from 50-100 KGs. Steel cylinders are the commonest, but various kinds if linings are also given for special products. The rules governing the design, testing and filling of cylinders are quite elaborate and must be followed.

(6) Tank cars for bulk transport of chemicals are very common, particularly for petroleum products, solvents, acids and alkali solutions. Tanks can be made of various materials of construction such as steel, stainless steel, rubber lined FRP or FRP lined, lead-lined or any other special construction. The tank cars could be in various sizes, holding 5-10 tons for road transport or 20-50 tons or more for rail transport. Now a days long tankers/trailers have been used to carry more weight.

The tank cars should be properly designed and fabricated to meet the service condition. Contamination should be avoided, as it could be dangerous for the product as well as the tanker. Good arrangement for receiving the chemical as well as discharging should be provided. Vent valves and arrangements to prevent static electricity build up when handling solvent, are a must. Gases under pressure such as liquefied natural gas, chlorine, etc. are also transported by tank cars. Then FFE and PPE should be carried with the vehicle and their safety rules should be followed.

14.2 Transportation by Different Mode:

Some safety aspects of transportation by different modes are as under :

(1) Railroad Transportation:

It accounts for quite a large proportion of the chemicals transportation. The greatest hazard in this mode of transportation is that because of the far flung operations, it is not possible to train everyone connected with the operation in the proper care to be taken. Proper labelling of hazards involved is a help. Derailment and accidents are other hazards.

The preventive measures are : (a) improved design of the tankers and the couplers, (b) limitations on the size of the tanks, (c) positioning of the hazardous chemicals away from the locomotive (d) avoiding hunching together of hazardous chemicals (e) proper labelling of content and the hazardous nature of the chemicals.

A serious risk is that an accident may occur at a place which is not easily accessible and where competent guidance may not be available. In the USA Dan organisation (CHEMETREC) has been set up to deal with such cases.

(2) Transportation of Explosives by Rail :

Such rules (Railway Red Tariff Rules 62 to 74) are as under :

1. No explosives other than safety fuses and fireworks shall be transported by rail except in the van specially constructed for the carriage of explosives and approved by the Chief Controller of Explosives and the Railway Board.

2. Label 'Explosive' on each side of the carriage shall be affixed.

3. Carriage containing explosives shall be kept away from the engine (other than electric locomotive) and close coupled to the adjoining carriage not loaded with explosives or other flammable or hazardous substances

4. Not more than 10 carriages containing explosives shall be attached to any one train. Not more than 5 carriages of explosives shall be loaded oi unloaded at any one time at any railway station.

5. No explosive shall be transported by any passenger or mixed train.

6. Safety fuses for blasting, explosives of the third class (nitro compounds) in the form of cartridges and not exceeding 2.5 kg in weight, detonators upto 200 (each weighing upto 225 gms) and sporting powders and propellants in double packing as prescribed, can be transported by passenger or mixed trains.

7. Explosive consignment shall be received at the specified railway premises only, during sunrise and sunset and by an authorised railway servant only.

8. Shunting of carriages containing explosives shall be carried out under the supervision of authorised officer. Shunting speed shall not exceed 8 km/hi and no loose shunting will take place.

9. The packages shall be removed by the consignee within 12 hours of day light following their arrival. The Station Master shall keep the packages at a safe distance and covered with tarpaulins or other suitable material.

10. No explosive shall be carried except by rail across any railway bridge. This rule is not applicable to carry safety fuses or gunpowder or nitro compound upto 5 kg or ammunition Class-6, Division 2 and 3.

International Regulations concerning carriage of dangerous goods by rail (RID) and British Railways list of dangerous goods and conditions of acceptances also provide rail transport guidelines.

See also Part 7.2.1 (5 to 8).

(3) Road Transportation:

Road tankers are constructed in a wide variety of materials like steel, stainless steel, lined material and FRP construction. Sometimes they need to be heated or cooled.

Road tankers and their fastenings should be capable of absorbing following forces -

1. In the direction of travel-twice the total weight.
2. Vertically downwards-twice the total weight.
3. Vertically upwards-total weight.
4. Horizontally at right angles to direction of travel-total weight.

The service equipment such as valves, fittings, gauges etc. should be protected against impact. Three types of independent stop valves - internal, external and blind flange- are required. For certain gases like HF, shell opening at bottom is not permitted. Fusible plug to operate below 93 °C is suggested in case of petroleum tanker. Spark arrester on exhaust, a portable fire extinguisher, TREMCARD emergency kit and instructions to driver are also necessary.

See Part 6.2 of Chapter-28 for Central Motor Vehicles Rules, 1989 for transport of hazardous goods also. Display of class labels on goods package (e.g. box, drum) and carriage (e.g. vehicle, truck, tanker) are compulsory u/r 129 and 134 respectively.

(4) UN, DOT, ADR, or SOLAS-74 Classification

The hazardous chemicals/dangerous goods are divided by the United Nation Committee of Experts on the Transport of dangerous goods into the following classes :

CLASS 1	:	Explosives
Division 1	-	Substances and articles which have a mass explosion hazard.
Division 2	-	Substances and articles which have a projection hazards but not a mass explosion hazards.
Division 3	-	Substances and articles which have a fire hazard and either a minor blast hazard or a major projection hazard or both, but not a mass explosion hazard.
Division 4	-	Substances and articles which present no significant hazard.
Division 5	-	Very insensitive substances which have a mass explosion hazard.
CLASS 2	:	Gases compressed, liquefied, dissolved under pressure or deeply refrigerated.
CLASS 3	:	Inflammable liquids.
CLASS 4	:	Inflammable solids, substances liable to spontaneous combustion; substances which, on contact with water, emit inflammable gases.
Division 4.1	-	Inflammable solids.
Division 4.2	-	Substances liable to spontaneous combustion.
Division 4.3	-	Substances which on contact with water, emit inflammable gases.
CLASS 5	:	Oxidising substances; organic peroxides.
Division 5.1	-	Oxidising substances.
Division 5.2	-	Organic peroxides.
CLASS 6	:	Poisonous (toxic) and Infectious substances.
Division 6.1	-	Poisonous (toxic) substances.
Division 6.2	-	Infectious substances.
CLASS 7	:	Radioactive substance.
CLASS 8	:	Corrosives.
CLASS 9	:	Miscellaneous dangerous substance.

See IS:1446 for classification of dangerous goods.

Arrangement for loading and unloading of the liquid have to be well designed. It is preferred to load toxic and flammable material from the bottom. It is preferable to provide a discharge pump on the tank.

Drums, crates and cylinders are also transported by trucks. The-important thing to see is that the chemical is securely packed so that spillage do not occur on the road and the toxic vapours are not released. The cylinders or drums should be securely lashed so that they do not fall off the truck and cause danger. The driver and the attendant should be fully conversant with the nature of the material and the hazards involved; and trained to handle the situation.

See also Part 7.2.1 (5 to 8).

(5) Emergency Planning for Transport of Hazardous Chemicals:

Various directives and recommended actions have been issued by international organisations like UN Committee of experts on the transport of dangerous goods, European Economic Committee (EEC), US Department of Transport etc. They need special labels or notices on packages or on vehicles, display of correct technical name of the chemical, special signs or plates, instruction in writing to the drivers i.e. TREMCARD (Transport Emergency Card), safe packing conditions, particulars in transport documents, display of supplier's name, address and phone number including phone number from where specialist advice can be available.

Master tests of some 400 TREMCARDs of hazardous substances are readily available from Chemical Industries Association of UK. ICMA of our country should also provide such cards in Indian languages.

The content of a 'Trerncard' should include name of cargo (material), nature of its hazard, protective devices including PPE and emergency action to (1) inform Police and Fire Brigade (2) Spill or gas control (3) Fire control and (4) First aid.

The transporter should carry 'Emergency kit' containing tool kit, emergency lighting, fire extinguisher, protective clothing, breathing equipment and first-aid kit

Proper training to drivers of hazardous chemicals is legally required. Safety checklist or transport vehicles shall be prepared and used. Tramcard should be given to workers. See checklist 2 of Part 15.3. See Chapter 31 for road and traffic safety.

Emergency Action:

In case of toxic release :

1. Driver of hazardous cargo should be trained to handle small emergencies.
2. Inform police, fire brigade and manufacturer.
3. Takeout trerncard, MSDS etc. from vehicle and give it to police.
4. Vehicle should be taken in open area and parked away from thickly populated area.
5. Cordon the area around leak.
6. Stop traffic and keep people away from the vehicle.
7. Leaking liquid can be contained in bunds of sand/earth.
8. Small leaks can be plugged by wooden peg.
9. If a leak is from cylinder valve it can be capped by yoke clamp.
10. A leaking cylinder can be turned so as to bring leaking portion in gas phase.
11. Water is not to be added on leaking cylinder and spill if chemical is corrosive.
12. Use water sprays, fogs to absorb toxic vapour cloud.
13. Evacuate the downwind area in case of large toxic leakage.

In case of inflammable chemicals :
1. Park vehicle on the road side.
2. Stop engine.
3. Inform police, fire brigade and manufacturer.
4. Takeout trerncard, MSDS etc. from vehicle and give it to police.
5. Cordon off the area, stop traffic and keep people away.
6. Do not smoke. Ignition source to be avoided.
7. In case of fire, try to extinguish it with fire extinguisher.
8. Try to stop leak by cutting off the source, close valve.
9. Keep the tank cool by water sprays to avoid explosion.
10. Surrounding area should be checked for explosion possibility and evacuated if necessary.

For Threshold Quantities of handling (including transport/transfer) chemicals and applicability of Public Liability Insurance Act and Rules see part 10 of Chapter 29.

(6) Water Transport :

Quite a lot of chemicals are transported by ocean going ships and on river tugs. Crude oil petroleum products, natural gas and other dangerous goods are some of the biggest bulk commodities in international commerce. Because of their huge quantities involved, spillage and leakage can create gigantic pollution problems, besides a fire hazard. There have been several mishaps of this type. Tanker design has assumed special safeguards being made to prevent accidental spillage.

When solid chemicals are transported, care should be taken that the material will not cake up because of moisture, so that it may require to be emptied pneumatically. When carrying drums or cylinders they should be properly lashed so as not to break loose. In river transport, spillage of chemicals may cause very serious pollution problems.

The carriage of dangerous goods by sea is day by day increasing. About 4000 million tonnes cargo enters world seaborne trade every year, of which about 100 million tonnes are dangerous goods in packaged form. More than 1 lac types of hazardous chemicals are transported by sea. They include solid, liquid and gases in bulk. While cutting oil-tanks and pipelines on ships at Alang shipyard (Bhavnagar) many fatal accidents have taken place. Thus these are the end problems even after transportation by sea.

International maritime Organisation (IMO), International Convention for the Safety Of Life At Sea, 1974 (SOLAS 74) and International Convention for the Prevention of Pollution from Ships, 1973 (MARPOL 73) have developed guidelines and codes for carriage of dangerous goods in packaged form by sea.

IMO has formulated International Maritime Dangerous Goods (IMDG) Code and 'Emergency Procedures for Ships carrying dangerous goods (EmS)'.

SOLAS has formulated 'Code of safe Practice for the Shipment of Bulk Cargoes (BC Code)' for transportation of dangerous solid goods in bulk.

Medical First Aid Guide (MFAG) for use in accidents involving dangerous goods, is available in IMO/WHO/ILO publication. IMO/ILO guidelines for packing cargo in Freight Containers or Vehicles and IMO recommendations on safe use of pesticides in Ships are also available.

SOLAS have classified dangerous goods in 9 classes [see UN Classification stated in foregoing para].

Main information required are proper shipping name and UN No., chemical name, formula, properties and observations, classification, packing, labelling, stowage and segregation, angle of repose, MFAG table number and special emergency procedure and action to be taken.

Training courses for ship's officers and crew are also recommended.

15 INSPECTION, TESTING AND MAINTENANCE

15.1 Process Flowchart and its Importance for Inspection

Process flow chart is most important in a chemical factory. It is to be designed by plant in-charge or process supervisor as per company's requirement. It includes names and weights of raw materials to be charged, their sequence of charging, time cycle for heating, cooling etc. and addition of water and other reactants. Reaction time details are to be filled in by shift in-charge, chemist or supervisor. After reaction is over, as the batch or process proceeds, those operations are also to be added. Sometimes it is called batch sheet when flow chart is prepared batch wise.

Process flow chart is useful in carrying out inspection. It helps us to take round in a chronological order of the process flow and to understand the process systematically. During inspection, round is required starting from unloading of material to the storage facility, process buildings/unit operations, filling of products, product godown, loading of product and effluent treatment plant etc. If process flow chart is understood in advance, inspection can become easy and complete.

15.2 Inspection Techniques for Plants, Vessels and Procedures

For plant safety inspection see Part 2 of Chapter 19. Those types of inspection and general guidelines are also useful for inspection of hazardous installations. Some specific techniques are mentioned below:

Detailed guidelines were issued on inspection of MAH installations under ILO Project IND/86/MOI/ FRG and circulated by the CLI, Bombay in January 1991. It was also reproduced in some different form in 'Training Manual (TM8)' on 'Labour Inspection and its Role in Improving Safety and Health with particular reference to the Chemical Industry' at Bangkok in June 1987. Its short abstract is given below :

Main areas of inspection are tabulated as under-

Inspection Areas

- Standard Conditions of Process & Storage
  - 1 Initial information
  - 2 Process description
  - 3 Operating instructions
- Plant Integrity
  - 1 Safe working limits
  - 2 Design, construction, inspection, test and certification
  - 3 Protective devices
  - 4 Maintenance
  - 5 Inspection & testing
  - 6 Inspection authority
  - 7 Evaluation of plant integrity
    - A Vessels
    - B Pipelines
    - C Pumps & ancillary equipment
    - D Modification to plant & equipment
    - E Management control
- Process Deviations
  - 1 Variables
  - 2 Process chemistry
  - 3 Pressure
  - 4 Temperature
  - 5 Level
  - 6 Flow rate
  - 7 Impact
  - 8 Services
  - 9 Start-up & shutdown
  - 10 Operator's error
    - A Sensory failure
    - B Failure in logic
    - C Failure to act properly
- Emergency Procedure
- Fire Precautions

Some salient points on above areas are summarised below:

1. Serious incidents arise from loss of containment of hazardous substances. Therefore these possibilities and plant items should be inspected in details.

2. The most vulnerable parts of die plant, procedure or system should be identified from going through the plant layout, process flow diagram and walking round the installation. Records of failure history and past accidents are useful.

3. Safety arrangements should be checked also in relation to off-site impact with the local population.

4. All available expertise should be applied, e.g. engineering, chemical, medical, management etc. A meeting and discussion with the experts in the plant can be useful.

5. Competency of the occupier and contractors should be verified regarding better choice of process, catalyst, equipment etc., operating pressure, temperature, residence time etc., and management control systems.

6. Process documents like process description, operating procedures, safety information, emergency manual etc. should be scrutinised for completeness and quality.

7. Process description should be inclusive of principles involved, basic chemistry of main and side reactions, hazards of materials and safety precautions, plant, equipment list and line diagram, transport, storage and transfer arrangements, operating parameters and their safe limits, SOPs and procedure for authorising process changes.

8. Operating instructions should include flow sequence & batch sheet, conditions to be maintained, actions of process controls and monitoring instruments, allowable variation limits and action necessary when that limit is reached, emergency procedure, reporting route and training schedule of operators.

9. For 'plant integrity, safe working limits of plant (including pressure vessels) should be carefully established as design data and compatible with normal process operating conditions.

10. The design data should include the range of pressure, temperature, loading, flow rates, operation cycles, basis for pressure relief and properties of substances.

11. The plant should be designed, constructed, inspected, tested and certified according to the design and construction code which will achieve the safe working limits.

12. Protective devices may include pressure/ vacuum relief valves, rupture discs, explosion vents, high/ low level alarms, high/low temperature/pressure alarms, weight tables, content gauges, maximum fill devices, padding air/gas reducing valves and many forms of instrumentation. Such devices should be checked for its suitability for the purpose intended.

13. Safe systems of work may include manual venting procedures, loading/unloading systems and temperature control at fill. Cold content stored below their safe temperature may cause brittle failure.

14. A scheme of testing protective devices should be made by a competent person with due regard to local conditions (e.g. environment), consequences of failure, duplication, fail safe provision and risk physical damage.

15. Preventive and conditions-based maintenance schemes should be established.

16. The plant should be periodically and appropriately inspected and tested. The vessel should be reassessed for continued use with particular contents and the safe working limits confirmed or revised. Pressure limits should be revised if the thickness is found reduced. Certification should specify safe working pressure, vacuum, temperature, load and fill ratio where the content may expand with temperature rise and date of next examination.

17. Pressure vessels should be inspected as per statutory requirements. The date of next inspection should be certified by the competent person.

18. Pipelines, pumps and ancillary equipment should also be periodically inspected and maintained. Colour code should be followed. Where failure can be hazardous, standby equipment should be provided (e.g. diesel driven fire pump, scrubber pump, stand-by power generator etc.). Emergency procedure should be available in case of pump or equipment failure.

19. Modifications to plant and equipment should be of a standard of original integrity, otherwise the plant should be down-rated. The modification should be tested and certified by a competent person for use and ability.

20. All process deviations which may affect the plant in relation to loss of containment should be scrutinised and the occupier's competence to prevent losses should be technically appraised. Such deviations concern process chemistry, pressure, temperature, flow rate, liquid level, viscosity, surface tension, pH, moisture content, contaminants, presence or absence of air/oxygen/ inert gas etc., impacts by external forces like vehicles, falling bodies etc., utility services, startup and shutdown abnormalities and operators' errors such as sensory failure, failure in logic (judgement or decision) and failure to act properly (omission) or acting improperly (commission).

Training can do little to anticipate these errors but good process design can minimise their effect and ensure that no single mistake will be capable of causing catastrophe. Effective supervision, check-lists and work permit system can reduce the incidence of errors.

Causes of pressure rise are failure of pressure protection or regulating system, temperature rise, exothermic, run-away or polymerisation reaction, back feeding of reaction mass into storage vessel etc. It can result in fire, explosion or/and toxic release.

Causes of temperature rise are failure of heat control, failure of cooling system, fire, exothermic reaction etc. It may result in rise of pressure, flow rate, filling ratio, foaming of vessel content, rollover, irreversible metallurgical change to vessel. It needs immediate venting or dumping.

Causes of level rise are failure of overfill prevention device, overflow device, level control device, communication between operators, misrouting of process streams, siphoning, loss of vacuum/pressure, surging etc. It may result in overflow, spillage or vessel rupture.

Causes of flow rate deviations (too high, too low or reversed) are changes in differential pressure, failure or furring up of pumps, pipelines and ancillaries, loss of pump prime, vapour lock, operator's error etc. It may result in pressure/ temperature deviations, rupture of process, heater or heat-exchanger, erosion or cavitation within pipes and pumps.

Criteria of investigation include sizing and location of pipes, pumps, vents, flares etc., isolation valves, gravity discharge, flexible connections etc.

Thus types of process deviations are many and so are their effects. Inspection process or checklist should pay due attention on them.

21. Emergency procedures include physical controls, systems of work and emergency plans (e.g. onsite/off-site emergency plan). Operators should be trained for emergency shutdown action when and how to be followed and when to consult senior officials. Procedures for quick stopping the reaction, dumping or flaring and by-passing the content should be established.

To control or mitigate effects of heavy spillage, measures like bunding, extra tank, catchments pits, dump vessels, diversion walls, grading of the ground and use of absorbents or super-sucker etc. are required. Bund walls should withstand thermal shock, hydrostatic loading and corrosivity of the chemical. For highly liquefied flammable gases like LPG, a remote evaporation area and sloppy floor are required. For toxic or cryogenic liquids, surface area should be minimised to reduce th6 evaporation, or suitable blanketing material should be sprayed. Possible adiabatic flashing may also be considered.

Effects of explosion can be reduced by impact walls near chances of explosion. Integrity of control room should be ascertained. Storage quantity and length and size of pipework should be minimised. Vessel outlets and fixed pipework should have remotely operated isolation valves.

Necessary personal protective equipment conforming to Indian Standards should be given to workers and well maintained. Workers should be trained to use them.

22. Fire protection for process and storage should be sufficient. Space separation, water drench, insulation, fire walls, adequacy of the fire water storage; their pumps and equipment, portable

extinguishers, fixed fire control installations, hoses, staff and regular fire-drills etc. should be vprifipd

CHECKLISTS:

Many checklists are available and can be developed for inspection of factories. Some sample checklists are given below :

15.3 Checklists for Routine Inspection of a Chemical Factory

(1) Checklist-1

Name & Address of the Factory :
Inspected on Date : Time :
Inspected by
Names of some workers contacted : (1) (2) (3)

A. Structural Stability and Safety :

1. Parts of building/shed requiring repairs.
2. Parts of vessels/ machinery requiring repairs.
3. Parts of Stairs/platforms requiring repairs.
4. Parts of storage/overhead tanks requiring repairs.
5. Parts of pit, sump, gutter, cover requiring, repairs.
6. Others requiring repairs:
7. Lightening arrester required? provided ?
8. New extension / alteration.
9. Stability Certificate available ?
10. Specific remarks, if any (Viz. Doors open outward ? etc.) :

B. Solvent Liquid chemical Storage Tanks :

<table>
<tr><td>1</td><td>Sr. No.</td><td>Chemical</td><td>No. of Tanks</td><td>Capacity</td><td>Fittings</td></tr>
<tr><td></td><td>1</td><td></td><td></td><td></td><td></td></tr>
<tr><td></td><td>2</td><td></td><td></td><td></td><td></td></tr>
<tr><td>2</td><td colspan="2">Vents with flame arrester</td><td>12</td><td colspan="2">FEE</td></tr>
<tr><td>3</td><td colspan="2">Flare connection</td><td>13</td><td colspan="2">PPE</td></tr>
<tr><td>4</td><td colspan="2">Automatic level indicator and high level alarm</td><td>14</td><td colspan="2">Fencing/gate/lock provided?</td></tr>
<tr><td>5</td><td colspan="2">Absorption media connection with drain safe valve</td><td>15</td><td colspan="2">Lightening arrester necessary? Provoded?</td></tr>
<tr><td>6</td><td colspan="2">Flame /smoke detector with alarm</td><td>16</td><td colspan="2">For acid/alkali/and other substances, safety showers near?</td></tr>

C. Gas Cylinders Storage :

1	Name & No. of Cylinders usually stored ?		
	O_2 (black)	CO_2 (black & white)	Acetylene (maroon)
	N_2 (grey)	NH_3 (black, red & yellow)	LPG C_4H_{10} (red_)
	Cl_2 (yellow)	Freon CCl_2F_2 (grey & violet)	Argon A (blue)
	Air (grey)	(Colour Code IS : 4379)	
2	Is the storage separate, away from source of heat and cordoned ?		
3	Gas detector with alarm.		
4	FFE & PPE nearby ?		
5	Are the cylinders safely arranged ?		
6	Notice of operating / handling instructions.		

D. Chemicals Store/ Godowns :

1	Combustible chemicals separate ?
2	Reactive (oxidizing, reducing, compatible, dissolving, flammable, explosive, corrosive, etc.) chemicals separate ?
3	Inorganic & Organic, liquid (drums, carboys etc.) separate ?
4	Poisonous chemicals in a locked room ?
5	Flameproof fitting necessary ? Provided ?
6	Earthing, FFE & PPE, Cautionary notice provided ?
7	All doors and windows can be locked properly ?
8	Ventilators as per vapour density provided ?
9	For acid / alkali, safety shower near ?
10	Quantity of each raw material and each product stored at any time.

E. Pressure Reactions:

1. Name and No. of Pressure Vessels and reactiol (Process, Steam, air etc.):

	Name of Vessel / Reaction & Location	Working Temperature Pressure	Exothermic ?	Then Constant cooling system provided ?
1				
2				

2. Safety Valve
3. Pressure gauge
4. Temp. gauge .
5. Second Safety valve necessary? (above 100 psi) Provided ?
6. Steam pressure reducing valve necessary? Provided ?
7. Rupture disc necessary? Provided ?
8. Drowning tank necessary? (after S.V. / R.D.) Provided ?
9. Scrubber necessary? Provided ?
10. Stirrer stop-alarm necessary? Provided ?
11. Flame-proof motors / fitting necessary? Provided ?
12. Earthing necessary? Provided ?
13. Temperature cut off device necessary? Provided ?
14. Feed/charge control necessary? Provided ?
15. Quenching device for neutralisation necessary? Provided ?
16. Drain / Discharge pipe?

17. Manhole
18. Vessel structure, foundation, position safe?
19. Pressure Test Report available? Date of last testing
20. Surrounding space open?
21. Sources of ignition near? Safety measures
22. Platforms, stairs, fencing, guarding provided?
23. Documents of complete reaction, reaction rates, pressure/temp, rise, exothermocity etc. available?
24. Gas/Flame detector in vicinity required? Provided ?
25. If jacketed (limpet coil) vessels, fitting with the jacket and how is the heating / cooling system?
26. Other devices necessary (viz. pressure temperature recorder, auto controls, alarms, remote controls etc.) Provided ?

E. Distillation Process:

1. Name and No. of Vessels, Process etc.

Sr. No.	Name of Vessel	Chemical	Atmospheric or Vacuum?	Column Provided?	Condenser Provided ? Heat/ Feed cut off device with condenser ?	Receiver Unit		
						Vented	Scrubber necessary?	Provided ?
1	2	3	4	5	6	7	8	9
1.								
2.								

2. Nature and type of heat source (direct heat, heat through jacket, heating media etc.)
3. Heat control devices provided?
4. Temperature gauge
5. Pressure/Vacuum gauge
6. Drain Pipe
7. Manhole
8. Stirrer necessary?
9. Source of spark away?
10. Flameproof motors, fitting necessary?
11. Platform, stairs, railing, guarding provided?
12. Gas/Flame detector in vicinity required? Provided? 13. Others necessary and provided?

G. Other Processes:

Sr. No.	Name of Vessel or equipment	Name of Process	Operating Temperature Pressure	Chemicals used / reacted etc.	Dangerous Conditions	Safety Devices Provided	Measures Still necessary
	1	2	3	4	5	6	7
1							
2							

H. Toxic and Explosive Gases, Fumes, Dust etc. and Controls :

Sr. No.	Name of the gas, fume, dust – evolution & probability	Toxic, combustion able or explosive	Its location	Scrubber and its type	Other neutralizing device (water blanketing etc.)	Flare, Incinerator	Gas Detector with alarm	Other controls necessary
1	2	3	4	5	6	7	8	9
1								
2								

Sr. No.	Gas Detection		Devices to collect safe discharge	Wind direction and velocity indicator available ?	Refrigeration unit for temp. control, N_2 or brine barrier etc.	Others
	Measuring instrument available	Periodic testing record available				
1	10	11	12	13	14	15
1.						
2.						

I. Liquid Effluents:

Sr. No.	Effluent	Nature, (acidic poisonous, fuming, corrosive etc.)	Discharge system (open gutter etc.)	Treatment Plant			Pumps, Motors, Machine guarding	Platform, Stair, Pond, Sump, Fencing etc.
				Provided ?	Approved by Pollution Board ?	Records maintained ?		
1	2	3	4	5	6	7	8	9
1								
2								

J. Flameproof, Explosion proof & Dustproof Fittings ?

Sr. No.	Place where such fitting is necessary	Type : Flame / Explosion / Dust proof motors, starters, switches, wiring etc.	Is it provided ?
1	2	3	4
1			
2			

K. Water Facility :

1	Water showers at 2.1m height with 2.5 cm dia pipe provided / Where not provided/ Water blanketing necessary ?	Provided ?
2	Eye washers/ Bottle / Wash basins/ Taps	Provided ?
3	Bathrooms provided ?	
4	Cooling water in jackets, condenser etc. available for all hours ? Own overhead water tank available ? If not, what is the alternate arrangement ?	
5	D.G. Set or Diesel engines ready to run water pumps when electricity fails ?	

6	Drinking water facility available ? Needs more centres ? Needs improvement ?	

I. Emergency Action Plan, Safety Manual, Workers' Training etc. :

1	Planned for operating emergency? (small fire, air failure, power failure, cooling water failure, steam failure, gas leakage, and storm etc.)
2	Planned for fire emergency ?
3	Planned for Disaster emergency ? (Explosion, flood, tank rupture, earthquake, riot/strike etc.)
4	Is safety manual ready and given to all concerned ?
5	Area all workers trained for these emergency operations ?

M. Medical Check-up of workers and records :

1	Pre-employment medical check-up ? Record available ? First-aid available ?
2	Place of work as per above report ?
3	Periodical medical check-up : At what interval? Forms maintained?
4	Cases of occupational disease/poisoning detected & recorded? Reported to Authority?
5	Name and address of the nearest Doctor/Hospital available?
6	ESIC facility available for such occupational health check-up and treatment?

N. Good Housekeeping :

1	Where cleanliness required ?
2	Lifting machinery safe moving ?
3	Tools etc. in safe position ?
4	Safety posters, precautionary notices in all rooms, floor displayed ? Where more necessary ?
5	Motors, gears, pulleys, belts, chains, coupling etc. guarded ? What not guarded ?
6	Stairs, platforms, railing covers etc. guarded/ Where required ?
7	Ventilation (natural and mechanical) and lighting adequate ? Where need more ?
8	Lunch room, canteen, clock-room, lockers, ambulance room, first-aid necessary ? Provided ?
9	Are labels provided on all chemicals stored and manufactured ?
10	Others : (Processes of fire and explosion hazards in separate room etc.)

O. Personal Protective Equipment (PPE) :

1	Hazards to be faced
2	Types given
3	Types necessary : Chemical filter, mechanical filter, air-line respirator, suction hose mask, pressure hose mask, canister gas mask, helmet, face shield, safety goggle and type, leg guard and type, apron and type, full suit, safety belt, others.

P. Fire Fighting Equipment (FFE)

1	Hazards to be faced
2	Types provided
3	Types necessary : Water type (Soda Acid), water type (gas pressure). Foam type, CO_2, type. Dry powder type. Hand & Stirrup pumps, water bucket, sand bucket, fire drills. No smoking notices. Flame traps Auto sprinklers. Hydrants, Fire calling buttons on all floors or in each room.

Q. Statutory Safety Records :

1	Form No. 9 (Hoist & Lifts)	7	Form No. 29 (Accident Register)
2	Form No. 10 (Lifting Machinery)	8	Safety Policy necessary ? Provided ?
3	Form No. 11 (Pressure Vessel)	9	Safety Committee necessary ? Formed ?
4	Form No. 20 (Health Register)	10	Safety Officer necessary ? Employed ?
5	Form No. 21 (Accident Register)	11	Records of safety meetings, accident investigation available ?
6	Form No. 22 (Poisoning/ Disease)	12	Compliance of safety inspections available ?

See also Reference No. 12 at the end of this Chapter for a further checklist of ten tables.

(2) Checklist-2

(A) Checkpoints before allowing a transport vehicle into factory gate.

Sr. No.	Points	Yes/ No.	Suggestion or Remarks
1	Qualified and licensed driver. No intoxication.		
2	Name & quantity of material as per order & bill. Note vehicle No.		
3	Quality of material arrived i.e. sampling.		
4	Trem card.		
5	Tyre condition, spare wheel and jack.		
6	Main valve & other fittings, in safe condition.		
7	Blind disc, gasket etc.		
8	Piping, couplings and tools.		
9	Tanker pressure test certificate if required		
10	Last material filled in and contamination if any.		
11	Cleanliness of the tank, if it is for filling.		
12	Exhaust muffler (spark arrester), if required.		
13	Fire extinguisher.		
14	Personal Protective Equipment required.		
15	First Aid Box and Antidote.		
16	Taking away bidi, cigarette, match box etc., and no smoking instruction.		
17	Product license, if any.		
18	Static charge and leakage, if any.		
19	Compatibility of the material to be transferred,		
20	Others as per social need.		

(B) Checkpoints before unloading hazardous material into storage.

Sr. No.	Points	Yes/ No.	Suggestion or Remarks
(a)	**Liquid chemicals:**		
1	Fixation of vehicle - wheel stopper, barricade, gear locking, engine stopping and wind direction		

	consideration. Note vehicle No.		
2	Level checking of factory tank and road tanker and material matching.		
3	Proper piping connections.		
4	Safe flexible hose pipe & couplings.		
5	Emergency transfer preparedness.		
6	Earthing. Flameproof electrical motors and fittings if required.		
7	Deep feed pipe to avoid static charge.		
8	Proper vent condition.		
9	Vapour line safety.		
10	Purging connection.		
11	Neutralising material for spillage.		
12	First Aid Box and Antidote.		
13	Fire Fighting Equipment.		
14	Personal Protective Equipment worn.		
15	Emergency kit ready.		
16	Lifting machinery, if required.		
17	Pump checking. Coupling guard, if required.		
18	Avoidance of air pressure transfer. If it is required, pressure gauge and safety valve on air tank. Pressure testing of air tank.		
19	Dyke, dyke discharge valve and partition wall condition. Acid proof lining for corrosive material,		
20	Safety shower / eye washer.		
21	Tank level gauge working and safe overflow pipe.		
22	Tank vent. Breather valve, N_2 purging, flame arrester. Pressure gauge. Safety valve. Non-return valve. Excess flow valve, Lightening arrester etc. as per need.		
23	High/low level alarms and trips. Indication of flammable condition inside the tank.		
24	Operator on duty during full unloading.		
25	No smoking and no tempering.		
26	Record filling.		
27	Spillage washing.		
28	Engine restarting only after closure of tank and tanker valves, and spillage cleaning.		
29	Special precautions depending on nature of chemical viz. Flammable, toxic, corrosive, explosive etc.		
30	AC godown for liquids of low boiling points.		
(b)	**Gases / Gas cylinders :**		
1	For liquefied gas in tanker viz. LPG, EO, NH_3, points as B(a) above.		
2	Double checking of earthing .and flameproof electrical connections.		
3	In case of leakage, portable hood and scrubber device, discharge in safe media, safe venting in air etc.		
4	Personal Protective Equipment.		
5	Fire Fighting Equipment in ready condition.		
6	For gas cylinders, lifting and transfer device.		
7	Open space for speedy dispersion of leaking gas.		

8	Wind sock in vision and consideration of wind direction.		
(c)	**Solid materials and godown safety :**		
1	Godown/warehouse condition regarding good ventilation, lighting, cooling, flooring etc. Windows/ Grills/ Louvers at I m height.		
2	No electric fitting for highly flammable material. Sufficient natural lighting.		
3	Flameproof electric fitting for flammable material.		
4	Separate stacking of flammable & toxic material - Zone or Area classification.		
5	Use of wooden/plastic crates and shelves.		
6	Spill collection arrangement and safe disposal to ETP or incinerator.		
7	Surrounding rain water gutters.		
8	Waste collection, beg filling and safe disposal. Ready stock of neutralizing material.		
9	Safe disposal of empty containers.		
10	Compatibility of material, before putting together.		
11	Proper flooring-slope, pit, pump etc.		
12	Water line for cleaning,		
13	Air line for use of air line respirators,		
14	Proper tools, trolleys, lifts and containers for safe and easy transfer.		
15	Smoke/Flame detectors and gas leak detectors with alarms.		
16	Sprinklers and other fire fighting equipment inside and outside the rooms.		
17	Personal Protective Equipment required.		
18	Locked godown for poisonous material.		
19	Fire resistant walls/doors if required.		
20	Emergency exit on opposite side.		

(C) Checkpoints for Process Plant and Equipment.

Sr. No.	Points	Yes/ No.	Suggestion or Remarks
1.	Selection of proper material of construction for a new vessel/reactor, and modification.		
2.	Proper design and fitting of vessel/reactor as per standard codes. Small batch size desirable.		
3.	Operating conditions at less pressure, temperature, flow, slow reaction rate and less hazards desirable.		
4.	Condition monitoring and pressure testing of vessels and equipment.		
5.	Safety fittings like Pressure gauge. Temperature gauge. Rupture disc. Level indicator, Non return valve. Excess flow valve, interlocks, alarm and trips. Flameproof fitting where required.		
6.	Safe operating procedure and safe close down procedure displayed for operator.		
7.	Batch sheet design and full filling with details.		

8.	Fire fighting equipment.		
9.	Use of personal protective equipment.		
10.	Open space, maintenance space and leakage checking.		
11.	Scrubber connections and scrubber working.		
12.	Safe columns, condensers, receivers and vent chillers and safety valve for distillation process.		
13.	Auto and manual devices to stop heating, charging etc., and quenching or safe transfer of material in case of emergency.		
14.	Close transfer/charging of hazardous material.		
15.	Local exhaust ventilation on toxic material charging, transfer and filling/packing,		
16.	Double earthing and static charge eliminator where required viz. Solvent in a glasslined vessel.		
17.	Proper piping and colour code.		
18.	Checking of proper O_2/N_2 lines and cylinders to avoid accident.		
19.	Use of safety work permit.		
20.	Machine guarding for drives, pumps etc.		

(D) Checkpoints for Pollution Control

Sr. No.	Points	Yes/ No.	Suggestion or Remarks
(a)	**Effluent Treatment Plant (ETP)**		
1	NOC and consent from GPCB.		
2	Norms suggested by GPCB like pH, BOD, COD, Oil & grease, colour, odour, suspended solid, total dissolved solid, heavy metals etc. Fill the format of logbook given below.		
3	Norms prescribed under the Factories Act (Schedule-2). Fill the format.		
4	Drawing approval of ETP.		
5	Continuous operation of ETP.		
6	Primary and secondary treatment plants.		
7	Continuous monitoring of parameters for final discharge from factory premises.		
8	Whether pollutant being discharged above prescribed limit?		
(b)	**Gas Emission/Leak Control**		
1	NOC and consent from GPCB.		
2	List of emission/leaking points, pollutants and their prescribed limits. See the format.		
3	Selection of proper scrubbing media.		
4	Proper design and continuous working of scrubbers/flare/ incinerator etc.		
5	Final vent gas detector with alarm and discharge value.		
6	Whether pollutant being discharged above prescribed		

	limit?		
(c)	Solid Waste Disposal.		
1	Authorisation from GPCB.		
2	Waste quantity and planning of safe transport and discharge.		
3	Waste classification.		
4	Incineration or method of safe disposal for detoxification of waste		
5	Safe burying in a land approved by the Govt.		
6	Safe disposal of waste and toxic containers.		

Format of Logbook for Pollution Control

Sr. No.	Name of Pollutant	Prescribed value (Norm)	Measured Value	Date & time of measurement	Difference of columns 3 & 4 and remedial measures required	Implementation of remarks in column – 6
1	**2**	**3**	**4**	**5**	**6**	**7**
1						
2						
3						
4						
5						
6						

(E) Checkpoints before allowing finished product to go out from factory gate

Sr. No.	Points	Yes/ No.	Suggestion or Remarks
1	Quality as per assurance and quality certificate.		
2	Marking and labelling of name, weight, batch, hazard class etc. on packages.		
3	Proper containers and safe weight within limit.		
4	Safety instructions.		
5	TERM CARDS/MSDS.		
6	Safe vehicle - proper truck/tanker body and valve, gasket, blind disc., vent, gauges, tyre condition, spare wheel, qualified and trained driver with cleaner, tools, First-Aid box. Antidote, pump and flexible piping and phone numbers.		
7	Necessary papers and licenses.		

(F) Other check points.

Sr. No.	Points	Yes/ No.	Suggestion or Remarks
1	Qualified & Experienced supervisor in each shift.		
2	Training to all workers.		

3	Safety policy and its copies to workers.		
4	Pocket safety manual given to workers.		
5	Safety committee and record of its meeting and working.		
6	Onsite Emergency Plan and its rehearsal.		
7	Medical check-up of workers.		
8	Safety Officer required? appointed?		
9	Safety poster, signs, symbols etc., displayed?		
10	Safety work permit system for all hazardous works.		

15.4 Pressure Vessels and their Safety Aspects :

Pressure vessels are of two types : (1) Fired Pressure Vessels which include Boilers, Economisers, Steam Pipes, Fittings etc., as per section 2, 2A, 2D of the Indian Boilers Act 1923, and (2) Unfired Pressure Vessels which include reaction vessels, autoclaves, digesters, heat-exchangers, receivers, containers, compressors, vulcanisers, agers, kiers, dyeing vessels, jacketed kettles etc. operating above the atmospheric pressure.

The portable gas cylinders, metal bottles used for storage or transport of compressed gases or liquefied or dissolved gases under pressure, gas-tankers, vessels for nuclear energy, refrigeration plant of less than 3 TPD capacity, vessels operating below I kg/ m2 etc., are not covered under the purview of the pressure vessels.

15.4.1 Pressure System Components and Safety Devices

Pressure system components are :

Pressure vessels	Pressure relief devices
Pumps, Compressors,	Pressure gauges
Fans, Control valves,	Pressure reducing valve (PRV)
Piping system, Tracing	
Dump vessels	Non –return valve (NRV)
Steam traps,	
Insulation	Pressure controllers or regulators
Vent for pressure relief	Utilities like steam, water, air, thermic fluid, inert gas etc.
Pressure recorders	

See Part 8.2 for various types of pressure relief devices. Other components are explained at their respective places.

Pressure reducing valve (PRV) is a statutory requirement u/r 61 of the Gujarat Factories Rules. It is to be provided between a source of supply of pressure (e.g. boiler or higher pressure side of any header) and the user point or a vessel receiving the pressure. It is to be set at a desired safe pressure. It will reduce the pressure on delivery side accordingly. This is the main safety function. A safety valve and a pressure gauge should be provided on low pressure side and a pressure gauge on high pressure side to see the pressure reduction. It shall not be bypassed at any time. It should be tested periodically.

Spring loaded safety valves with oil seals are desirable. For high pressures, rupture or bursting disc or rupture diaphragm should also be provided. Pressure reducing or pressure control valves are necessary. Safety valve should be connected nearest (close) to the vessel. It should not be connected where pulsating pressure fluctuates.

Rupture or bursting disc should be provided in upstream of the safety valve and if toxic or inflammable ' mixture/gas is pressed, ducting should be provided covering fully the outlet of the rupture disc so that in case of rupturing of the disc, the mixture/gas coming out from it will be collected in duct or blow down tank and not in environment.

Rupture disc and safety valve can be provided in series (in vertical line of the same outflow) with a pressure gauge in between. Two such sets can be provided side by side, parallel, on two different outflows, to handle much volume at a time. RD and SV can be provided in parallel also. In any case, their setting should be slight different to allow time lag.

Fusible plugs, pressure gauges, temperature indicator, stop valve, drain valve, air vent, auto controls and recorders are also necessary.

Routine inspection schedules should be devised for maintenance of pressure safety devices in good working order. A sample schedule regarding rupture disc inspection is given below as a guidance.

Routine inspection of rupture discs

Procedure:

1. Obtain Permit to Work Certificate from Plant incharge.
2. Obtain Rupture Disc Inspection Record sheet.
3. Ensure system to be worked on is isolated, free from pressure and vented/drained down.
4. Check that vent line drain hole is clear. Note : If no drain hole exists raise modification work order to make one.
5. Carefully remove rupture disc and holder ensuring no debris enters vessel, and clean thoroughly.
6. Check that all bursting disc specifications are correct.
7. Inspect rupture disc holder for pits, hairline cracks or other damage and renew if necessary. Ensure inspection is carried out using adequate light.
8. Ensure rupture disc inlet and outlet vents are clear and free from obstruction.
9. Check mounting flanges are clean and parallel. Note : The Team Manager must assess the significance of the conditions found and arrange, if necessary, to review the future maintenance periodically.
10. Renew gaskets and refit rupture disc and holder, ensuring disc is correctly orientated.
11. Carefully tighten diagonally opposite bolts to achieve a gas tight seal, using torque wrench if necessary.
12. Ensure plant is safe for use, complete permit to work and hand over to Plant in-charge.

15.4.2 Standards & Codes

Section 31(1) of the Factories Act 1948, Rule 61 of the Gujarat Factories Rules 1963 and Section 1.2.1 of the Indian Standard -Code for Unfired Pressure Vessels IS:2825 give definition of the pressure plant/ vessels. The operating pressure should be above the atmospheric pressure.

The IS:2825 provides more details on the subject of construction and other requirements for the design, fabrication, welding, inspection, testing, marking and certification of fusion welded unfired pressure vessels in ferrous and non-ferrous metals. Terminology of maximum working pressure, design pressure, minimum thickness and allowances to add into it, weld joint efficiency factor, ligament efficiency, post-weld heat treatment and allowable stress value are also explained in this Code. Pressure relief devices and corrosion, erosion and protection details are also given. It has considered BS 1500, 1515, ASME and the Swedish Code.

For ISO 14001, OHSAS 18001 and other Standards see Part 1.17 of Chapter-19.

Rule 61 of The Gujarat Factories Rules :

The terms design pressure, maximum permissible working pressure (MPWP), plant and pressure vessel are defined.

Design Pressure means the maximum pressure that a pressure vessel or plant is designed to withstand safely when operating normally.

Maximum Permissible Working Pressure (MPWP) means the maximum pressure at which a pressure vessel or plant is permitted to be operated or used under this rule and is determined by the technical requirement of the process.

Scope : This rule applies to a pressure vessel or plant operating above the atmospheric pressure and includes piping system.

The rule does not apply to

1. Vessels operating at a pressure below 1 Kg/ cm^2.
2. Where Indian Boilers Act 1923 is applicable.

3. Where Gas Cylinders Rules 1981 are applicable.
4. Where pressure is solely due to static head of liquid.
5. Vessels with nominal water capacity less than 500 litres connected to a water pumping system.
6. Vessels subjected to nuclear energy.
7. Refrigeration Plant of capacity less than 3 tonnes per day.
8. Working cylinders, steam traps, turbine casing, steam separators, dryers, strainers de-superheaters, oil separators, air receivers with MWP below 1.33 Kg/cm2 and volume 85 litres, and other air vessels.

Design & Construction : Every pressure vessel or plant should be

1. Properly designed on sound engineering practice. .
2. Of good construction, sound material, adequate strength and free from patent defects.
3. Properly maintained in a safe condition.

When Indian Standard or any other Code is applicable, a certificate from the manufacturer or competent person shall be obtained and produced before an Inspector.

Safety Devices:

1. Suitable safety valve or pressure relieving device of adequate capacity to ensure that MPWP shall not be exceeded. If more safety valves are provided, one will be set at MPWP and others at not more than 5% in excess of the MPWP.
2. Suitable pressure gauge with dial range 1.5 times the MPWP and red mark indicating MPWP.
3. Stop or isolation valve to shutoff the pressure source.
4. Drain cock (valve) to drain the vessel.
5. Suitable pressure reducing valve (PRV) or automatic pressure regulator to disallow the pressure greater than the MPWP. A safety valve shall be fitted on low pressure side of such device.

15.4.3 Fundamentals of Pressure Vessel Design

IS:2825, Section I includes in its Design section, General Provisions, Corrosion, erosion and protection, Cylindrical and spherical shells. Domed ends. Conical ends. Unstayed flat heads and covers. Stayed and braced plates. Openings branches and compensation, Access and inspection openings. Bolted flange connections. Ligament efficiency, jacketed vessels, Supports and Internal structures.

The Code also explains materials of construction, allowable stress, materials for low temperature service and materials for welding.

It also explains flange calculations for non-standard flanges.

Design, marking, capacity, setting, installation and discharge lines of pressure relieving devices are also specified.

In its Section II manufacture and workmanship are explained in the headings of Approval of design, General considerations and Design of welded joints, Preparation of parent metal. Assembly of plates and fit-up, Alignment and tolerances. Welding procedure, Welding of non-ferrous metals. Rectification of welds, Repair of drilled holes. Repair of cracks and Post weld heat treatment. The Section also prescribes Welding procedure, qualifications and Welder's performance qualifications.

Section III of the Code gives Inspection and Test methods. Marking and Records.

Then Appendices A to N give various values of stress, temperature, recommended practice, typical design of welded connections and proformas.

These are the fundamental subjects of pressure vessel design, construction, inspection and testing. For the details the Code (IS-.2825) itself should be referred. Basic formulae from the Code are given below.

Design Formulae : The following formulae shall apply in the case of cylindrical and spherical vessels subject to internal pressure.

For Cylindrical Shells

$$t = \frac{pDi}{200fj-p} = \frac{pDo}{200fj+p} \quad \text{or } p = \frac{200fjt}{Di + t} = \frac{200fjt}{Do - t}$$

For Spherical Shells

$$t = \frac{pDi}{400fj-p} = \frac{pDo}{400fj+p} \quad \text{or } p = \frac{400fjt}{Di + t} = \frac{400fjt}{Do - t}$$

where

t = Minimum thickness of shell plates exclusive of corrosion allowance in mm

p = design pressure in kg/cm^2

Di= inside diameter of the shell in mm.

Do= outside diameter of the shell in mm.

f = allowable stress value in kg/mm^2 (see Appendix A IS-.2825)

j= Joint factor or efficiency (see Table 1.1 IS-.2825)

Depending upon the material of the shell and the design temperature, the factor 'f' should be selected from the tables given in Appendix A of the IS:2825 This 'f' is from 9.5 to 9.8 for some carbon and low alloy steel plates to be used upto 250°C design temperature.

J = 1.00 to 0.90 for Class I vessels i.e. normally used. J = 0.85 for Class 2 and J = 0.7 to 0.5 for Class 3 vessels.

For example, for a cylindrical shell of 5 kg/cm: design pressure (p), internal diameter 1000 mm (Di) f = 9.6. T = 0.9. the thickness t is given by

$$T = \frac{5x1000}{200 \times 9.6 \times 0.9 - 5} = \frac{5000}{1728-5} = \frac{5000}{1723} = 2.90 \text{ mm}$$

Similarly if thickness and diameter are known pressure can be calculated. For example for the t = 2.5 mm and internal diameter 1000 mm, design pressurep is given by

$$P = \frac{200 \times 9.6 \times 0.9 \times 2.9}{100 + 2.9} = \frac{1728 \times 2.9}{1002.9} = 4.9967 = 5kg/cm^2$$

Thus the formulae are cross-checked.

The safe working pressure (p in lb/in2) of a sizing cylinder shall be calculated on the basis of the minimum thickness actually measured (t in inch), the diameter actually measured (D in inch) by the formula p = 2ts/D where s = stress of the material in Ibs/in2 say 5000 for copper.

For example, for a copper cylinder of t = 1/8 inch and D = 50 inch, safe working pressure will be

$$P = 2 \times \frac{1}{8} \times \frac{5000}{50} = \frac{100}{4} = 25 \text{ psi.}$$

15.4.4 Over-pressure Protection and Pressure Relief Devices :

Pressure exceeding the maximum permissible working pressure (MPWP) of a pressure vessel poses high hazard and needs pressure relief devices.

See Part 8.2 where such devices on storage vessels are discussed.

Rule 61 of the Gujarat Factories Rules (see foregoing Part 15.4.2) requires safety valve or pressure relieving device, suitable pressure gauge, stop or isolation valve to shut off pressure source, drain valve, pressure reducing valve or automatic pressure regulator. In Chapter 28, other safety laws requiring such provisions are also discussed.

IS:2825, Section I, Part 5 gives much details on this subject. It requires as under -

1. Fully liquid filled vessels should have liquid relief valve.
2. If a vessel is fitted with a heating coil or element, pressure increase due to its overheating, should be considered while designing relieving capacity of the protective device.
3. Vessels operating under vacuum should have a vacuum break relief device.
4. Vessels operating under pressure and vacuum (due to cooling of content) both, should have a combined pressure-vacuum relief device.
5. Pilot or other indirect control valve alone are not permitted. Main valve opening at a set pressure automatically must be provided. The relief valve shall be so designed that they cannot be inadvertently loaded beyond the set pressure.
6. Bursting (Rupture) Discs are preferred where pressure rise is fast like explosion, or where choking may make the safety valve inoperative and where even minute leakage of fluid cannot be tolerated (because of high toxicity or flammability). The disc may be mounted independently or in series with a relief valve provided that the bursting pressure of the disc shall not exceed MPWP of the vessel and its opening (diameter) should be sufficient to prevent interference with the proper functioning of the relief valve. If the disc is fitted on the discharge (outlet) side of the valve, back pressure should not be built-up to reduce the lifting pressure of the valve. The disc shall be marked with bursting pressure at a specified temperature and shall burst within ± 5% of that bursting pressure.
7. The relief valve shall be of sufficient capacity to discharge the maximum quantity of the fluid and when it is discharging, pressure in the vessel should not rise of more than 10% above the set pressure.

    The capacity of a relief valve to discharge gas or vapour (other than steam) is given by -

$$W = CKAP\sqrt{\frac{M}{T}}$$

where W = rated capacity in kg/h, C = constant (given in Table 5.1, IS:2825), K = coefficient of discharge depending on shape and specific to any particular valve, A = discharge area in 2 P = accumulation pressure (1.10 x set pressure) in kgf/cm2 abs, M = molecular weight and T = inlet temperature in °K.

8. Set pressure of the pressure relieving device (valve or disc) shall not exceed MPWP. This setting pressure will include the effect of static head and constant backpressure. If more than one protective device is provided, only one be set at MPWP and other devices at pressure not more than 5% in excess of the MPWP.

9. Vapour relief valve shall be provided in vapour space and liquid relief valve in below the liquid level.

10. Discharge line (after relief device) diameter shall not be less than that of the relief device outlet Size of drainage or blowdown tank should be such that it will not reduce the relieving capacity of the relief device. Discharge lines shall be properly anchored, particularly at their open ends, not to allow any displacement.

See Part 8.2, 9.1.5 and 15.4.2 also.

Let us see some practical examples which can cause accidents. Where a pump feeds a receiver, the safety valve should pass the volume being pumped if it has to open. In distillation column where normally there is no pressure, overpressure may be created due to increased heat input because of cooling failure or loss of reflux or loss of sub-cooled feed and increase in temperature difference in reboiler. Therefore safety valve becomes necessary on distillation vessel or column. Low pressure storage tanks can withstand a very low pressure. Safety valve should be provided on it to tackle any accidental pressure rise. Safety valve of low pressure side of a heat exchanger should be sized to handle the flow from twice the cross sectional area of the high pressure tube in the exchanger to relieve its sudden bursting pressure.

To check whether safety valves operate reliably, they should be daily opened by hand.

The number of safety valves on any vessel depends on the volume of working fluid and discharge capacity of the valves.

High noise is created by blowdown of safety valves. Engineering control to reduce this noise are necessary. Workers in safety valves testing area should wear ear, eye and hand protections.

Water Seal is used on pressure vessels that operate at low pressure or slight vacuum such as alcohol stills and gas holders. A U-pipe filled with water with one end connected to the pressure side and other end open works as a low pressure safety valve.

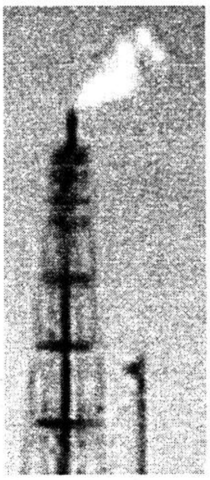
Depressurismg devices or pressure interlocks are required on autoclaves, vulcanisers, digesters, jet dyeing vessels, retorts etc. where charging doors are to be opened. The device or interlock will prevent the door opening till all pressure inside is relieved or prevent the pressure build-up till the door is closed.

High pressure alarms give audio visual alarm that the pressure is being increased. They are useful when pressure relief device may not work. In that event a vent valve or discharge valve should be manually or remotely opened and the reason of non-functioning of the relief device at its set pressure should be investigated.

Pressure/Temperature recorders or printouts are useful to study the process behaviour or investigate an accident happened on the system.

15.4.5 Flare :

In plants where highly toxic or flammable gases are generated in bulk or continuously, a flare, system becomes necessary for their collection and safe discharge by burning at height. The flare should be designed to vent the gases during normal operations and emergency conditions. Maximum possible discharge at a time should be considered for safer venting and preventing pollution of the environment.



A flare system consists of a flare stack and piping to collect the gases to be vented. At the flare tip, steam nozzles are provided for air entrainment and seals to prevent flashback of the flame. At the base a knockout drum is provided to collect the liquid from the gases passing to the flare.

Wet gases and dry, cold gases are collected through separate lines. A low level and a high level flare can be combined together so that normal operating and start-up loads are handled by the low level flare, while both flares are used to handle occasional high volume emergency loads. Thus an environmental impact of flaring can be kept to a minimum.

An intense heat radiation occurs from a flare. Therefore it should have sufficient height and no population in surrounding area. The discharge heat rate may be of the order of 10" BTU/h.

Hazards associated with flaring are -

1. Obstruction in the flare system.
2. Explosion in the flare system.
3. Low temperature embrittlement of the pipework.
4. Emission of toxic materials from the flare.
5. Heat radiation from the flare.
6. Liquid carryover from the flare.

The last three are environmentally objectionable. Smoke, glare and noise of the flare may also cause problems.

Efficient combustion in the flame is necessary otherwise a smoky flame will result. Liquid carryover can also result in smoky flame. By good mixing of fuel gas, steam supply and air entrainment good combustion is achieved. For this, the operator relies on visual observation. An automatic system operates based on flame root temperature.

Because of the air entering down in the stack when the flame may not be working or when any valves are open or due to corrosion this air and flammable gas may enter in explosive range and may explode. To avoid such air explosion, measures taken are purge gas, leak elimination, monitoring oxygen concentration, water seals, molecular seals and flame arresters.

A fuel gas is used as a purge gas to maintain positive pressure in the system to disallow air inside. This can be confirmed (no air intake) by monitoring oxygen content.

Heat radiated from a flare is given by-

$$I = \frac{FQ}{4\Pi r^2}$$

where I = intensity of heat radiation, Q = heat release rate, r = radius from centre of the flame and factor F = 0.16, 0.33. 0.30 and 0.38 for methane, propane, butane and ethylene respectively.

Acceptable heat radiation level at ground level is 1000 'BTU/ t2h so that men can reach in the vicinity of the flare without harm.

If chlorine and sulphur are burned in flares, they will emit HCI and SO_2. This requires more height of the stack so that ground level concentrations of these toxic gases may come down to permissible level.

15.5 Types of Tests, Certificates and Records

Storage and pressure vessels are to be tested and checked for the assessment of their reliability. Testing of pressure vessels and their parts is most essential. Mainly two types of tests are in practice, pressure test and non-destructive tests (NDT). Pressure tests include hydraulic, pneumatic and combined. NDT includes radiography, dye penetrant, magnetic particle and ultrasonic. NDT methods can be used before or after pressure test methods. Mechanical tests are also employed for fusion welded seams and test plates. Main tests methods are explained below.

Tests:

Tanks should be erected after considering its static load (as if fully filled), wind load, factor of safety and other allowances and testing the soil for its bearing capacity and making the foundation accordingly.

The underground tanks should be erected in underground RCC sump so that their leakage cannot pollute the soil or underground water.

The tanks which are not pressure vessels should be tested for its water load (static) test by filling it fully with water and observing any subsidence or damage.

The tanks which are pressure vessels, should be tested as per statutory provisions, its design Code and Standards or recommended by the manufacturer. See Part 9.4.4 following.

Periodicity of fest should be decided after considering material to be filled, its properties, storing parameters (pressure, temperature, flow, vibration etc.), heating/cooling, method of use, rate of corrosion and type and thickness of metal. Its condition monitoring is most essential. See IS:2825 also.

When tanks are tested, its fittings should also be tested and replaced if necessary.

Major causes of material or equipment failure are as under which need to be periodically tested :

1. Suitability (compatibility) of the material of construction (e.g. metal, plastic, lining etc.) with chemical. It can be checked by a metascope. See Table 18.1 & 18.2.
2. Mechanical failure due to excessive stress.
3. Mechanical fatigue and shock.
4. Thermal fatigue and shock.
5. Brittle failure due to cold liquid.
6. Creep due to plastic deformation and rupture.
7. Hydrogen attack due to atomic or molecular hydrogen generated by corrosion. Alloyed steels (with Cr, Mo etc.) are useful to mitigate hydrogen attack.
8. Corrosion by water or corrosive chemicals. See Part 15.6 for details.

Before testing or allowing welding, cutting or repairing, the tanks should be thoroughly cleaned and purged by inert gas if it was containing any flammable material. It should be made gas free if it was containing any toxic or flammable gas. Testing equipment should be safely utilised and a safety work permit should be followed. Oxygen content should also be measured. Top, bottom and side nozzles should be opened and free ventilation should be allowed. First it should be externally examined for manual checks and then it may be hydraulically or pressure tested. Test record should bemaintained.

15.5.1 Pressure Tests :

They are of three types as under -

(1) Hydraulic (Proof Hydrostatic) Test :

Water is used to pressurise the vessel for hydraulic test. By a hand pump, the pressure is gradually increased, stopped, observed any leakage if any and again increased. Test pressure is 1.3 to 1.5 times the design pressure. A standard pressure gauge should be used to watch the pressure. Slight higher test pressure is required for an old or repaired vessel than for a new vessel.

Testing by air, steam or gas pressure is more hazardous as air, steam or gas are more compressible than water and contains more energy at equal pressure. Therefore air-pressurised vessel can burst with great explosive force and can make great damage. The water-pressurised vessel, if bursts at the same pressure, will release less energy, no shock wave will be generated and make less damage. Therefore hydraulic test is a safer test. It provides easy detection of leak also.

After the test pressure is attained, it is held up for some time (15 to 20 minutes). If no leakage or no deformation, the positive test certificate can be issued.

Examinations & Tests u/r 61, Gujarat Factories Rules:

They are prescribed as under -

1. New vessel to be used for the first time Hydraulic test at 1.3 x design pressure.
2. Old vessel, unused vessel for more than 2 months or where repair/alteration is made - Hydraulic Test at 1.5 x MPWP, i.e. maximum permissible working pressure.
3. Where water is not suitable for test - Pneumatic (air) test at
   - Design Pressure for new vessel
   - MPWP for old vessel.
4. Glass lined vessel - Hydraulic or Pneumatic test at
   - Design Pressure for new vessel.
   - MPWP for old vessel.
5. Test certificate from the manufacturer or competent person should be obtained before using any vessel for the first time. Inspector may demand it.
6. No vessel can be operated at a pressure higher than that mentioned in the certificate.
7. Inservice test/examination as under
   (1) External test at 6 months.
   (2) Internal test at 1 year.
   (3) Hydraulic test at 2 years.
   (4) Internal or Hydro test a 4 years for vessel in continuous process.
   (5) If external, internal or hydro test is not possible as above, then - NDT for metal thickness and other defects.

8. Thin - walled vessels of non-ferrous metal
   (1) Maximum life 20 years.
   (2) 5% reduction in MPWP every year.
   (3) New, second hand or repaired vessel shall be tested at 1.5 x MPWP before its use.

Report by a Competent Person :

1. It should be in Form II.
2. Condition stated in report must be fulfilled before using the vessel.
3. Where pressure reduction on repair is suggested, the competent person shall send a copy of such report to the Inspector within 7 days of the completion of the test.

See Part 15.4.2 for remaining part of Rule 61, GFR.

To determine the ultimate bursting pressure, the vessel is subjected to five or more times the design pressure. Burst pressure tests are used only to test a sample of a large number produced to verify the adequacy of calculations and manufacture.

Precautions necessary while hydro-testing are as under

1. Use of standard and correct pressure gauge.
2. Removal of air from the vessel before testing.
3. Visual inspection for clearly visible defects if any
4. Use of a rupture disc to test at a high pressure
5. Protected area away from public. A pit or steelbox is preferable.
6. Limiting the liquid volume in the test vessel to reduce the energy stored at the time of testing. To achieve this, bigger size solid pieces should be inserted in the vessel to take up as much of its volume as possible.

After hydraulic testing if more than 0.2% increase (elongation or deformation) in volume is noticed, the vessel should not be recommended to use as a pressure vessel.

(2) Pneumatic Test:

This test is useful where even traces of water cannot be tolerated in its service or where a vessel is so designed and/or supported that it cannot be safely filled with the water or testing fluid.

Such test shall be carried out under close supervision by the inspecting authority. Adequate precautions like blast wall or pit and means for remote observation are essential.

The pneumatic test pressure should be more than the design pressure but less than the hydraulic test pressure. In the beginning, the pressure should be gradually increased up to 50% of the test pressure. Thereafter it should be increased in steps of 10% of the test pressure till the required test pressure is achieved. Then the pressure will be reduced up to design pressure and held at that pressure for a sufficient time to permit inspection of the vessel.

(3) Combined Hydraulic and Pressure Test :

Here a test vessel is partially filled with water and then air pressure is applied to the space above the liquid level. The test pressure (not exceeding hydraulic test pressure, but more than the design pressure) shall be deducted by the pressure due to the static head of the water in the vessel.

15.5.2 Non Destructive Tests (NDT) :

(1) Significance and Limitations :

Rule 61 of the Gujarat Factories Rules says that if external, internal or hydro test is not possible, NDT in-service test shall be carried out for metal thickness and other defects.

By visual inspection, external or internal, it is impossible to see under surface or inner defects, cracks, porosity, thickness reduction etc. Hydraulic test can check the overall integrity (soundness) of the vessel but it. cannot show the above defects. A way of finding the weakest part by hydraulic bursting, or a test piece cutting is a destructive test. Therefore non-destructive tests are developed to test boilers, pressure vessels and nuclear components.

NDT can detect (1) Inherent metal defects like porosity, shrinkage, non-metallic inclusions (2) Processing defects like residual stresses, cracks caused by grinding of casting and forging, spruing and (3) In-service defects like corrosion, erosion, change in section etc.

Limitations of NDT are : They can measure thickness, cracks, flaws, porosity, discontinuities, soundness etc.. but not the overall integrity of the material against permissible pressure as a proof test. From the measured thickness, permissible pressure can be calculated. Overall integrity of a vessel can be tested by pressure (hydraulic) test only.

(2) Radiography:

IS 2478, 2595 and 2598 should be referred for Code of practice and safety for radiographic testing. IS:2825, Section III, Part 8.7 also explains radiographic examination.

No radiographic examination is required where the thickness of butt welds is less than 6 mm. It is also not required where thickness may be up to 12 mm but the outside diameter is less than 102 mm. For thickness between 12 to 19 mm and diameter between 102 to 170 mm, 5 to 10%- of the total length of welds shall be radiographically examined. For thickness more than .19 mm and diameter more than 170 mm all the welded Joints shall be examined.

Radiography is a process of detecting discontinuities (defects) in test objects by passing ionising (short wavelength) radiation through them and recording the transmitted radiation pattern on X or Gamma ray films.

A simple radiography set-up consists of radiation source (shielded), test object and X-ray film between a pair of lead screens enclosed in a light proof cassette. The image on the film is converted into black or white pattern which indicates the structure of the test object.

An air bubble inside a steel plate shows black spot as more radiation passes through air bubble than the rest of the part and gives more blackening on the film.

A tungsten inclusion in steel plate would appear as white patch compared to rest of the parts as tungsten absorbs more radiation than steel of the same thickness.

Radiographic examination should be conducted before final heat treatment. At least two penetrameters shall be used for each radiograph. A viewing device of suitable illuminating power should be used to see the radiographs on the original films. Each radiograph should be identified with the portion of seam represented. At least 2 % thickness difference should be detected. The width of the radiograph should be at least equal to the total width of the welded joints plus an allowance of about 10 mm on each side of the welded joint.

Where the required quality is not shown by the test, welded joints or parts shall be repaired and reexamined radiographically.

All workers exposed to X or Gamma rays and engaged in radiographic work shall be shielded against direct and scattered radiation.

Follow IS:2598 for Code of safety for industrial radiographic practice.

Nature of personnel exposure is due to external or internal radiation. External radiation arises from radiographic sources, radioactive contamination on inanimate sources and on the skin or clothing of personnel. Internal exposure arises from radio-nuclides within the body. They may enter by inhalation, ingestion through skin wounds or be absorbed through intact skin. Effects of exposure may be somatic and genetic (to descendants) both. Exposure should not be more than the permissible dose.

Personnel monitoring should be done with film badges, pocket dosimeters, pocket ionisation chambers. Workplace monitoring i.e. radiation survey and site monitoring should be carried out by radiation survey instruments - Geiger-Muller tubes and Ion chamber instruments.

External exposure can be prevented or reduced by (1) Reducing time of exposure (2) Increasing working distance from the source of radiation and (3) Interposing attenuating (protective) barriers between the source and the workers. Radiation source should be shielded and located in a room with lead or concrete walls and the controls being outside the room. Until the room door is not closed the control should not start (interlock).

Where more than 20 radiation workers work, Radiation Safety Officer is recommended. Personnel exposure and health (medical exam) records should be maintained. Radioactive waste (leaking sources, contaminated equipment or decayed sources) should be stored and disposed in the prescribed manner.

See Part 5 of Chapter-28 also.

(3) Ultrasonic:

IS 2417, 9346 & 11630 are on this subject.

Ultrasonic is an inspection technique to test both metallic and non-metallic products such as welds, castings, forging, sheet, tubing, plastics and ceramics by using sound waves (vibrations).

It discloses the soundness, thickness or physical property of the material or nature of discontinuities without impairing the material and by exposing its one side only. Ultrasonic waves i.e. vibrations are created by an electronic generator and passed through a material due to its elastic properties. Vibrations above the human hearing range (20000 Hz) are called ultrasonic vibrations. An ultrasonic testing unit uses vibrations of about 5x10666 Hz (5 megahertz).

Electrical energy is applied to a piezoelectric crystal also called transducer which causes material displacement within the specimen. The transducer converts electrical energy into mechanical and vice versa. Thus transducer can transmits or receives the energy. Transmission of energy can be pulsed or continuous. Steel, water and oil can transmit ultrasound very well but air is a poor transmitter because of its low particle density. Velocity of sound in steel, water and air are 5.9, 1.48 and 0.33 km/sec respectively. Therefore water, oil (grease) or steel is used as a couplant between the transducer and the test specimen. The pulses (waves) return back (reflect) from discontinuities in their path or from any boundary (end) that they strike. The received reflections are displayed on a cathode ray tube (CRT). The quality of the material is measured in terms of energy lost by a sound beam as it travels through the material.

Normally two methods are used. In 'Contact testing' method the transducer is coupled to the material through a thin layer of couplant. In ‘Immersion testing' method, both the material and the transducer are immersed in a tank of couplant (usually water). Immersion technique is commonly used to inspect tubing; pipe and butt welds.

There are two types of test systems - Pulse - echo reflection and Through transmission as shown in Fig. 19. A third system known as 'Resonant frequency' is rarely used because its functions of 'thickness measurement' and 'bond or lamination inspection' are also performed by the pulse-echo system.

High speed ultrasonic scanning generally utilises the C-scan presentations (there are A, B and C-scan, three types of visual displays).

Three types of discontinuities can be detected (1) Inherent wrought and inherent cast (2) Processing and (3) Inservice discontinuities.

A discontinuity is not necessarily a defect until the inspector-identifies and evaluates its negative effect on the service of the part or to the requirement of the specification.

Biological effects have been noticed on workers. Shielding of electrical connection causing electromagnetic fields, sound isolated booth, use of cotton lined rubber gloves, absorbent lining to tools, ear muffs, noise & vibration control, and periodic medical examinations are necessary.

(4) Magnetic Particle Methods :

Mostly forgings are tested by this method. Finely ground ferromagnetic particles of different forms and colours are available. Depending on the condition of surface to be inspected and type of indication to be located, form of particles and type of method - dry, wet or fluorescent - are selected. Colour is selected to have full contrast with the surface.

Then magnetic field is applied by DC or AC (low volts) current. This attracts and holds magnetic particles right on the surface. Defects if any, interrupt the magnetic field and are clearly shown by the pattern formed by the particles. Nature of discontinuities (defects) is disclosed and acceptable and unacceptable material can be separated in accordance with predetermined standards. After the test is over, the part should be demagnetised by reversing and reducing the magnetic field.

Local exhaust is necessary to control dust particles. If it is not possible, dust mask (respirator) and eye and skin protective equipment should be worn by the workers.

Smoking should not be permitted near wet bath process. Electrical arcing (caused by loose contact, excessive current or slipping of prods) can cause sparks or fire. Filters should be used on the black light while testing with fluorescent particles, to protect skin or eyes.

Burns can be caused due to resistance heating in the part or in the prods. Therefore these parts should not immediately be touched after the test.

IS 3415, 3703, 7743, 10724 and 10543 should be referred for details.

(5) Eddy-current or Electromagnetic Method:

Eddy current, magneto-inductive and radar frequency - three types of methods are used.

In eddy current method, an eddy current is induced in the part to be tested by passing alternating current in a coil or probe. Defects cause changes in the strength and distribution of the eddy current. Readout is presented on a cathode ray tube, on a meter or by audio-visual alarm. IS'.12965 should be referred for details.

In magneto-inductive method, variations in the permeability of magnetic materials are used to create variations in a probe or pickup coil.

In radar frequency method, high frequency radar waves are used to measure electromagnetic properties of thin coatings and surface layer of material. Workers should not pass in between the object being tested and the testing device otherwise they may burn internally. Barriers should be provided to the area.

(6) Dye Penetration Test :

Organic compounds or dyes are used as a penetrant which is applied on the surface after cleaning it. By capillary action (Capillilarity) the penetrant is drawn into discontinuities or defects and flaws (cracks, pores, leaks). Time is allowed for penetrant to seep into the opening. The excess penetrant is removed from the surface by cleaner and the developer is applied in the form of a thin uniform white layer, which absorbs the entrapped penetrant from the surface flaws and brings it up as a visible indication. It remains visible in defects until removed by cleaner like water, solvent or an emulsifier followed by a water wash. A coloured dye penetrant contracts with the surface colour in white light while a fluorescent penetrant shows defects under ultraviolet (black) light.

The penetrant should be non-corrosive, non-toxic non-destructive and having low halogen and sulphui contents.

Skin contact should be avoided. Skin should be washed just after exposure and before eating, drinking or smoking.

IS 3658 and 12889 should be referred for liquid penetrants for flaw detection.

(7) Strain Measurement:

Like non-destructive testing, condition monitoring is the measurement of the state of the equipment including pressure vessels, other vessels, pipework and machinery and it is carried out during construction/ fabrication and operational life. It is based on the performance or condition of the equipment. Various methods employed include following :

1. Corrosion monitoring.
2. Vibration monitoring.
3. Performance monitoring.
4. Thermal image monitoring.
5. Sound level monitoring.

6. Strain measurement.
7. Temperature measurement.
8. Speed measurement.
9. Torque measurement.
10. Position measurement.

Thus strain measurement is one of the condition monitoring methods. Any material undergoes stress (due to pressure or force) or strain (due to stretch or pull) depending on forces acting on it. Major forces are mechanical strain and pressure and temperature.

Following methods are used for strain measurement.

1. Strain gauges.
2. Displacement measurement.
3. Lacquers and coatings.
4. X-ray diffraction.
5. Interferometry utilising Moire grid. Speckle and holographic method.

A strain gauge (electrical) measures strain in one direction only and it is less sensitive. Interferometric techniques measure a two dimensional strain and are more sensitive. In Moire grid method a linear grid is applied to the object and its distortions are measured.

Photoelastic coatings and brittle lacquers are used to detect strain existence. The holographic method takes a silicone replica of the strained surface and analyses in a laboratory using powerful laser.

15.5.3 Role of a Competent Person :

See Part 6.8 of Chapter 6.

U/r 61 of the Gujarat Factories Rules, a recognized competent person has to carry out different tests of a pressure vessel. This includes external, internal, hydraulic and non destructive tests. He has to feel Form No. II, GFR, and has to suggest defect and remedial measures if any.

Under Static and Mobile Pressure Vessels (Unfired) Rules, a recognized competent person has to carry out tests, examination, inspection and certification for installations and transport vehicles. U/r 19 periodic hydraulic testing is required at an interval of five years. U/r 43 certificate of safety in prescribed proforma is required from a competent person.

15.5.4 Records in prescribed Forms :

Some statutory forms and proforma as stated above are to be filled after necessary tests and to be signed by a competent person. Where statutory proforma is not prescribed, competent person has to design it requiring relevant information. Such prescribed forms/proforma should be shown to the inspector on demand.

15.6 Corrosion, Erosion, Causes, Inspection and Prevention

Reasons of Pressure Vessel Failure are many. Wrong selection of material of construction, mechanical failure due to overpressure, overheating, external loading (e.g. platform, stairs, ladders, supports, brackets etc.), excessive stress (uneven or over tightening), brittle fracture, creep (due to fire or maloperation), mechanical fatigue and shock (due to pressure or flow variations, vibrations, expansion effects), thermal fatigue and shock (due to temperature difference and rate of change of temperature), hydrogen attack (blistering or embrittlement) and corrosion failure are some of the reasons.

Corrosion is an electrochemical reaction between a metal and its environment. It results in a loss of metal or weakening of it Corrosion reaches deeply, creates maintenance problems and incurs cost of loss in lacs of rupees over the years.

Corrosion failure has also many reasons to occur. General, local and external corrosion, galvanic, crevice, knife-line, intergranular and stress-related corrosion, scaling, exfoliation, corrosion pitting and erosion are some common types of corrosion in process plants including pressure vessels.

Corrosion due to oxidation at high temperature is called scaling, e.g. steam boilers. Exfoliation is a type of scaling caused by oxidation in steam atmosphere e.g. feed water heaters. General corrosion takes place due to a corrosive chemical or impurity over the exposed surface.

Intergranular corrosion occurs in stainless steels heated upto 500-800 °C and then exposed to corrosive conditions.

Galvanic corrosion happens due to current flowing between tow dissimilar metals which form a galvanic cell. It occurs when two such metals are joined together at a weld. A typical pair is iron and copper.

Corrosion pitting results from electrochemical potential set up by differences of oxygen concentration inside and outside the pit. The oxygen-lean part acts as anode and the metal surface as cathode.

Knife-line corrosion takes place between parent and weld metals, e.g. austenitic stainless steels.

Crevice or contact corrosion occurs at the point of contact of a metal and non-metallic material, e.g. threaded joints.

Erosion is a type of corrosion and is caused by flow restriction or change of direction, e.g. elbows, tees, baffles, nozzles and valves and point opposite to inlet nozzle. It is increased if the flow contains solid particles or by bubbles in liquids and by two phase flow. Wet steam flow, air jet flashing flow and pump cavitation can cause severe erosion.

External corrosion occurs by material of insulation. Leaching of chloride salts from insulation can corrode pipework.

Underground piping can be corroded by soil due to electrochemical action and cathodic protection is used to control it.

Stress corrosion cracking is the result of corrosion and static tensile stresses. Corrosion fatigue is caused by corrosion and by alternating fatigue stresses. Chlorides are a common cause of stress corrosion cracking. Stress may be internal or external. Stress corrosion cracking caused by an alkaline solution is known as caustic embrittlement, which has been a frequent cause of failure in boilers. Therefore treatment to boiler feed water (removal of caustic and chloride content) is necessary. Control measures are elimination of corrodants, reduction of residual stresses and vibrations etc.

In plants handling nitric acid and nitrates, "nitrate stress corrosion cracking" of mild steel is possible. This was the reason of crack in the reactor at Flixborough resulting in removal of the reactor and temporary installation of the 20" pipe which gave way and the disaster took place.

At high stresses and temperatures, traces of other metals like zinc can cause rapid and severe **zinc embrittlement** of some types of steels. Wetting of the steel by molten zinc is a favourable condition to zinc embrittlement. This may cause local fire and catastrophic failure. To avoid this, zinc-coated items should not be placed in direct contact with stainless steel or in positions where they can drip molten zinc on it. For example galvanised wire netting used in insulation should not be in direct contact with stainless steel pipe. During welding and fabrication, zinc contamination of stainless steel should be prevented. Special metallurgical examination will reveal zinc embrittlement.

Corrosion Prevention is of high importance as it prevents accidents and reduces cost of corroded materials. Substitution of non-corrosive or less corrosive material (e.g. SS instead of MS) tolerated by the process technology and economy and selection of such material from the design and erection stage avoids most of the corrosion problems. Then selection of powder coated metal parts (sheets, structural members, machine parts, guards, covers etc.) instead of painted, give long life. Mild steel parts of tanks structures piping, machines and vessels must be regularly painted by anti-corrosive paints. Protection from rain and plant water, dripping and leaking of corrosive chemicals, oxidation and contact of zinc and copper is necessary. Rapid cleaning of spillage, good housekeeping, cathodic protection, control of flow, fluctuations and vibrations, water softening and removal of salts, checking of scale formation on plates and tubes, thickness measurement and defect monitoring by NDT methods stated in foregoing Part 9.5.2 and latest instruments and equipment, scanning by computer methods, descaling, dechoking, scrapping, timely repairing and preventive maintenance are also useful to avoid corrosion and erosion.

Other methods to stop corrosion and erosion are as under :

1. Two compatible metal prevent or slow down the rate of corrosion.
2. A strategically placed gasket i.e. to provide insulating material between the two metals.
3. Cathodic protection and conversion coating.
4. Crevice corrosion can be avoided by choosing materials having corrosion resistance. Stainless steels are prone to crevice corrosion and not recommended for such use.
5. Dezincificaiton (removal of zinc from brass) can be prevented by using alloys of brass containing Sn, As, P or Sb.
6. Use of non-metallic material like plastic.
7. Applying monomolecular film (inhibitor) of grease, paint, synthetic organic coating or a plastic sheet (liner) over the surface.
8. Use of oxygen scavengers (e.g. Sodium sulphite and hydrazine) to add into boiler water to remove oxygen.
9. Inhibitors like phosphonates are used in cooling water for corrosion control.
10. Use of acid pickling as corrosion inhibitors.
11. Use of heavy oils or greases, waxes dissolved in solvents or sulphonate salts dissolved in petroleum as a barrier between die environment and the metal surface.

    However it should be verified that chemicals being selected as inhibitors should not be carcinogenic.as they can cause cancer. For example p-t-butyl benzoic acid, sodium nitrite, nitrosamines, thiourea etc. are carcinogenic and should not be used.
12. Non-metallic materials like plastic, rubber and synthetic elastomers can also be attached by corrosion or cracking due to solvent, environmental stress or thermal effect. Corrosion process in plastic takes place because of swelling, softening or loss of physical properties. Polyurethane, polyethylene, polystyrene, ABS, acetal homopolymers and polyethersulfone are the plastics having good resistance against corrosion.-

Rubber lining (e.g. chloroprene, nitrile and butyl rubber) on steel tank prohibits attack of strong acids.

15.7 Safe Start-up & Shutdown Procedures

Start-up or restart operation after a short or long shutdown and shutdown procedures need special precautions.

Starting sequence should be well defined, written and known to the workers involved in this work. Starting in sequence of utilities like water, air, power; purging, charging, slow and gradual heating, monitoring of pressure, temperature, flow and reaction rate, cooling if necessary, starting of exhaust system, scrubber or condenser etc., observing noise, vibration, speed, alignment, synchronising etc. are all important.

During start-up if drains remain open, vent valves remain closed, wrong valves are operated, unwanted material enters e.g. oxygen instead of nitrogen as blanketing over flammable reaction, water where it is incompatible, air instead of steam or steam instead of air, excess or less charging of material or catalyst, delayed cooling or heating, not starting of any pump or instrument, no indication or alarm due to failure or malfunctioning of instrument in the beginning, no starting of local exhaust or scrubber when it is essential and failure of interlock or trip resulting in unwanted mixing or reaction, mixing of air with hydrocarbons, contacting hot oil and water, thermal or mechanical shocks etc. are some of the examples of possible disorders.

Correct identification of pipelines, valves and gauges, correct sequence of control operation, correct charging or addition-rate and instead of relying on instruments only Counter-check of other parameters and strict manual observation and satisfaction are requisite precautions for safe start-up procedure.

Attention should be paid on preparatory activity, verifying content, removal of air or venting, purging and disposal of purged material, removal or addition of water, slow and sequential starting of heating or cooling, gradual reaching of working parameters and normal operation.

Other points needing attention in start-up are removal of shutdown blinds, providing running blinds, opening of scrubber or discharge line valve, opening of isolation valve before safety valve, starting of local exhaust ventilation, pump cooling and priming, readiness of fire fighting equipment, leak detection, opening vents and drains before allowing steam in the system, partial opening of steam valves, introducing steam from the bottom part, observance of level and overflow if any, safe increase in loading, avoidance of incompatible material, avoidance of moisture and impurities in breathing air, purging of blow down tanks and flare, removing air from vacuum equipment, inspecting joints and valves for leakage, verifying steam traps working for condensate discharge, safe displacement of steam, water or purge gas after their use, removing residual water before, introducing hot oil (initially cold oil should be introduced), using heat-exchanger for indirect and gradual heating or cooling etc.

Shutdown operation needs sequential steps like cooling and de-pressuring, pumping out, removal of residual content e.g. hydrocarbons, corrosive or toxic chemicals, water, oil, pyrophoric catalyst, disposal of effluents and sludge, drainage and blinding and isolation activities.

Heat source should be cut off, cooling may be continued till required, where vacuum is possible due to cooling, inert gas or air (if compatible) should be introduced to maintain atmospheric pressure, pumping out material after cooling and de-pressuring and pumped out hot oil should be cooled below its flash point. Residual hydrocarbons can be removed by purging with steam, water or water followed by steam. After purging, air should be allowed into the system. Residual water should be removed. Lastly running blinds should be removed and shutdown blinds should be installed.

If the shutdown is required due to any fault, the cause of the fault should be found, studied and removed before restarting the plant.

15.8 Maintenance

Maintenance should be considered as early as the design stage. Good engineering initially can reduce maintenance problems considerably. Those parts of equipment that need frequent attention should have good accessibility and be easy to remove or replace. Space must be available for tools or special maintenance equipment such as lifting gear, jacks or large torque wrenches. The planned maintenance system that is introduced should include plant condition monitoring. This enables the state of the plant to be deduced whilst still in service, cutting maintenance costs considerably compared to strip-down inspection methods.

Any planned maintenance/condition monitoring system should include a breakdown maintenance repair and analysis system. This enables modifications to be made subsequently to such schemes by modifying maintenance periods or adding or subtracting other operations. It will also help to identify poorly designed or constructed plant and enable better specifications to be produced for replacement items.

The third safety objectives is to train operators in the correct operating procedures. As all installed plant, including pumps, tankage, electrical systems and • instrumentation is the responsibility of the operations department, operating procedures must include safety regulations which prohibit unauthorised access to equipment. This is done by means of a work permit system.

Maintenance Policies and Types :

British Standard BS 3811 - Glossary of maintenance terms used in tero technology - defines terminology used for maintenance policies.-

Like health & safety policy or good quality assurance policy, a maintenance policy should also be defined to include breakdown or corrective maintenance and preventive or planned maintenance. Then it is possible also to develop a check list for plant maintenance.

Maintenance includes planned or scheduled shutdowns or stoppage of work to see all inaccessible (during normal working) parts also. Such periodical and planned in advance shutdown is a preventive maintenance. Instead of such a fixed schedule, "condition based' maintenance is also possible to carry out condition monitoring. Mostly NDT techniques are employed in condition monitoring.

Various types of maintenance and terminology used in BS 3811 are explained in Fig. 18 in a decision tree form

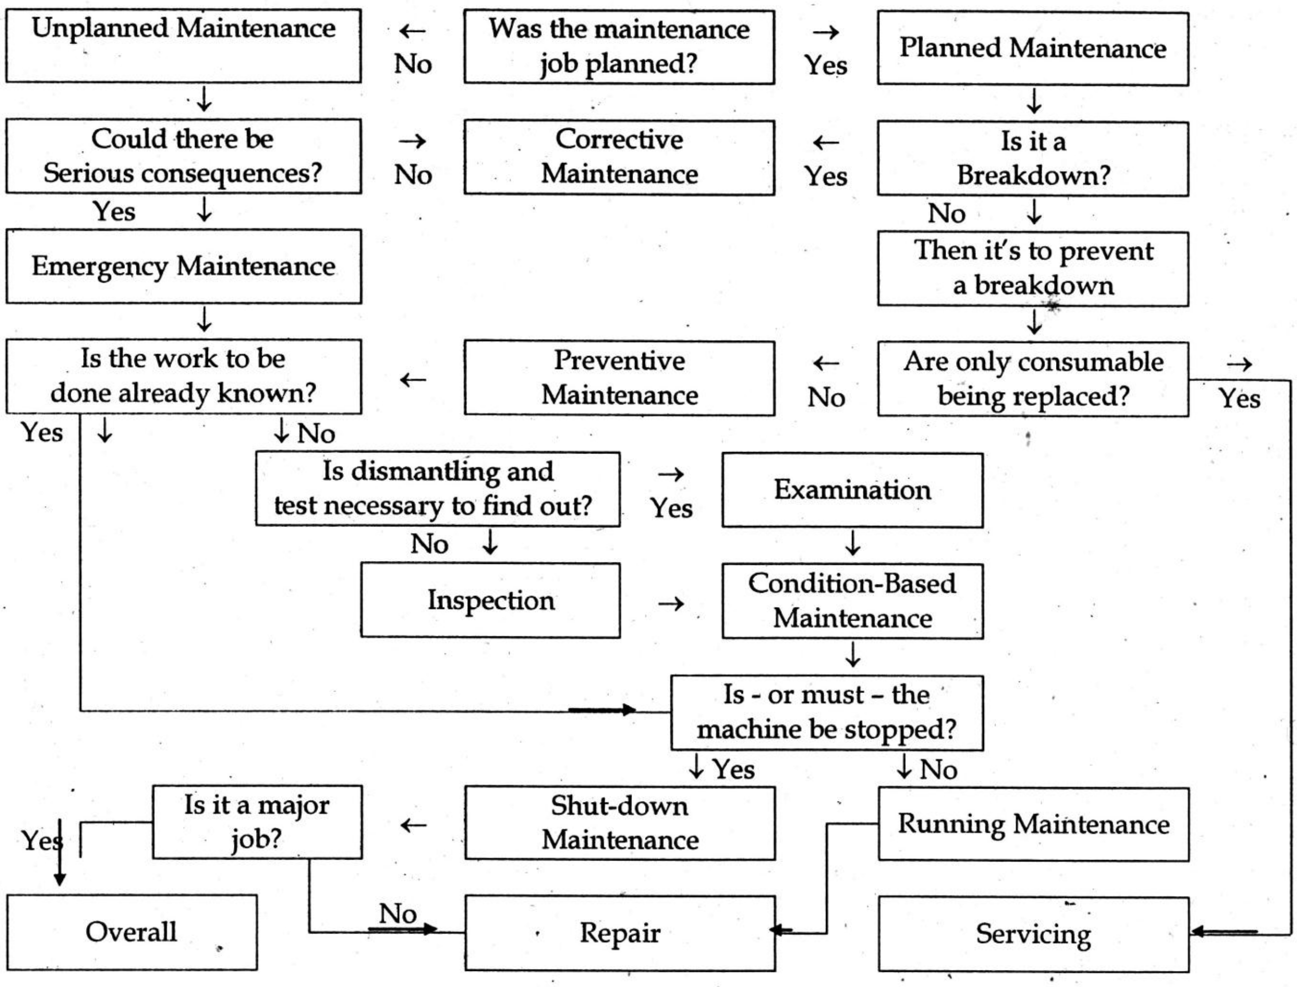


Fig. 18. : Decisions on Maintenance

Main intention of any maintenance system is to identify failure situations and by timely repair, replacement and servicing to stop the possible failures. This certainly saves subsequent costs of damaged plant, machinery, equipment, material and stoppage time and accident costs to persons, property and environment. Therefore maintenance cost must have due consideration and budgetary provision.

Maintenance activities include -

1. Running maintenance - rum-ling repairs with little interruption to production.
2. Servicing - replacement of consumable including lubrication and overhauling.
3. Production assistance - adjusting machine settings.
4. Breakdown, Corrective or Emergency Maintenance - unscheduled repair to broken parts.
5. Condition-based maintenance - unscheduled testing and repair based on unsafe condition noticed.

6. Shutdown or Preventive maintenance - scheduled (planned) or periodical testing and repair including servicing.

Maintenance activities may be of the type Emptying, purging, cleaning, breaking of pipelines, repair, demolition, hot work, welding, hot tapping, part removal, repair and refitting.

Information from reliability engineering (see Part 5 of Chapter-19) is quite useful to plan preventive maintenance. Identification and qualification of failures that may result in accident or hazardous condition, plant downtime or direct repair costs are useful. Main failure regimes of equipment are early failure, constant failure, random failure and wearout failure. Reasons of early failure include (1) Incorrect design, specification, selection and construction or manufacturing faults (2) Incorrect fault finding, repair method, replacement parts, refitting and bad working conditions and (3) Start-up mechanical or temperature stresses.

Repair, reconditioning or replacement should be carried out as per original design, specification, material and technique. Regular inspection can reduce maintenance. Now a days on-line testing, monitoring and inspection techniques reduce the breakdown maintenance.

Steps in preparing for maintenance are (1) Identification of plant or part (2) Its isolation and (3) Other preparatory measures such as venting, cooling, depressuring, purging and cleaning.

Maintenance can be made safe and systematic by work permit systems (see Part 1.8 of Chapter 19 and part 16 of this Chapter), audit of permit systems, tags and lockouts, power or content isolation.

Proper tools, lifting machines and equipment and personal protective equipment should be used while maintenance work.

16. WORK PERMITS FOR HAZARDOUS WORK

See also Part 1.8 of Chapter-19.

The objectives, methodology, issue of permit, its execution and termination, foreseeing of hazards and arrangement for their controls, testing and certification of working atmosphere, use of tools and personal protective equipment, first-aid and rescue equipment and training of workers for such work are the common factors in any type of work permit application. Its sole purpose is to save life and avoid accident.

Hazardous substances are many. They may be explosive, flammable, toxic, hot, corrosive and may be in the form of dust, gas, vapour, steam, hot oil etc. They pose high degree of hazards, have caused many accidents world-wide and need strict safety precautions while working with them.

Other factors being common, the vital part of devising any safety work permit is to concentrate on typical hazards involved and then to apply their remedial measures. Material Safety Data Sheet will expose property hazards. Storage, process and vessel conditions can reveal their specific hazards (Parts 6 to 17 of this Chapter discuss such hazards in details) and due consideration to all such hazards is necessary before devising any substance wise work permit. Statutory provisions mentioned inchapters 27 & 28 also supply useful and mandatory information.

Normally hazardous works of maintenance or modification need work permit system. It is given for the following category of works :

Operations	Excavation, vessel entry, working at height, hot work, welding and cutting, equipment removal, pipe breaking, line breaking, lining in furnace, waste disposal, ship breaking and cutting.
Equipment	Electrical, pneumatic, hydraulic lifting machine, crane, sprinkler or hydrant system.
Hazardous area	Explosive, flammable, corrosive, radioactive or toxic atmosphere.

Time Overtime or after hours work.

General and special hazards both should be considered. For example, work with flammable dust, gas, vapour or liquid requires flameproof equipment and avoidance of all sources of ignition, but depending upon the class of fire, specific fire extinguisher is required. Work with a toxic dust or gas needs local exhaust or capture device, but depending on type (e.g. chlorine, phosphine, CO) and concentration, specific respirator is required. Work with corrosive acid needs acid-proof hand-gloves, goggles and apron, but depending on fumes given by it (e.g. HCl, SO, nitrous fumes) specific respirator is required. Work with hot substance requires shielding and hand protection but depending on its nature (e.g. steam, oil, molten metal, liquid glass, hot surface), the specific type of hand protection (cotton, leather, asbestos) can be selected. Working on a fragile roof needs a crawling board, substantial platform or support and a safety belt but the height, place and position will decide the type of ladder or platform and type of anchoring as specific requirement. Work with dust requires exhaust or suction device but the type (e.g. sand, coal dust, wood dust, chemical powder, bio-organism) and size (microns) decide specific type of respirator.

Knowledge of appropriate solvents, scrubbing media, absorbers, adsorbers and inactivating substances is always useful while preparing work permit for any specific substance.

Knowledge of right type of tool, tackle, equipment and instrument helps in suggesting work with safety.

Work permit to demolish or repair any tank, vessel or equipment needs special precautions. Inner content should be identified and removed before allowing any hot work. The atmosphere must be rendered non-flammable. Residues lie not only on the bottom but also on the walls and may evolve volatile material and catch fire. Polymer residues normally lie on the upper walls or the roof. To remove such residues first requirement is to clean them. Cleaning can be performed by hand cleaning, machine cleaning or steaming out. Bottom residues can be covered by water or protein foam as blanketing. Inerting is also possible but this needs oxygen reduction below 10% to carry out any hot work on the tank.

Where liquid content (residues) is of low flash point (e.g. $<40\ ^0C$), the tank may be fully filled with water and then cold cutting (using pneumatic chisel) method may be applied. Cutting should start from the top and proceed toward bottom. Here the vapour space is minimised, resulting in turn, minimisation of the hazard. But the tank should be capable of withstanding the water load.

In another type of method, high expansion foam (e.g. 40 m^3/min) can be used as a blanket. Heat exchanger containing flammable vapour can be filled with water and crushed for demolition.

However it should be noted that all such techniques require special knowledge and need of an expert/competent person.

16.1 General Checklist:

A general checklist (Format) of permit for Hazardous Work is given below in Table 18.9.

Table 18.9 : Work Permit for Hazardous Work.

Name & Address of the Factory : ________________________________ Sr. No. : _____________
Name & Address of the Contractor : ________________________________ Date. : _____________

Permittee (the site supervisor)			Plant/ Section	Location of the work to be done	Date & time of issue (Permit)	Date & time of expiry (Permit)
Name of the person	Designation	Company				

Description / Nasture of the work to be done. (to be filled in by the permittee)	**Equipment/ tools/ hazardous substances to be used** (to be filled in by the permittee)	**Probable Hazardous** (to be filled in by the contractor's site engineer)	
	☐ Crane (No _________)	☐ Fall of persons from height ?	☐ Suspended load ?
	☐ Chain pulley block.	☐ Falling objects/ overhead work ?	☐ Fire ?
	☐ Slings & other lifting tackles.	☐ Fall below grade level ?	☐ Toxic / flammable dust / fumes/ vapour ?
	☐ Electrical equipment?	☐ Electrical shock ?	☐ Exposure to hazardous substances ?
	☐ Portable electrical tools ?	☐ Moving machinery ?	☐ Damage to underground service, line, etc.
	☐ Scaffolding / work platform ?	☐ Ionising radiation?	☐
	☐ Hazardous substances	☐ Eye injury (flying objects / arc) ?	☐

The following requirement / safety measures are necessary and have been provided/ ensured.	Following safety measures/ precautions to be taken during execution of the job	Special precautions to be taken (if any), please specify.
☐ Proper scaffolding/ work platform with handrails.	☐ All workmen use safety helmet at the site.	
☐ Means of access to work place at height (ladder, etc.)	☐ Workmen use safety belt & anchor it properly with fixed structure.	
☐ Safety net (Catch Net)/Static lines to arrest fall of person.	☐ Use of proper safety goggles by the workmen.	
☐ The crane is in good working condition & certified	☐ Provision of shoring / bracings in deep excavation.	
☐ The crane operator is competent & has licence.	☐ Guards on moving machines.	
☐ Electrical equipment provided with proper earthing.	☐ Static lines are provided and used by the workmen at height.	
☐ Power supply to hand tools through ELCB.	☐ Cordoning off deep excavations / hazardous area with warning signs.	
☐ Hazardous area barricaded /protected.	☐ Hand lamps to be used with safety guards.	
☐ Condition / capacity of lifting tackles ensured.	☐ Power supply to lighting through ELCB.	
☐ Specific work procedure is necessary and is available.	☐ Specific work procedure shall be adhere to.	
☐ Hot work / vessel entry permit is necessary and obtained.	☐ Familiar with emergency procedure.	
Signature (Contractor's Site engineer)	Signature (Contractor's Site Supervisor)	Signature :

16.2 Permit for Vessel Entry:

For the definition of 'Confined space' and other details, see Part 2 of Chapter-16.

Safe entry in any confined space like pit, sump, vessel, vat, tank, chamber, furnace, oven, pipe, flue, gutter or isolated and unknown place needs work permit system. The hazards of work are toxic or flammable gas inside, asphyxiating atmosphere, accidental inflow of chemical or starting of agitator etc.

See Part 1.8 of Chapter-19 for formats of safety permit and details wherein provision of Section 36 of the Factories Act is also mentioned.

More danger is foreseeable when any gas or vapour - visible or invisible, having odour or not heavier than air (vapour density > 1) is suspected in the confined space. Fatal cases have been reported. No person should enter or allow another person to enter such situation without going through the following steps :

1. Report the need of such entry to higher officer whose duty is to prepare and sign a necessary work permit for such work.

2. Work permit will be prepared after observing the situation from outside, allowing the vessel to be cooled and giving full thought to all the safety points to be incorporated.

3. If it is an underground pit, sump, chamber or tank having no connections except a manhole at the top, the manhole should be opened after wearing a self breathing apparatus, free air movement and venting should be allowed for some time and then the gas test and the oxygen level test should be carried out. Toxic gas should be safely driven out by air purging and a flammable gas by nitrogen purging. The worker doing this job should be experienced and wearing self breathing apparatus. Such work should be carried out during day time with good natural lighting. While replacing any flammable gas or hydrocarbons, sources of ignition must have been removed and non-flameproof electric lighting/fitting deenergised. Only a flameproof torch may be used. To avoid static electricity, airline should be bonded with the metal of the vessel.

4. After evacuating gases as above, again their level (ppm in case of toxic gas and percentage in air-LEL-in case of flammable mixture) should be measured and brought down to a safe level. But this is not sufficient. Oxygen content should also be measured and it should be more than 18%, otherwise specific instruction of SBA shall be mentioned in the work permit.

5. If it is a vessel, tank, reactor, pipe or other space having nozzles and connections, first top and bottom, vent and drain/flush valves should be opened to discharge lighter and heavier gases. Inlet connections should be isolated, blinded or removed from joint. By nitrogen purging inner gases should be fully pushed out. Then the vessel should be washed and drained by steam and water if it is not incompatible. Then the manhole and other top and bottom connections should be removed making the top-bottom nozzles fully open for better (cross) ventilation and lighting. This ensures that neither heavier nor lighter gases will remain inside and free entry of air will keep the space breathable. Otherwise positive air supply should be provided. If it is not possible to open any joint except manhole, the procedure stated in para 3 and 4 should be followed.

6. After ensuring ambient condition and isolation or disconnection of inlet lines, opening maximum nozzles possible (at least flush bottom drain and top vent), removing or isolating any common connection (e.g. header or common vent or scrubber line) and measuring gas and oxygen content to a safe level, electric connections (e.g. driving motors for stirrer, pump, blower, exhaust, vacuum or any ingress or egress of material) shall be removed (by removing fuses and indicated by a warning notice and tagging) and the overall situation shall be verified for safe entry.

7. Only after assessing the real need of entry and verification as above, the work (vessel entry) permit shall be signed and safety precautions mentioned in it shall also be verbally explained to the permit holder and the worker who has to enter inside. The issue of permit should be done by a responsible and experienced person only.

8. If it is not possible to achieve safe working level inside due to presence of toxic gas or less oxygen content, the condition of self breathing apparatus and a safety belt having its free end (life line) in the hands of a capable person standing outside to pull him out, and first-aid and rescue/reviving apparatus in ready condition, shall be clearly mentioned in the work permit and explained to the workers and supervisor.

9. If work is to be carried out of replacement of any pyrophoric catalyst under nitrogen blanketing or of removal of any deposit, scale, sludge, waste or lining inside, instructions stated in para 8 shall be strictly observed.

10. Now after receiving the permit, it shall be fully understood before execution. All conditions shall be fulfilled including wearing SBA, safety belt and necessary equipment. Environment shall be cool for entry and safe working. Manual bell may be carried to give signal of any emergency situation and indication to pull the life line or supplying any thing necessary.

11. Air line respirators are not safe because of the possibility of detachment of air supplying pipe. Canister gas masks are also not advisable. A self breathing apparatus with low pressure alarm seems to be the safe remedy.

12. After the work is over, the permit shall be signed and returned to the person who issued it. Experience or suggestion if any shall be mentioned to make the future work more safe.

If the work cannot be completed in one shift- or within time limit mentioned in the permit, the permit should be submitted for extension before continuing the work

No statutory format is available. A company can devise a format best fitting to their nature of jobs. Items to be included in such format are - Place of work, work to be done, whether withdrawal from service, isolation, cleaning and purging, testing, conditions, expiry time and authorisation to work, acceptance of certificate, completion of work, extension is required, permission of extension, cancellation of the permit and provision for signature, date and time.

Isolation of pipelines and electric power should be positive and effective. Mere closing of valve or switch is not sufficient.

If a worker inside becomes unconscious or is in trouble, entry for rescue shall be allowed with SBA, safety belt and other persons standing outside to pull the life line (with head up). If this is not done, multiple fatalities are possible.

17 REPORTS OF SOME EXPERT COMMITTEES

After the Bhopal disaster on 3-12-1984, various expert committees were formed by the Central and State Governments and their reports are also published. Some such reports are : Government of India's Safety Policy and SAHARA Plan, Gujarat Task Force Committee's Report, and its Empowered Committee's report, Maharashtra Environmental (Garg's) Safety Committee's Report, ILO Committee's report. World Bank and IFC guidelines and Report of the Inter— ministerial Group, Department of Chemicals and Petrochemicals, Ministry of Industry, Govt. of India. The details of all these reports are beyond the scope of this Chapter. It is recommended to study them to consider experts' findings and views on chemical safety. All India Citizens' Report published by the Centre for Science and Environment, New Delhi-110019 is also worth considering. The abstracts of all these reports are readily available in Reference No. II given at the end of this Chapter.

General recommendations of some such reports are given below in brief.

17.1 Garg Committee's Report (1985)

In addition to the specific recommendations, the Committee suggested the following general recommendations which should be implemented by all the factories and the concerned agencies to avoid major mishaps :

1. The operators should be adequately trained in handling abnormal situations in plant operations and refresher courses should be arranged for them regularly.
2. Toxic gases in the factory environment should be continuously monitored.
3. Safety devices and instruments in the plant should be frequently inspected, tested and a record kept.
4. Storage of intermediate products which are hazardous in nature should be restricted to eight hours requirements and before any plant shut down all such intermediate products should be consumed.
5. Risk analysis should be carried out in all the plants where hazardous chemicals are handled and measures for containment in case of such a risk be identified.
6. All factories handling hazardous chemicals should educate the neighbouring population (in consultation with local authorities) about measures to be taken in the unlikely event of release of any such chemicals.
7. All the containers, plant equipment and pipelines be made unserviceable when disposed of as scrap.
8. For transportation of hazardous chemicals, a safety code should be evolved by the competent authority.
9. New buildings and hutment should not be allowed to come upnear factories handling hazardous chemicals.

17.2 Report of the Gujarat Task Force Committee (1985)

The Government of Gujarat constituted a "Task Force" Committee under the chairmanship of Shri J.J. Mehta of Bombay to oversee the safety measures in various industries in Gujarat dealing with hazardous/ toxic materials, wide Industries, Mines & Power Department Resolution No. APC-1084/186(86)-G, dated 10-1-1985, Sachivalaya, Gandhinagar.

The Committee considered (1) Toxicity (2) Boiling Point (3) Fire & Explosive hazards (4) Reactivity and (5) Quantity of storage to identify hazardous chemicals and made a list of 27 such chemicals.

Observations : Major observations made by the "Task Force" are as follows :

(A) Identification of Potentially Hazardous Units :

The major units handling and having substantial inventories of hazardous/toxic chemicals are identified by this "Task Force" as A. High disaster potential and B. Low disaster potential.

The units in category A can be studied in greater details by an experts committee which should meet regularly, say once in two years to discuss various technological developments in the safety and share their experience. Agencies like Gujarat Safety Council can organise such meetings.

The units in category B can regularly monitor and review the safety aspects in such industries.

(B) Transportation of Hazardous Toxic Chemicals :

1. Transportation of all acids, oleum, corrosive liquids and toxic chemicals should be brought under statutory control. Transportation of such chemicals in poorly equipped, maintained carrier should not be allowed.
2. Tanker carrying acids and corrosive chemicals be regularly inspected for their thickness.
3. All the tankers should have two valves at the outlets. During transportation of filled tankers the valves should be blinded.
4. Pressurising with compressible fluid should be avoided for unloading.
5. The tanker carrying hazardous/toxic chemicals should not be allowed to pass through city/town if by-pass is available.
6. The go downs of transport agencies, for storage of hazardous/toxic chemicals, inside the city limits should not be allowed.
7. The transport agencies drivers carrying hazardous/, toxic chemicals should be educated and trained to tackle emergency situations on the road.
8. The manufacturers of hazardous/toxic chemicals should prepare a list of materials incompatible with the chemicals produced by them and tell the transporters not to carry them together.

(C) Safety of Surrounding Inhabitants :

1. *Existing Industries :* No new housing colonies/ slums should be allowed within 2 km from the boundary wall of the units identified to be having high disasters potential and I km from the boundary wall of the units identified as having low disasters potential. Local authorities should act immediately to stop construction of colonies within above boundary areas. The hutment dwelling should be relocated in safe areas.

2. *New Industries :* Govt. should not ask the new industries (proposing to handle hazardous/toxic chemical) to go to inaccessible locations and at the same time the unit should be located at a safe distance. The development of the area should be properly planned and controlled and haphazard development of housing colonies, slums should not be allowed around the industrial units.

G.I.D.C. can plan to develop chemical estate, with 'Hazardous Zone' (proposing to handle hazardous/ toxic chemicals) which could be located 1-2 kms away from the main estate.

(D) Medical/First-Aid Facilities:

1. The industries should have trained medical personnel to treat the workers.
2. Keep sufficient required antidotes, drugs etc. at the factory hospital. The doctor should have the knowledge about the chemical poisoning and the kind of treatment required.
3. Sufficient number of emergency breathing equipment and cylinders should be available in all the potentially hazardous industries.

(E) Fire Protection Arrangements and Provision :

1. The Units should have protection system with fire hydrants and water monitor and plenty of water.
2. A fire water line should be able to develop 10kg/ cm^2 pressure for fire fighting. The fire water pump should be able to run with emergency power. Diesel driven water pump should also be installed for use in case of total power failure. G.I.D.C. should ensure this for their major estates.
3. All the major units should organise their own fire brigades.
4. The fire fighting services with emergency breathing equipment and cylinders should be provided for combating fire hazard in toxic atmosphere.
5. Fire stations of G.I.D.C./Municipal Corporation etc. should have a few self contained breathing apparatus.

(F) Safety Management:

Top management of major units should actively participate in the safety management of their units and the head of the safety department should report to the top management directly. Safety officers should be appointed in major G.I.D.C. estates, having chemical industries.

(G) Disaster Plan:

The industries handling hazardous chemicals should prepare their own disaster plan involving the district administration, city fire service, medical personnel, police department, the people in the surrounding area etc. to avoid or minimise loss of life.

(H) Miscellaneous:

1. Small customers (hazardous/toxic chemicals buyer) should be educated by the major producers regarding certain preliminary DOS and Don'ts while handling the chemical.
2. The workers in the industries should be educated and trained to control emergencies and such programmes should be held at regular intervals. People living in the surrounding area should also be given certain preliminary information to handle emergencies.
3. Regular preventive maintenance and safety drilling should be carried out by the industries to check the workability of equipment, instruments, controls etc.
4. Pressure vessels should be regularly inspected for their thickness so that failure of such vessels due to corrosion, erosion etc. can be avoided.

5. Health hazard data should be collected.
6. Recycling of waste products should be carried out to minimise the effects of pollution.
7. Automation and remote control system should be followed to minimise manual handling.
8. The meteorological data regarding wind velocity, direction etc. should be collected.
9. Easy finance should be made available to hazardous units for providing safety measures.

17.3 An Extract of the Inspection by three ILO Experts on Inspection of 91 MAH Factories

The guidelines circulated by the CLI, Bombay, in Jan'91 are as under :

(1) General Recommendations.

1. A written safety policy, signed by a factory manager, should be framed and distributed to workers or displayed.
2. In preparation of the emergency plans more attention should be paid to an adequate emergency organisation, emergency control centre, external communication and phasing of activation of the emergency plan.
3. Qualified plant personnel should be trained in conducting HAZOP study and this technique should be applied in identifying .and controlling the hazards involved in the plant process.
4. Material Safety Data Sheets of hazardous chemicals handled in plants should be prepared and the workers should be made aware of these.
5. Preventive maintenance of the pipelines, storage and process vessels should be improved especially by incorporation of the non-destructive testing method. A regular schedule should be drawn and complied with.
6. Separate Work Permit Systems should be framed for cold work, hot work and vessel entry.
7. The piping and instrumentation (P&J) diagram of the installations should be updated and readily available.
8. The electrical fittings in the flammable installations should comply with the prescribed standards. The flame proof electrical equipment should be maintained properly.
9. The pipelines should be painted in accordance with the prescribed colour code.
10. Installations handling corrosive chemicals should be provided with emergency showers and eye fountains at appropriate locations.
11. Emergency fire fighting rehearsals should be carried out regularly at least once in two months.
12. It has to be ensured that sufficient quantity of water is available for fire fighting.
13. Standards and Codes used for design of the installations should be available at the factory.
14. A map of surroundings with a radius of 5 km around the factory should be drawn up.
15. On-site emergency plan drills should be carried out regularly.
16. Responsibility of authorisation of a plant modification should be assigned to a specified group of personnel.
17. Written Safe Operating Procedures should be available at the different units of an installation.

18. Adequate Personal Protective Equipment should be available to attend plant maintenance and emergency control work.

(2) Specific Recommendations for Installations

A. LPG

1. Sight flow indicators made of glass used in LPG discharge line should be guarded adequately to prevent breakage due to external impact.
2. LPG spheres and bullets should be provided with two level monitoring equipment independent of each other.
3. The remote operated valve should be provided in the outlet line of the LPG storage vessel and should be located as close as possible to manual outlet valve. These manual and remote operated shutoff valves should be fire resistant for at least 2 hrs. The manual valve should be fitted to the bottom nozzle.
4. One of the level monitoring instruments should automatically close the remote controlled shutoff valve, when the level of LPG has reached the maximum allowable limit.
5. The flow under the LPG spheres or bullets should be slopped in such a way that any liquid spillage of LPG may be directed towards an evaporation bed of gravel or a catchment pit and should be at least 15 meters away to prevent heating of storage vessel in the event of fire.
6. Any isolation valve fitted between a single pressure relief valve and upper space of the storage vessel should be locked open. Flammable vapour audio-visual alarms set to 20% of the lower explosive limit should be installed in the storage area and close to the evaporation bed or catchment pit.
7. The main cap of the vent line of LPG storage vessels should be loose fitting so that it blows off easily in case of pressure relief.
8. When any road tanker is being unloaded, the engines of all the road tankers in the unloading area should not be operated. Provision, should be installed to prevent inadvertent movement of the tank trucks when connected for loading or unloading.
9. The sprinkler system of LPG installations should be quick acting.
10. Any manual operated shutoff valve in the sprinkler system should not be close to the LPG storage vessel.
11. The surface area of the platform at the top of LPG storage vessel should be sufficient to avoid scaffolding for maintenance work.
12. Section of a LPG carrying pipeline between two block ends should be provided with a pressure relief device such as pop-off valve.
13. Excess flow valve should be installed in the inlet and outlet pipelines of the LPG bullets.
14. The areas around the LPG installation should be classified in relation to use of flame-proof equipment.
15. It should be ensured that all the earth connections provided for prevention of accumulation of electrostatic charge are maintained in good condition.

See Part 8.6.3 also.

B. CHLORINE

1. The storage vessel should be provided with two independent level monitoring devices. At least one of these devices should be provided with high and extra high level alarms and a trip action; or the vessel may be provided with a load cell which gives an alarm at a certain set weight. In this case first high level alarm has to be provided with a trip function.

2. The pressure relief valve on the top of the chlorine storage vessel should be provided with a bursting disc and an isolation valve. In between the bursting disc and pressure relief valve a pressure indicator and alarm should be installed to give warning of failure of bursting disc.

3. The isolation valve provided between vapour space of the storage vessel and pressure relief valve should be locked open. If two such relief devices are provided it should be ensured that at least one of the isolation valves is" always locked open.

4. Expansion vessels with a bursting disc should be connected to the liquid chlorine pipelines wherein liquid chlorine can be trapped between two close valves.

5. The expansion vessels should be provided with pressure relief valve venting to the neutralising tower.

6. A pressure indicator alarm should be installed on the expansion vessel.

7. A remote operating shutoff valve should be provided in the chlorine transferring line as close as possible to the storage vessel. This remote operating shutoff valve should be closed to the manually operated shutoff valve.

8. Excess flow vales should be installed in the liquid outlet lines of the storage vessels. This should be directly connected to the outlet nozzles of the storage vessel.

9. Emergency kit and personnel protective equipment should be available at a reasonable distance from the chlorine storage. These should be maintained in good condition and their location should be known to all the workers in the chlorine storage area.

10. An automatically operated pressure control valve should be installed on a storage vessel and receiver to control the air pressure while padding the liquid chlorine for transfer.

11. The dew point of the padding air should maintained below -40 °C, to minimise moisture content.

12. Chlorine toners should be stored securely in a raised platform.

13. The overhead crane in the toner "storage area should be provided with a proper lift beam to handle chlorine cylinders.

14. To contain the chlorine gas leaking from a toner suitable provision should be made to exhaust it through an alkaline scrubbing system.

15. All chlorine toners should be fitted with safely caps.

16. Chlorine toner storage area should be provided with a shed.

17. There should be separate areas for storage of filled and empty chlorine toners and these should be clearly marked.

18. A multipoint continuously monitoring chlorine gas detection system should be installed in those areas where chlorine gas can escape out of an installation. This detection should be provided with an alarm set at 3 ppm.

19. Emergency kit specially designed for checking the chlorine leakage from a toner should be available in the toner storage area.

20. Self contained Breathing Apparatus and Gas Mask with canister should be available and maintained in good condition. Their location should be known to all the workers for use in emergency.
See Part 8.6.1 also.

C AMMONIA

1. A bund wall should be provided outside the radius of a Horton sphere which should not be less than one meter in height. This bund should have minimum capacity to contain 20%" of ammonia content in the Horton sphere.
2. The bund should have impervious floor and provision for low point drain pit discharging flanged valve to remove any water collected. This flanged outlet valve should normally be kept closed.
3. A remote operated shutoff valve should be provided in the bottom outlet as close as possible to the storage sphere.
4. The isolation valves beneath the pressure relief valves should be kept locked open or interlocked in such a way that always at least one of the two is in open position.
5. Venting of Ammonia through safety relief valve should be at least ? meter above the platform at the top of the storage vessel. This vent line should be provided with loose fitting rain caps.
6. In. the Ammonia tank, truck and railway wagon loading/unloading station, technical provision should be installed to prevent trucks or rail wagons from being driven away while hose is connected. This could be a barrier which is removed only after hose and/or the load arms have been put back in its position.
7. The insulation of pipelines carrying Liquid Ammonia should be maintained properly.
8. An excess flow valve should be installed in the liquid Ammonia line of the Horton sphere. This valve should be as close to the sphere as possible.
9. A multipoint continuously Ammonia monitors with alarm should be installed in the storage and Ammonia handling areas.

See Part 8.6.2 also.

D. OLEUM

1. Oleum storage vessel should be provided with level indicator with high level alarm.
2. The high level alarm should automatically shutoff the valve in the filling line.
3. Oleum storage vessels should be provided with an acid proof bund having a capacity of containing 110% content of the biggest vessel in the group.
4. It is to be ensured that manually operated shutoff valves in the vent line connection to scrubber are kept locked open.
5. A second standby pump for the operation of the scrubber should be installed.
6. Provision should be installed to prevent inadvertent movement of the road tanker while it is connected for loading/unloading operation. This can be done by using handbrake, wheel blocks, and removing ignition key from the vehicle.
7. A schedule for preventive maintenance and inspection of equipment, storage vessels and pipelines handling Oleum should be drawn-up and complied.

8. Oleum storage vessels should be properly labelled to indicate its identity and capacity.

9. Pipelines carrying Oleum should be properly supported.

10. The road tanker loading area should be provided with an impervious acid 'proof slopping to a catchment pit. The pit should have enough capacity to contain the full leakage from the tanker.

See Part 8.6.5 also.

E. CARBON DISULPHIDE

1. Carbon Disulphide storage vessels should be fitted with two independent continuously level monitoring instruments of which one should be provided with high level alarm.

2. Properly designed rupture discs should be used instead of asbestos plates for the Carbon Disulphide manufacturing furnaces.

3. Safety seal outlet of the Carbon Disulphide furnace should be extended above the roof level.

F. OXYGEN

1. Oxygen storage tank should be provided with a pressure gauge with high pressure alarm. 2. A remote operated shutoff valve should be installed in the Oxygen outlet line of the Oxygen storage tank and should be as close as possible to the tank.

3. A non-return valve should be installed near the process pump discharge of the liquid Oxygen inlet line.

G. ETHYLENE OXIDE

1. Ethylene Oxide storage vessels should be provided with a second level monitoring instrument which gives high level audio & visual alarm.

2. The fire water tank should be provided with a level indicator.

3. The process reactors in the Ethylene Oxide plant should be provided with pressure relief valve and the relief discharge should be vented safely.

4. Ethylene Oxide reaction vessel should be provided with Oxygen detectors which gives high audible and visual alarm at the level of oxygen of 6%.

5. The bonding cables of static current equalisation system between tank truck and Ethylene Oxide storage vessels should be maintained properly.

EXERCISE

I. State, Explain, Mention or Discuss

1. Why chemical industry is inevitable despite its many hazards?
2. As place of chemical industry in society is inevitable, place of safety in chemical industry is also inevitable.
3. Statutory provisions pertaining to chemical factory.
4. Content of MSDS and its significance.

5. Expand : TLV, OSHA, LEL, PVRV, HAZOP, ILO, STEL, API, PPM, NDT.

6. The following terms (1) LD50 (2) LC50 (3) Explosive Range (4) Toxicity (5) TLVSTEL (6) MTRF (7) Mutagenesis (8) Chemical Asphyxiants (9) IDLH (10) Biological Monitoring.

7. Storage and handling procedure for the following : (1) Benzene (2) Hydrochloric Acid (3) Concen. Nitric Acid (98 %) (4) Carbon disulphide.

8. Safety and Risk phrases, their examples and utility.

9. Storage vassals and their safety aspects.

10. The general principals involved in a safe layout of bulk storage for flammable liquids, corrosive and compressed liquifiable or dissolved gases under pressure.

11. Safety measures required in storage and handling of following specific materials. (1) Flammable (2) Explosive (3) Corrosive (4) Toxic.

12. Hazards and Controls of Exothermic reaction.

13. Describe important aspects of pressure vessel inspection and the inspection of their protective devices.

14. Hazards and Controls of Toxic reaction OR Flammable reaction.

15. The various characteristics of unit operations and unit processes in a chemical process industry.

16. Which are the additional safety devices and fittings normally provided for pressure vessel in addition to those, which are statutorily required? Why are they so provided?

17. What are utilities? Explain their hazards and control measures.

18. Various types of operational deviations and control measures for them.

19. Different modes of packaging.

20. Precautions or emergency action while transporting hazardous chemicals.

21. Safety aspects of pipelines for transferring chemicals.

22. Importance of process flow chart for inspection.

23. Different types of inspection techniques for plant, vessels and procedures.

24. Inspection and testing of pressure vessels.

25. Different types of tests for pressure vessels.

26. Causes of corrosion and their preventive measures.

27. Types and methods of maintenance.

28. Different types of work permits for hazardous work OR confined space entry.

29. Explain the working principles of combustible gas indicator.

30. Define "Hazardous process" as per Factory Act and list 10 chemical covered under Schedule 1.

31. Important safety precautions to be observed in loading and transportation of a class-A' flammable and toxic liquids.

32. DOT Classification of hazardous chemicals. Mention safety precautions to be observed during transportation of hazardous chemicals by road including statutory requirements.

33. Plan to keep control on health hazards related to chemical factory handling toxic and poisonous chemicals.
34. As a Safety Officer of a chemical plant, what plan of action would you draw to reduce the accidents ? State giving priorities to different actions.
35. What safe methods for storing and handling you will suggest for following chemicals : (1) Benzene (2) Phosgene (3) Benzidine (4) Hydrochloric acid (5) LPG (6) EO (7) Oleam
36. Discuss the safety measures required to be taken in transfer of chemicals by pipe line in chemical factories.
37. The importance of identification of pipe work and colour coding in chemical factories.
38. The safety precautions to be taken in handling of chlorine in factories.
39. Basic steps for start-up of a plant after a period of closure.
40. "Reactor Safety" is of fundamental importance in Chemical Factories. Give basic considerations for safety of a reactor.
41. Various five prevention and five protection measures required in a process plant handling/steering processing highly flammable liquids /gases and toxic materials.
42. The safety measures that are required to be taken during storage and handling of gas cylinders filled with following gases. (a) Chlorine, (b) Phosgene, (c) Ammonia, (d) Acetylene.

2. Write Short Notes :

1. Need of Safely in chemical industry.
2. Types of chemical industry.
3. Types of hazards in a chemical factory.
4. Incompatible chemicals.
5. TDG flammability
6. Types of flammable material.
7. Health hazard data.
8. Hazard communication system.
9. Run away reaction.
10. Safety in chemical reaction.
11. Inspection checklist.
12. Protective media for safety purpose.
13. Safe handling and storage of Chlorine OR Ammonia.
14. Safe handling and storage of LPG OR EO OR Oleum.
15. Dyke walls and bunds around bulk storage of flammable liquids and corrosive substances.
16. Prepare an instruction checklist for storage/loading/unloading/ transportation of hazardous chemicals.
17. Safety in laboratory.
18. Process control system.

19. Safety valves.
20. Exothermic reaction.
21. Control System Characteristics
22. Instrumentation for Safety.
23. Safely aspects of instruments.
24. Transportation of explosives by rail.
25. Classes of dangerous goods for 4 transportation.
26. Different Codes for transporting chemicals by Sea.
27. Safety aspects of under-ground pipelines.
28. Identification and colour code of pipelines.
29. Precautions while breaking pipelines.
30. Safety aspects of in-plant transfer of chemical by different modes.
31. Nitrate stress corrosion cracking.
32. Non Destructive Tests.
33. Role of Competent person for safety of vessels OR Usefulness of checklists.
34. Safe start-up OR Safe shutdown procedure.
35. Vessel entry permit and precautions.
36. Safety suggestions of Garg Committee's Report.
37. Gujarat Task force Committee's Report for hazardous plants.
38. ILO Experts' inspection remarks for MAH factories.
39. Inter lock system for process control.
40. Trip system for process control.

3. Explain the Difference with examples between following;

1. Simple asphyxiates and chemical asphyxiates.
2. Dust hazards and bio-hazards.
3. Hazards of metals & non-metals.
4. Compatible and incompatible chemicals.
5. Fire & Explosion data and Health hazard data in MSDS.
6. CAS No. UN NO. and ADR No. of chemicals.
7. Flash point. Boiling point and Auto ignition temperature.
8. Hazardous decomposition products, Hazardous combustion products and Hazardous reaction products.
9. Vent pipe and Overflow pipe
10. Safely valve and Rupture disc.
11. Earthing and Bonding.
12. Unit processes and Unit Operations.

13. Exothermic and endothermic reaction.
14. Safety fitting for Pressure and Vacuum reaction.
15. Pyrometer and Thermometer.
16. Corrosion and Erosion.
17. (a) Hydrogenation &: Halogenation
    (b) Nitration & Amination
    (c) Oxidation & Polymerisation.

4. Comment on following explaining whether it is true or not :

1. In endothermic reaction heat-is given out and in exothermic reaction it is taken in.
2. Inert blanketing is required for toxic reaction.
3. Rota-meter is required to measure rotational speed.
4. Auto feed stop is an alternative to overflow pipe.
5. Dyke is not necessary for nitrogen storage tank.
6. Lightning arrester should be fitted just on the storage tank.
7. Manometer is used to measure vacuum in a reactor.
8. Flammable liquids are safe in plastic tanks.
9. Wooden crates are used to handle glass bottles.
10. Checklists are useful for inspection of a chemical factory.
11. Canister with face mask can be used inside .a "confined space" for protection against toxic vapours/fumes
12. Outlet valve of a dyke around storage tanks should be kept closed
13. Explosimeter used for measuring Hydrogen/ air mixture reads 20%. This indicates that there is 20% hydrogen in the sample.
14. Carbon monoxide arid Hydrogen cyanide are known as chemical as phyxiants.

   - 6.5 *Role of the Authorities*
   - 6.6 *Role of the Workers & Public*
   - 6.7 *Role of the Public*
   - 6.8 *Safety Report, Safety Audit Report & Risk Assessment Report*
7. *On-site and Off-site Emergency Plans :*
   - 7.1 *Need and Types of Emergency Plans*
   - 7.2 *Statutory Provisions*
   - 7.3 *On-site Emergency Plan*
   - 7.4 *Off-site Emergency Plan*

1 SAFETY APPRAISAL, ANALYSIS AND CONTROL TECHNIQUES

1.1 Objectives :

1 To appraise means to set a value on. Safety appraisal, therefore, includes all ways and means to measure and indicate the value of any plant, machinery, process, method, exposure etc. in terms of their individual and total safety effectiveness, performance, maintenance and control techniques. This is the first step of any safety organisation in its march toward accident or loss prevention programme.

2. Safety appraisal are of many types. :

(A) *Qualitative appraisal* is carried out to find the area where safety improvement is necessary. It includes techniques of inspection, audit, review, analysis, study etc. for the exclusive purpose of safety. Previous approval of plant and building, machinery layout, safety measures provided and to be provided are required under the Factories. Act and Rules for this objective.

(B) *Quantitative appraisal* is the method of computing accident frequency, severity, incidence and their index rate as we studied in Part 11.2 of Chapter-5. Frequency rate is useful in comparing safety performance of different units in a given time, while severity rate is useful in comparing safety performance of the same unit in different periods. Significance and utility of such injury rates are explained in details in Chapter-5.

(C) *Preventive appraisal* includes preventive maintenance before any accident occurs. Plant safety sampling, safety survey, faulttree analysis, risk analysis. HAZOP and HAZAN studies, safety inventory, system safety, safety standards, safety permit system, safety tag and lockout, safety steward etc. are used for this purpose. Inspections by the plant personnel. Safety Officer, safety expert and factory inspectors must be utilised for this objective.

(D) *Corrective appraisal* includes corrective maintenance after any accident takes place or any defect (crack, corrosion, wear & tear etc.) detected. If such damage/injury valuation and repairing is not carried out, it will continue the interruption of activity and ill-effect on health and safety. Accident investigation, analysis, identifying the key facts, accident potential and causes, application of the remedy (corrective action) are carried out for this objective.

3. Statutory appraisal tests and records are prescribed as a minimum- measure necessary. Testing of boilers, pressure vessels, lifting machinery, fire safety, monitoring and analysis of toxic, flammable, explosive or harmful environment and medical health check-ups .of workers are prescribed under the Factories Act and Rules. Water/Air Pollution Control Acts, Environment (Protection) Act & Rules and similar statutes are also for this objective.

4. Organised industrial safety is, now, recognised as an integral part of routine industrial operations. Inspections of plant, machinery, tools, equipment, premises, work practices, processes, procedures and general environment must be carried out for the health and safety of plant-people and surrounding. On-site and Offsite Emergency Plans are also useful in this regards.

5. To assess the overall standard of safety performance the concept of Safety Audit developed by Chemical Industries Association is also useful in non-chemical industry.

6. The concepts of Total Loss Control and Total Loss Prevention are also useful to measure and maintain the levels of safety.

7. As we have seen in Part 4 of Chapter-5, indirect cost of accident is more than the direct cost of compensation and medical expenses. Injured party can also sue the employer. Similarly compensation is also payable for breach of product safety. A manufacturer may be economically out due to such accident losses. Therefore he must seriously think to save such high costs and losses by adopting good safety appraisal systems.

1.2 Safety Appraisal System :

Safety appraisal system is a system, method, practice or procedure to measure the safety performance or standards for the purpose of evaluating its effectiveness and reliability, to find out drawbacks or deficiency if any and to suggest the safety measures to raise its safety value.

For this broad aspect, safety appraisal system includes many techniques of measurement and control. It is desirable to adopt it as a regular practice of plant safety inspection or safety auditing before any accident occurs. Measurement of injury frequency rate, severity rate, incidence rate, safety activity rate and total cost of accident is an quantitative appraisal system. The qualitative system includes statutory safety approval, inspection, checklists and follow up, design and construction safety, process & product safety, safety checks and standards, machine guarding, good house keeping and maintenance, chemical safety, engineering controls, use of safety devices and equipment, safety survey, safety sampling, hazard/risk detection, measurement, assessment and control techniques, safety study, safety tour .safety training, safety observation plan, damage or loss control, job safety analysis, critical incidence technique, fault tree analysis, HAZOP and HAZAN, safe inventory, system safety, circuit approach to safety, safety permit system, total loss control, safety stewardship scheme, plant safety inspection, checklist and audit, safely recommendations and compliance, accident investigation, fact finding, analysis, selection and application of remedy, report writing and maintaining good safety records to check safety performance at any time. On-site and Off-site emergency plans are useful to plan and handle emergencies and control major hazards. All factories should prepare their on-site emergency plans from their own resources. This will be useful to minimise heavy accidental losses. All these systems are explained below in brief :

1.3 Damage Control:

Damage means severity of injury or physical, functional or monetary loss that could result if control of a hazard is lost.

Damage Control is directly concerned with the protection of machinery, materials and manufactured goods assets from accidental loss within the factory. Indirectly it is concerned with money asset and manpower asset.

The Problem of Damage Accident was highlighted by H. W. Heinrich some 75 years ago. He analysed 75000 accidents and concluded that an accident can result in human injury and damage to property or both and the causes of injury and damage are similar - lack of skill, knowledge, unsafe system etc. Frank Bird (USA)'s study of 90,000 accidents in 1959 revealed that damage accidents were 5 times more frequent than injury accidents. He concluded that for 145 disabling injuries there were 15000 other injuries and 75000 property damage accidents. He carried out second study in 1966 of 17,53,498 accidents of 297 industries employing 17,50,000 workers. He concluded that 30.2 property damage accidents were reported for each disabling injury. He pointed out the ratio 1-100500 of disabling injury (1),to minor injuries (100),and incidents with no visible injury or damage (500). Similar other researches also conclude that damage accidents outnumber personal injuries and then account for greater loss then injury accidents. In spite of this fact/ is it not strange that safely programmes are more oriented to injury prevention than damage prevention?

Impediment to damage control was due to old definition of accident considering personal injury only, and referring property damage accident as ' no injury accident ' The modern definition_of accident is ' an unintended event that results in physical harm to a person or damage to property'. Un-r,eporting or underreporting of damage accidents, no statutory requirement (except dangerous occurrence) and failure to set up a realistic programme to damage control are other impediments.

Therefore damage control problem should be property recognised to prevent all accidents causing (a) damage to plant, machinery, equipment, tools, building and other property (b) loss of quantity or quality of materials during storage, handling and transport and (c) delay to process, function or activity due to need of repair or replacement.

Benefits of damage control scheme are :

1. Reduction in potential accidents and chance of injury accidents.
2. Reduction in severe injuries, production delay, and costs of maintenance, replacement and damaged materials.
3. Detection of unsafe conditions and unsafe actions which may contribute to injuries.
4. Increase of quality control, profit, importance and status of safety organisation, awareness of supervisors and management to control property damage.
5. Suggestion of remedial measures to prevent recurrence.

Steps to introduce good damage control programme are as follows :

1 **Spot checking :** Includes visiting repair centres, making observation and taking notes.

2 **Damage Reporting and Investigation :** All unplanned or unintended happenings likely to cause personal injury must be reported by workers and supervisors to management. Such cases should be property investigated and corrected.

3 **Damage Costing and Auditing :** Cost of repairs arising out of accidental damage must be marked by 'D', accounted for and their records must be maintained. A full time damage control inspector can audit all work orders, conduct regular inspections, spot checking of repair centres and analysing damage cost factors.

Computation of direct and indirect cost of damage accidents should be carried out as explained in Part 4 of Chapter-5. Another method is Ledger cost concept which is concerned with damage to machines, equipment, materials and loss of production time. Having worked out the damage cost for full year, the cost-severity rate can be evolved by the formula -

$$\text{Cost-severity Rate} = \frac{\text{Total cost of accidents} \times 10^6}{\text{Total production man-hours}}$$

This property damage severity rate can be compared from year to year.

4 **Remedial Engineering :** Collecting data of repetitive repairs to equipment and property from repair shop, redesign of equipment, revision of layout or work method and engineering controls should be implemented to prevent those damage accidents.

1.4 Total Loss Control (TLC)

The Concept clarified : The concept of Accident Prevention when applied to prevent human injuries only, it is called Injury Prevention or Control. When it is applied to control property (machinery, materials and manufactured goods) damage (losses) only, it is called Damage Control. When it is applied to control human injuries and property damage (losses) both, and also extended to include injuries and property damage to society or surrounding, it is called Total Loss Control (TLC), Total Accident Control (TAC) or Total Injury Control (TIC). When this concept of total loss control is applied or achieved by means of engineering controls, it is known as Total Loss Prevention (TLP).

The terms damage control, loss control, loss prevention and risk management are defined in Chapter-2 with other terms to realise the total concept of safety.

The concept of Total Loss Control is also defined as follows :

It is an evolution from injury prevention to .the control of all business losses by the application of sound management principles.

It is a system of reporting and controlling all incidents, however small, whether the associated loss is small or large. All incidents are examined, potential losses estimated and recommendations are made and acted upon to avoid repetitions.

It is a programme to eliminate unnecessary costs by means of identification of down grading situations, measurement of the loss potential, selection of methods to control the situation and finally implementation of the methods within the industrial enterprise. A down grading incident could be defined as any deviation in accepted performance levels resulting in injury, occupational sickness or disease, property damage, fire or explosion, breaches of security, pollution or product liability and business interruption.

Development of the Concept : Historically, the concept evolved from H. W. Heinrich's ratio in 1931 that for one serious injury there may be 29 minor injuries and 300 no-injury accidents (Ratio 1-29-300). Frank E Bird, after intensive research in 1966, gave this ratio as 1-100-500, John A. Fletcher, after a world-wide survey in 1969, gave this ratio as 1-19-175.

Though this ratio differs because of different study conditions, it proves two important conclusions: (1) No injury accidents are far greater than the serious or major injury and (2) It is necessary to control or prevent large number of no - injury and minor injury accidents for controlling or preventing a major or disabling accident.

Thus increasing hazards to persons and property because of the industrial revolution in western countries has developed this TLC concept and now, many books are available on this subject.

Relevance of Total Loss Control to India : This concept of TLC has great relevance to India as every loss reduced or eliminated would help to conserve our limited resources and control prices.

Some Annual Indices of avoidable losses in India are estimated below:

1. Accidental deaths in industries and elsewhere 1,40,000.
2. Non-fatal injuries in factories, 5,00,000.
3. Workmen Compensation being paid Rs. 500 lakhs.
4. ESIC benefits being paid Rs. 20000 lakhs.
5. Loss due to deficiencies in packing, transportation and storage of commodities like food, cement fertilisers etc. Rs. 5000 crores.
6. Losses due to fire Rs. 2000 Crores.

These figures reveal great opportunity to prevent as many losses as possible by our collective efforts.

The Fundamentals of Loss Control: Some fundamental principles are given below :

1. Accidents, unsafe conditions and unsafe actions are symptoms of something wrong in the management system.
2. Certain sets of circumstances can be predicted to produce sever injuries, which can be identified and controlled.
3. Safety should be managed like any other company function. Management must direct the safety efforts by setting achievable goals by planning, organising, and controlling to achieve them.
4. The key to effective line safety performance is management procedures that fix responsibility and accountability.
5. The function of safety is to locate and define the operational errors that allow accidents to occur.

The functions of safety -can be carried out in two ways :

1. By asking wily i.e. searching for root causes and
2. By asking whether or not certain known effective controls are being utilised.

Management for Loss Control : Risks Department, Risk Manager and Departmental Heads should, first, formulate Total Loss Control Policy for the company. Loss Prevention Committee should be formed to execute the policy. Responsibility should be fixed. By special attention to employees selection, placement, training and participation and adopting safety in design, safety audits and checklists, the goals should be achieved.

Four Steps procedure is necessary :

1. Identification of hazards.
2. Evaluation of hazards and their detailed analysis.
3. Planning and implementing measures to reduce hazards and
4. Frequent review.

Application of this procedure brings following benefits :

(a) Mi-nimismg damage to men, machines materials (raw and finished) and methods.
(b) Saving on insurance or better insurance cover at lower cost.

Control measures monitored by the Loss Control Department are:

1. Rules and Regulations.
2. Traffic Laws.

3. Standard Procedure Instructions.
4. Measurement of safety performance by various ratings (Indices).
5. Occupational safety and health standards/ rules.
6. Investigation of Losses and
7. Summary Analysis.

Thus by adopting Total Loss Control we can render the workplace fully safe and efficient.

1.5 Job Safety Analysis (JSA) :

Purpose & Definition : Job safety Analysis is a procedure of analysing job for the purpose of finding the hazards in each step and developing safety precautions to be adopted.

Though this technique tan be applied at any stage, it is most useful at the stage of planning, design and starting the process.

It can be used to review job method and uncover hazards (a) that may have been overlooked at the design or planning stage of plant layout, building, machinery, equipment, tool, workstations, processes etc. (b) that were noticed subsequently (c) that were resulted from changes in work procedure or personnel. It is the first step in hazard or accident analysis and safety training. .

It determines details of each job in terms of duties, skills, abilities, qualification, safety aspect, tools required, methods, sequence of operation and working condition. It is useful for routine or repetitive job as well as maintenance and short orders.

Advantages (Benefits)

1. It suggests what personal characteristics such as age, sex, qualification, skill, experience, abilities, physical standards etc. are necessary for selecting a right man for a right job.
2. The job breakdown sheets are useful to train new workers in proper sequence of doing the job safely and efficiently.
3. The hazards are noticed before they cause any accident.
4. It suggests preventive measures in advance to avoid accidents.
5. It helps for planned and effective safety inspection and accident investigation.
6. It suggests improved job methods, motions, positions, actions and work standards.
7. Proper organisation of methods consistent with accepted safe and efficient practices.
8. Preplanning, preparedness and propel performance can be started by executing properly the requirements of the operation.

Procedure : Four basic steps of simple procedure

1. Select the job.
2. Breakdown the job into successive steps.
3. Identify hazards and potential accidents in each step.
4. Develop safety measures to eliminate above hazards and consequential accidents. These steps are briefly explained below :

Jobs with potential for more frequent accidents, severe injuries and new jobs wherein hazards are unknown should be selected first.

The job should be broken down in proper sequence and steps. Operation, description, hazards (existing or potential) and precautions should be mentioned.

To identify hazards observe the operations as many times as necessary, ask the operator concerned or others having good knowledge of that job and list the hazards in each step. Consider all possibilities of accident, failure mode and effect etc.

The safely solution to the hazards noticed may be worked out by (a) finding a new method to do the job (b) changing the physical conditions creating hazards (c) eliminating hazards still present or changing the work procedure (d) reducing the need of doing that job or at least the frequency of the job and (e) suggesting personal protective equipment if any.

Everything of above findings should be recorded on Job Breakdown Sheet (Job sheet or Job instruction sheet) and it should be explained to operators and trainees to perform the job safely.

Job safety analysis should be carried out by a person well conversant with the job. The supervisor is well suited for this. Where safety officer is appointed he may carry out the analysis jointly with the supervisor.

Example:

The procedure of Job Safety Analysis is illustrated below.

In a factory rough castings of 15 Kg. are .fettled by hand on a pedestal grinder (dia 12"). The castings are picked up from nearby store, fettled on the grinder and replaced on the floor on the other side of the machine. Carry out job safety analysis and prepare the job breakdown sheet.

Job Breakdown Sheet			
Operation Step	**Description**	**Hazards**	**Precautions / controls**
1.	Start the job.	1. Breakage of wheel 2. Contact with wheel 3. Flying particles	1. Check and adjust the Guard 2. Adjust tool rest 3. Get wheel dressed if necessary 4. Use goggles/ shield
2.	Pick up the job.	1. Sharp edges 2. Unsafe gripping or lifting	1. Use hand gloves 2. Use Safety shoes 3. Proper method of storing 4. Proper training in lifting.
3.	Grind	1. Flying particles 2. Wheel breakage due to jamming etc. 3. Dust-Silicosis, nuisance	1. Use goggles shield 2. Do not jam 3. Local exhaust for machine and respirator 4. Aprons 5. Gloves
4.	Replace the job.	1. Sharp edges 2. Fall of casting 3. Strain and sprain	1. Use hand gloves 2. Use safety shoes 3. Proper method of storing 4. Proper training in lifting

Further details maybe written at the end of this sheet

1.6 Safety Inventory System :

This method proceeds to analyse quantity of hazardous material and to reduce it to the minimum possible level, to find out its safe substitute if any, and to find out necessary control measures to prevent or contain any accident due to it.

See Part 10.8 of Chapter-28 for MSIHC Rule; and Rule 681 of the Gujarat Factories Rules wherein threshold quantities of chemicals are stated in Schedule-2 and 3. In Sch-2 the quantity varies from 0.75 tonne (for Carbonyl chloride) to 15000 tonnes (for flammable liquids). In Sch-3 the quantities varies from 1 kg (for many chemicals) to 1250 tonnes (for Ammonium nitrate fertiliser) and 50000 tonnes (for flammable liquids). If the quantity exceeds this threshold limits, the unit is identified as MAH unit and specific safety rules are applicable. These rule; include disclosure of safety information, notification of major accident, notification of industrial activity, safety reports and on-site and off-site emergency plan. Thus inventory plays now statutory role also.

Threshold Quantities are listed for -

1. Toxic chemicals up to 1 kg.
2. Toxic chemicals > 1 kg and up to 200
3. Highly reactive substances 2t to 1250t.
4. Explosive substances 100 kg to 50t.
5. Flammable substances 15t to 50000t.

Steps suggested by the World Bank and IFC Guidelines to prevent major accident and to limit their consequences are: Proper design, construction, inspection, maintenance and operation of storage vessels and process plants, alarms, trips, dump-tanks, scrubbers, water curtains, emergency procedures; information, training and protective equipment to workers, and on-site and off-site emergency plans.

It is also suggested that within I km. radius of major hazard, no population should be allowed and within I to 2 km, limited development of low density such as warehouses and light industry may be allowed.

See Part 17 of Chapter-18 for some Committee Reports. ,

1.7 Product Safety :

It is a legal responsibility of every manufacturer seller, agent or supplier of each product to render it safe (non-injurious), otherwise if any harm is caused to a consumer, buyer, user by that product, legal damages are payable over and above any statutory compensation, for accidental injuries.

Section 7B of the Factories Act imposes duty upon every designer, manufacturer, importer or supplier of any article and substance for use in an) factory, to make that product safe and without risk; to the health of the workers, to carry out necessary test for this purpose and to supply safety information regarding safe use of that product The product should conform to the Indian and Foreign (higher) standards.

Negligence or Breach of Warranty should be proved to establish product liability.

The manufacturer is obliged to (1) exercise care in planning, designing and producing his product, reasonably safe for all users and (2) provide adequate warning and precautions with the product for the safe use.

Breach of warranty may be expressed (written) or implied (oral). Advertising and sales literature also amount to warrantees to the ultimate consumer and any remote consumer can recover damages for breach of these warrantees. Product liability cases involve heavy direct and indirect costs.

In USA, National Commission on Product Safety estimate that more than 20 million are injured and 30,000 deaths per year due to products. This lead to the enactment of Consumer Product Safety Act there. The Consumer Protection Act has also been enacted in our country and Consumers' Councils and Courts work at many places where complaints regarding 'product' can be launched.

Product safety programme should include clear policy, duties and responsibilities of personnel in design, manufacturing, quality control, marketing and servicing. The committee should include Chief Engineer, Sales Manager, Service Manager and representatives from other departments. The committee shall carry out various functions such as review of design, change required, safety warning signs and warnings, review of accidents and claims and education of engineers and operators.

1.8 Safety Work Permit:

Objects and Types : Some jobs in a factory are dangerous to life and therefore well advanced precautions arc necessary before their commencement and till the completion. Hot work like welding and cutting, entering any confined vessel, working at height or on fragile roof, opening of dangerous pipelines, electric work and handling dangerous chemicals etc. are some example. For the safety from such works, a work permit system is highly essential.

Work permit system requires that authorisation be issued and obtained before any work is performed on process. Equipment or area and instruction contained therein must be strictly followed by the permitted workers till the time limits.

A work permit system should cover the following points

1. Who requires a work permit, e.g. contractors, engineers, maintenance workers, etc.
2. What jobs require a work permit, e.g. all maintenance work, tank cleaning, electrical inspections, etc.
3. What types of permit are available :

General work permit	For work of a non-hazardous or 'cold' work type.
Special work permit	For work on live equipment, or hot work.
Confined spaced entry permit	For work involving entry into confined spaces such as tanks, sewers, excavations where toxic or flammable vapours may be present.
Gas Test Certificate	This may form part of the above permits and specifies what gas tests are necessary at particular periods.
Electrical Isolation Certificate	Specifies what electrical isolations are required and whether locks, earths, notices are to be applied.
There are will be occasions when the work to be done requires all the above permits and certificates to be issued.	

4. Who is responsible for issuing work permits a list should be compiled by management authorising specific persons to be responsible.
5. Arrangements for recording the issue, revalidation and retention periods of permits.

Most Commonly used permits are fire or hot work permit, safe (vessel) entry permit, excavation permit, electrical work permit, chemical area work permit, high height or depth permit and so on.

Who Issues and to Whom : Work permit is issued by supervisor, safety officer or responsible officer of the area and equipment. It is generally issued in the name of a supervisor or technician who has to carry out the required job under his direct supervision.

Contents of the permit : Some contents may very according to the permit but generally the contents are : Name of the supervisor or person to whom it is issued, workplace, equipment, name of the work to be carried out, date and time of start and completion, personnel permitted, details of actions, conditions, equipment, procedure and precautions from the authority who issues it.

The elements of a permit to work system are :

1. Hazards of the plant, chemicals and work are fully explained to the workers involved.
2. Instructions are in details and fully understood by both the parties.
3. Work area should be clearly identified, made safe or the hazards highlighted.
4. In-charge of the area who issues the permit, should be competent and responsible and should sign the document stating that he is satisfied regarding necessary isolation, blanketing etc. completed and it is made safe for the workers to work in that area.
5. The in-charge of the team of workers, who receives the permit must sign the permit stating that he has fully understood the work to be carried out, the hazards potential, precautions, conditions and procedure and the PPE/FFE to be utilized.
6. Any monitoring including gas testing required before, during and after the work should be specified and the results noted on the document.
7. When the work is completed (after necessary extension of the permit if work continues), the work in-charge signs off the permit stating that the specified work has been completed and the plant is in a suitable state to return to operations.
8. The area in-charge signs to accept that the work has been completed and he now accepts the responsibility.

Formats : A format can be designed according to the work but it should cover above mentioned eight points. More care is required when the permit is to be given to a contractor's workers. Necessary equipment must be supplied to them. Some formats are given in Table 19.1 to 19.3.

Table 19.1 : **General Format : Safety Work Permit**

Permit to work	Name & Address of the Factory :	Permit No. ___________ Date :
Date & Time of Issue ________________________ Date & Time of Extension if any ________________________ Date & Time of Validity ________________________ Date & Time of Work Completion and Return of the Permit ________________________		
A. Issue 1. Location of work		

2. Work to be done 3. Hazards involved 4. Precautions / conditions necessary 5. Equipment to be used 6. Procedure to be followed 7. Special instructions 8. Prior work done and certified. Necessary isolation, cleaning, purging and testing/ monitoring is done and reported below with results :			
Name & Designation of the Area-in-charge	Signature Date Time	Validity Date Time	Ratification by the Safety Department
B. Acceptance I have read and understood this permit and will carry out the work as per directions stated above.			
Name & Designation of the Area-in-charge	Signature Date Time	Validity Date Time	Ratification by the Safety Department
C. Acceptance I have re-examined the situation above and hereby extend this permit to expire at Date _______________ Time _______________ Further instructions if any : Signature Date Time			
D. Completion and Cancellation I certify that the work is completed and the plant can be put to its normal operation. Signature Date Time (By the person who accepted the permit) I accept the above plant back into service. The permit is cancelled hereby. A new permit will be required if work is to be done again. Signature Date Time (By the person who accepted the permit)			

N.B. : Detailed instructions shall be written in this document. Where possible. Part A shall be- ratified by the Safety Department.

Table 19.2 : General Format : Safety Work Permit

Permit to Work

Permit No.______
Date:

Procedure used shall be in accordance with safety instructions
(Give consideration to each word. Strike out those not applicable)

Name & Address of the Factory :
Plant___________ Section/Equipment ________ Valid Until Date _______ Time :_____Hrs.____

PART - A ; Preparation________

A-l Following Hazards are possible.
☐ Gas/Fume
☐ Corrosive, Hot & other Liquid
☐ Gas or liquid under Pressure
☐ Toxic Materials
☐ Dust
☐ Fire & Explosion
☐ Hot Metal
☐ Trace Heating
☐ Steam Condensate
☐ Falling Objects
☐ Electricity Mains/Static Electricity/Shock
☐ Moving Machinery
☐ Overhead Hazards, Cranes etc.
☐ Underground Service
☐ Traffic (Road & Rail)
☐ Radio active substances
☐ Noise
☐ Work at
☐ Height
☐ Other (Specify)

A-2 Physical Isolation
☐ Physical isolation is required/not required
The Equipment isolation permit No. ______________________________
Method of Isolation
☐ Single/Double isolation, valve closed/blind/tagged (no.
☐ Lines slip plated
☐ Physical disconnection : open and blanked off
☐ Vent. Drain or blow off open

A-3 Precautions already taken : ____
____

☐ A-4 Hotwork Permit:
A hotwork permit is not necessary.
A hotwork permit is necessary, permit issued no.
A-5 Vessel Entry Permit :
☐ A vessel entry permit is not necessary
A vessel entry permit is necessary, permit issued no.

A-6 Installed Radioactive Source:
☐ There is no installed radioactive source
☐ There is an installed radioactive .source and is made safe
I have made the installation sate for the duration of tills Permit By

Signature of Qualified person

A-7 Electrical Isolation:
☐ Electrical isolation is not required
Electrical isolation is required and has been made by following methods and tagged (Tag No.)
☐ Fuse withdrawn
☐ Drive Unit Disconnected / Denergised
☐ Racked out
☐ Locked out Name___________ Signed _________________

A-8 Other (e.g. Instrument, Cathodic Protection)
Isolation not required
Isolation required and has been done (Tag. No. ____________)
by (Name) ____________________ Signed _________________________
A-9 Preparation Completed:
Name Designation Signature

PART - B : Operation

B- 1 Job to be done

____
____
____
____
____
____

B-2 Precautions to be taken.

☐ Wear PVC suit
☐ Use self breathing apparatus
☐ Wear PVC, Rubber, Leather, Asbestos etc. gloves
☐ Use air line respirator
☐ Wear Ear Muff/Plugs
☐ Wear a safety belt with life line
☐ Wear Helmet
☐ Keep fire extinguisher ready
☐ Wear Full face shield
☐ Keep rescuer available
☐ Wear Goggles
☐ Use only safety torch/hand lamp
☐ Use Gas Mask for___________(gas)
☐ Use only 24 Volts inspection lamp
☐ Use Dust mask
☐ Use ELCB

B-3 Removal of Equipment
☐ Removal of equipment from the site is not required
☐ Removal of die equipment from the site is required
☐ The equipment is cleaned

☐ The equipment is not clean. Take following precautions

B- 4 Special instruction

____
____
____

PART - C : Issue, Acceptance & Return

C-l Issue and Acceptance

	Name	Signature	Date and Time
Issued by	____________	____________	__________
I have read the conditions of this permit			
Accepted by	____________	____________	__________

C-2 Extension of Validity (Please sec on the back)

C-3 Text/Rotation check required

Signature of person making request ____________________________________

Electricity restored by ____________________ Sign. _____________________

Test run Completed/Rotation check correct Sign _________________________

Electricity isolated by ______________________ Sign. ________________________

C-4 Completion of job

This job is completed :The job site is cleaned and material removed.

Returned by Name & Sign ________________________ Time and Date _____________

C-5 In case of hot work permit/vessel entry permit.

The Hotwork permit No. _________________ is cancelled

The Vessel entry permit No.______________is cancelled

Countersigning person have been informed

Sign. __________________Name ____

C-6 Cancellation

This permit is cancelled. Please restore electricity. Remove or restore radioactive source/others

Name ______________________ Sign ______________ Date & Time ______________

C-7 Installed radioactive sources

I have recommissioned the installation

Signature of qualified person_______________________________________

C-8 Electricity Restored

☐ Fuse replaced ☐ Racked in

☐ Drive unit reconnected ☐ Lock removed

Signature ______________ Name ____

C-9 Other isolation (Specify) ____

Restored by ____

Sign______________ Name ____

C-10 Details of job done

____
____
____
____

(back page) Instructions (See Part C2)

1. The Permit to Work does not ensure that the job is safe but it tells you the exact state of the job, precautions already taken, precautions to be taken by the permittee and residual hazards associated with the job Therefore the issuing authority must give consideration to each point/word and strikeout which is not applicable or marked D in the appropriate box. The permittee must read the contents of the permit carefully and follow the instructions and precautions to be taken.

2. In case of any emergency in the plant, the job shall be stopped and the permit shall be treated as cancelled. The work can be restarted after the emergency is over but the permit to work shall be endorsed by the issuing authority before starting the work.

Extension of Validity

C-2 The job is not yet completed. Therefore this permit requires extension of validity.

Extension of validity requested by		Time & Date up to which the Validity is requested		Reasons for requesting Extension	The permit is extended i.e. revalidated UPTO :			
Name	Signature	Time	Date		Time	Date	Name	Signature

Table 19.3 : Hot Work Permit

Name & Address of the Factory	HOT WORK PERMIT	Permit No. : Date :

A. Job Details :
Requested by ______________________ Dept./Plant ____________ Section ________________
Validity Date _____________________________ Time : From ______ Hrs. To _________ Hrs.
Location Details ____
Description of Work : ____

____

B. Precautions : Tick (✓) in the relevant boxes where applicable and score out the others.

Already taken by operators	To be taken by Maintenance

☐ Equipment has been properly – Tick (✓) in the box (a) depressurized ☐ (b) Drained ☐ (c) Washed ☐ (d) Vented ☐ (e) Purged ☐ (f) Steamed ☐ (g) gas freed ☐ (h) isolated ☐ (i) blinded ☐ ☐ Surrounding area checked and protected against hazards of spark / fire. ☐ Sewer openings covered /protected. ☐ Frequent explosimeter monitoring required during continuation of job. ☐ Keep fire station informed. ☐ Standby man available for rescue. ☐ (others) ________________________	☐ Sparks can ignite the material in the surrounding areas. Effects protect process sewers / material / equipment in the vicinity from a potential fire hazard. Keep the area wet. ☐Properly ground the equipment and use insulated welding cable. ☐ Keep escape route clear. ☐ Keep fire extinguisher ready. ☐ Keep fire hose connected with nozzle for use (not charged) ☐ Use only fir proof gloves /suits. ☐ Make provision to contain the sparks by shielding the job location from all sides using fire blankets.

C. **Initial Explosimeter Test :** (Indicate the exact locations where the tests are carried out)

Sr. No.	Location	Explosimeter (LEL) reading	Date	Time	Name	Signature

D. **Authorisation :**

Shri _________________________of Dept. : _____________ Section ___________ is hereby given permission to carry out the above work. This permit expires at _____ hrs. on ______ unless extended, [see (E) below]. Signature of issuing authority_________________ Date : __________ Time : ______Hr. Approved by : _____________ Signature ______________ Date : ____________ Time : _________Hr. Signature of accepting authority ____________________Date : ___________Time : ___________Hr.

E. **Extention of Validity** (To be renewed after every shift, maximum validity 24 hrs.)

(I) Condition at the site checked and found OK. The Explosimeter reading _____%LEL Time : ________ hr.
The validity of the above permit extended up to : _____ hr. on _____________ (date). Signature (Shift-In-Charge) _______________ Time : _________: hr. Date : ___________
Approved by: Signature:

(II) Condition at the site checked and found OK. The Explosimeter reading ____%LEL Time : ______ hr.
The validity of the above permit extended up to : _____ hr. on _____________ (date). Signature (Shift-In-Charge) _______________ Time : ___________ hr. Date : ___________
Approved by: Signature:

F. **Work Completion** (By the Maintenance Group) :
The work is completed. Area cleaned up. The permit returned to the issuing authority at _____hr, Date _______ Name: Signature : _____________________

G. **Job Acceptance :** (By Issuing Dept.) - The job has been completed and the work area has been restored in its original condition. Hence, the permit is hereby cancelled.

Name : Signature Time : ____ hr. Date :

The format of the permit to work should be designed by the safety officer, safety consultant or an experienced engineer of the company. Well thought precautions and safety measures can certainly minimise the accidents.

Vessel Entry Permit : Under section 36 (2) of the Factories Act 1948, no person in any factory shall be required or allowed to enter any confined space (chamber, tank, vat, pit, pipe, flue etc. having dangerous fumes likely to involve risk) until all practicable measures have been taken to remove any fumes which may be present and to prevent any ingress of fumes and unless a certificate in writing has been given by a competent person based on a test carried out by himself that the space is free from dangerous fumes and fit for persons to enter or such person is wearing suitable breathing apparatus and a safety belt securely attached to a rope (life line) die free end of which is held by a person outside the confined space.

Isolation of the vessel from sources of energy or harmful substance by way of cooling, disconnection, blinding, blanking etc., draining, cleaning, washing and purging to make free from toxic gases, testing the air for oxygen or toxicity content, opening top and bottom connections for good ventilation, lighting and exit, wearing safety belts, helmet and suitable breathing equipment, allowing low voltage (24 volts) light, standby arrangement etc. are essential requirements.

See Part 2.2 of Chapter 16 and Part 16.2 of Chapter-18 for safe entry procedure to confined spaces.

Hot work Permit : For welding and cutting, working with open flames or sparks due to grinding, chiselling etc. or where hot work is dangerous or may cause fire. Hot work or Fire Permit is necessary.

The area must, first, be made free from hazards of fire and explosion. Tests for explosive air mixture or possibility should be carried out. All lines to the vessel shall be blinded or' disconnected. Sufficient vents and flameproof light shall be provided. Fire protection and alarm shall be kept ready. Dangerous work shall not be allowed in the vicinity. Water facility shall be used to extinguish sparks, hot slugs etc.

See Table 19.3 for a Hot Work Permit.

Electrical Work Permit : The model form of permit-to-work is given in IS:5216 (Part-1).

Department of power generation, distribution, control etc. issues permit in the name of Electrical Engineer/Supervisor in charge of the job to be attended.

Before issuing permit it is ensured that the apparatus concerned is made dead, earthed and isolated from all live conductor by opening all relevant switches, circuit breakers, fuses, isolators etc. He who receives the permit, also rechecks to ensure that there is no possibility of accidental power supply. Then only he starts the work. In case when the work is continued in the next shift, the permit is transferred in the name of another person continuing the job. On completion of the job and before returning the permit for cancellation, it is verified that all persons on the apparatus are withdrawn, and temporary earth connections are removed. The permit issuing authority rechecks the apparatus, cancels the permit and energises the apparatus by closing all switches, fuses, breakers, isolators etc.

Similarly Work Permits can be prepared for other types of hazardous work keeping their special precautions in mind.

It is advisable to use separate permits for separate works instead of using a common (multiple) form for different works.

All contractors and company staff such as engineers and maintenance workers must be in possession of a valid work permit before they start any job at a company site. In some instances, operating staff must also have a valid work permit for operating jobs which may have a hazardous content such as opening a pressurised system, such as a product filter, pipeline, removing pyrophoric catalyst, working at height etc.

See also Parts 16 of Chapter-18 for further details of work permit system.

1.9 Safety Tag System :

IS:8095 provides specification for accident prevention tags. The tags are used as a temporary means of warning employees of an existing hazard or to warn them not to start any switch or operation, because some other person may be injured due to that. For example, while working in any movable or rotational machine, tag on isolated switch is necessary. To prevent wrong operation of any switch, valve, control etc., tagging is essential during repair. It is more useful for new or untrained workers. They should not be used in place of or as substitute for accident prevention signs. The tag shall be removed as soon as die hazard is removed or eliminated. 'Do Not Start' tag on power machine should be provided till the repairing is over and then it should be removed. Defective equipment tag shall be placed till die defect exists only. Accident prevention signs are of permanent nature, while the tags are temporary. For safety signs and colours see IS:9457.

The tag should be in the language understood by the workers.

Type of tags arc : Do not start tags. Danger tags. Radiation tags. Biological Hazard tags etc. Colours for some tags are prescribed but not the size which should be suitable .

1.10 Standard (Safe) Operating Procedures (SOP)

Hazardous works or frequently required jobs need standard and safe operating procedures. If they are well defined and described beforehand and available in the form of ready made document, they are most useful to plant people for easy use. Such procedures are useful in avoiding and reducing accidents.

Meaning and usefulness:

A Standard Operating Procedure (SOP) is a set of written instructions describing steps of safe working method and standard engineering practice for hazardous job or frequently required industrial activity.

It describes technical as well as administrative operating instructions from the management. It is designed by duly qualified and well experienced technical persons in the plant. It should be amended and updated based on experience of its use. SOP standardizes work procedure and avoids variations among different workers. It establishes uniformity and safety in working methods. It ensures that the same work is done in the same way by all workers safely and efficiently.

SOP should be written correctly. Steps should be chronological. If not written correctly, it is of limited value. The best written SOP may fail if not followed. Copies of SOP should be ready available in work areas so that they can be readily used. SOPs are useful to prevent shortcuts, wrong habits and unsafe practices.

Format for SOP :

SOP should be written in a well designed format. It should be easy to understand. It should clarify its purpose, method of use, tools, equipment and PPE necessary, work permit to be used if any etc. Steps and sub steps should be well arranged. SOP should have title, Sr. or Id. No., Date of preparation. Date and number of revision, steps and procedure, action by whom and remarks.

Some example of SOP are as under :

1. Nitrogen purging in a reactor.
2. Loading and unloading of tanker of hazardous substance.
3. Safe starting or closing down of a plant.
4. Catalyst loading into a reactor.
5. Flue or toxic gas sampling procedure.

SOP should get approval from the top management including safety department. It should be reviewed and revised. Checklist can be used to prepare SOP.

1.11 Incident Recall Technique :

This method is based on collecting information on hazards, near-misses, unsafe conditions and unsafe actions from working people. It can be used to investigate man-machine relationship and to improve equipment and operations. The technique consists of interviewing personnel regarding involvement in accidents or near-misses, errors, mistakes, difficulties and conditions which may cause accident. It accomplishes the same result as an accident investigation. Even isolated incidents reported by the technique can be investigated to determine whether corrective action is necessary or advantageous.

Plant people should be given accident case studies for reading and thinking. Then their memory should be recalled to know their understanding and further suggestions if any.

1.12 Critical Incident Review Technique:

The Critical Incident Technique by W.E. Tarrants, is a method of identifying or reviewing potential accident causes by collecting information on unsafe conditions and actions, near-misses, hazards etc. from experienced plant personnel. It can be used to study man-machine operational relationship and to use the information to improve equipment, operations and procedures.

An' experienced reviewer or surveyor first explains to key personnel what he wants to know. Then he asks each worker individually questions on safety matters. Workers' involvement in accidents, near misses, mistakes, errors, difficulties in performance and probable causes of accidents are thoroughly discussed. Their comments including preventive measures are also asked.

It has been estimated that for every mishap there are at least 400 near-misses. Information on possible accident causes can be obtained from participants of accidents and non-participants but having knowledge.

When interviews report similar difficulties, hazards or near misses with similar types of operation or equipment, it indicates an area to be investigated and results of investigation can suggest the remedial measures necessary.

1.13 Procedures Analysis :

This method reviews the possibilities of accidents due to actions of workpeople. First of all it checks whether the work method is hazardous or not. It ensures that the man-machine motion does not endanger the operator in following the method suggested by the designer or supplier.

A procedure is a set of instructions for sequenced actions to conduct operation, maintenance, repair, assembly, test, calibration, transportation, handling, emplacement, removal etc.

Procedure analysis is a review of the actions that must be performed for intended tasks, the equipment that must be operated or used and the environment in which personnel must work. Analysis ensures that the procedures are not only effective but also safe. Hazardous tasks like welding, tank entry etc. must be analysed in detail.

Procedure analysis sheet contains five columns : Task, danger, effect, cause and corrective or preventive measures. The procedure suggested should contain preparatory instructions, operating instructions, warning and precautions, checks and tests, step-by-step instructions to perform operation, stopping instructions and emergency instructions.

1.14 Methodical Analysis :

In the beginning of 20th century, Gilbreths suggested an orderly examination of an operation from its first step to the last, tracking the flow of work as it progresses. Symbols were used to draw a network diagram. Gilbreth's objective was to improve the work method by eliminating unwanted steps or re-planning the work so as to conserve time and effort. Safety in itself was not a consideration (Ref. No. 32).

This methodical analysis was the first of the analytical techniques to draw attention of the safety specialist. It was employed, subsequently with some modification, to assist in hazard control in manufacturing and as a basis for hazard identification and analysis.

1.15 Technique for Human Error Rate Prediction (THERP) :

Human Error Analysis identifies potential human errors and their effects or identifies the cause of observed human errors.

The Sandia Corporation developed a method to quantify the likelihood of employee error in manufacturing operations with the objective of reducing defects (Ref. No. 32).

The method is based on the principle that non-repetitive or infrequent actions may be difficult or impossible to predict, but the repetitive actions can be studied to determine human error probability data.

THERP establishes a basic error rate (BER) for selected tasks employing statistical methods to identify valid human error rates in performing the task. The BER unit is error per million operations.

Such data of human failure rates is interesting to safety specialists. It is useful for fault tree analysis discussed in Part 4.8. The data is mean average and may not be applicable to a particular operator. Skilled operators may commit less errors.

1.16 PERT and CPM :

PERT means programme evaluation review technique and CPM means critical path method. The first method was developed by US Navy for its Polaris Weapons Systems in 1958 and at the same time the second method was developed by the Du Pont Company (Ref. No. 32)

PERT and CPM generally deal with planning, scheduling and logistical problems involving the availability of materials, equipment etc. at appointed times and places for the process to flow expeditiously to completion. Safety is not their main objective, but it can be used for safety purpose.

In its modified form to include safety, PERT and CPM can be directed to (1) arrange activities so as to minimise the possible bottlenecks and total time (2) obtain an estimate of total time required to facilitate personnel and material planning to foresee the probable impact on delivery dates to customers and (3) foresee any possible hazards and take steps in the planning so as to eliminate or minimise them.

1.17 Safety Codes and Standards :

Codes of practice and standards are normally derived by experienced professionals and their organisations. Codes and standards transmit experience of problems and solutions and develop good industrial or engineering practice.

With change in technology and new inventions, revision becomes necessary. Thus codes and standards should be updated with the current time.

Standards and Codes should be followed in following order:

1. Statutory Standards.
2. Indians Standards (IS) and Codes.
3. International Standards like ISO 9001 & 14001 and OHSAS 18001.

(1) Statutory Standards.

Enacted Safety and other Acts, Rules and Regulations are mandatory or statutory and require legal compliance, failing which legal action may be instituted. Tlie Factories Act 1948 and Rules made there under prescribe standards for ventilation, artificial humid ification, workspace, lighting, drinking water, latrines, urinals and spittoons, lifting and revolving machines, pressure plants, excessive weights, protection of eyes, precautions in case of fire, toxic exposure, safety of buildings and machinery and welfare facilities. Factory Inspectors are also appointed to check these standards. It is also a statutory duty of Safety Officers where they arc legally required.

(2) Indians Standards (IS) and Codes.

If Statutory Standards are not available or if required as additional need, Indian Standards should be followed. They provide number of Safety & Product Quality standards. ICI marks are considered as good standards and they raise sale values. It assures good safety precautions. Indian Standards for safety and health, pressure vessels, chemicals, gas works etc. are of prime importance and used by good designers.

Codes are made from the groups of Indian or International Standards pertaining to particular subjects. Vizs. National Building Code, National Electric Code, National Fire Protection Association (NFPA) Code, American Society of Mechanical Engineers (ASME) Code etc.

Some are voluntary standards which may be followed for safe practices. Standards are often used for design, testing, certification and approval. Standards may be changed by time due to new knowledge or experience. Standards and Codes can be used as basis on which checklists can be prepared by which the plant's facilities, equipment and operations can be analysed or audited for hazards.

It should also be noted that standards or codes may be lacking in requirements or the requirements may not be stringent enough for actual conditions or they may not be applicable. Therefore blind observance of standards is not justifiable. Each hazardous situation must be examined and analysed-critically for full-proof safety.

(3) International Standards

After compliance of Statutory Standards and Indian Standards, International Standards should be followed.

Two standards are important for safety of environment and safety from occupational health hazards. They are as under :

(A) Environment Management 'System (EMS) ISO 14000 and Standard ISO 14001.

Environment is the basic requirement for survival and sustaining life on earth. We have been blessed environment from our forefathers and it provides us an opportunity to live long and happily. It is the duty of all of us to protect the quality of this environment and add our contribution so as to leave a better environment-and adequate resources for our posterity.

Developments in Science & Technology have added greatly to the longevity and quality of human life. These developments have sometimes had flip sides manifesting most notably in adverse impacts on the environment.

All organizations should have concerned with the protection, promotion and preservation of environment. Throughout the world, the government, organizations, firms and individuals are now increasingly concerned for the promotion of environment and prevention of pollution. All the employees of organization, shall contribute in the conservation of resources; prevention of pollution and promotion of environment.

It is recommended to implement ISO 14001 Environment Management Systems (EMS) Standard and request that there shall be no compromise in any manner which affects the environment at the site and this shall be ensured through strict adherence to environmental regulations and environment management system procedures; raising awareness on environment among employees; the contractors/ personnel working at the site and sharing our knowledge with the surrounding public.

The relations between men, flora, fauna, water, land and air are non-separable and these relations require to be maintained without affecting the equilibrium which the Nature has given us the day life began on earth.

All of us shall explore opportunities for the minimization of waste; and shall endeavour to minimize environmental aspects and impacts arising out of our operations. We shall ensure that there is zero material waste; full utilization of resources. We shall protect the plants; animals; birds at our site and shall not cause any harm to them and our fellow employees.

Advantages of EMS - ISO 14000 :

1. HSE Systems get further strengthened.
2. Fulfillment of national and international HSE requirements, particularly w.r.t. Occupational Health and Industrial Hygiene.
3. Complying local legal requirements and new norms w.r.t. Environmental Protection published by Government from time to time.
4. Employees' motivation and proud place in industrial society.

What is ISO - 14000?

1. ISO - 14000 is a series of voluntary international standard covering environmental management tools and systems developed by the International Organization for Standardization.
2. Intent to provide all industries - whether in manufacturing or service -with a structure for Environmental Management System.

What is ISO - 14001?

1. It is the standard a company will use to establish its Environmental Management System.
2. It provides frame works for environmental .management and integrates that frame work with overall business management activity.
3. It is a specification for Environmental Management System for ensuring and demonstrating compliance with stated Environmental Policy and Objectives of the Organization

Definitions:

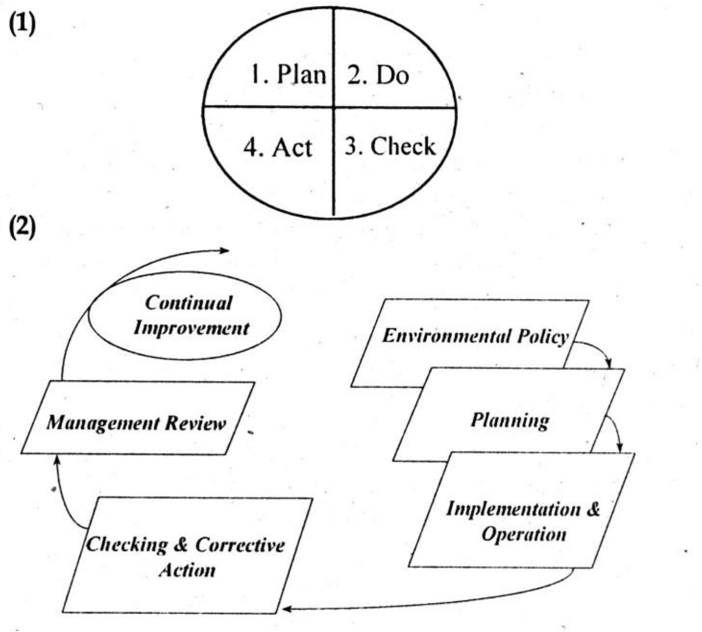
1. Environment - Surrounding in which an organization operates including air, water, land, natural resources, flora, fauna, humans and their interrelation.
2. Environmental Management System - The part of the overall management system that includes organizational structure, planning activities, responsibilities, practices, procedures, process and resources for developing, implementing, achieving, reviewing and maintaining environmental policy.
3. Environmental Aspect - Element of an organization's activities, products or services that can interact with the environment.
4. Environmental Impact - Any changes to the environment, whether adverse or beneficial, wholly or partially resulting from an organization's activities, products or services.

Elements of ISO - 14001

1. General Requirements
2. Environmental Policy
3. Planning
   (1) Environmental Aspects
   (2) Legal & Other Requirements
   (3) Objectives & Targets
   (4) Environmental Management Program
4. Implementation & Operation
   (1) Structure & Responsibility
   (2) Training, Awareness and Competence

(3) Communication
(4) Environmental Management System Documentation
(5) Document Control
(6) Operational Control
(7) Emergency Preparedness and Response.

Environmental Management System Model



For details see website : www.isol4000- isol4001-environmental-mariagement.com

(B) Occupational Health and Safety Management System 18000 and Standard 18001.

Occupational Health and Safety Assessment Specification (OHSAS) is an international standard defining requirements related to health and safety management systems, enabling organization to manage both their operational risks and improve their performance. .It was developed in 1999.

More and more organizations are increasingly concerned about achieving and demonstrating sound Occupational Health & Safety performance to their customers, employees and shareholders, by managing the risks and improving the beneficial effects of their activities, products and services.

This Occupational Health and Safety Assessment Series (OHSAS) specification gives requirements for an occupational health and safety (OH&S) management system, to enable an organization to control its OH&S risks and improve its performance. It does not state specific OH&S performance criteria, nor does it give detailed specifications for the design of a management system.

This OHSAS specification is applicable to any organization that wishes to:

1. establish an OH&S management system to eliminate or minimize risk to employees and other interested parties who may be exposed to OH&S risks associated with its activities;
2. implement, maintain and continually improve an OH&S management system;
3. assure itself of its conformance with its stated OH&S policy;
4. demonstrate such conformance to others;
5. seek certification/registration of its OH&S management system by an external organization; or

6. make a self-determination and declaration of conformance with this- OHSAS specification.

All the requirements in this OHSAS specification are intended to be incorporated into any OH&S management system. The extent of the application will depend on such factors as the OH&S policy of the- organization, the nature of its activities and the risks and complexity of its operations.

This OHSAS specification is intended to address occupational health and safety rather than product and services safety.

The organization shall establish and maintain an OH&S management system, the requirements for which are set out in clauses.

Advantages of OHSAS 18001 Accreditation.

1. HSE Systems get further strengthened.
2. Fulfilment of national and international HSE requirements, particularly with respect to Occupational Health and Industrial Hygiene.
3. Complying local legal requirements and new norms with respect to Occupational Health, Environmental Protection and Safety as published by Government from time to time.
4. Employees' motivation and proud place in industrial society.

What is OHSAS 18000?

It is an Occupational Health and Safety Management System or Series which provides a framework for managing OHS responsibilities. The framework is designed to allow companies to become more efficient and operate in a more integrated manner.

Specifically, OHS management systems specify a process of achieving continuously improved OHS performance and complying with legislation.

What is OHSAS 18001 ?

OHSAS 18001- 'Occupational Health and Safety Management Specification or Standard' is an international health and safety management system specification, embracing BS 8800, AS/NZ 4801, NSAI SR 320 and other publications. It is under OHSAS 18000.

OHSAS 18001 has been developed to be compatible with the ISO 9001 (Quality) and ISO 14001 (Environmental) management systems standards.

What is OHSAS 18002?

To compliment OHSAS 18001, the British Standards Institute published OHSAS 18002'Occupational Health and Safety Management Systems Guidelines' to assist in the implementation of OHSAS 18001.

This explains the requirements of the specification and shows companies how to work towards implementation and registration.

By adopting this package, it will allow companies to :

1. Identify elements of business that impact on health and safety and gain access to the relevant legislation.
2. Produce objectives for improvement and a management program to achieve them, with regular reviews for continual improvement.
3. BSI Management Systems will periodically assess the system and, if complied, register your company or site to OHSAS 18001.

How does it work ?

The OHSAS 18001 Specification follows the Plan-Do-Check-Review cycle, with an emphasis on continual improvement. Registration can be obtained.

For details see website : www.ohsas-18001occupational-health-and-safety.com

1.18 Safety Steward System :

Safety Steward or Monitor system is an old concept of deputing one supervisor or a senior man for overall safety supervision in a plant. The steward or monitor will take rounds of the plant, premises, processes and persons assigned to him and will observe them for their safe behaviour. He may correct the things on the spot if possible, or, may direct the step necessary. He is solely supervising and monitoring for all safety works. This system is useful in small factories but not convenient in big factories. There may be one steward for one plant or different stewards for different departments in one plant. The steward is reportable to his higher officer or to the Safety Department. This old system of safety stewardship is rarely traccable now-a-days.

1.19 Circuit Approach to Safety :

This approach is based on a principle that all safety points should be checked in a sequence (circuit) so that they can be remembered and attended easily. It touches the points coming in line only. The circuit study can be said complete when all the circuits are examined fully, otherwise, it is partial. Depending upon time, each circuit can be checked one by one (the dangerous first) and necessary corrections are made. Thus by this approach partial or full appraisal is possible.

Various industrial circuits are well known. Some circuits and their sequential check-points are mentioned below:

	Circuit	Check-points
1.	Electrical Circuit	Main supply board, OCB / MOCB, transformers, lightening arrester, earthings, cautionary notice, OCB / ACB, fuses, MCC board, starters, relays, motor starter, capacitor, single phase preventer, overload relay, cut-off switches and flameproof fittings in hazardous areas.
2.	Steam Circuit	Boiler, Boiler Mountings such as pressure gauge , safety valve, low water safety valve, coal feeder, damper, oil burner, flow meter, recorder, etc. then on high pressure, low pressure and distribution steam lines up to user points – reducing valve, safety valve, non return valve, steam traps, stop valve, strainer, steam flow indicator and regulator etc. Then on steam using vessel and equipment similar items.

3	Air Circuit	Air filter, compressor, cooler, oil separator, stop valve, air receiver, pressure gauge, safety valve, pressure cut-off switch, air governor, unloader, stop valve, pressure reducing valve, drain valve, by pass valve etc.
4	Water circuit	Stop valve, by pass valve reducers, flanges, couplings, gaskets, and cocks etc.
5	Process Circuit	Depending upon nature of manufacturing process and its flow sequence, various points should be identified listed and approached in sequence. P & I diagram should be used. Chemical process and Gas circuits need more attention.
6	Safe Disposal Circuit	The residues, solid, liquid or gaseous wastes, and constant or accidental emissions of dust, gas, fume, vapour, smoke etc. should be properly scrubbed, neutralized, inactivated and treated in treatment plants to render safe disposal their all control points should be checked in sequence. Actually the process should be designed wasteless by using recycling system.

Only some highlights are given above. More such circuits and more points in each circuit: must be located, inspected and kept safe.

2 PLANT SAFETY INSPECTION

Plant safety inspection is an old and effective method of appraising plant safety. Its techniques are explained below :

2.1 Definitions and Objectives :

As defined by BS 3811-1964 inspection is the process of ensuring by assessment that a facility reaches the necessary standard of quality or performance and that the level is maintained.

As defined by the same standard, maintenance is work undertaken in order to keep or restore every facility i.e. every part of a site, building and contents to an acceptable standard.

Thus maintenance implies some measure of inspection as part of its function to determine (1) what maintenance is needed and when, and (2) whether the results are acceptable.

Safety inspection is defined as 'that monitoring function conducted in an organisation to locate and report existing and potential hazards which have the capacity to cause accidents in the workplace.

Safety and health inspection ensures that working conditions/environment and actions (methods) conform to legal or safety requirement and combine efforts of employers, employees, safety experts and inspectors to create a safe working environment.

Objectives of Inspection are :

1. To find out hazards, accident causes (unsafe conditions and actions) losses and appropriate remedial measures for their prevention and control.

2. To maintain safe work environment, operational profitability and control unsafe actions of people.
3. To check statutory provisions of the Factories Act and similar other safety statutes.
4. To check the effectiveness of the existing systems and to find improvement if required for the purpose of Total Loss Control.
5. To check quality control, product safety. Good Manufacturing Practice (GMP), wear and tear, corrosion, tests and also personnel selection.
6. To gain workers' confidence in organised human activity and factory life.

2.2 Types and Procedures :

Inspections can be classified in many ways as explained below:

1. Planned Inspection : These are of 4 types :

(i) *Periodic Inspection :* Plant, machinery, equipment, lifting machines, pressure vessels, apparatus, procedures, methods and health of the workers should be examined at regular pre-planned period. Statutory forms, checklists, tables and period of inspections, if any, must be strictly followed. Nonstatutory periodicity may be decided according to the need. The whole area should be covered and plant people should be informed in advance for necessary arrangement. It should be deliberate, thorough, detailed and systematic. Safety committee, safety officer, competent person, safety consultant, industrial hygienist, doctors and other safety and health personnel should carry out such inspections.

(ii) *Intermittent Inspection :* It is carried out at irregular intervals to check new equipment installations, procedures and workers; modifications, accident analysis etc. Some partial inspections are also carried out at uncertain intervals.

(iii) *General Inspection :* It is general or routine' inspection to check places which are not covered by .other inspections. Isolated areas, parking places, side - walks, fencing, light - illumination, reporting after long shutdown etc. are checked by such general or overhead inspections.

(iv) *Special Inspection :* Safety or hazard analysis, accident investigation, checking of dangerous operation or vessel, building safety, subjects of complaint only, inspection during special campaigns and new installations, and only for storages, processes, methods, hand-tools, scaffolds, guards, facilities, protective equipment etc., fall within this category.

2. Continuous (ongoing) Inspection: Some personnel like safety officer, maintenance men, electricians etc. spend their all time in observing certain equipment, vessels, processes, operations, safety devices, personal protective equipment etc., to maintain them in safe and efficient working condition. Thus continuous watch and familiarity with employees, equipment, machines and environment are maintained as part of informal and co-operative responsibility.

3. Statutory Inspection : This is carried out by Factory Inspectors and other authorities under various safety statutes (See Chapters 27 & 28) to check the implementation of statutory provisions. Strict and timely compliance is necessary. Breach of law may attract prosecutions. For most of the factories where there is no system of internal inspection, statutory (government) inspection is the only effective inspection and therefore it should be carried out in detail and the governments must employ sufficient staff to achieve better safety inspections. Non-technical workload on Inspectors should be minimised. Inspectors' powers and duties are statutorily prescribed.

Planning and Procedures:

The persons making inspections should be familiar with (1) the know-how and sound knowledge of plant, relevant standards, codes, rules etc. (2) the systematic inspection steps or checklists (3) the method of using data, evaluating and report writing. They should behave like friends, philosophers & guides. They should explain what, why and how. They should know the reasons of past accidents, working unsafely, the safe alternative or remedial measures and they should convince the people for better practice.

Basic Steps of inspection are : (1) To contact the department head for his help (2) To observe all conditions for compliance with established standards (checklists preferable) (3) To observe all operations for unsafe acts or violations of safety rules and (4) To prepare a systematic report with all hazards detected and corresponding remedial measures. The report should include good suggestions of plant people and the recommendations may be discussed with the persons concerned. The report should be sent to the concerned people for compliance and follow-up actions should be continued till full compliance is achieved and reported to the management.

2.3 Non Destructive Testing (NDT) :

See Part 15.5.2 of Chapter 18 for details.

2.4 Safety Checklists :

Process or system checklists are used to identify common hazards and ensure compliance with standard procedures.

A checklist is a convenient means of communicating minimum acceptable levels and hazard evaluation. It can be as detailed as necessary to satisfy the specific situation.

Checklists should be regularly audited and updated. They provide results quickly.

Checklists are complementary to the inspection technique and makes the. inspection more perfect, speedy and systematic. There are so many checklists designed in various ways and differing from plant to plant and person to person based on their knowledge and experience. Industry, plant, process, equipment, tools and machine wise checklists and those for good housekeeping occupy volumes. Therefore some sample points are given below and other checklists (for textile, chemical, housekeeping etc.) are given in respective chapters.

A broad checklist for plant inspection :

1. **Environmental Factors :** Parts most likely to develop unsafe or unhealthy condition because of stress, wear, impact, vibration, heat, corrosion, reaction, misuse or neglect etc.

2. **Machinery :** Pinch points, catch points, shear points, squeeze points, run-in points, operation points etc. Power transmission viz. shafts, belts, gears, pulleys, electric power, unsafe starting or stopping mechanism and machine guarding.

3. **Tools :** Wrong tool for the job, tool in unsafe condition or placed in unsafe position, hazardous or defective hand tools and machine tools.

4. **Work Area :** Flooring-uneven, obstructed, slippery, cramped quarters, exposure to traffic, insecure. piles .or overhead material, poor illumination, glare, temperature -too hot, too cold, exposure to gases, dusts, fumes, vapours etc., hazards from nearby operations; flying or falling objects, electrical, chemical, radiation and trip-fall hazards, work space, aisle, platforms, stairs, railings, spillage, exits, doors, roofs, roadways, yards etc.

5. **Material Handling :** Nature of material or objects heavy, unwieldy, rough, sharp, hot, corrosive, explosive, toxic etc., unsafe handling of equipment-lifts, hoists, chain pulley blocks, containers, conveyors, trucks, cranes, derricks, transport vehicles, elevators, chains, cables, slings and handling methods.

6. **Equipment :** Pressure vessels, revolving and vibrating equipment, pumps and motors, tanks, scrubbers, flares, effluent treatment plants, safety devices, maintenance tools, personal protective equipment, fire fighting equipment, production and related equipment, electrical equipment, power or energy equipment, store equipment etc.

7. **Unsafe Work Practices :** Operating without authority, operation at unsafe speed, guards removed or made ineffective, use of defective tools or using unsafely, handling materials unsafely, standing or working under suspended load ,open hatches, shafts or scaffolds, walking on rail road tracks, driving vehicles wrongly etc., repairing or adjusting equipment in motion, under pressure, electrically charged or containing dangerous substances, distraction of attention, failure to use or using wrong personal protective and fire fighting equipment, poor housekeeping and failure to remedy unsanitary or unhealthy conditions.

8. **Specific Points :** Special check points depending upon specialty of the plant, process, material etc. and points not classified elsewhere should be included here. Special checklists for the points of plant layout, machine guarding, housekeeping, lighting, ventilation, fire, material handling and various processes viz. engineering, textile, chemical etc. are given in the relevant chapters.

   See Part 15.3 of Chapter-18 for checklists of chemical factories.

2.5 Safety Survey:

A safety survey is a detailed examination of a narrower or specific major key area identified by safety inspection or audit, individual plant, procedure or particular problem common to a works as a whole. It is followed by a formal report, action plan and subsequent monitoring. .It is a general inspection of the particular dangerous activities, processes or area.

Its difference with safety audit is evident. Safety audit covers all parts of a plant one by one, while safety survey picks up only one or two most hazardous or important part of the plant and carries out its inspection in depth. It is carried out by an expert team.

2.6 Safety Study :

Here particular area is selected and it is critically studied in details, a report is prepared and submitted to the authority. The study report is useful to all concern. A safety study of one industrial estate examines all or sample factories in the estate for requisite points (mostly in proformas) and gives actual picture of the state of affairs in respect of safety. It spells out number of recommendations and remedial measures based on the study. A report of Hazards in Chemical Factories at G. 1. D. C., Vapi (A Study) by Shri C. G. Pandya and published by Gandhi Labour Institute, Ahmedabad in October 1986 is an example of such safety study.

Similarly within a plant some particular sections, departments, processes or accidents can be selected for safety study. It is desirable that such study should be carried out by experts of that field, otherwise many defects may escape unnoticed. HAZOP, HAZAN, Fault Tree and similar techniques may be utilised for safety study.

Advantages of such safety study are many. It reveals hazards and industrial hygiene effects to be considered at the design stage as well as for operating plants. It gives general picture of an industrial estate studied for safety purpose. It suggests real remedial measures and precautions to avoid accidents. Study of accident analysis suggests appropriate preventive measures.

2.7 Safety Tour :

It is an unscheduled examination of a work area carried out by works managers or safety committee members to ensure that the standards of housekeeping are at an acceptable level, hazards are removed and safety standards are observed. Its scope is less than that of a safety inspection. It is general inspection of the workplace.

2.8 Safety Review :

Its purpose is to identify unsafe conditions or operating procedures that could lead to an accident. It ensures that the plant and procedures (operating and maintenance) match the design intent and standards. The procedure

- initiates application of new technology to existing hazards.
- Reviews operating procedures for necessary revisions.
- Reviews adequacy of maintenance of safety inspections.
- Keeps plant personnel alert to the process hazards.

2.9 Safety Sampling :

It is a systematic sampling of particular dangerous activities, processes or areas. Its a method of measuring hazard or accident potential by random sampling and by counting safety defects while touring specified location by a prescribed tour of @ 15 minutes at the weekly intervals. The quantum of defects noticed is used to portray trends m safety situation. The point on a safety sampling sheet includes items such as nonuse of personal protection, obstructed fire exits, environmental factors, lighting, ventilation, temperature, faulty hand tools, guarding position etc. The results are collected by the Safety Officer and presented in graph form to monitor the effectiveness of the safety programme.

Formula $N = \dfrac{4\,(1-P)}{V^2\,(P)}$

gives number of observations N,

when percentage of unsafe operations P and Value of accuracy V (normal value = 10%) are known. For example, if during preliminary survey of 60 observations, 20 were found unsafe, then

$$P = \frac{20}{60} = 0.33\% \text{ and } N = \frac{4\,(1-0.33)}{(0.10)^2(0.33)} = 812.12$$

This means 812 sample observations would be required to ascertain various unsafe practices with an accuracy of 10%. If 200 observations are possible in one tour, four tours (three tours of 200 and last tour of 212 observations) will be required for satisfactory results.

This technique was first employed by American chemical plants and then by ICC's Dyestuffs Division in UK. It is based on Heinrich's ratio 1:29:300 opportunities must be observed before one lost time accident. It is based on samples and not on detailed surveys.

It's difference with safety tour is that the tour is an unscheduled examination of work area by a team of safety personnel and may last for a longer period to assess safety standards, while safety sampling is a short tour of @ 15 minutes, generally by one observer for the purpose of random sampling of visible defects and to mark them on a sampling checklist.

Steps of the technique are :

1. List safety defects and hazards applicable to the area.
2. Define routes-at least two per section or department-which the observer can traverse within 15 minutes.
3. Train the observers for correct use of their respective routes and printed checklists.
4. Tell the workers the purpose of safety sampling.
5. Observers must meet at a convenient place once a. week or fortnight. One observer should cover one route alone and mark his sheet.
6. Defects found should be corrected by supervisor or Department Head.
7. Results of Sampling Check List are added to summary sheets and plotted on a graph.
8. Comparing with the graphs of past period, deviation in the safety performance is noted and safety measures are decided to improve the performance.

Advantages or Benefits of this technique are :

1. Management is provided with a week by week picture of accident potential.
2. Defects are cleared at least once a week. Many defects are cleared on the spot.
3. Supervisors' eyes are sharpened by practice and begin to be more vigilant.
4. Supervisors and Managers are put on the spot when they fail to take action after the defects have been pointed out to them.

Subjects of Safety Sampling Checklist are:

1. Protective Equipment-Non use or misuse of guards, fire extinguisher, first aid box, safety notice, machine under repair etc.
2. Protective Clothing - Non use, misuse or defects of goggles, mask, gloves, helmets, safety boots etc.
3. Housekeeping-Blocked passage way, stairways, slippery patches, chemical spillage, blocked drains, tripping hazards etc.
4. Tools-Wrong or defective tools, using or towing tools unsafely, power tools, plugs, wiring etc.
5. Unsafe Conditions-Leaking joints, valves etc., fans not working, -poor supports, unsafe scaffolding, erection, lifting machines, pressure vessels, dress, design and construction, improper illumination, ventilation, material position etc.
6. Unsafe Actions - Adjusting, cleaning or oiling machinery in motion, operating at unsafe speed, making safety device inoperative, distracting/ teasing, taking unsafe position, wrong ladder

position, unsafe method, carrying heavy load, hand trucks unsafely loaded, persons riding on fork lift, trolleys, machine part etc.

2.10 Contact Scheme :

Here supervisors are directed to contact the workers under their control, to talk with them at the work place regarding safety points viz. wearing eye protection, providing guard, clearing work benches, tool condition etc. and to put a tick mark on the Contact Scheme Card designed for this purpose. This method is useful for on the spot correction and motivating people for safe attitudes.

2.11 Good Manufacturing Practice (GMP):

This concept was first developed by the Pharmaceutical Manufacturer Association, USA in 1961 and first GMP regulations were issued by U. S. Food and Drug Administration in 1963 and was subsequently adopted in 1969 by the World Health Organisation (WHO). Thus this concept originated for quality control in pharmaceutical industry is also useful for other industries, because, it helps in overall improvement in manufacturing practices by four quality elements of men, machinery, materials and methods. Points included in GMP are:

1. Hygiene.
2. Product security.
3. Importance of labelling.
4. Defined procedures, SOP, SOI, PO etc.
5. Cross contamination.
6. Housekeeping and
7. Safety.

GMP brings us nearer to the ultimate good products with built-in quality and safety.

WHO requirements for GMP are personnel, premises, equipment, sanitation, starting materials, manufacturing operations, labelling and packaging, quality control system, self inspection, distribution records and complaints and reports of adverse reactions.

All processes, procedures, records and systems are clearly defined, personnel and operators are trained and records are well documented for quality and safety assurance at every stage.

2.12 Recommendations & Follow Up Actions (Compliance) :

The inspection report should be clear and concise with enough explanation, to make it understandable. Copies of the recommendations should be sent to the concerned persons for implementation. Progress should be reported to the management at regular intervals. Periodic checks should be made until they have been fully complied. In case of government inspection, the compliance report should be sent to the authority within the time limit.

Rule 19 of the MSIHC Rules, 1989 and Rule 68J(13) of the GFR speaks of improvement Notice" that may be served by the authority for compliance of contravened provisions or matters leading to that contravention. The occupier shall remedy that and any other measures (directions) specified within 45 days or the period also be specified.

2.13 Responsibility for Inspections :

Safety inspection cannot be carried out effectively by any one agency or individual. The responsibility should be shared by all concerned. All personnel at the various levels should clearly understand their responsibilities and functions so that management's objectives are implemented through their co-ordinated efforts.

Safety Officer, Safety Committee and Line Management comprising of senior plant managers, first line supervisors, engineers and workers are all responsible for effective inspections and their speedy compliance.

3 ACCIDENT INVESTIGATION, ANALYSIS AND REPORTING

3.1 Philosophy :

Philosophy of industrial accident investigation should be clear and well explained to workers. It should not be oriented toward fault-finding and blaming any individual. It's main objective is to find out the real cause (s) of the accident and then based on it, to suggest appropriate remedial measures to prevent its recurrence.

For gross unsafe action, negligence, omission or personal fault, attention of the person should be drawn explaining him the consequence and to improve himself not to commit such act in future. He should be properly trained if necessary. See Part 3.5 for accident analysis.

3.2 Purposes of Investigation and Report:

The main purposes arc :

1. To learn accident causes so that similar accidents can be prevented by improvement of working conditions, actions and supervision. This helps in designing accident prevention strategies.

2. To make the hazard known to the management, workers and supervisors to direct their attention to accident prevention.

3. To find facts to determine legal liability and information for preventive purposes. If the purpose is 'to fix blame or responsibility', vital information will often be withheld or distorted. Therefore an investigation should be for the preventive purposes to disclose facts and not faults.

4. To establish procedure to combat damage claims under compensation laws.

5. To determine the 'change' or deviation that produced an 'error' that in turn resulted in an accident (systems safety analysis).

6. In case of accident affecting the society as a whole the Government may intervene for the purpose of banning of the hazardous material or process.

7. To find out injury rates to compare safety performance.

8. To use the record for the purpose of job safety analysis.

9. To develop safety rules, procedures, bulletins, posters and material for safety meetings and motivation and

10. To amend die safety law if it is thought necessary by the Government.

3.3 Process and Types of Investigation:

Process of investigation includes observation at site, interrogation with workers, fact findings, judgement and recommendations.

Some objective questions to be considered and answered by the investigator are : Who was injured, what was he doing at that time, where was he, who was with him, what he has to say about happening, what part of the injured is involved, how was he injured, what was unsafe-the condition, the method or the action of the injured? what does the medical report suggest, what safeguards should be used, what safeguards are provided to prevent recurrence and what are yet to be provided. Such and similar other questions and their answers constitute a Supervisor's Accident Report.

The first requirement for the injured person is to provide him medical treatment. It is a mistake to make him upset by questions. It is advisable to wait till he recollects his thoughts and gets his nerves under control. Initial story should be collected from spot checking and interrogation with co-workers and eye-witnesses. There should not be delay in initial inquiry. The conditions should be kept unaltered pending the investigation. Photographs, sketches, notes, computer and DCS records etc. will help much. Chronological questions should be asked and the concerned facts should be collected viz. testing reports, registers, documents, instructions, defective or damaged parts etc. The fact findings should aim to determine exact causes of the accident. All causes should be considered and classified according to severity and responsibility for preventive purpose. As the last step, suggestions and recommendations for the prevention should be submitted in writing. An emphasis should be put to suggest engineering controls than to suggest human responsibilities. If it needs, training methods should be suggested. Effectiveness and practicability of the recommendations should not be forgotten. Implementing difficulties should be considered and replied. Then the report is sent to the management for implementation.

All fatal and serious accidents and dangerous occurrences must be investigated thoroughly and all reportable, non-fatal and repetitive accidents should also be inquired. If time permits non-reportable and near-miss accidents should also be investigated.

Types of Accidents are mentioned in Part 8.1 of Chapter-4. Accident statistical forms are given in Part 9 and 12 of Chapter-5. Accident classification (analysis) is explained in Part 3.5 following. Types of investigations depend on the circumstances and objective of each case. Some types are failure mode and effect analysis, HAZOP, fault tree, event tree, cost effectiveness, statistical method, critical incident method, system safety etc. as described in foregoing two parts of this Chapter.

3.4 Agencies investing accidents :

In case of statutory reportable accidents, generally factory inspectors (Govt. Labour Dept.) investigate, but, because of -a $mall number of staff and big number of accidents in hundreds of factories in their charge, obviously, they cannot investigate all small accidents reported to them. They investigate serious and fatal accidents and give detailed report showing the facts, breach of law if any, and remedial measures. They may order to prohibit the use of some plant, equipment, process or premises if it is found of imminent danger to them. Investigation of Bhopal accident resulted into an order of permanent closer of the factory. A committee may be constituted by the Govt. to inquire into serious accidents. The finding may be used to amend the safety law if required.

Major, permanent and immediate responsibility of accident investigation lies upon the factory management and it is in their interest also. Even then it is noticed that majority of the small factories have not yet thought to self-inspect or investigate their own accidents. They simply report and rest upon the insurance. This is not good. Each factory should have its own system or arrangement to investigate accidents, hazards and to suggest and implement the remedial measures. This is most advisable and useful for the purpose of safety. They may utilise safety consultancy services of safety specialists.

Depending upon the gravity and nature of the accident, it may be investigated by foreman or supervisor, safety officer or engineer, safety committee or an expert group including consultants. The supervisor should report and investigate each accident, as he is the nearest man having more knowledge of the accident facts and remedial measures. The safety officer should investigate each important accident for his own information and report to the top management for necessary steps. His specialised knowledge, training, experience and ability make his report more valuable and useful in preventing recurrence. The safety committee's report is sometimes more effective as it carries workers' voice as representatives in the committee and rich knowledge of the Department Head.

The information gained from accident investigations should be used throughout the establishment where it is applicable. All similar or identical possibilities should be judged to prevent similar accidents.

3.5 Accident Analysis (Classification)

Investigation and analysis go together. The facts found form the investigation are first analysed. The analysis should reveal one hypothesis to explain all the facts adequately. Result oriented Objective Analysis procedure should include the following :

1. Identify and locate the main source of accidents from actual experience, materials, machines, tools, jobs, men and methods most likely to produce injuries.

2. Disclose the nature and size of the accident problem in departments and among occupations.

3. Indicate the need for engineering revision by identifying the unsafe conditions, materials, equipment and environment.

4. Disclose inefficient operating procedures, processes, poor layout and outdated methods to reduce accidents.

5. Disclose the unsafe practices for training of employees.

6. Disclose improper placement of personnel in instances of handicaps contributing to accidents.

7. Guide supervisors to use their maximum time for safety work by providing them information about the hazards in their departments.

8. Evaluate the success of a safety programme by continuing analysis of the effects of different safety measures, educational techniques and other methods to prevent injuries.

3.5.1 As per IS : 3786

The principal factors related to causation of accidents are : (a) agency (b) unsafe mechanical or physical condition (c) unsafe act (d) unsafe personal factor (e) type of accident (f) nature of injury and (g) location of injury.

A standard classification as given in Appendix B of IS:3786 could serve as a guide for detailed analysis of accidents for the study of various causative factors and their relationships.

The major divisions are given below. For details the Appendix -B should be referred.

B-l Classification According to Agency.
B-2 Classification According to Unsafe Material or Physical Conditions.
B-3 Classification According to the Unsafe Act.
B-4 Classification According to Unsafe Personal Factor.
B-5 Classification According to Type of Accident.
B-6 Classification According to Nature of the injury.
B-7 Classification According to the location of the injury.

Example 1 :

A lathe operator lost his two fingers of left hand when it was trapped in the nip of unguarded speed changing pulley belts when the start switch lever was accidentally turned to 'on position' by striking his body to the lever. Analyse this accident by identifying the key facts (factors) and causes of this accident.

S. No.	Analysis	Key Factors (Causes)	Part of IS : 3786
1	Agency --	Speed changing pulley belt of the lathe	2023
2	Unsafe condition --	(1) Unguarded pulley-belt (2) Start switch of the wrong type	10
3	Unsafe Act	Taking unsafe position of posture	60
4	Unsafe personal factor	Nil	
5	Type of accident	Caught between moving objects	133
6	Nature of Inquiry	Amputation of two fingers	340
7	Location of injury	Fingers	447

Example 2:

A helper in a chemical plant while transferring 2-4 dichlorophenol in a carboy through pumping and with tight fitting rubber hose-pipe inserted in the carboy without venting was splashed by the chemical came out due to rupture of the pipe, died within 15 minutes. He has not worn the PVC overall and hand gloves. Analyse this accident as per IS Classification.

S. No.	Analysis	Key Factors (Causes)	Part of IS : 3786
1	Agency --	Toxic Chemical	2324
2	Unsafe condition --	1. Rubber hose - pipe 2. No venting while filling i.e. hazardous arrangement.	30

3	Unsafe Act	1. Not wearing protective equipment and Not allowing air vent in the carboy i.e. unsafe placing.	50
4	Unsafe personal factor	Nil	
5	Type of accident	Contact by absorption of harmful substance.	171
6	Nature of Inquiry	Death by acute poisoning	370
7	Location of injury	Upper limb, multiple locations	448

Thus seven key factors (facts with causes) are explained above by two examples. These factors are defined and classified in Appendix B of IS:3786. Also refer Chapter-30 for case studies of number of such accident cases and try to classify them accordingly.

Relative importance of proximate cause and accident (key) factors in any accident investigation is evident from above examples and case studies. The proximate cause (unsafe condition/action) explains the phenomena of accident and suggests the appropriate remedy to prevents recurrence. If the cause is not known, selection of remedy and its application are not possible. Other accident factors viz. agency, type, nature and location of injury explain the classified effects of an accident which are useful in determining type of guard or guard position, safety device, protection from dangerous contact and type of personal protective equipment necessary.

3.5.2 As per the Directorate of Industrial Safety and Health and Labour Bureau

Statutory accident reports received by all Factory Inspectorates are classified as below. Labour Bureau, Shimla also publishes the accident statistics in the same classification. Only the major heads are given and for further details the full classification list should be referred.

Personal Faults

Material and Mechanical Faults

(i)	Lack of training	(i)	Physical hazards
(ii)	Chemical hazards	(ii)	Chemical hazards
(iii)	Poor discipline	(iii)	Poor housekeeping
(v)	Others	(iv)	Improper clothing
		(v)	Others

Textile Machinery:

1. Opening & Blow room m/c.
2. Cardroom m/c.
3. Drawing Frames
4. Speed, Stubbing, Inter and Roving Frames.
5. Spinning m/c.
6. Weaving m/c.
7. Finishing ni/c.
8. Flying shuttles. 8A Nip Accidents.
9. Other Miscellaneous textile m/cs.

Non-Textile Machinery and others:

101 Prime Movers
102 Shafting
103 Transmission m/c.
104 Lifting m/c.
105 Power Presses
106 Others
107 Circular Saws
108 Planning m/c.
109 Vertical Spindle moulding m/c.
110 Others
111 Rollers for calendar mixers etc.
112 Others
113 Power shunted Railways
114 Manually shunted Railways
115 Power driven vehicles
116 Manually handled vehicles
117 Electricity
118 Explosions
119 Fires
120 Gassing
121 Molten metal & Hot substances
122 M/c not moved by mechanical power
123 Others
124 Handtools
125 Struck by falling body
126 Falling from heights
127 Falling on the flats
128 Falling into pits etc.
129 Stepping on or striking against objects
130 Handling goods or articles
131 Others

Accident classification is required industry class wise. Therefore Industrial Classification should be seen together.

3.6 Industrial Classification. (NIC-1987):

Accident causation classification and classification should be studied together for data of industry wise and causation wise See Table 5.22 of Chapter-5.

National Industrial Classification (NIC) India, 1987 is a four digits classification of all industries in India and is extensively used to classify factories according to their manufacturing process or activity and to arrange them for national labour statistics.

3.7 Accident Investigation Report and its Content:

3.7.1 Types of Reports :

After analysis the next step required is to write a clear and purposeful report in the report form. Statutory forms viz. Form No. 21, 22 and 29 under the Gujarat Factories Rules should be filled in first and sent to the authorities within stipulated time. As these forms do not provide sufficient information for the purpose of accident causation, analysis, costing and preventive measures, new forms should be designed and utilised for internal use. Part 9 of Chapter-5 provides such detailed Accident Statistics Form and Accident Cost Form for above purposes. Part 12 of the same Chapter provides useful tables for keeping a purposeful record of safety statistics. Such report forms and records must be written clearly emphasising the detailed causation and consequences of accidents and their usefulness in searching remedial measures.

Some Accident Report and Analysis formats for internal use are given below.

Format 1: Incident / Accident Investigation Report

(To be submitted immediately after the incident)

Name & Address of the Factory: Sr. No. ____________
Date ______________

1. Contractor ____ Project : ______________________
____

2. Date of Incident ____________________________________ Time _________ Location _______

3. Event (a) Personal Accident _____________ ☐ (d) Pollution Contamination ☐
(b) Fire or explosion ______________ ☐ (e) Spillage / Gas Release ☐
(c) Mechanical Failure _____________ ☐ (f) Others ☐

4. Result (a) Injury _____________ ☐ (d) More loss of Mandays ☐
(b) Material Loss _____________ ☐ (e) Property Damage ☐
(c) Near-miss incident _____________ ☐ (f) Environmental Pollution / Others ☐

5. Name of the Injured : ____
Age ___________ Sex ________ I.D No. _____________________ Trade __________________
6. Hours at which he started work on the day of injury _______________________________
7. Description of Incident (Describe what the involved person was doing, Mention the exact location / area of incident and equipment)
____
____
____
____
8 Specify the injury (i.e. state the extent of wound/ fractures etc.)/ damage (Approx. Loss)
____
9 (1) If caused by Equipment / Machine give name _______________________________________
(2) State whether it was moved by mechanical power at that time ______________ Yes / No.
10. Where there any unsafe conditions ? ____
11. Whether any unsafe act was done by him ? ____
12. Protective clothing / equipment used ? What ? _____________________________________
13. Was he under influence of Liquor / Narcotics ? Yes/No.
14. (1) Whether job safety analysis was explained to him ? ______________________________
(2) Who explained it ____
15. How long will he remain away from work : ____
16. State whether the medical aid given to him ? ______________________________________
17. Probable causes of Incident ? ____
____
18. Describe what steps should be taken to prevent such recurrence in future __________________
____
19. Name of Witness : (1) Name ____________________________ Dept. ____________________
(2) Name ____________________________ Dept. ____________________
20. Name of Resident Engineer / Engineer-in-charge ____
Date _________________________ Signature _______________________________________

Format 2: Incident / Accident Investigation Report

(To be submitted immediately after the incident)

Name & Address of the Factory:

Sr. No. ____________
Date ______________

First Aid	Recordable Non Lost Time	Lost Time reportable

Fire	Spill & Leak	Near Miss Property Damage

1. Name of the injured person :
2. Contractor :
3. Plant/Section :
4. Employee Code No./Designation :
5. Age/Sex :
6. Date & Time of Incident :
7. Normal Working Hours :
8. Location of Indicent :

Area	Equipment No.	Name of Equipment

9. Type of Incident :
10. Nature of Incident :
11. Body part injured :
12. Extent of Material LOSS/Property Damage :
13. Details of Incident
    a. Sequential Occurrence Description :
    b. Activity of the injured at the time of Incident :
    c. Observations & Inference :
14. Conclusion:
    Probable Causes:
    a. Immediate causes:
    b. Basic/Root causes:
15. Preventive Measures :

Sr. No.	Recommendations	Action By	Date	Status
1.				
2.				

16. Evaluation :

Severity Potential			Probability Potential		
Major	Serious	Minor	Frequent	Occasional	Rare

17. Investigated By :

Fire & Safety Dept :
Plant concerned :

18. Discussed & Reviewed OR to be discussed & reviewed at
19. Copies for Action to :

Signature

Name & Designation

Format 3: Work Injury Investigation Report
(To be submitted immediately after the incident)

Name & Address of the Factory:

Sr. No. ____________
Date ______________

If not employed by Company, Contractor's Name & Address ______________________________

<table>
<tr><td colspan="12">Nature of Injury</td><td colspan="11">Parts of Body Affected</td><td>Struck against</td></tr>
<tr><td rowspan="8">Abrasion</td><td rowspan="8">Contusion</td><td rowspan="8">Laceration</td><td rowspan="8">Cut</td><td rowspan="8">Puncture</td><td rowspan="8">Sprain</td><td rowspan="8">Fracture</td><td rowspan="8">Foreign Body</td><td rowspan="8">Burns (chem..)</td><td rowspan="8">Chemical Exposure</td><td rowspan="8">REsp. system</td><td rowspan="8">Head & scalp</td><td rowspan="8">Face & Neck</td><td rowspan="8">Eye</td><td rowspan="8">Arms & Fore Arms</td><td rowspan="8">Hands & Fingers</td><td rowspan="8">Chest</td><td rowspan="8">Abdomen</td><td rowspan="8">Back</td><td rowspan="8">Thigh/Leg</td><td rowspan="8">Knee</td><td rowspan="8">Foot</td><td rowspan="8">Any other (Specify)</td><td>Struck by</td></tr>
<tr><td>Caught in</td></tr>
<tr><td>Fall from height</td></tr>
<tr><td>Slipped on ground</td></tr>
</table>

Category	Minor	Name : __________ E.C. No. ____________ Age : _______ Sex :___	
	Recordable Non lost time	Designation : ___________ Dept/Plant:_________ Section:__________	Contact with Chem.
		Date of Accident : __________ Time : _________ Place : ____________	
	Recorable Lost Time	Injured came on duty : Date : ______________ Time : ______________	Contact with Temp.

Description of Accident :	Arrived at Medical Centre at : __________ Hrs. Departure From Medical Centre at : _______ Hrs. Treatment Given :	Inhalation Ingestion
Exactly what the injured was doing :	Treatment at Medical Centre ( ) Yes ( ) No Referred to Hospital ( ) Yes ( ) No Fit for Duty ( ) Yes ( ) No	Machine Vehicles
If exposed to Chem.:____() Sligth ()Severe	If unfit, __________ Days w.e.f _____________	Tools
Name of the chemicals: ________________	Likely Loss Time ______________ Days/Hours Remarks (if any) :	Conveyors
State of Chemicals : () Gas () Liquid () Solid ( ) Hold () Cold ( ) Room Temp		Stairs/Ladder
Whether Safety Equipment was being used Yes No Safety Glasses ____ ____	Signature of the Medical Officer / Shift	Electric App. Chemical

Safety Shoes ____ ____		
Helmet ____ ____	Nurse ________________________	
Hand Gloves ____ ____	Name : ________________________________	
Face Shield ____ ____		
Gas Mask		Others (Specify)
PVC Clothing

Safety belt		
________		

Format 4 : Statutory Accident Forms:

(1) Under Gujarat Factories Rules 1963 - Form No. 21, 21-A, 22 and Sch. 6 u/r 68-J.
(2) Under MSIHC Rules 1989 - Sch. 6.

These statutory accident forms should be referred from the law books and should be sent within prescribed time limit.

Statutory Report:

A good management should keep a system of investigating and recording all injury cases-major, minor and all first aid treated cases-as well as cases of damage to property or environment. Accident Register (Form no. 29 GFR) and Health Register (Form No. 20 GFR) must be kept up-to-date. Accident Reports (Form No. 21 GFR) must be filled in details, attached with the detailed investigation reports, properly classified and filed.

Annual reports should also be prepared to compare the year to year performance. The reports should be reduced to simple charts, graphs or computer data. Safety bulletin may be prepared and circulated to read such data. Publication of typical accidents, their causes & remedial measures etc., accident rates, safely award winners etc. will promote safely and motivate people. Safety reports circulated among industries make them alert. Reports sent to the Government are useful to many industries, as the Government feeds such information to planners to help them to decide upon the course of action. It may be of State or National interest to discuss safety reports (from the Chief Inspector of Factories and others) in the Legislative Assemblies or the Parliament. Publicity of the abstract of safety reports through TV, radio, books and newspapers are also desirable.

3.7.2 Content of Accident Investigation Report:

An Accident Investigation Report (Remarks) should contain

1. Name and address of the factory.
2. Name and address of the investigator (inspector) and with whom.

3. Facts finding-including date, time, place and manner of the accident, persons involved, result, facts seen or known by the investigator, facts stated by the workers injured and the co-workers who saw the accident, facts stated by other persons and facts of judicial notice.
4. Drawings, photographs, sketches, records, registers, documents and computer printouts pertaining to the accident.
5. The process at the time of the accident.
6. The causes of the accident in details and with break-up.
7. The remedial measures.
8. The breach of law if any.
9. Compensation to be paid and information for insurance purpose.
10. The delivery of the report to whom and how.

The statements recorded should be enclosed. Such reports should be preserved till the legal cases are over and to use them for preventive purpose.

Primary responsibility to report accident lies upon the supervisor. First he will report to the management. The routine of reporting may vary according to the size and set-up of the plant and its organisation. The safety officer/engineer should go through the supervisor's report and should put his comment or notes. He may further inquire for his satisfaction or more details. The top management will report to the Government and should take keen interest in going through the report and to implement it. The safety officer's report should include trend of injury rates, total time lost, cost of the accident and his suggestion to improve safety and to save unwanted cost.

3.8 Methods of Collating and Tabulating Data :

For analysing a small number of reports the tabulation by hand sorting and tallying is efficient. Its advantage is that the original records are being used and all the information is available for reference.

For analysing and filing a large number of reports, keysort cards may be used. This card contains the information of the original report. The code numbers assigned to the various factors may be punched in the cards so that they can be sorted by a special needle. Sorting is a hand operation.

A third method of tabulation uses card tabulating machine. Here the code numbers only are punched into the cards which can be quickly and accurately arranged into various groups. This methods is very useful when the number of reports is very large, when many classification and cross or sub classifications are required or when tabulation of numerical data such as days lost etc. are necessary.

Modern method of computer processing can also be utilised for such tabulation. See part 13 of Chapter5 for management information system (MIS).

3.9 Follow-up for Corrective Action :

Merely obtaining, recording and tabulating of safety data is of no use. It must be followed by necessary corrective action to provide safe working condition, to teach safe working actions, to improve existing training system,, to make new safety rules necessary to improve inspection techniques and analysis to design -posters, safety manual and positive actions to minimise accidents.

Follow up action must be and should consider every compliance. Reasons of prompt and immediate recommendation for not following the recommendation or delays necessary to make changes should be explained. The accident causation should be applied to all identical cases in other departments also to prevent similar recurrences.

3.10 Record Keeping :

Record of accidents reported to the plant management and to the Government authorities, facts collected as a result of investigation, analysis of the facts, conclusion about remedial measures necessary and status of implementation of those measures must be kept in a well documented form. Computer is more useful in this regard. In DCS system, printouts of accident situations at the time of accident should be kept out and preserved.

Safety department should design formats of safety records applicable to the factory, train personnel to fill such records and maintain them.

Records keeping may be ordinary or computerised and in much details. Good record is always useful for

1. Studying past accident causes and remedial measures concluded.
2. Monitoring status of implementation of safety measures.
3. Taking decisions regarding future action in the matters of safety.

Period of maintaining record should be decided depending on the utility of the subject matter.

4. HAZARD AND RISK ASSESSMENT TECHNIQUES:

This subject requires clear understanding of definitions and difference between hazard and risk, analysis and assessment etc.

4.1 Hazard, Risk & Detection Techniques:

For definitions of hazards and risks see parts 3.34 and 3.75 of Chapter 2.

Risk results from hazard i.e. an unsafe condition, action or .situation. Risk is the probability of frequency of hazards during a certain period (e.g. 2 explosions per year, 20 fires per year, 5 accidents per month, 200 fatalities per year, I disaster per 10 years etc.). Therefore if hazard is identified and 'removed first, risk is automatically reduced.
Some definitions are as under:

Hazard is the inherent property of a substance or unsafe condition, unsafe action or situation to cause harm which may cause human injury, damage to property or the environment or some combination of these criteria.

Chemical Hazard is a hazard due to chemical (including its storage, process, handling etc.) and it is realised by fire, explosion, toxicity, radiation etc.

Risk is the likelihood, chance, frequency or probability of an undesired event (i.e. accident, injury or death) occurring within a specified period or under specified circumstances and its severity, effect or consequences.

As per example risk of death for a man aged 30 is $1x10^{-3}$ per annum and that for a man aged 60 is 1×10^{-2} per annum.

This means death possibility of a man aged 30 is I out of 1000 per year, while that of a m<in aged 60 is I out of 100 per year. Risk unit '1×10^{-n} means 1/10" i.e. one time event out of- 10^{n} such occurrences during a period (e.g. I year).

Individual Risk is the frequency at which an individual may be expected to sustain a given level of harm from the realisation of specific hazards.

Societal Risk is a measure of the chances of a number of people being affected by a single event or set of events and is often presented as f/n curves, (i.e. frequency v/s number of people affected).

Almost all human activities involve some risk and zero risk is not possible. Therefore the concept of Acceptable risk is developed and Fischoff defines it as 'the level which is good enough where the advantages of increased safety are not worth the extra costs of reducing risk'. Thus it indicates the balancing condition of accident costs v/s preventive costs. Hazard and Risk distinguished:

For example, banana skin lying on the road is a hazard but 2 persons falling per hour due to that, is a risk. Non-provision of safe overflow pipe is a hazard but weekly overflowing of the tank due to that, is a risk. Process of sand blasting is a hazard but contracting of silicosis by a worker at any point of time, is a risk. Storage of toxic gas is a hazard but due to its escape and effects, probability of deaths of 100 persons per 10 years, is a risk. Not providing a 'safety valve is a hazard but bursting of vessel once In 5 years, is a risk. Bad housekeeping is hazard but 2 accidents per month or 20 workers leaving the job every year due to it, is a risk.

Thus identification, analysis and assessment of hazards are different than the identification, analysis and assessment of risks, though both are interrelated. Factors of tune, frequency or ill effects (consequence) are added in 'risk' distinguishing it from 'hazard'.

Some definitions relevant to risks are as under :

1. **Exposure to Risk :** A situation created whenever an act or omission gives rise to possible gain or loss that cannot be predicted.

2. **Cost of Risk :** The cost imposed upon organisation because of the presence of risk. Its component parts are (1) the cost of losses that do occur and (2) the cost of uncertainty itself.

3. **Risk Management :** A general management function that seeks to identify, assess, address, control and review the causes and effects of uncertainty and risk on an organisation. It includes assessment, control, financing and administration of risk as defined herein below.

4. **Risk Analysis :** Technical process of identifying, understanding and evaluating risk (analysing cause and effect wise).

5. **Risk Assessment :** It is a judgement of significance or activities that enable the risk manager to identify, evaluate and measure risk and uncertainty and their potential impact on the organisation.

   This judgement can be taken when the measured value of hazard or risk is compared with the value or standard legally or otherwise prescribed. This calls for an expertise of an industrial hygienist.

6. **Risk and Uncertainty Assessment :** All activities associated with identifying, analysing, measuring, comparing and concluding risk and uncertainty.

7. **Risk Control :** All activities associated with avoiding, preventing, reducing or otherwise controlling risks and uncertainties.

8. **Risk Financing :** Activities providing means of reimbursing losses (i.e. finance for the cost of risks and losses) that occur and that fund other programmes to reduce risks and uncertainties.

9. **Risk Administration :** Activities and strategies associated with the long-term and day-to-day operation of the risk management function.

10. **Risk Selection :** The control technique best described as the conscious acceptance of risk in accordance with an organisation's overall goals, objectives and risk taking philosophy.

11. **Risk Avoidance :** A risk control technique whereby a risk is proactively avoided or abandoned after rational consideration.

12. **Loss Prevention :** Those strategies and activities intended to reduce or eliminate the chance of loss.

13. **Loss Reduction :** Activities minimising the impact of losses that do occur.

14. **The Risk Chain :** Five elements or links connected with accident i.e. hazard, environment, interaction, outcome and consequence.

15. **Subrogation :** Risk transfer by legal document as a loss reduction tool.

16. **Risk Transfer :** If risks cannot be controlled, the last resort is to transfer the risk by contract of job, or property or insurance to pay for losses.

17. **Risk Retention :** A risk financing method in which the organisation experiencing a loss retains the risk by self financing or borrowed funds, or by a group to which the organisation belongs. Retention may be passive or active, unconscious or conscious, unplanned or planned.

18. **Information Management** (as a risk reduction tool) : The use of information for the express purpose of reducing uncertainty or for enhancing stakeholder awareness or knowledge of organisational risks.

Hazard detection techniques :

Unsafe acts and unsafe conditions must be observed to find out hazards. Statutory accidents reports (e.g. Form 21 & 29 GFR) should be seen to detect past accident causes. Unsafe acts due to psychological and physiological personal factors should be detected as explained in Chapters 3 and 4. Hazards of unsafe conditions are mechanical, electrical, chemical (including radiation) and environmental. Some hazards are visible and some invisible.

Visible hazards can be detected by various techniques such as (1) Plant inspection based on statutory requirement, checklist, safety survey, safety audit and safety sampling (2) Detection and monitoring systems (3) Functional test of machinery and equipment (4) Accident investigation (5) Repair shop (6) Store consumption and (7) Shop feed back etc.

Examples of visible hazards are unguarded machinery, bad housekeeping, wrong practices etc. To discover such hazards careful planning and inspecting system is necessary. Some steps are : (1) Make a list of all statutory applicable provisions of the Factories Act and other Acts, make a survey of the plant to compare the existing provisions and find out the missing provisions (hazards) for implementation (2) Make a list of materials, processes, operations, vessels, equipment, machinery and classify them as hazardous and non-hazardous. Chemicals should be classified according to their hazardous properties. (3) Prepare layout of plant, machinery, equipment, premises and utility services like power, water, air, gas and heating / cooling media. From these prepare a list of possible hazards. (4) By means different techniques mentioned in Part I and 2. Further details of the hazards should be detected and (5) By means of a detailed inspection report preventive measures should be suggested.

Invisible hazards like gas leaks, concentration of toxic and hazardous vapour, malfunction or failure of machinery, equipment, pressure plants and miscellaneous environmental factors may cause sudden accident and heavy damage. They must be detected and controlled by built in self corrective systems. The devices used are detectors, recorders, alarms, trips, probes, sensors, limit switches, meters, analysers, electronic or auto controls, scrubbers, incinerators etc.

In modern machines various automatic movements take place near and around point of operation. Feeding devices, clamping action and work head movements should be interlocked with each other. Each position of these elements must be sensed and linked with command controls. Any malfunction of moving elements is indicated on audio-visual panel and the machine stops.

Repair shop data reveals clues to unsafe conditions like poor design, defective material, poor construction, wear and tear etc. Repetitive repairs indicate major hazards. Similarly store consumption data also indicates some defects. There should be a regular feedback of information from repair shop, stores, operators and foremen to monitor hazards and to take corrective actions.

Heating equipment should have temperature controllers and additional thermostats for better protection and to give audio-visual signals and to cut off power supply or heat source. In furnaces using flammable fuel in scaled chamber, the components are charged through hydraulically operated carriages and such carriages, fuel flow and flame curtain are sensed by various gadgets like photo-sells, probes, limit switches etc. Failures are sensed and indicated o panel. Suitable corrective actions are automatically taken viz. purging nitrogen etc. Toxic exposures are neutralised by scrubbers. Flammable exposures are controlled by flameproof fittings, flare and vents. Effluents are treated in 'treatment plants to nullify their harmful effects.

4.2 Hazard and Risk Progression Chart:

Process of Risk Management in six stages is explained below in a progression chart

Hazard and Risk Study Progression Chart

Stages of hazard and risk studies	**Hazard identification**	**Hazard analysis**	**Risk analysis**	**Risk assessment**	**Risk management**
1. Identification of source of hazards and their causes.	Qualitative (i.e. HAZOP)				
2. Analysis of mechanism of hazard occurrence. 3. Analysis of terminal consequences of hazards.		Qualitative (i.e. HAZOP)			
4. Probability or frequency of a hazard			Qualitative	Usually Qualitative	Mixture of

occurring and thence an estimation of risk.	
5. Judgement of acceptability of risk against social, political or local criteria.	
6. Making decision and establishing ownership of action and monitoring to contain within limits of criteria.	

1. Hazard Identification (Identify sources and causes of hazards).
2. Hazard Analysis (Analyse how hazards will occur and affect).
3. Risk Analysis (Estimate risk i.e. hazard occurring per unit time).
4. Risk Assessment (Compare the risk with acceptable criteria - legal, social or political - and decide whether the risk is lesser or higher than that criteria), and
5. Risk Management (Form organisation to carry out above exercises and to monitor, control, review and keep the risks within permissible limits).

A stage of 'Hazard 'Assessment' is also possible after hazard analysis. When hazard is compared with its standard prescribed e.g. noise level, light, air flow or chemical exposure (TLV, STEL, LD/LC etc.) is compared with their statutory values or Indian Standards and inference is drawn about their difference (measured value- prescribed value), it is called hazard assessment.

4.3 Risk Analysis, Assessment and Management:

Procedure of Risk Management is Stated below which includes Risk Analysis and Assessment.

(A) Five Steps as per HSE (U.K.) guidelines (Qualitative):

1. Look for the hazards.
2. Decide who might be harmed and how.
3. Evaluate the risk and decide whether the existing precautions are adequate or whether more should be done.
4. Record your findings.
5. Review your assessment and revise it if necessary.

These steps suggest simple method of Risk Assessment for any hazardous activity.

It is qualitative only. No factor is quantified. Effect of control measures is taken into account.

(B) Five steps as per Defined Risk Assessment Methodology (Qualitative and Quantitative):

1. Identification of sources of hazards and their causes. It is qualitative, e.g. HAZOP.
   This step is known as "Hazard Identification"
2. Analysis of
   (i) Mechanism of hazard occurrence and
   (ii) Terminal consequences of hazards.
   This is quantitative e.g. HAZAN. Consequence analysis quantifies concentration, deaths, injuries and damage, (e.g. damage distance and effect).
   This step is known as "Hazard Analysis".

3. Probability, frequency or likelihood of hazard occurring and thence an estimation of risk.

This is also quantitative as it depends on failure rates, number of chances or cycles and reliability engineering.

This step is known as "Risk Analysis".

4. Judgment of acceptability of risk against legal, social or political criteria.

Here measured value of hazard or calculated risk is compared with permissible safe limit (e.g. Sell. 2, Factories Act, GPCB norms etc.) and then inference is drawn whether hazard or risk is higher or lower than the permissible safe limit or standard.

Therefore, this is usually quantitative.

This step is known as "Risk Assessment".

5. Decision making and taking control measures to prevent, reduce or transfer the risks, by short and long term planning.

This is a mixture of qualitative and quantitative criteria.

This step is known as "Risk Management".

Risk or Safety Manager should assist the top management in this regard.

(C) Types or Methods of Risk Assessment:

1. Simple or Qualitative Risk Analysis:

It is an identification of hazards and taking appropriate control measures.

It is as per Five steps explained in para (A) above.

Here quantification of hazards and their terminal consequences (damage distances, severity of injury or loss etc.) are not worked out.

It is sufficient to think about the adequacy of existing control measures vis-a-vis hazards identified and to adopt more safety measures if necessary.

Its important aspect is to consider the effect of control measures provided (in place) and to think for the 'Residual Risk' and 'Residual Control Measures' only.

2. Quantitative Risk Assessment:

Here hazard potential is quantified, possible risk is also determined if failure rate data available and then it is compared with the 'permissible standard'. This will indicate whether calculated risk is lower or higher than the permissible limit. Based on this, new control measures or modification in existing control measures can be decided.

Values of following 'Hazard potentials' can be quantified

1. Properties of the material.
2. Storage parameters.
3. Process parameters.

4. Manual exposures.
5. Visible or measured hazards.
6. Transportation hazards.
7. Pollution hazards.

These values give 'severity' part of the risk.

Similarly values of "Control Measures provided" can be quantified depending on the poor controls to the best controls.

Proper classification of good, better and best control measures, is necessary. These values give 'probability' part of the risk.

Then by using the formula. Risk = Severity x Probability, the existing risk level can be calculated and identified as low, high, higher or highest risk.

This method is useful to carry out 'material wise' risk assessment. This method and other methods using ranking matrix are used to carry out 'activity wise' risk assessment also.

3. Other Methods

There are two methods:

(1) Method based on the formula of Risk R = Probability x Severity. This method is mostly useful for assessing risks to workers in the factory. Hazards are considered material wise or activity and sub activity wise.

(2) Method based on computer model. This method is mostly useful for accessing risks to public in vicinity. Gas dispersion models are used and toxic concentration or / and heat radiation [1]ect or / and explosion over pressure effect at different distances (damage distances) are calculated.

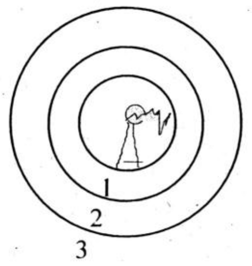
Here it is assumed that if all or some control measures may fail, what would be the highest risk (mostly to public) in terms of toxic effect, fire, explosion or BLEVE effect and at what distances.

This calculation is very complex, needs 'source strength calculation', leak hole or release dimensions, mass released or release rate, wind speed, weather conditions and classification, path obstructions or sinking mechanism, dispersion calculation and use of computer models. Safety, Phast, Aloha, Cirrus, Archie, IIT-Kanpur, Whazan, Effect etc. are such computer models for assessment of this type of risks. Lastly foot prints and risk counters are to be interpreted. Risk counters plotted on geographical plot plan can give Arial view of the area likely to be affected and decision for evacuation or stay-in condition.

Main purpose of this type of risk assessment is to assess the risk to the Public and to make Off-site Emergency Plan based on those risks.

(D) Risk Counters (foot prints):

In case of toxic dispersion, normally three zones are considered. The inner most or zone-I contains the highest concentrations of leaking gas wherein maximum fatality/injury can be predicted. No



entry or no rescue operation may be possible there. Then in intermediate or zone-2, evacuation becomes most necessary and must be carried out at the earliest possible otherwise great fatalities or/and injuries may result. This is the target area of emergency planning and rescue activities. But in doing so, use of necessary personal protective equipment and vehicles is to be done very carefully. The outermost or zone-3 is a safe zone but it can be affected also if dispersion aggravates or lasts for a longer time. Therefore alert and warning action is required in this zone. People must be advised to go away by their own arrangement and should be helped if necessary.

Use of risks counters is useful in On-site and Off-site Emergency Plans for the judgement of area likely to be affected and emergency preparedness for evacuation and other emergency activities.

(E) Risk Control Measures or Elements of Risk Management:

They are as under:

(a) Mission Identification:

1. Establishing risk management policies and procedures.
2. Risk communications.
3. Management of contract portfolios.
4. Claims supervision.
5. Reviewing, monitoring and evaluating the risk management programme.

(b) Risk and Uncertainty Assessment:

1. Hazard, identification.
2. Risk analysis.
3. Risk measurement.
4. Risk assessment.

(c) Risk Control:

1. Risk avoidance.
2. Risk or Loss prevention.
3. Risk or Loss reduction.
4. Information management.
5. Risk transfer. (Contract).

(d) Risk Financing:

1. Risk retention.
2. Risk transfer (Insurance).

(e) Programme Administration:

1. Day to day or short term planning.
2. Long term planning.

Risk Management Activities:

Basic steps of Risk Management are :

1. Identify the Hazards,
2. Analyse the Risk.
3. Select and Evaluate Remedies.
4. Implement any necessary Safeguards.

5. Audit & Review if necessary.

Risk control also includes methods to improve understanding or awareness within an organisation of activities affecting exposure to risk.

Risk reduction activities can be focused On-

1. Altering or modifying the hazard.
2. Altering or modifying the environment in which the hazard exists.
3. Intervening in the processes whereby hazard and environment interact, e.g. fire walls within a structure to separate fire-prone area from other area, shock absorbers to stop transfer of vibrations, silencers to stop transfer of noise, insulation to stop transfer of heat or electricity etc.

If however, risks cannot be controlled, the last resort is to transfer the risk by contract of job or property, or insurance to pay for losses. Risk transfer offers complete protection for the transferor. The burden of risk falls completely on the transferee. In case of accident causing injury, death or damage to property, money can compensate the financial losses but not the pain, suffering and loss to families. Thus risk transfer cannot eliminate all effects of risk. Engineering risk control is the only best remedy.

Risk Managers' duties include

1. Assisting organisation in identifying risks.
2. Implementing risk control programmes.
3. Reviewing contracts and documents (e.g. safety audit, emergency plan, safety reports etc.) including insurance for risk management purposes.
4. Providing education arid training on safety matters.
5. Implementing statutory provisions.
6. Arranging non-insurance financing schemes (e.g. self-insurance or captive insurance subsidiaries).
7. Claims and litigation management.
8. Designing and co-ordinating employee benefit programmes.

4.4 Preliminary Hazard Analysis (PHA) and Hazard Analysis :

This is an initial study to determine hazard causes, effects and controls. Facts of proposed product, process or operation are to be known to determine hazards. For example, for the product using electric power the hazards to be presumed are: electric shock, burns, fire, sparking, hot surface, inadvertent starts of equipment, failure of the equipment to operate at a critical time to cause accident, radiation effects, electrical explosions etc. Similarly adverse effects of foreseeable causes like chemical exposures, reactions, acceleration, mechanical effects, pressure etc. can be listed. Then appropriate remedies are selected and applied.

Since the PHA is fast, cost effective and not complicated like other methods of hazard assessment, it should be adopted as the first step. Its basic steps are as under:

1. Assume a type of accident or hazard possible (e.g. fire, explosion, toxic release, finger cutting etc.)
2. Find out which plant component, system or machine can cause this accident (e.g. storage vessel, reactor, pipeline, circular saw etc.).
3. Find out the event (result) initiating the hazard or accident (e.g. release of explosive or toxic gas, runaway reaction, leakage, running without guard etc.).

This will naturally suggest the corresponding safety devices (safety valve, rupture disc, alarms, gauges, guards, interlocks, trips etc.).

The component system or part in step-2 can then be further examined and analysed for details of failure and how to remove them.

This study indicates which system is more or less important from major hazard point of view and to limit the assessment to priority problems and screening less important ones.

Preliminary hazard identification is required at different stages of project as under :

1. R & D : Chemicals, reactions, impurities and pilot plant.
2. Pre Design : Hazard indices, hazard studies.
3. Design : Process design checks, HAZOP, Failure mode and effects.
4. Commissioning : Safety audits, mechanical commissioning tests, NDT, emergency planning.
5. Operation : Condition and corrosion monitoring.

PHA is generally used for early identification of hazards. It is based on -

Raw materials	Operating environment
Intermediates	Operations
Final products	Other facilities
Plant equipment	Safety equipment etc
Interface among system components.	

For Hazard Analysis see Part 3.35 of Chapter 2. Based on this definition detailed analysis should be carried out.

4.5 Failure Mode and Effect Analysis (FMEA) :

This procedure considers each component of a plant in turn and all possible failure modes and rates and their consequences. The results are recorded in a standard format. HAZOP study is a well developed form of FMEA.

It is a process of hazard identification where all known failure modes of components or features of a system are considered in turn and undesired outcomes are noted.

It is a tabulation of system/plant equipment failure modes. -Each failure mode assigns critical ranking. Human error/ operational error is not generally examined in FMEA.

This is the method derived from reliability engineering. A product or a piece of complex equipment is divided in its components and each component is studied to know how it can fail, at what rate and what could be the effect on it or on the other components. Failure rates of each item are determined and listed. The method is used to determine satisfactory operational life of an equipment, how failures might occur, modes and frequencies of failure and the necessity for proper and timely maintenance and replacements. This knowledge can be used to improve the life and quality of the product. Thus it is primarily more useful to a manufacturer than its user.

FMEA has its own limitations. Data of failure rates and calculations for failure frequency must be correct. The method cannot analyse the problems created by bad design, adverse environment and operators' errors.

FMEA consists of imaginatively Constructing every conceivable situation that could arise with the component, including its designed failure point (life expectancy) and its effect on related components. Considerable imagination with much experience is needed to foresee how a component of the system can cause an unwanted occurrence.

Failure Effect Analysis can be tabulated as under:

Item No.	Assumed Failure	Possible Causes	Symptoms	Consequences
1	2	3	4	5

Compensating provision	Effect on	Probability of occurrence	Failure classification	Remarks
6	7	8	9	10

In above table, compensating provision identifies what should be done to avoid the consequence of the assumed failure.

Probability of occurrence is the average elapsed operating time before a failure of the assumed type will occur.

Probability of occurrence can be expressed in terms of average time between failures as under :

Probable :	1 failure before 10000 hours of operation.
Reasonably Probable :	1 failure during 10001 to 100000 hours of operation.
Remote :	1 failure during 100001 to 10 million hours of operation
Extremely remote :	1 failure after 10 million hours of operation

Failure frequency data is difficult to obtain. It is obtained from two types of testing of component i.e. performance test or reliability test.

Failure classification distinguishes between the possible effects of the assumed failure. A four-part classification is safe, marginal, critical and catastrophic indicating increasing severity.

4.6 Hazard and 0perability(H AZOF) Study:

See Part 3.40 of Chapter-2 'for basic discussion. HAZOP is defined as 'The application of a formal systematic critical examination to the process and engineering intentions of the facilities to assess the hazard potential of mal-operation or malfunction of individual items of equipment and the consequential effects on the facility as a whole'.

In HAZOP a multidisciplinary team searches deviations from design intent through fixed sets of guide words or checklists or knowledge.

HAZOP can be conducted to check the designs or operating procedures for a new project or an existing one. It can also be conducted to improve safety of existing facilities. 'It is also useful before implementing significant modifications or for other operational or legal reasons. After carrying out the Preliminary Hazard Analysis (PHA) as explained earlier, the plant component, system or machine/

equipment part which can cause 'major hazard' becomes known to us. Now to find out deviations or malfunctions leading to such event and its mode of operation, HAZOP helps us. Thus HAZOP is complimentary to PHA.

HAZOP study is carried out to determine deviations from normal operation and operational malfunctions which could lead to uncontrolled events.

Although the HAZOP study was developed to supplement experience-based practices when a new design or technology is involved, its use has expanded to almost all phases of a plant's life. It is based on the principle that several experts with different backgrounds can interact and identify more problems when working together then when working separately and combining their results.

Therefore HAZOP study is performed by a multidisciplinary expert group always including workers familiar with the installation.

The examination procedure takes a full description of the process, systematically questions every part of it to discover how deviations from the intention of design can occur and decides whether these deviations can give rise to hazard.

Each part of design is analysed with questions formulated around a number of guide words, which ensure that the question posed to test the integrity of each part of design will explore every conceivable way in which that design could deviate from design intention and then each deviation is considered for what the consequences it could lead to. The potential hazards are noted for remedial action. Trivial or meaningless consequences are dropped out.

Stages at which HAZOP can be carried out are

1. At an early stage of development to decide the site and identify major hazards.
2. At design freeze stage i.e. when design is completed and construction is to be started.
3. At pre-start-up stage i.e. when construction is completed and the operation is to be started.
4. Studies on existing plants.
5. Studies prior to plant modification.
6. Studies prior to taking a plant, out of service.
7. Studies on research facilities.

Procedure for HAZOP study follows the sequence(1) Define objective and scope (2) Select the team (3) Prepare for the study (4) Carry out the examination (5) Follow up and (6) Record the results.

The objectives may be (1) to check a design (2) to decide whether and where to build (3) to decide whether to buy an equipment (4) to obtain a list of questions to put to a supplier (5) to check running instructions and (6) to improve the safety of existing facilities etc.

The team may be composed of Mechanical Engineer, Chemical Engineer, R & D Chemist, Production Manager, Project Manager, Instrument/ Electrical Engineers, Civil Engineer etc. The team should not be too large. The team is headed by an experienced specialist from works management or by a specially trained consultant.

After examining one part of the design and recording potential hazards if any, the study proceeds to examine the next part of the design and it is repeated until the whole plant has been studied.

The Preparative Work includes four stages (1) Obtain the data (2) Convert the data into a suitable form (3) Plan the sequence for the study and (4) Arrange the necessary meetings.

After discovery of a hazard, follow-up action becomes necessary. There may be a number of possible actions. Generally they are of four types :

1. Change in the process (material, recipe etc.).
2. Change in process conditions (pressure, temperature, flow etc.).
3. Alteration to the physical design including safety guarding.
4. Change of operating methods.

While choosing between such possible actions, two categories become relevant :

1. Those actions which remove the cause of hazard.
2. Those actions which reduce the consequences.

Obviously the first category is first preferable. But then the study should be carried out at design stage to execute it at the minimum cost and better integrity.

Suppose the hazard is 'sudden evolution of gas and pressure due to it'. For this, four actions are possible -

1. Change the material to eliminate the possibility of gas generation.
2. Change the process condition (e.g. cooling, catalyst, low temperature, temperature control and Cut off etc.) to control the gas generation.
3. Provide safety valve/rupture disc and vent for safe discharge.
4. Provide personal protective equipment.

Action-I is 100% effective and should be die first choice. Action-2 may be selected, if Action-1 is not possible and reliability of the control system is good. Action-3 may be selected, if Action-2 is not possible and effective only if the vent and dump-vessel can be designed to cope with the full discharge. Action-4 is the last resort if Action-I, 2, 3 are not possible or not effective.

Recording needs 'hazard file' containing

1. Copy of the data as under :.
   (1) Process description, process flow diagram, material and enthalpy balances.
   (2) Piping and instrumentation diagrams.
   (3) Process equipment layouts - plan, elevation and section.
   (4) Operating manual.
   (5) Safety manual.
   (6) Vendor information (P & I diagrams).
   (7) Equipment specification sheets.
   (8) Piping specifications.
   (9) Plot plan.
   (10) MSDS for materials.
   (11) Any reports on safety reviews.

Copies of such documents should be marked by the team leader slating that they are examined.

2. Copy of all the working papers, questions, recommendations, redesigns etc. produced by the team and others as a result of the study.

The file should be retained on the plant and a report be prepared for the guidance of the managers.

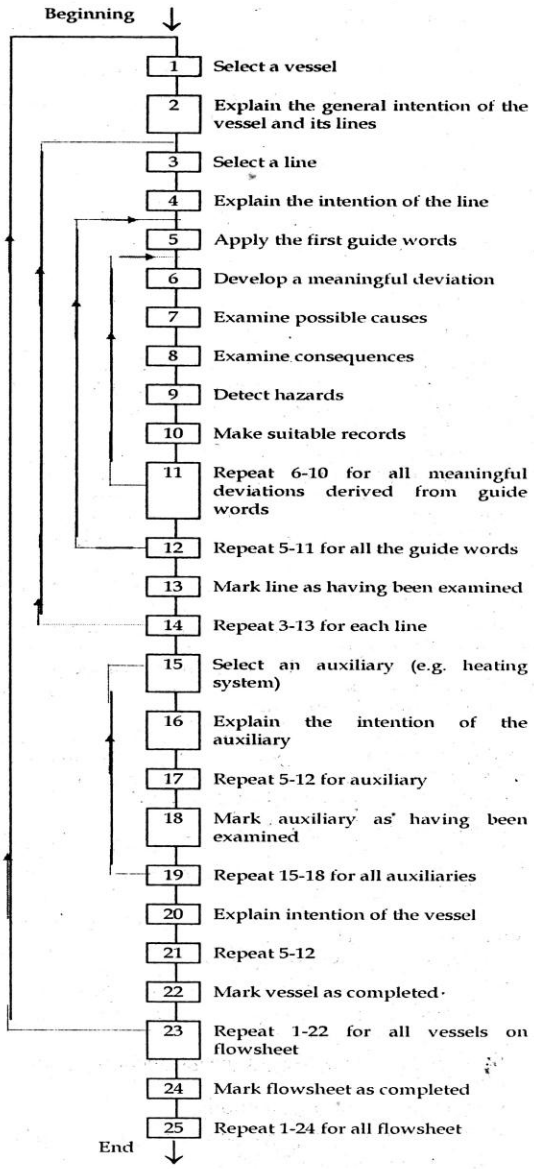
Guidewords used in HAZOP are given below.

A List of some Guide Words

Guide Words	Meanings	Comments
NO or NOT	The complete negation of these intentions	No part of the intentions is achieved but nothing else happens.
MORE LESS	Quantitative increases or decreases	These refer to quantities + properties such as flow rates and temperatures as well as activities like 'HEAT' and 'REACT'.
AS WELL AS PART OF	A qualitative increase A qualitative decrease	All the design and operating intentions are achieved together with some additional activity. Only some of the intentions are achieved; some are not.
REVERSE OTHER THAN	The logical opposite of the intention Complete substitution	This is mostly applicable to activities, for example reverse flow or chemical reaction. It can also be applied to substances, e.g. 'POISON' instead of 'ANTIDOTE' or 'D'' instead of 'L' optical isomers. No part of the original intention is achieved. Something quite different happens.

A Sequence of Study proceeds as follows.

Sequence of HAZOP Examination



Various methods for HAZOP studies are described by DOW Safety Guide, HAZOP studies by ICI, by Chemical Industry Safety and Health Council (CISHC), by Kletz, Gibbsen, Lawley and other experts. The basis of studies may be a word model, a process flow sheet, a plant layout, fault free technique etc.

See Reference No. 29 for more details.

4.7 Hazard Ranking (DOW & MOND Index):

This is a method of identifying and ranking of hazards present in a process plant. It was developed by Dow Chemical, USA and is usually known as Dow Fire and Explosion Index. ICI improvement on this is known as Mond Index.

The index provides weightage for inventory, flammability, reactivity, toxicity and hazards due to reaction exotherm, operating condition, corrosivity, plant drainage, access, rotating equipment, leaky joints etc.

The ranking indicates damage radius, maximum probable property damage (MPPD) and maximum possible days outage (MPDO).The ranking is useful for decision making, for example, it shows why protection is more extensive in LPG storage sphere than LPG reflux drum.

DOW and MOND Index:

Various hazard indices have been developed to (1) Qualify the expected damage due to fire, explosion or toxicity (2) Identify the equipment that would create or escalate an accident and (3) Communicate such risk potential to management to take necessary remedial measures e.g. increasing separation distance, erecting a blast wall or fireproof construction and revision of fire fighting and gas control facilities. '

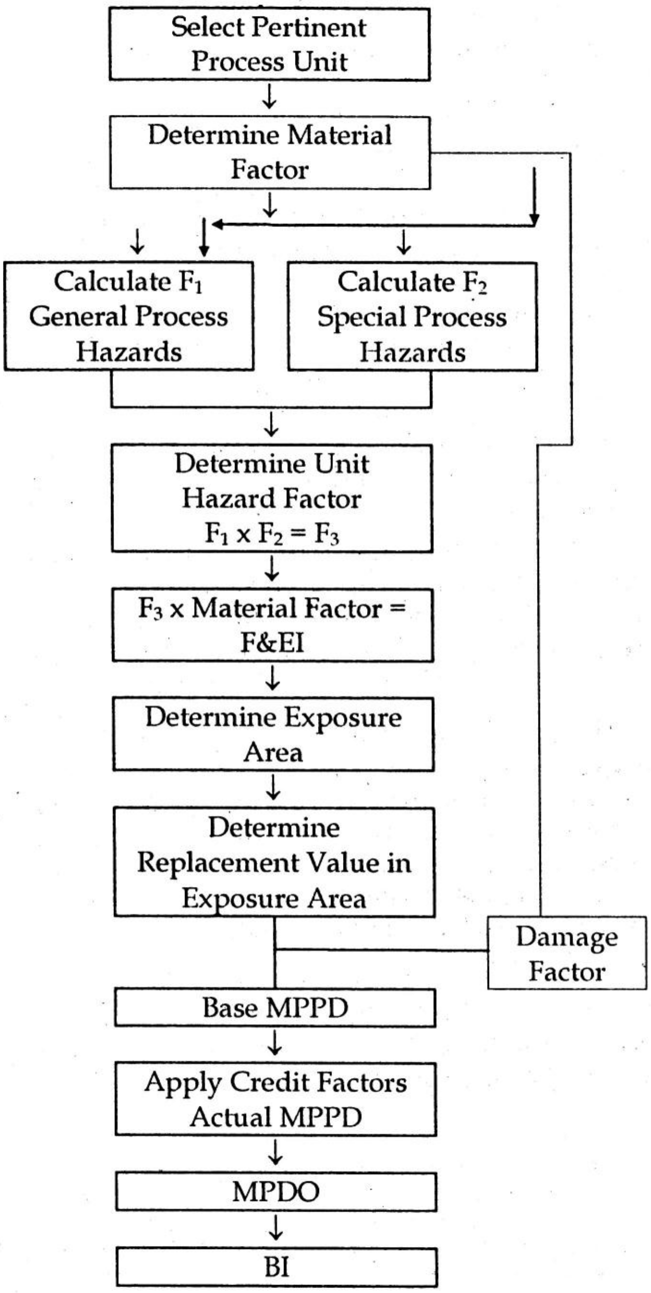
The most famous and widely used hazard index is the Dow Index developed by the Dow Chemical Company of USA since 1964. The MOND Index is an extended Dow Index based on the similar methodology with an useful extension e.g. to estimate fire load of an area and a unit toxicity index.

In the first three editions the methods of determining the Fire and Explosion Index (F & El) were developed and in the fourth edition, the method of calculating Maximum Probable Property Damage (MPPD) from the F & El was suggested and a Toxicity Index (n) was introduced. For details the Company's Guide has to be referred.

To develop an F&EI and risk analysis summary, we need -

1. An accurate plot plan of the plant.
2. A process flowsheet.
3. An F& El Hazard Classification Guide.
4. An F& El Form.
5. An Unit Analysis Summary.
6. A Plant Risk Analysis Summary, and
7. A cost data for the installed process equipment under study.

A schematic diagram of procedure to calculate F & El, MPPD, MPDO (Maximum Probable Days Outage) and BI (Business Interruption loss) is shown below.



As revealed from the figure, the procedure for assessment is summarised as under

1. Identify on the plot plan any Process Units that are considered pertinent to the process and that would have the greatest impact on the magnitude of a fire or explosion.
2. Determine the Material Factors (MF) for each process unit. It can be calculated from flammability and reactivity, or from its ready table (some figures are given below).
3. Evaluate each of the contributing hazard factors listed on the F & El Form, under 'General Process Hazards' and 'Special Process Hazards' and apply the appropriate penalties. This will give F_1 and F_2.
4. Unit hazard factor $F_3 = F_1 \times F_2$. This gives the degree of hazard exposure of the process unit. From the chart, using unit hazard factor with the MF to determine Damage Factor (DF) which represents the degree of loss exposure.
5. F & El = MF x F,. From the chart, by using F & El, Area (radius) of Exposure surrounding the process unit can be determined.

6. Determine the Rupee value of all equipment within the Area of Exposure. This value is used to obtain the Base maximum Probable Property Damage (Base MPPD).
7. The Base MPPD can be reduced to an actual MPPD by applying various Credit Factors and/ or 'by relocating certain high value equipment outside the Area of Exposure.
8. Actual MPPD is used to obtain MPDO, from which Business Interruption (BI) can be calculated.

Material Factor (MF) is the basic starting value in the computation of the F & El and other risk analysis values. It is a measure of the intrinsic rate of potential energy release from fire or explosion produced by combustion or chemical reaction.

The MF is obtained from N, and N, the NFPA signals expressing flammability and reactivity (or instability) of a material at ambient temperatures. As fire and reaction hazards increase with temperature, 'Temperature Adjustment of MF' is also required. In case of mixture, normally the MF of the component with the highest MF value is considered.

The MF is a number in the range from I to 40 and higher number indicates higher hazard. MF and Heat of combustion H_C of some common chemicals are given in following table :

MF & H_C Values

Chemical	MF	HcBTU/lb
Acetaldehyde	24	10500
Acetone	16	12300
Acetonitrile	24	12600
Acetylene	29	20700
Acrylonitrile	24	13700
Ammonia	4	8000
Benzene	16	17300
Bromine	1	0
Butane	21	19700
Carbon disulphide	16	6100
Carbon monoxide	21	4300
Chlorine	1	0
Ethyl alcohol	16	11500
Ethylene	24	20800
Ethylene oxide	29	11700
Formaldehyde	21	8000
Gasoline (petrol)	16	18800
Hydrogen	21	51600
Hydrogen sulphide	21	6500
Methyl alcohol	16	8600
Naphtha	16	18000
Nitrobenzene	10	10400
Nitro-glycerine	40	7800
Phenol	10	13400
Sulphur	4	4000
Sulphur dioxide	0	0
Toluene	16	17400
Vinyl chloride	21	8000

Xylene	16	17600

In the above table higher MF indicates high hazard potential and higher H. indicates high heat generation while burning, which in turn, indicates more quantity of fire fighting material (e.g. water, foam, DCP etc.) and equipment. MF for dusts is determined by different methods.

The Toxicity Index is used to evaluate process exposure level for toxicity hazard and is defined as -

$$Tl = \frac{Th}{100} \quad \frac{(P+S)}{100}$$

where T_h is the factor for the most hazardous material present in appreciable quantity with the lowest TLV, P the total GPH (General Process Hazards) penalties used and S the total SPH (Special Process Hazards) penalties used.

T_h can be known from the NFPA health rating N, as under

N_h	T_h
0	0
1	50
2	125
3	250
4	325

Assessment from Index : The degree of hazard potential can be determined from the value of F &: El as under:

F & El Range	Degree of Hazard
0 – 60	Light
61 – 96	Moderate
97 – 127	Intermediate
128 – 158	Heavy
159 & above	Severe

Example : Suppose General Process Hazard factor F_1 and Special Process hazard factor F_2 have been calculated as 2.8 and 3.8 respectively. Then with a MF 24 for acrylonitrile (ACN), the F & EI value is F_3 x MF – F_1 x F_2 x MF - 2.8 x 2.8 x 24 = 255. As it is above 159, it indicates severe hazard.

Based on F & EI and toxicity index TI, following categories are available:

Category	**F & EI**	**TI**	**Degree of Hazard**
I	F<65	T<6	Low
II	65<F<95	6<T<10	Medium
III	F>95	T>10	High

Fire Potential can also be assessed if the Fire Load F (BTU/ft^2) for particular area is known (calculated). Then a range of expected fire duration and hazard categories can be assessed from following table.

Fire load. Duration & Hazard Category

Fireload F in BTU / ft^2 of normal working area x 103	Range of expected fire duration in hours	Hazard category	Example
0-50 50-100 100-200 200-400 400-1000 1000-2000 2000-5000 5000-10000	0.25-0.5 0.5-1 1-2 2-4 4-10 10-20 20-50 50-100	Light Low Moderate High Very high Intensive Very extreme	Buildings Dwellings Factories Occupied Buildings Rubber 100-Ware- houses

Explosion Potential can be known from the following table if Internal Plant Explosion Index 'E' or Aerial Explosion Index 'A' is known.

Category	E	A
Light	0-1	0-10
Low	1-25	10-30
Moderate	2.5-4	30-100
High	4-6	100-500
Very high	>6	>500

Thus by knowing the hazard potential categories, inter-unit separation distances and unit boundary distances can be determined from the following tables.

Inter Unit Boundary Distances

Unit 'A' of Reduced Dow F & EI	Minimum distance in Meters to Unit 'B' having Reduced Dow F & EI of					
	Mild	Light	Moderate	Moderately Heavy	Heavy	Extreme
Mild	0	5	6	8	10	12
Light	5	6	8	10	12	15
Moderate	6	8	10	12	15	17
Moderately heavy	8	10	12	15	17	20
Heavy	10	12	15	17	20	25
Extreme	12	15	17	20	25	30

Within Unit Boundary Distances

Unit Reduced Dow F & EI	Minimum distance in Meters to		
	Works Boundary	Plant Boundary	Offices, Amenities Control Rooms etc.
Mild	20	15	10

Light	25	20	12
Moderate	30	25	15
Moderately heavy	40	30	20
Heavy	50	35	30
Extreme	75	50	45

It should be borne in mind that all such assessment and distances are approximation and suggest a minimum guideline. The complex computation method has its own limitations. DOW index cannot predict probability of hazard occurring. Corrosion and leakage have special effects. Reactions difficult to control, operation in or near flammable range and greater than average explosion hazard certainly contribute to high risk category.

Revised DOW index model is also available.

4.8 Fault Tree Analysis (FTA) :

It is a method to represent the logical combinations of various systems which lead to a particular outcome (top event).

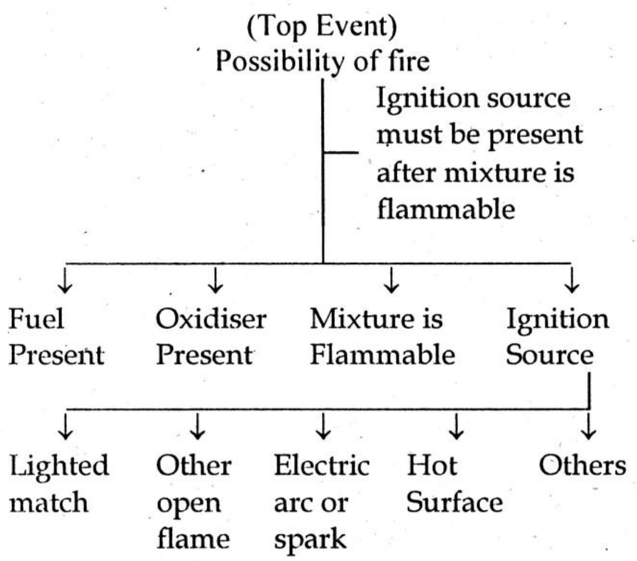
It is a graphic model that determines various combinations of equipment faults and failures that can result in an accident.

This is a sophisticated form of reliability assessment and it requires considerable time and skill. The procedure is to start from a selected undesirable top event such as 'gas coming out of a scrubber' and then trace it back to the combination of faults and conditions which could cause the events to occur. Apart from identification of hazards, it is widely used for quantitative risk analysis. It will be necessary to obtain meaningful failure data of each component to arrive at the frequency of occurrence of the 'top event'.

In fault tree analysis, abnormal operations are assumed in normal operations of a plant. The ultimate abnormal event (such as gas leakage) is shown in a rectangle at the top. Then all combinations of individual failures that can lead to that abnormal event are shown in the logical format of the Fault Tree. By estimating the individual failure probabilities and then using the appropriate arithmetical expressions, the probability of the top abnormal event can be calculated or predicted. This Fault Tree Analysis makes it easy to investigate the impact of alternative preventive measures. Fault tree is developed from top to bottom through a series of symbols which define the flow of logic from the base causes of an event itself. Detailed' probability data are most desirable.

This method of Fault Tree Analysis was developed by Bell Laboratories (USA) in 1961 to predict potential catastrophic events which could occur with the Air Force. It is more useful to assess chemical hazards.

Without specific Fault Tree symbols (symbology), a schematic diagram of one top event (possibility of fire) is shown below.



Some sample top events for Fault Tree Analysis are

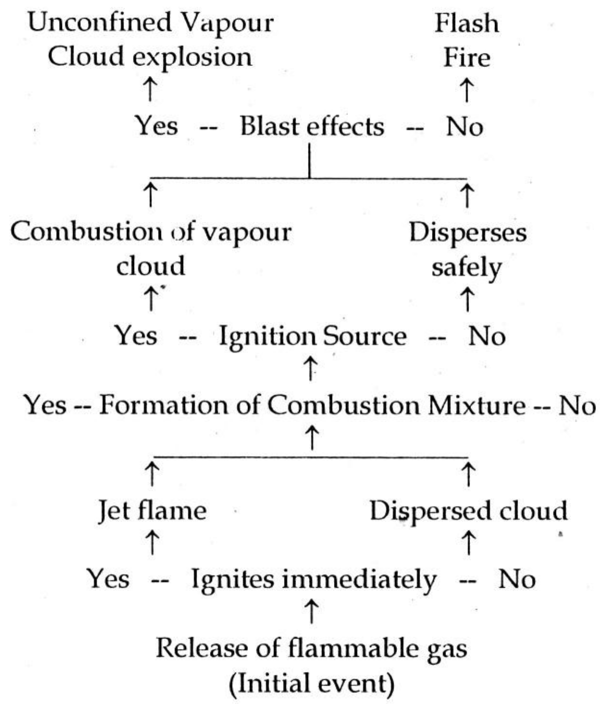
1. Injury to ___________
2. Damage to ___________ from ___________
3. Explosion of ___________
4. Loss of control of ___________
5. Rupture of______
6. Loss of pressure in ___________
7. Overpressurisation of ___________
8. Unscheduled release of ___________
9. Collapse of ___________
10. Overheating of___________
11. Uncontrolled venting of ___________
12. Inadvertent start of etc. ___________

A computer is much useful to carry out mathematical Fault Tree calculations using Boolean algebra.

4.9 Event Tree Analysis (ETA) :

Event tree analysis is a method to illustrate the intermediate and final outcomes which may arise after the occurrence of a selected initial event.

This technique is complementary to Fault Tree, but in reversed direction. Whereas a fault tree starts from a final event and works from the top down, an Event Tree begins with an initial event such as a power failure and explores all possible outcomes by working from the bottom up. An illustration is shown below, for an initial event of release of flammable gas.



ETA identifies the sequences of events following an initiating event that results in accident. Event tree considers operator response or safety system response to the initiating event in determining the potential sequence.

Some sample initial (bottom) events for Event Tree Analysis are :

1. Failure of pump of____
2. Failure of stirring of ____
3. Failure of water/cooling media/heating media in ______
4. Stoppage of motor at ____
5. Mistake of____

4.10 Accident or Cause Consequence Analysis :

Cause-Consequence Analysis identifies potential accident consequences and the basic causes of these accidents.

Any hazard or risk assessment is incomplete if the consequences of a possible accident are not known. Therefore the last step in hazard assessment is to analyse the consequences that a potential major (credible) accident may-cause on the plant itself, on die workers, on the surrounding and on the environment. Therefore an accident consequence analysis should contain

1. Cause of the accident (fire, explosion, rupture of a vessel, pipe, valve etc.).
2. Estimate of the mass released (flammable, explosive, toxic quantity).
3. Calculation of the dispersion of the material released and the damage distance, (liquid, vapour or gas).
4. Estimate of the effects (heat radiation, blast wave, toxic, degree of burn, severity etc.).

1 & 2 can be known by using the results of the hazard assessment while mathematical models have to be applied in finding 3 & 4. See Part 4.12 for effect of 2,3,4 above.

The results of ACA can be used to select necessary PPE, FFE, alarm or pressure relief device. It is also useful in deciding plant siting and layout and emergency planning in addition to risk assessment.

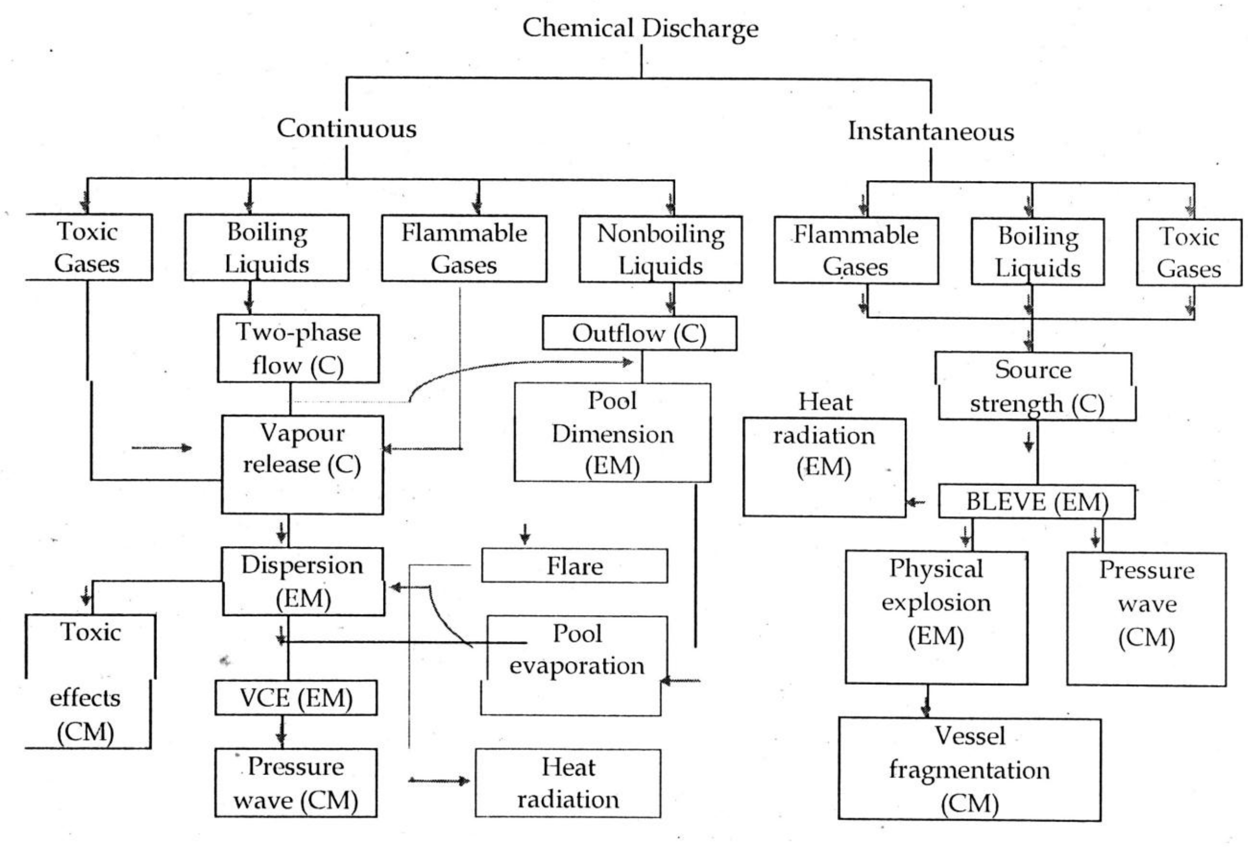
However higher estimates may lead to unnecessary additions to a plant and excessive capital cost. Therefore it is advisable that a company using such quantitative risk analysis should use its own experience and judgement to define targets for comparing the results.

The effects after accidental release of a chemical depend on many factors like type and quantity of the released chemical, meteorological conditions; topography, location or presence of ignition source. The accident scenarios can be divided into different categories such as

1. Liquefied gas or boiling liquid release under pressure (e.g. LPG)
2. Flammable/explosive gas release (e.g. H)
3. Toxic gas release (e.g. CL,)
4. Non-boiling liquid release (e.g. benzene)

Following figure shows the typical chemical discharge modes and their linkup to show their effects (radiation, explosion, toxic release etc.) Consequence analysis considers physical effects and damage caused by them. A combination of different discharge effects should also be considered.

Different Discharge Modes to Consider Consequence Analysis Chemical Discharge



C = Calculation, CM = Consequence Model, EM = Effect Model

Extensive data are to be collected during preliminary MCAA. It includes physical, chemical, thermodynamic, transport and safety properties of hazardous chemicals, process units and overall layout of the chemical plant and meteorological and demographic conditions. Subsequently the integrity of the process and storage units, process activities and work culture at each site are to be assessed. .

Overflow models calculate the source strength of the released material. Post-release phenomena (fire, explosion or toxic dispersion) can be quantified with the help of computer software packages based on mathematical models given below. Gaussian model is useful for neutral density (lighter) gases while other models (e.g. 3D) arc also available for heavy gas dispersions.

Mathematical models for consequence analysis

Sr. No.	Phenomenon	Application models
1	*Outflow*	
	Liquid Two phase mixtures Gas/vapour	Bernoulli flow equations; phase equilibria; multiphase flow models; Orifice/nozzle flow equations; Gas laws; Critical flow criteria.
2	*Discharges*	
	Spreading liquid	Spreading rate equations for non penetrable surfaces based on cylindrical liquid pools.
	Vapour jets Flashing liquids	Turbulent: free jet model. Two zone flash vaporisation model.
	Evaporation of liquids on land and water	Spreading boiling and moving boundary heat transfer models; Film and metastable boiling phenomenon; Cooling of semi-infinite medium.
3	*Dispersions*	
	Heavy Gas	(i) Buoyancy dominated, stably stratified and passive dispersion models (similarity). (ii)3D models based on momentum, mass and energy conservation.
	Neutral Gas	Gaussian dispersion models for neutrally byoyant plumes.
	Atmospheric stability	Boundary layer theory (turbulence); Gaussian distribution models:
4	*Heat radiation*	
	Liquid pool fires	Burning rate, heat radiation and incident heat correlations (semi-emperical); Flame propagation behaviour models.
	Jet fires Fireballs	Jet dispersion models API fireball models relating surface heat flux of flame, geometric view" factor and transmission coefficients.
5	*Explosions*	
	Boiling liquid expanding vapour clod explosion	Fireball and physical overpressure models, Deflagration and detonation models; ID gas dimensional computations.

6	*Vulnerability*	Probit functions; non-stochastic vulnerability models.

Criteria for heat radiation, explosion and toxic effects can be used to classify the accident scenarios for further investigations and to calculate effect and damage for primary events. Such damage criteria are as under :

Damage Criteria

Heat Radiation		**Explosions**		**Toxic Gas Dispersions**
Incident Flux kw/m^2	**Damage**	**Peak over pressure, bar**	**Damage**	**Damage**
37.5	100% lethality; Heavy damage to equipment	0.3 0.1	Heavy (90%) Repairable (10%)	The extent of damage depends upon the concentration of the toxic compound in the atmosphere; the relation between percent of injuries and the toxic load is normally given in the form of Probit Functions.
25	100% lethality; nonpiloted ignition	0.03 0.01	Damage of glass Crack of windows	
12.5	100% lethality; piloted ignition			
4	Not lethal; 1st degree burns			
1.6	No discomfort even after long exposure			

Past accidents provide useful clues and supporting information for the effect and damage calculations. Data bank TACTS' of past accidents is available from TNO. The Netherlands has vital information of more than 15000 chemical accidents that occurred in various parts of the world. Such databank of accidents in our country can be developed by NSC or LPA.

4.11 Maximum Credible Accident Assessment (MCAA) :

See Part 3.100 of Chapter-2 for definition.

MCA means maximum credible accident i.e. an accident with a maximum reasonable damage distance possibility.

MCAA means maximum credible accident analysis or assessment. Here probability of accident occurrence is not calculated but the probability of maximum damaging effect (potential and distance) is calculated to assess injury to people or/and properties in the surrounding area.

Hazard potentiality is considered by (1) Type of material stored/processed (toxicity, flammability etc.) (2) Quantity of the material (it affects distance) (3) Process or storage conditions (temperature, pressure, flow etc.) (4) Location of the unit or activity with respect to adjacent population.

Based on above factors, units/activities are selected, accident scenarios established and effect (domino or cascade) and damage calculations are carried out.

Following steps are employed in MCAA :

1. Chemical Inventory Analysis.
2. Identification of hazardous processes in individual units.
3. Identification of chemical release and accident scenarios.
4. Data acquisition for MCAA.
5. Effect and damage calculations for the primary events'
6. Analysis of past accidents of similar nature.
7. Short listing of maximum credible accident scenarios.

These steps are explained below in brief.

The chemical inventory is to be identified by MSIHC Rules or Rule 68 J of the Gujarat Factories Rules (see Part 10.8 of Chapter-28), short listed and prioritised on the basis of hazard potential. The chemicals are generally classified as non-boiling and boiling liquids, gases/vapours and solids.

Hazardous processes- are also identified by above statutory provisions. Runaway reactions need due consideration during preliminary MCAA.

4.12 Vulnerability Analysis :

Vulnerability is the susceptibility of life, property and the environment to injury or damage if a hazard manifests its potential.

The vulnerability analysis identifies what part of the community is susceptible to more damage if a hazardous substance releases. It provides information on :

1. Vulnerable zone (affected area) for a spill or release and the conditions that affect the zone (wind speed & direction, size of release).
2. Population, in terms of size (density) and types (residents, workers, sensitive population hospitals, schools, nursing or care centres, old men's shelter, prisons, spectators in auditoriums or stadiums) lying within the vulnerable zone.
3. Private and public property (homes, offices, businesses) that may be damaged, including essential support system (water, milk, food, fuel, power, medical) and transport centres, and
4. Environments (land, air, water, crops, food, vegetable, animal habitats, livestock etc.) that may be adversely affected and impact on sensitive natural areas and endangered species.

To get information on 1 (i.e. vulnerable zone) mathematical and computer models or probit equation can be used. To get information on 2,3, & 4, following steps are useful -

1. Survey of the area (first hand information by driving through the area).
2. Interviews of fire, police, emergency and planning department personnel.
3. Review of planning department documents and statistics on land use, population, highway usage and the area's infrastructure.

By consequence analysis damage or physical effects resulting from the release of hazardous substances can be determined while by vulnerability analysis such effects (consequences) can be translated in terms of injuries and damage to exposed people, property and environment. All such exercises are useful for emergency planning (i.e. on-site and off-site emergency plans).

In estimating size of vulnerable zones following variables arc considered :

1. Quantity and rate of release to air. This depends on (a) Total quantity released (b) Physical state (solid, liquid, gas) and (c) Conditions (pressure, temperature) of storage or handling.
2. Meteorological conditions.
3. Surrounding topography.
4. Level of Concern (LOC) i.e. the concentration of an extremely hazardous chemical (EHS) in air above which there may be serious irreversible health effects or death as a result of a single exposure for a relatively short period of time.

   No precise measure of LOC is available. Different guidelines suggest different values. It is to be estimated from IDLH, LC/LD, TLV, STEL and other permissible values. Rough estimation is as under -

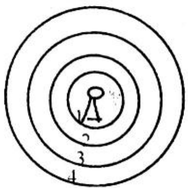
   Estimated IDLH = LCL_0, or
   = LC_{50} x 0.1, or
   = LCL_0 x 0.1, or
   = LC_{50} x 0.01

   Then LOC = 0.1 x estimated IDLH or direct IDLH available.

   $$\text{LOC (in gm/m}^3\text{)} = \frac{\text{LOC (in ppm)}}{1000} \times \frac{\text{MW}}{24.5}$$

   Note : IDLH immediately dangerous to life & health, LC=lethal concentration (gas), LD=lcthal dose (solid or liquid), TLV=threshold limit value, STEL=short term exposure level and MW=molecular weight. See Part 6.9 of Chapter24 for details.

5. Estimating vulnerable zones for initial screening and revaluation of the estimated zones as shown below.



It is important to mention that different assumptions or conditions give different radius of estimated vulnerable zones as shown in the figure.

The four circles differ as under -

1. Selection of higher LOC.
2. Use of higher wind speed and less atmospheric stability. -
3. Small quantity and less rate of release.
4. Radius for initial screening zone.

Calculations should be based on credible worst case assumptions and considering wind speed, stability class and chemical toxicity. Instantaneous and continuous releases including spills, leaks, fires, explosions and BLEVE should be considered. Multiple point sources operating concurrently may be considered. Gaussian or other models (see Part 14.2 & 14.3 of Chapter-18) may be used depending on prevailing conditions. Site effects of terrain are relevant. The results of the calculations should be represented in graphical format.

Use of Probit Equation :

The probit function is given by

$P = K_1 + K_2 + \text{Log}C$

where P = Probit, a measure for the percentage of people exposed who incur a particular injury (for conversion table from probit to percentages see Part 6.2.3 or Reference No. 27), K_1 = a constant depending on the type of injury or type of load or causative factor C and K_2 = a constant depending on the type of load C.

For toxic release calculations, probit equation is given by -

$$P = K_1 + K_2 \text{Log}(C^n t)$$

where C = concentration of the toxic substance in mg/m^3, t = the exposure time in minutes and K_1, K_2 and n are constants depending on the toxic substance.

For example, these values for three main gases are given as :

Chlorine, $P = -10.29 + 0.92 \text{ Log } (C^2 t)$
Ammonia, $P = -27.27 + 2.27 \text{ Log } (C^{1.36} t)$
SO_2 $P = -17.73 + 2.10 \text{ Log } (Ct)$

These equations estimate that in case of chlorine, death will occur in 50% of the persons exposed to a concentration of 1050 mg/m^3 at an exposure time of 15 minutes and in case of SO_2, 1% mortality will occur to a concentration of 550 "g/ 3 at 30 min exposure time.

Fire : For heat radiation calculations, probit equation is given by –

For lethality, $P = -36.38 + 2.56 \text{ Log } (C^{4/3} t)$
For first degree burn,
$P = -39.83 + 3.0186 \text{ Log } (C^{4/3} t)$

where,
C = thermal load W/m^2 and t = exposure time in seconds. The values given are for unprotected body. If people are wearing clothes, injuries are assumed to be reduced by a factor of 7.

See Part 6.2.3 for further discussion.

Explosion : A pressure wave caused by BLEVE or gas cloud explosion will make probable damage as under:

Peak over pressure (bar)	Type of damage
0.01	Windows smashed.
0.03	Damage by flying fragments of glass.
0.1	10% of houses seriously damaged.
0.3	90% of houses seriously damaged.

A peak overpressure of 0.1 bar is taken as the limit for fatality and 0.03 bar as the limit for causing wounds. Within the zone of a peak overpressure of 0.3 bar, the risk of death in houses is I in 80 people.

Thus vulnerable analysis employs scientific assumptions and calculations to estimate damage zones and number of people likely to be affected. Emergency planning is not possible without such efforts.

4.13 What if Analysis :

The method involves possible deviations from die design, construction, modification, or operating plant. A question 'What if is asked, e.g. What if wrong material is charged? What if pump stops functioning?

This method identifies possible accident event sequences and thus identifies the hazards consequences and steps for risk reduction. -

5 RELIABILITY ENGINEERING

Hazard control technology mostly involves the probabilistic methods to detect failure possibilities and accidents. Reliability engineering is a branch concerning this aspect.

Various topics on reliability engineering include statistics, mathematics, set theory, failure rate and analysis, unreliability, availability, failure distributions including exponential, binomial and lognormal distributions etc., repair and maintenance, scries, parallel and standby systems, Marcov models, Monte Carlo simulation graphs, diagrams and flow sheets and computer programmes.

Application of reliability engineering in process industry is very wide. It is applicable to mechanical, electrical and instrument systems, critical equipment and devices, nuclear systems, quality control, analysis of faults and abnormal occurrences, repair and maintenance etc.

5.1 Principles of Reliability Engineering:

IS.-10139 on presentation of reliability, maintainability and availability predictions and IS:8161 (II Parts) on guide for equipment reliability testing are most relevant. Reliability of electrical/electronic equipment and performance data is given in IS:7354 (6 Parts), 8607 (Part-8) and 1885 (Part 39) electro technical vocabulary - reliability of electronic and electrical items. IS:8161 guide for equipment reliability testing, Part-1 is for principles and procedures and out of total II parts. Parts 6 & 7 are on tests for validity of constant failure rate assumption and meantime between failures. They should be referred for details.

Reliability is defined as the probability that an item will perform a required function under stated conditions for a stated period of time.

Thus reliability depends on probability, time and failure, I;ailure may be due to failure in operation (e.g. equipment in continuous service) or failure to operate on demand or failure to operate before or after demand (e.g. equipment operating intermittently).

Probability P of a particular event is

$$P = \lim_{n \to \infty} \frac{\text{Number of occurrences of the event}}{\text{Total number of trials (n)}}$$

Thus if fire happens 5 times when trials (n) to cause it are made 10 times, the probability is 0.5, or

$$P = \frac{\text{Lim}}{n \rightarrow \infty} \quad \frac{5}{10}$$

If an equipment fails 3 times when total operations (chances to fail) happened 1000 times, the probability or failure rate is said to be of 0.003.

If a person falls 2 times when he climbs a particular staircase 100 times, the probability of falling or the falling rate is said to be of 0.02.

Reliability - R(t) of an element or system can be defined as the probability that the element or system will operate to an agreed level of performance, for a specified period, subject to specified conditions.

In a measurement system 'agreed level of performance' could mean, for example, an accuracy of 1.5%. If the measurement system is giving error more than this, it is considered to have failed, even though it is otherwise working normally.

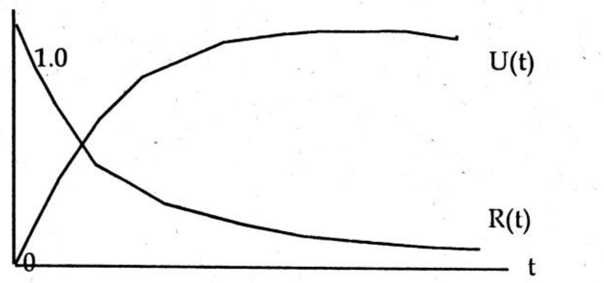
Reliability varies with fane. A system just checked and calibrated should have a reliability of I when placed in service. After a year the reliability may be only 0.5 as the probability of failure increases.

Unreliability U(t) can be defined as the probability that the element or system will fail to operate to an agreed level of performance, for a specified period subject to specified conditions.

The sum of reliability and unreliability must be unity, i.e.

$$R(t) + U(t) = 1$$

See following figure for this relationship.



Variation of reliability and unreliability with time for constant failure rate and no repair.

Unreliability also depends on time. A system just checked and calibrated should have an unreliability zero, when first placed in service but it may increase to say 0.5 in few months.

Mean Time Between Failure (MTBF) is applicable to any type of equipment whose faulty component or unit can be replaced or repaired. Suppose N identical elements or systems are tested for a total period T years. Each fault is recorded, the equipment is repaired, put back into service and the total number of faults F during T found. Then

$$MTBF = \frac{NT}{F_N}$$

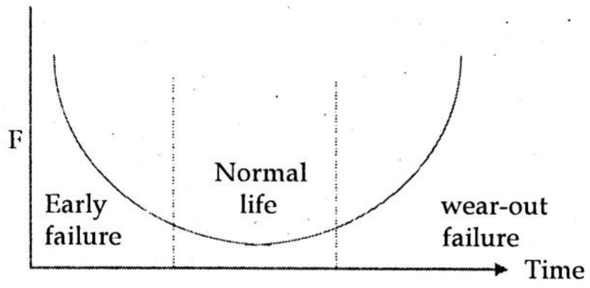
where the test interval T does not include the total repair time. Thus if 50 faults are recorded for 100 differential pressure transducers over 2 years, the

$$MTBF = \frac{100 \times 2}{50} = 4 \text{ years}$$

Failure rate - F is the average number of faults per item of equipment, per unit time. It is mostly constant over much of their working life and therefore reciprocal of MTBF i.e.

$$F = \frac{1}{MTBF} = \frac{F_N}{NT}$$

The failure rate varies throughout the life of the equipment shown as under.



Variation in Failure rate (bathtub curve)

Three phases - early failure, mature failure (normal working life) and wear-out failure give bathtub curve as shown in the figure. The early failure region, lasting normally for 6 months, is due to weak components and unfamiliarity in operating the system. The mature region, lasting possibly 10 years, is characterised by a low constant failure rate, all weak components have been removed from the system and the system is being operated correctly. The wear-out region is characterised by an increasing failure rate as components reach the end of their .working life.

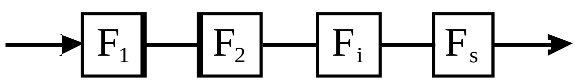
Relationship between R(t), U(t) and F is given by

$$R(t) = \frac{n_s}{n_o} = e^{-Ft} \quad \text{and} \quad U(t) = \frac{n_f}{n_o} = 1-e^{-Ft}$$

where $n_s = n_o - n_f$ = number of items still serviceable,

n_o = items of equipment set in operation at time $t = 0$, n_f = items survive after time t.

Reliability of a system in series is shown in Fig. 19. Here S elements of a system are in series with failure rates F_1, F_2, F_i, F_s. The system will only survive if each clement survives.



Reliability of a system in series

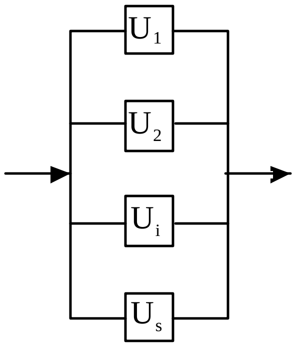
If one element fails then the system fails. Assuming that the reliability of each element is independent of the other elements, then the system reliability is the product of the element reliabilities i.e.

$$R_{syst} = R_1 R_2 ... R .... R_s$$
$$= e^{-F1t} \times e^{-F2t} \dots e^{-Fit} \dots \times e^{Fst}$$
$$= e^{-Fsyst} = e^{-(F1+F2+..Fi..+Fs)t}$$

and $= F_{sys}t = F_1 + F_2 + ..F_i.. + F_s$

where F_{sys} is the overall system failure rate and F_1 F_2. F_s are individual failure rates of S elements.

Reliability of a system in parallel is shown below. Here S systems are in parallel with their unreliabilities U_1, U_2, Ui, Us.



Reliability of 'S' systems in parallel

The overall systems will only fail if every individual system fails. Assuming that the unreliability of each system is independent of unreliability of the other systems, the overall unreliability is the product of the individual system unreliabilities i.e.

$U_{overall} = U_1 \times U_2 \times U_i \times \dots . U_s$

Common Mode Failure is that failure due to fault which causes more than one element in a system to fail. For example, loss of air supply to a pneumatic flow control loop causes failure of D/P transmitter, controller and valve.

Failure Rate Data of various components are needed for reliability calculations. Following Table gives some such data from international literature.

Average Failure Rates for some mechanical, hydra hydraulic and pneumatic components

Sr. No.	Component	Failure Rate % per 1000 hrs.	Type of Fault
1	Seals or valves, Gaskets, Joints(pipes), Orifices, Diaphragms (metal), Bellows (metal)	0.05	Leakage / blockage
2	Bourdon tubes	0.005	Leakage

		0.02	Creep
3	Joints (mechanical)	0.02	Breakage
4	Nuts, bolts, rods, shafts	0.002	Breakage or loose
5	Pressure vessels	0.3	Rupture or leakage
6	Pipelines Dia upto 3" Dia 3" – 15" Dia > 15"	Failure rate per meter per year Rupture 10^{-6} 10^{-7} -	 Leakage 10^{-5} 10^{-6} 10^{-8}
7	 Pressure vessel Atmosph. Vessel	Failure rate Rupture Rupture 10×5^{-6} 10^{-4}	Per year Leakage $10x5^{-5}$ 10^{-3}
8	Human error Walk through inspection Checklist inspection Non-routine operational error (start-up / maintenance) Non-critical routine task (misread temp/ press data) Critical routine task (tank isolation)		Probability of error / task 50^{-1} 10^{-2} 10^{-1} $3x10^{-3}$ 10^{-3}

Availability characteristics in a process plant are (1) Probability of obtaining nominal output and downtime (2) Probability of obtaining other outputs and downtimes and (3) Probability of infrequent but very long downtimes.

The objective of system availability analysis is to assess system availability and to identify critical aspects and then to effect required improvements.

Data on availability of whole subsystems are useful, otherwise it is necessary to calculate system availability from failure rate and repair time data. Availability of raw materials and services and availability of other plants which receive outputs like by-product, electricity, steam etc. are to be considered.

Availability A(t) is a function of time and may be expressed in terms of uptime u(t) and downtime d(t) as

$$A(t) = \frac{u(t)}{u(t) + d(t)}$$

The unavailability v(t) is

$$V(t) = 1 - A(t) = \frac{d(t)}{u(t) + d(t)}$$

In addition to methods like density function, Markov models, logic flow diagrams and throughput capability method, computer flow sheeting methods can also be used to determine plant availability. Plant availability is affected by storage (main and intermediate), which introduces additional flexibility and may allow units upstream or downstream of a failed unit to continue to operate for a time.

For other principles and mathematical details see Reference No. 27 at the end:

5.2 Application of Reliability Engineering :

Reliability engineering was developed during the second world war to solve the problems of reliability of the missile and vacuum tubes used in electronic equipment by the US Army.

Main fields of application of reliability engineering are electronic equipment [see IS:7354 (6 Parts) and IS:8607 (8 Parts)] and nuclear energy. Methods are developed to assess the hazards of nuclear reactors and to design instrument trip system to shut down safely. Its application to process industries was developed at a later stage.

Reliability of mechanical equipment pose less problem. Reliability application is also concerned with availability, maintenance, failure data, repairs and repair time etc. With the growth of instrumentation and control branch of engineering, applicability of the reliability engineering in process plants has become wide and more important. Complex distributed circuit systems (DCS), trips and alarms, auto control and auto corrections, locks and interlocks and a variety of process control equipment for inputs, outputs, flow, temperature/pressure measurement, recording etc. are increasing, day-by-day, the need of application of reliability engineering.

Work on reliability involves assessment and improvement of the system. The assessment work may show that the system is fully reliable or less reliable and the ways and means to improve the reliability. It is the duty of the reliability engineer to identify the areas where improvement is necessary. Existing level of reliability should be studied for further improvement Failure rates, effects on people exposed if failure occurs and weather conditions are factors to be considered.

Quality control improves reliability. Deficiencies in specification, design or application are causes of unreliability. A good quality equipment, if badly designed, will remain unreliable.

5.3 Concepts of Critical Equipment and Devices :

Reliability analysis of critical equipment and devices like safety valve, auto control valve or device, trip device, flow, temperature or pressure control, trip device, alarm, measurement or recording device, actuators for safe venting, discharge or transfer, pumps, thermocouples, converter and many electronic subsystems, is of more significance and needs careful consideration of accurate data of failure rates, availability, repair time etc. Some concepts of reliability considerations for such critical equipment are mentioned below in brief :

1. Initially three steps arc required (1) Assessment of system reliability itself (2) Identification of critical features interrupting reliability and (3) Methods to improve reliability and selection of a cost effective or safe methods from different alternatives.
2. For above purpose, first those subsystems (components) should be identified that affect the overall system reliability. No much effort is necessary to go into details of a subsystem which does not affect the overall reliability of the system.
3. Sometimes engineering estimates of data may be sufficient but sometimes field data arc also necessary. The matching of the data to the application is more important.

4. For example, connections of three pumps with a storage tank, all in parallel or two in parallel and one as common standby give selective 'reliability. Similarly a temperature measurement system consisting of three identical thermocouple systems in parallel is reliable but expensive. Since the thermocouple failure rate is II times greater than converter and recorder failure rates, a more cost effective redundant system would have three thermocouples in parallel and only one converter and recorder. Alternative way is to place a middle value selector.
5. Use of logic flow diagram (Fault Tree Analysis) is a widely used method. Failure diagram for hazardous occurrences and success diagram for trip system operation or plant availability are utilised.
6. In event space method, a list of all possible events is made and failure and success events are sorted out.
7. In path tracing method the paths in a system are traced which constitute success. These paths are known as tie sets and the system reliability is obtained from the minimum tie sets.
8. The reversed method is to fit cut sets which break all the paths and thus ensure failure. System unreliability is obtained from the minimum cut sets.
9. Bayes' theorem is used to select a key component which makes it possible to decompose the system.
10. Markov models are used to determine repair rates and mean life for complex systems.
11. Monte Carlo simulation methods, are also useful to determine reliability and/or availability of complex systems including-critical equipment.
12. The concepts of consequence analysis i.e. effects on exposed and vulnerable people, property and environment, if any critical equipment or device fails, arc to be considered and depending on their gravity, the reliability of the equipment should be selected.

6 MAJOR ACCIDENT HAZARD (MAH) CONTROL

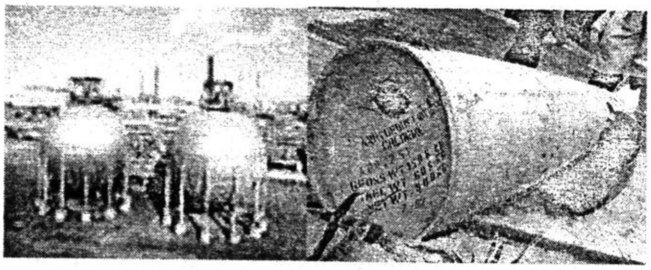
With the growth of chemical industry and use of hazardous chemicals, the world had seen many major accidents during last 50 years but the concept of major accident hazard (MAH) control came in our country after Bhopal accident in 1984 only. Thereafter there is a constant rise in bulk storage, hazardous processes and heavy transportation of dangerous chemicals. This needs to realise and take appropriate safety measures to identify and prevent the major accident causes and to mitigate their consequences.

6.1 Concept of MAH:

Some definitions are as under:

For definitions of 'major accident' and 'major accident hazard' (MAH) see definitions in rule 2 (j) and 2 (ja) of the Manufacture, Storage and Import of Hazardous Chemicals Rules 1989. See part 10.8 of Chapter 28 for further detail.

Major hazard means that hazard which arises because of (1) the hazardous nature of the substance and (2) its storage quantity equals or exceeds the threshold quantity prescribed in MSIHC Rules 1989.



Major hazard is due to isolated storage or industrial activity that has the potential to cause extensive damage to men, materials or environment within or outside the site boundary.

The Statutes - Manufacture, Storage and Import of Hazardous Chemicals Rules 1989, Rule 68J of the Gujarat Factories (Amendment) Rules 1995 and the Chemical Accidents (EPPR) Rules 1996 have defined the term 'major accident'. See Chapter-28 for these laws

Some reported major industrial accidents arc mentioned below:

Examples of Major Accidents

Year	Place	Deaths	Injuries	Chemical involved
1943	Germany	57	439	Butadiene & Butylene (butene), explosion
1944	US	136	77	Methane, fire
1948	Germany	207	3818	Dimethylether, explosion
1954	Germany	32	16	Kerosene, explosion
1966	France	18	90	LPG, fire, BLEVE
1973	US	40	-	LNG, fire
1974	US	7	152	Propane, explosion

1993	China	84	-	Plastic toy factory

The Bhopal disaster has remained at the top and opened eyes throughout the world regarding major chemical hazards, their consequences and controls.

All such accidents, differing in the mode of happening and the chemical involved, have some common features as under :

1. They were uncontrolled events caused by fire, explosion or/and toxic release.
2. They resulted in death or/and injury of a large number of people, inside or/and outside the plant, or/and
3. They caused evacuation of people of the 4 surrounding area, or/and
4. They caused heavy damage to plant, property and environment.

The storage, process, use and handling of such flammable, explosive or toxic chemicals pose high potential to cause disasters and are normally referred as major hazards. Their potential is due to their inherent nature (property) of the chemicals, their quantity, type of process, way of handling or sudden failure of some part of the plant including vessel, equipment, fitting, pipe and vehicle.

The main objectives of major hazard control system are:

1. To distinguish between minor and major accident potential and to set priority for identification and inspection of major hazard works first or more frequently.

2. To define hazardous chemical by defining its fire, explosion and toxicity criteria and to define their threshold quantities for storage and use to classify the work as MAH installation.

3. To define and list the hazardous processes to identify the unit as MAH installation.

4. To make, enact and implement the law for MAH chemical works or isolated storage by providing statutory provisions and requirements.

5. To identify the major hazards, developing and utilising the special techniques like hazard and risk assessment, HAZOP, FTA, ETA, consequence analysis, vulnerability analysis, environmental impact assessment etc. as mentioned earlier and carrying out plant safety inspection by various methods mentioned in Part 2 & 4 of this Chapter.

6. To take all possible preventive measures based on identified major hazards to prevent the causes of such hazardous events. Training and education may be incorporated.

7. To foresee the consequences on the workers, public and environment in case if any possible major accident may occur, and to work out an emergency action plan to control and mitigate the effects.

Components of a major hazard control system re:

1. Definition and identification of MAH installation based on types of hazards.
2. Information about the installation e.g. safety report, safety manual etc. Information should be given to workers, public and authorities.
3. Assessment of major hazards, by works management and competent authorities. Cause, effects, consequences and safety measures must be assessed.
4. Control of the causes of major industrial accidents by detecting causes and following sound engineering and management practices e.g. good design, fabrication, installation, operation, maintenance, inspection and use of good safety equipment and instrumentation.

5. Safe operation of major hazard installations by training to workers, following SOPs and investigating accidents and near misses.

6. Emergency planning i.e. on-site and off-site emergency plans and their regular-rehearsals.

7. Siting and land-use planning by ensuring safe separation distances.

8. Inspection of MAH units by the plant management and also by the Govt. authorities at top priority and more frequently.

Causes of major accidents to be studied include component failure, deviations from normal operating conditions, human and organisational errors, outside accidental interference, natural forces, mischief and sabotage.

Safe operation of MAH installation should pay attention on

(1) Design, manufacture and assembly of components,
(2) Process control,

(3) Safety systems (sensors, controllers, pressure relief, emergency shutdown, bunds, water spray, fire detector etc.),
(4) Monitoring of safety-related components and systems,
(5) Inspection, maintenance and repair,
(6) Effects of change,
(7) Training of workers,
(8) Supervision and
(9) Control of contract work.

6.2 Types and Consequences of Major Accident Hazards:

Generally fire, explosion and toxic release are the main types of major hazards and death, injury, evacuation of people, property loss and environmental damage are the main types of their consequences.

6.2.1 Fire, Explosion and Toxic Release:

Fire can cause thermal radiation and skin burns. The severity (degree and percentage) of burns depends on heat intensity, exposure time and type of clothing.

Heat radiation effect $\alpha = \dfrac{1}{\text{distance}^2}$

Generally skin withstands a heat energy of 10 kW/m^2 for 5 seconds and 30 kW/ 2 for only 0.4 seconds before pain is felt.

Frequency of fires in industry is more than explosions and toxic releases but its lethal effects are comparatively less. However if the ignition of escaping flammable vapour is delayed an unconfined vapour cloud may form and it may explode if ignited.

Types of fire may be a jet fire, pool fire, flash fire and BLEVE i.e. boiling liquid evaporating vapour explosion. A jet fire occurs from an ignited gas pipe leak, a pool fire from drained material in a dyke, flash fire occurs if the gas reaches a source of ignition and rapidly burns back to the source of release and BLEVE occurs when flammable vapour leaking from any vessel or pipe expands and disperses in air as a cloud and when this cloud is ignited. Then a fire ball occurs causing enormous heat radiation. A BLEVE from a 50 tonne propane tank can cause third-degree burns at @200 mts and blisters at @400 mts.

Explosion is a shockwave that can damage where it hurts. Primary or direct effect is due to the shockwave of the explosion itself. Those in the direct vicinity may die due to effects of over-pressure. People can also be thrown away, blown over or knocked down and buried under collapsed materials. Secondary or indirect effect is the effect of shock-wave generated by the primary effect. The history of explosions show that the indirect effects of collapsing buildings, flying or broken glasses and debris cause far more deaths and injuries.

The effects of shock-wave depend on the type of material, its quantity and the degree of confinement of the vapour cloud. A pressure of 5 to 10 kPa can cause direct injury. Death may occur at a higher pressure but demolition of building or breaking of windows occur at 3 to 10 kPa. The pressure decreases rapidly with distance. As an example, the explosion of a 50 tonnes propane tank can cause a pressure of 14 kPa at 250 mt and 5 kPa at 500 mt.

Types of explosion are deflagration, detonation, confined and unconfined vapour cloud explosion and gas and dust explosion.

When burning velocity or flame speed is slow (e.g. I to 10 m/sec), deflagration takes place in a confined space. It generates low pressure (e.g. 70-80 kPa).

When flame speed is very high (e.g. 2000-3000 m/ ' sec), it causes detonation and generates high pressure like 200 kPa. Some degree of vapour confinement is necessary.

Explosion in a confined place like vessel, pipework, drain or building is called confined explosion and that occurring in the open air is called unconfined explosion. Confined explosion causes higher pressure and may reach upto hundreds of kPa.

Explosion of a vapour cloud after heavy leakage of a flammable gas is called gas explosion. Large vapour cloud can cause unconfined vapour cloud explosion (UVCE), boiling liquid expanding vapour explosion (BLEVE) or fire ball.

Explosion of a solid material in the form of dust, powder or small particles mixed with air is called dust explosion. Grain, milk powder, flour and coal dust are flammable dusts. Effect of dust explosion is mostly confined to the workplace.

See Chapter-13 for more details and control measures for Fire and Explosion.

Toxic releases are caused due to leakage and dispersion of toxic chemicals (gas or vapour) in air. As the workers are working nearby they can be affected first. Therefore workplace monitoring, air/gas sampling, environmental monitoring etc. as mentioned in Part 1.6 and 1.7 of Chapter-24 are all important.

Consequences of toxic release are influenced by wind speed, weather condition, leak rate or mass released, toxicity (LD/LC) and concentration (ppm) at a particular place, and also by age, sex, genetic background, ethmic grouping, nutrition, vulnerability (old or tender age, sickness, disease), exposure to other substances with synergistic effects, pattern of work and time of exposure.

Chlorine, ammonia and other chemicals like methyl isocynate have caused disasters. Study o toxicity and consequence analysis of such chemical and advance emergency planning are most essential For example, instantaneous release of 10 tonnes chlorine may produce 140 ppm at a 2 km downwind distance and 15 ppm at a 5 km distance in D5 weather Chlorine can be lethal at 1000 ppm or at 100-150 ppm for 5-10 minutes. Its effect is dangerous even at 10-2C ppm for 30 minutes. Such data should be kept ready by all major hazard works in respect of their highly toxic chemicals with effect (distance and ppm) counter; of surrounding area.

6.2.2 Types and Effects of Gas Dispersion:

(1) Types of Toxic Spills : Three types : liquids, gases stored as liquids (like Cl_2, NH_3) and gases (N_2, O_2)

No buoyant plume created, unless there is a fire

Liquid Spills : Material which is normally a liquid at atmospheric pressure and temperature causes a pool to form. viz., benzene, acrylonitrile and vinyl chloride

Rate of evaporation from the pool depends on:

1. Vapour pressure of the liquid.
2. Area of the pool.
3. Heat of evaporation.
4. Air temperature.
5. Ground temperature:
6. Heat transfer of convection & radiation etc.

The viscosity of the liquid determines the rate of growth of the pool, i.e. its area.

Generally the initial rate of emission will be greater per unit area than the equilibrium rate. The pool is cooled because of evaporation.

Liquid Gas Spills : Material stored in pressured and/or refrigerated containers, -viz. Cl_2, NH_3, LPG.

If the release rate is slow enough the material will enter the atmosphere as a gas. But in a sudden release such as a tank rupture, the dispersion process can be described in 4 phases.

1. Turbulence called 'flash off caused by rapid escape of the liquid or gas. For a 20-ton NH_3, tank rupture, tests suggest @20% vapour & 80% liquid aerosol coming out as a cloud.
2. The cloud (liquid cylinder or column) starts to slump like a water column starts to spread out. During slumping, air is entrained slowly. This second stage lasts 30 to 40 seconds for a 20-T NH_3, spill.
3. The gas cloud now enters the ground hugging phase. Most of the air entrainment takes place through the top surface. Depending on ambient temp., gases in the cloud will reach ambient air density in 3 to 5 minutes after slumping starts from a 20-T NH_3, spill.
4. The natural process of atmospheric turbulence takes over, and the cloud diffuses while travelling along with the wind, like any other material in the atmosphere.

Gas Spills : Such spill results in the formation of air-gas mixture at a temp. some what below ambient temp.

(2) Meaning of Dispersion and Effects:

Dispersion and diffusion means spreading and dilution of gas in air. When smokes come out from a chimney, vaporisation takes place from boiling or evaporating liquid, any material leaks or spills due to leakage or handling and discharges gas or vapour in atmosphere, safety valve or vent opens and liberates gases, any accidental failure of any vessel or equipment occurs giving sudden rise of vapours or gases or due to any fire or explosion when gases come out, dispersion phenomenon takes place. Because of discharge pressure, lighter vapour density, buoyancy, kinetic energy, temperature etc. the escaping material travels in air and because of turbulence in air and wind velocity the mixing (air-entrainment), diffusion and spreading in wind direction take place. Weather conditions and topographical factors also affect. Dispersion may be of a flammable gas-air mixture or non-flammable (inert, toxic or corrosive) gas-air mixture. It may be a continuous emission or instantaneous puff or plume release.

The dispersion is of more concern when it is of very toxic gas or highly flammable vapour, because it can give direct rise to toxic effect, fire or explosion.

Toxic release in bulk quantity and for a long duration (e.g. Bhopal incident) affects public at large. To assess the consequence, fatalities, injuries and property damage and for the purpose of evacuation to save life, scientific calculations become necessary which include probit equation and analysis and -a variety of gas dispersion modelling. The computer models can give quick results.

In case of toxic dispersion, normally three zones are considered. The inner most or zone-1 contains the highest concentrations of leaking gas wherein maximum fatality/injury can be predicted. No entry or no rescue operation may be possible there. Then in intermediate or zone-2, evacuation becomes most necessary and must be carried out at the earliest possible otherwise great fatalities or/and injuries may result. This is the target area of emergency planning and rescue activities. But in doing so, use of necessary personal protective equipment and vehicles is to be done very carefully. The outermost or zone-3 is a safe zone but it can be affected also if dispersion aggravates or lasts for a longer time. Therefore alert and warning action is required in this zone. People must be advised to go away by their own arrangement and should be helped if necessary.

A flammable gas in explosive range with air can cause fire or explosion and may be consumed by combustion. But a large vapour cloud is capable of producing an unconfined vapour cloud explosion. Boiling liquid expanding vapour explosion (BLEVE) and/or fireball are also possible.

A dispersing gas gets diluted in air during dispersion, diffusion and travelling and its 'density becomes close to air density. Therefore the majority of dispersions are known as 'air-density or neutral density dispersion'. Only some dense gas dispersion needs special calculations and treatment.

A gas released from any point may be ignited if flammable and may cause, BLEVE, flare or pool fire and cause heat radiation damage. Fire may generate toxic products and adds toxic effects too. If immediate ignition is not possible, the gas may vaporise, disperse and may cause delayed ignition which by pressure wave may cause flash fire or explosion and ultimate damage. If the released gas is not flammable but toxic it causes toxic effects and if it is inert like nitrogen, causes oxygen deficiency in a confined space. It the gas is in no way injurious, no adverse effect is possible.

Types of releasing gas may be of the following

1. Liquefied pressurised gas (e.g. LPG).
2. Flammable gas (e.g. fuel gas, H_2).
3. Toxic gas (e.g. Cl_2 NM_3, CO).
4. Low boiling liquid (e.g. petrol/benzene).
5. Liquid with toxic combustion products.

Their hazardous effects may be of the following types.

1. Heat radiation from a jet, pool fire, a flash fire or BLEVE.
2. Explosion overpressure.
3. Toxic effects from toxic materials or toxic combustion products.

The following effects consequential to the accidental release of hazardous materials are of much interest:

1. Atmospheric dispersion as a function of source strength, gas density, weather conditions and topographical situation of the surrounding area.

2. Intensity of heat radiation (in kW/m^2) due to a fire or a BLEVE as a function of the distance of me source.
3. Energy of vapour cloud explosions (in N/m^2) a.' a function of the distance of the exploding cloud
4. Concentration of the evaporated material which may be explosive or toxic.
5. Concentration of the toxic products-of combustion produced by a fire and
6. Duration that these respective effects may prevail.

Some damaging effects due to heat radiation, blast overpressure or toxic concentration are summarised below:

(A) Radiation Effects:

Exposure Duration	Radiation energy required for 1% lethality	
	Without protection	With protection (e.g. clothing)
	(kW/m^2)	
10 Sec	16.7	21.2
30 Sec	7.3	9.3

(B) Blast wave Effects due to Overpressures :

Type of damage	Peak overpressure
Total destruction	0.830 E + 5 Pa
Heavy damage	0.350 E + 5 Pa
Moderate damage	0.170 E + 5 Pa
Minor damage	0.035 E + 5 Pa

Approximately 0.1 bar peak over pressure may cause 1% fatality or serious damage to 10% of the housing/structures.

(C) Toxic Effects (fatalities) :

Chemical	LC30 in mg/m3 (lethal concentration at 30 min exposure)	
	1% Fatality	50% Fatality
NH_3	1871	5999
CO	787	7949
Cl_2	364	1005
EO	432	4443
HCl	391	3950

Dispersion can be studied in four types of areas (1) Leaks and spillage (2) Dispersion from vents and jets (3) Dispersion of heavy gases and (4) Dispersion by fluid curtain. Simultaneous study of meteorological and topographical conditions becomes a part of the subject of dispersion and modelling.

6.2.3 Probit Analysis

Probit Analysis is a method (calculation) tc assess probability of injury or damage due to serious or lethal dispersion. It is a mathematical expression in the form of a probit function as under :

$$V = K_1 + K_2 \text{ In } C \qquad (I_n = \log_e)$$

where V is a measure of the vulnerable resource (human or property) which gets injury or damage, and variable C is a measure of the intensity of the causative factor which harms the resource.

The logarithmic term (I_nC) i.e. log C in above equation arises because in any population, some people can tolerate high intensity of harmful causative factor than others. The distribution is slanting (oblique).

The constants K_1 and K_2 can be calculated from the relationship between the intensity of causative factor and the degree of harmful response. In case of fire, K_1 and K_2 depend upon effective time duration(s), radiation intensity (W/m^2), duration of pool burning(s) and radiation intensity from pool burning (W/m^2). In case of explosion, they depend on peak over-pressure (N/m^2) and impulse (Ns/m^2) and in case of toxic release, they depend on concentration (ppm) and time interval (min).

In case of fire, burn deaths may take place due to flash fire or pool burning. In case of explosion, deaths or injuries may take place due to impact, card rum rupture, flying fragments, structured damage, glass breakage and lung haemorrhage. In case of toxic release, deaths or injuries may take place due to toxicity and concentration of the gas.

In case of fire, deaths or injuries may happen due to thermal radiation. This effect is time-dependent and is given by following probit equation :

$$P = K_1 + K_2 \ In \ C^n t = K_1 + K_2 \log, C^n t$$

where P is the probit i.e. a measure of probability of people that may be affected, K_1 and K_2 constants, C a causative factor (here radiation intensity in kW/m^2), n = 4/3 and t = time in seconds.

The values for K_1 and K_2 are mostly derived from experiments with animals. However, human toxicity factors have been derived from past accidents. Inhalation experiments with rats seem to be best applicable to predict damage to people from acute intoxication.

In above probit equation following probit constants are relevant for the following chemicals :

Chemical	Probit Constants		
	K1	K2	N
NH_3	-15.8	1	2.0
CO	-7.4	1	1.0
Cl_2	-14.3	1	2.3
EO	-6.8	1	1.0
HCl	-6.7	1	1.0

Examples:

(1) Let us consider C = 21.2 kW/m^2 radiation energy for I % lethality with exposure time 10 seconds, then for Ethylene oxide (E.O),

$$\begin{aligned} P &= K_1+K_2 \ In \ C^n t \\ &= -6.8+1 \ In \ (21.2^1 \times 10) \\ &= -6.8+1 \ In \ (21.2 \times 10) \\ &= -6.8+In \ 212 \end{aligned}$$

	=	- 6.8 + 5.35
	=	-1.45

(2) Let us consider C = 1871 mg/m^3 concentration for ammonia at its LC_{30} then for 20 seconds exposure,

P	=	$K_1+K_2 \text{ In } C^n t$
	=	- 15.8 + 1 In (1871^2 x 20)
	=	- 15.8 + In (3500641 x 20)
	=	- 15.8 + In 70012820
	=	- 15.8 + 18.06
	=	+ 2.26

(3) Let us consider C = 25 mg/m^3 concentration for chlorine, then for 5 minutes (5 x 60 = 300 seconds) exposure,

P	=	$K_1+K_2 \text{ In } C^n t$
	=	- 14.3 + 1 In ($25^{2.3}$ x 300)
	=	- 14.3 + In (1641.57 x 300)
	=	- 14.3 + In 492473.96
	=	- 14.3 + 13.10 = -1.2

The profit P is a random variable with a mean 5 mid variance 1. The probability (range 0 - 10) is generally replaced in probit work by a percentage (range 0 - 100) from the following table :

Probit	% (approx)
2.5	0
2.67	1
3	3
3.5	8
4	15
4.5	30
5	50
5.5	70
6	85
7	98
7.5	100

Thus probit P = 2.67 represents 1% of the exposed 'population, P = 5 represents 50% of the exposed population, P = 5.5 represents 70%, P = 7 represents 98% and P = 7.5 represents 100% of the exposed population or percentage damage or degree of injury that can result from the exposure.

In previous example (2) of ammonia release, P = 2.26 indicates that approximately 0.9% of the population may be affected.

A common rough estimate for the hazard range for large pool fires is about 2 pool diameters, and for large drifting vapour clouds 1.5 cloud diameters.

Thus a probit equation generally gives the relation between the causative factor and the probability of death.

However it should be borne in mind that probit equations are just approximation 'in an impact model of hazard assessment and there may be a vast difference in actual result.

See also Part 4.12 for use of Probit Equation.

6.3 Criteria (Identification) for the Plant to be under MAH unit :

Schedules 1, 2 and 3 of the Manufacture, Storage and Import of Hazardous Chemicals Rules 1989 (and also u/r 68J of the Gujarat Factories Rules) prescribe criteria for toxic, flammable and explosive chemicals, list out the hazardous chemicals and give their threshold quantity for application of certain rules. These storage quantities and processes listed in Schedule-4 are, now, legal criteria to identify the plant to be under MAH unit. For details the Schedules should be referred.

Chemical	Quantity (t)	Chemical	Quantity (t)
HCl gas	25	Chlorine	10
NO_x SO_3	50 15	Formaldehyde	5
Acetylene	5	HCN, HF, H_2S	5
Acrylonitrile	20	SO_2	2
Ammonia	50	EO	5
Bromine	40	Hydrogen	2
CS_2	20	Phenol	10

Thus the plants keeping quantities equal to or more than the threshold quantities mentioned in the Schedule-3 (above table is a part thereof) or the isolated storage (other than a factory) storing quantities equal to or more than the threshold quantity mentioned in the Schedule-2 (e.g. Ammonia 60t. Flammable gases 501, Highly flammable liquids 10000t, Bromine 50t) are to be identified as major hazard installations (factories or isolated storage).

As the Oleum is not named in Sch. 2 or 3, the quantity of S0,, (15t) is to be considered for oleum.

For the purpose of determining the threshold quantity of a hazardous chemical in a factory or isolated storage, the aggregate of all installations within a distance of 500 mt of each other and belonging to the same factory/isolated storage (or the same occupier) shall be considered as mentioned in Sch. 2 & 3.

Based on above discussion, the MAH units are mostly those associated with

1. Storage/processes of Cl, NH,, & LPG.
2. Other chemical/petrochemical plants and refineries.
3. Pesticide factories.
4. Explosive factories and
5. Large fertiliser plants.

6.4 Role of the Management

Under the Manufacture, Storage and Import of Hazardous Chemicals Rules, 1989 the general responsibilities of management of any MAH unit are to

1. Provide information to the authorities, of criteria, quantities and processes of hazardous substances to identify the unit as an MAH unit. See Rule 4 & 7, and Sch. 7 &: 9 for notification of site and MSDS.
2. Carry out Safety Audit and Risk Assessment and collection, development and dissemination of information as mentioned-in Rule 17 and Sch. 8 to 12. Submit Safety Report and Safety Audit Report.
3. Report to the authorities the results of the hazard/ risk assessment in the prescribed formats e.g. Safety Report in Sch. 8, MSDS in Sch. 9, Information of imported chemicals in Sch. 10, Onsite Emergency Plan in Sch. II and information required by the authority to prepare Off-site Emergency Plan in Sch. 12. This plan is to be rehearsed once in a year.
4. Set up an emergency plan i.e. on-site and off-site emergency plan based on the guidelines from Factory Inspectorate. See Sch. II & 12.

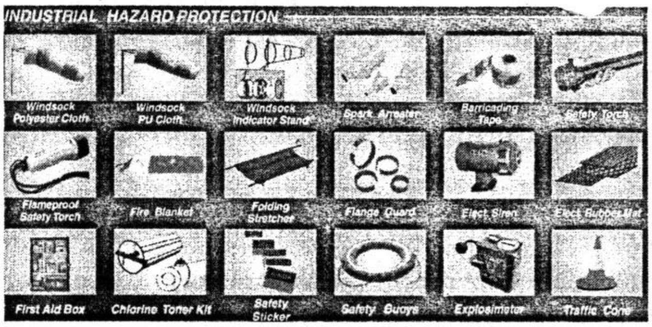

Fig. 19.1 Major Hazard Protection Equipment & Stickers

5. Take all necessary safety measures to prevent major accidents and to limit their consequences to persons and environment, provide to the workers with information, training and equipment including antidotes necessary to ensure their safety as mentioned in Rule 4. This is the main responsibility to operate and maintain the plant safety and to mitigate consequences .of the accident. See Fig. 19.1 for Major Hazard Protection Equipment & Stickers. They should be used and displayed.
6. Update the information following changes in the threshold quantity, other hazards and safety report as mentioned in Rule 8 and 11.
7. Give information to the public liable to be affected by a major accident as mentioned in Rule 15.
8. Notify within 48 hours, to the concerned authority mentioned in Sch. 5, a report of major accident occurred on site in the Sch. 6. See Rule 5.
9. Inform the concerned authority (mentioned in Sch. 5), before 30 days, the particulars mentioned in Rule 18, regarding import of hazardous chemicals. The records of imported hazardous chemicals shall be maintained in Sch. 10

For various methods of hazard/risk assessment see Part 4.3 of this chapter.

6.5 Role of the Authorities :

In controlling major industrial hazards and accidents, the Government authorities have an important role to play as Under

1. To enact, implement and amend the law on major hazard control.
2. To require statutory information from industries to identify them as MAH installations (sites & isolated storage), in the form of Safety Report, onsite emergency plan and other relevant information.

3. To compile the data of MAH units, nation-wide, statewise and districtwise with the lists of MAH factories, isolated storages, hazardous chemicals involved in such units, their quantities, types and consequences of hazards and areawise contingency (emergency action) plans.
4. To publish and circulate useful information for the MAH management, their workers and the general public. This should include the role of different agencies and the public and information on medical help and antidotes.
5. To set up the Crisis Alert System as provided by rule 4 of the Chemical Accidents (Emergency Planning, Preparedness and Response) Rules 1996. See Part 10.10 of Chapter-28.
6. To establish and maintain uptodate an inventory of MAH units based on the Safety Reports received and location of the units in relation to populated areas.
7. To inspect the MAH units based on safety reports and on-site emergency plans received to check the correctness and effectiveness of the safety arrangements provided. To give direction for further action if necessary.
8. To draw up an off-site emergency plan (by local authorities) after consultation with the MAH units and agencies like fire brigade, police, hospitals and ambulance, transport, telephone etc. Budget and arrangements to train participants and public and carry out rehearsals should be made.
9. To make and implement siting policy to separate MAH units from other units and population.
10. To acquire for self, expertise by establishing a group of experts, to prepare checklists to evaluate plant safety measures and to develop inspection systems and programmes for the use of Factory Inspectorates.

6.6 Role of the Workers:

The workers of the MAH units have to play an important role as under :

1. They should understand the concept of major hazard control and its importance to operate the plant safely.
2. They should give full co-operation in undergoing training and implement it to run and maintain the plant with safety and responsibility so as to avoid any hazard or accident to self and others.
3. They should watch their workplaces for safety, use necessary equipment and follow safe working procedures for their health and safety.
4. They should know and play their role in the onsite emergency plan of their company.
5. They should make proper use of safeguards and safety devices meant for them and co-workers.
6. They should not displace, alter, remove or interfere with safety guards, devices and appliances.
7. They should not temper with process controls, valves, piping, pumps, mechanical, electrical and other machines and equipment so as to cause any deviation or hazard.
8. They should not do any unauthorised act.
9. They should report immediately imminent dangers, defects or any unsafe condition to their supervisors, safety committee members or the concerned safety officers.
10. The trade unions can also contribute by educating and training their members on above matters. They should give active co-operation to the management in implementing major hazard control system.
11. The workers or their unions should prepare and circulate training and information materials addressed to workers to promote safety awareness and their duties toward health & safety.

6.7 Role of the Public:

The public has to play their role as under :

1. They should know their role at the time of off-site emergency affecting them. They should attend meeting for this purpose with the authorities and the factory management and to clarify their doubts and duties.
2. At the time of off-site emergency they should follow the instructions for them regarding their staying in houses or be prepared for evacuation. They should not make panic or frighten others by misguiding or spreading false information.
3. The injured people should take immediate medical help or antidotes suggested by the doctors.
4. The public should give full co-operation in emergency activities entrusted to them by the authorities e.g. traffic control, helping sick and handicapped persons etc.
5. They should not cause obstructions, hindrances or difficulties at the time of emergencies. They should give correct information to the authorities.

6.8 Safety Report, Safety Audit Report and Risk Assessment Report.

6.8.1 Safety Report:

Statutory information required in a safety report is given in Sch. 8, Rule 10(1) of the MSIHC Rules, 1989

Before 90 days of any modification (having material effect), an updated Safety Report shall be submitted to the authority.

6.8.2 Safety Audit Report:

Safety audit with the help of an expert not associated with such industrial activities is to be submitted every year within 30 days after the completion of such audit.

Like financial audit, 'Safety Audit' has also been popularized and has come into practice since last ten years. After statutory requirements (GFR 1995 & MSIHC Rules 2000), audit frequency has been increased. Looking to this need, BIS also published an Indian Standard - IS:14489 in 1998 as standard guideline for practice on occupational safety and health audit. This IS does not include rating (points) system like British Standard. Therefore, it gives qualitative analysis and not the quantitative.

1. Need of Safety Audit:

Safety audit is mainly required for two reasons:

(A) **Safety Requirement:** It is utmost necessary for the purpose of maintaining safety (accident free atmosphere) in industry that all systems of work should be thoroughly checked from safety point of view at regular interval and deficiencies identified should be removed by due compliance of safety recommendations. -A pro-determined checklist is useful for a fixed class of industry (e.g. chemical industry) but, however, audit points are variable and should be best suitable to the type of industry to be audited.

(B) **Legal Requirement:** Rule 12-C & 68-0 of the Gujarat Factories Rules 1963 and Rule 10 & 12 of the Manufacture, Storage and Import of Hazardous Chemicals Rules 1989 need submission of safety audit reports to the concerned authorities within prescribed time.

2. Audit Procedure:

Lead auditor along with his team may adopt following procedure:

1. Constitution of Audit team (at least two members).
2. Constitution of Auditee representatives.
3. Recording identification and brief history of the auditee industry.
4. Deciding audit goals, objectives and scope.
5. Drawing audit plan with time schedule.
6. Holding opening meeting with the auditee.
7. Study of process and applicability of safely laws and standards.
8. Taking plant round and noting observations.
9. Examining records and documents.
10. Filling checklists of audit points (e.g. filling of Annexure A, B & C of IS-.14489). Element wise (Annex. A) files will be useful.
11. Holding of closing meeting and discussing findings.
12. Preparation and submission of Audit Report (with Executive summary in the beginning).
13. Report distribution for compliance.
14. Compliance audit if required by the audittee or client.
15. Visit for compliance audit and its report.

3. Audit Frequency:

Normally an external or third party safety audit should be conducted once in two years and an internal audit may be organized once in every year.

4. Audit Goals:

Following goals can be decided while starting the audit:

1. Assessment of Auditee's OS&H system against existing standards and identification of areas for improvement.
2. Determination of conformity of the implemented OS&H system with specified requirements and identification of areas for improvement.
3. Checking of statutory requirements.

5. Audit Objectives:

Following objectives can be decided for the audit:

1. To carry out a systematic, critical appraisal of all potential hazards involving personnel, plant, services, methods etc.
2. To ensure that company's OS&H system and safety policies, objectives etc. satisfy the legal requirements.

6. Audit Scope:

The scope and depth of the audit should be decided as per auditee's or client's requirements. This should include:

1. Which plants or areas to be audited.
2. Which OS&H system elements to be audited.
3. With what legal and other safety standards, rules or documents, the auditee's OS&H systems should be compared. Benchmarking if any, should be considered.

4. List of resources and evidences including workers and experts that will be available for audit.
5. Within what time frame audit should be completed and with what other terms and conditions. A written agreement, if necessary, should be prepared and signed.

7. Audit Plan:

Audit plan should be finalized after consultation with auditee and should be informed to auditors and auditee in the opening meeting. This plan should include:

1. Audit goals, objectives and scope as stated earlier.
2. Names of audit team members and management's representatives.
3. List of documents to be checked.
4. List of legal and other standards to be followed during audit.
5. Auditee's OS&H policy and its other intentions.
6. Time schedule of audit visits of each plant or location.
7. Schedule of meetings to be held with auditee for the audit purpose.
8. Expected date of issue of the audit report.
9. Procedure or methodology of compliance of the report, and
10. Whether compliance audit will be required by the auditee and if yes, it's probable time schedule, and method of communication.

8. Checking of Records & Registers:

Statutory forms, records and registers under the Factories Act & Rules and other safety laws should be checked for relevant information and statutory compliance. This may include (for Gujarat):

1. Form No. 1 A (GFR) i.e. structural stability certificate.
2. Form No. 9, 10, II (GFR) for hoists, lifts, lifting machines and pressure vessels.
3. Reports of Competent Persons regarding examination of dangerous machines, safety devices, dangerous operations etc.
4. Form No. 29 (GFR) i.e. Accidents Register.
5. Form No. 20, 32 & 33 (GFR) i.e. Health records for workers.
6. Form No. 37 (GFR) i.e. work place monitoring record.
7. Industrial Hygienist's report regarding measured values of gas, vapour, noise, WBGT (Heat stress parameters), ventilation system etc.
8. Statutory cautionary notices, safety policy and minutes of safety committee meetings.
9. Certificate of safety, testing of pressure vessels and safety valves etc. under SMPV (U) Rules 1981 and Petroleum Act & Rules, if applicable.
10. Forms under Gas Cylinder Rules if applicable.
11. Testing certificates of effluents, air pollutants, solid wastes, ambient air quality etc. under GPCB norms.
12. Licenses under applicable Acts and Rules and their validity.
13. Public liability insurance policy, if required.
14. Records of storage quantities of hazardous chemicals for verification of threshold quantities and identification as MAH installation.
15. Records and Registers (29) as suggested by Annexure - B of IS:14489.
16. Other relevant records and registers as considered necessary by the auditors.

9. Checking Applicability of Safety Laws:

From above records, registers, licenses etc. and physical verification of storage quantities, number of gas cylinders etc., act-wise applicability and validity of licenses etc. should be checked, discussed and narrated in audit report.

10. Points of Plant-visits:

All safety points (audit points) seen during plant visits should be recorded plant-wise or location-wise so that plant-wise implementation will become easy. This should be separately reported in the audit report.

Such points are to be seen as requirement of law and other standards. Their mention will include reference of relevant section, rule, standard (attributes) etc.

11. Audit Observations and Recommendations:

Safety audit questionnaire sheet should be prepared in the following form:

Sr. No.	Items to be observed	Observation seen/ found (Non conformities)	Recommendations i.e. safety suggestions.
1	2	3	4

Observations should be clear and specific. Recommendations should also be clear, specific, easy to understand, brief and with reference of safety standard or reason as per auditor's opinion.

Annexure - C of IS:14489 is a good guideline for safety audit which can be used for a chemical industry also. It should be utilized as a whole or with necessary modification deem fit by the auditors. Points may be decreased or increased depending on the size, status, contents, materials, processes, procedures and systems of works and experience of the auditors.

As Annexure - C includes many items of safety •inspection and audit including safety policy, organization, training, general working conditions, hazard identification and control, technical aspect, work permit system, PPE, fire protection, emergency preparedness, hazard area classification, static electricity, vessels and equipments, storage safety, communication system, transport, pipelines etc., they are not separately discussed in this article. There is no end to such items. Only experience can specify and classify them. Therefore, audit by duly qualified and experienced auditors is more useful.

12. Closing Meeting:

After recommendations are ready, prior to preparing the audit report, auditors should hold a closing meeting with auditee's senior managers to explain them the result of the audit. Audit observations and recommendations should be explained to them. Power point presentation is more effective. Querries of the audience should be replied forthwith. Reasons (legal requirements, standards etc.) of recommendations should be properly explained. It should also be clarified that the purpose of this effort (audit) is not to criticize but to try to find out the methods of further improvement.

13. Report Preparation & Submission:

Audit report should be well documented by the auditors, audit certificate should be signed (with date) by the lead auditor and enclosed with the audit report and it should be sent to the auditee or client as soon as possible. If it cannot be sent within agreed time limit, reasons of delay should be communicated. The auditee should send acknowledgement of receipt of audit report to the auditors and client and final report of compliance when it is over.

14. Report Distribution and Compliance:

Auditee will decide internal distribution (relevant copies) of audit report to the concerned departments or managers with its instructions of compliance within specified time limits assigned to each of them. The auditee will collect the reports of compliance, will verify and arrange in chronological order against each point of recommendation.

15. Report Retention:

Auditee should retain the audit report alongwith its compliance report and should show them to the authorities on demand. Such retained audit reports will show the history of safety improvement of the auditee. Minimum time of retention is till full compliance of the audit report. Cost benefit ratio can also be determined based on this.

If compliance or follow-up audit is required by the same auditors, auditee or client should inform them accordingly.

6.8.3 Risk Assessment Report:

As explained in part 4.3 risk assessment should be carried out by using risk ranking table (matrix) and computer models for damage distances due to toxic gas release or fire or explosion phenomena. First hazards of main industrial activities and sub activities are identified. Then ranking points are assigned to them. Quantitative assessment is derived fgr probability and severity part of the risk. Than using the formula risk = probability x severity, risk levels are calculated and tabulated.

A format of risk assessment report should contain following items:

Executive Summary
1. Legal Requirement of Risk Assessment
2. Words and Concepts Defined.
3. Hazards Identification
   3.1 Identification of the Factory
   3.2 Brief History of the Factory
   3.3 List of Products
   3.4 List of Raw Materials.
   3.5 Process in brief
4. Hazards Analysis
   Listing of hazards activity wise and their classification
5. Hazards & Risk Assessment
   5.1 Risks as per Work Environment Report (Form No. 37, GFR).
   5.2 Risks as per Health Records of the Workers (Rule 68 R&T, GFR).
   5.3 Risks due to Toxic Chemicals (as per Gas Dispersion Calculations)
   5.4 Risks due to Flammable Materials
   5.5 Assessment of Residual Risks-material wise or activity wise and using appropritate metrix with formula
      Risk = Probability x Severity.

Tables of ranking points

6. Risk Control
   - 6.1 Control Measures Provided
     - 6.1.1. Risk Reduction Measures
     - 6.1.2. Risk Prevention Measures
     - 6.1.3. Information Management
   - 6.2 Control Measures Suggested.

7. Risk Management
   - 7.1 Functions of SHE & Fire Departments to identify, assess, address, control and review the risks
     - 7.1.1 Functions of the SHE Department
     - 7.1.2 Fire Fighting Facilities.
   - 7.2 Risk Financing (Transfer by Insurance)
     - 7.2.1. Insurance Policies for Workmen's Compensation
     - 7.2.2. Insurance Policies for Property Protection.
     - 7.2.3. Public Liability Insurance.
   - 7.3 Risk Administration
     - 7.3.1. Long-term Programme
     - 7.3.2. Day-to-Day Operations

7 ON-SITE AND OFF-SITE EMERGENCY PLANS

7.1 Need & Types of Emergency Plans

Minor accidents do not cause much damage. But major accidents due to emergency or disaster cause extensive damage to person, property and environment. Many accidents like Bhopal tragedy have occurred at many places in the world causing heavy loss of life and property. Some cases are discussed in Chapter 30. Emergency situation arises all of a sudden and contains high potential to cause havoc. Therefore such situations (chances) and risks should be thought in advance and it should be planned beforehand to tackle them immediately and to control them within the shortest possible time. Reasons of emergency planning are as follows:

Reasons of Emergency Planning :

1. Experience of years have shown that accident, dangerous occurrence, emergency or disaster occurs at any time and we lose life, property, production etc. if not fully prepared to control over and minimise it. Therefore it is most advisable to foresee such situation and to plan for total loss prevention and control.
2. There is no alternative to emergency planning. Only the best planning, periodical drill or rehearsal, co-ordinated and sincere efforts by all authorities at all times and speedy follow up as per planning will help to achieve the goal.
3. Planning reduces the thinking time for necessary steps at the time of accident .
4. It is easy to set in motion all machinery already planned and trained in advance to meet the situation.
5. Prevention is better than cure. Planning intends first prevention and if it fails, subsequent control to cure the situation. Emergency needs such planning. .
6. Planning helps to contain the incident and to minimise the loss to the national wealth including human lives, resources, business and administration.

7. It is our moral, social and legal obligation to serve the society for safety, health and welfare. Emergency preparedness or planning is the best step in this direction.
8. Many companies, organisations and nations have succeeded in above goal by planning and follow up only. This suggests the need for planning.

Types of Emergency:

See Part 3 of Chapter-2 for definitions.

There are three basic types of emergencies : (1) Operating (2) Fire and .(3) Disaster.

1. Operating Emergency : It is an emergency, that can be locally handled by unit personnel alone without help e.g. small fire, air failure, power failure, cooling water failure, steam failure, gas leaks etc'. .
2. Fire Emergency : It is a fire which is beyond the control of operating staff or the unit. It requires the assistance of the other fire fighting force.
3. Disaster , A disaster is a catastrophic situation in which the day-to-day patterns of life are, in many instances, suddenly disrupted and people are plunged into helplessness and suffering and as a result need protection, clothing,, shelter, medical and social care and other, necessities of life, such as -

    (1) Disasters resulting from natural phenomena like earthquakes, volcanic eruptions, storm, surges," cyclones, tropical storms, floods, landslides, forest fires and massive insect infestation. Also in this group, violent draught which will cause a creeping disaster leading to famine, disease and death must be included. ..-
    (2) Second group includes disastrous events occasioned by man, or by man's impact upon the environment, such as armed conflict, industrial accidents, factory fires, explosions and escape of toxic gases or chemical substances, river, water, "land and air pollution, mining or other structural collapses; air, sea, rail and road transport accidents, aircraft crashes, collisions of vehicles carrying inflammable liquids, oil spills at sea, and dam failures.

Advance emergency planning and proper training of every employee in the 'emergency function is very essential to make emergency control measures more effective. It is not possible to completely eliminate emergency situations, but it is definitely possible to control them. An emergency, if uncontrolled may cause a disaster which in turn may create a catastrophe.

There are two types of emergency control plans (1) On site emergency plan and (2) Off site emergency or disaster plan. The first is to be prepared by an industrial unit under the guidance of the government and local authority and the second one is to be prepared by the local authority or the government itself with the help of the government machinery and resources including the concerned industrial units also.

They arc explained below as a guide line. Necessary alteration, addition etc. must be made according to tile specific types of hazards, situations and control measures required.

7.2 Statutory Provisions :

Section 41B(4) of the Factories Act, 1948 requires an on site emergency plan and detailed disaster control measures for the safety of the factory workers and the general public living in the vicinity of the factory. The occupier is required to inform the workers and the public about the safety measures to be taken in the event of an accident.

Rule 13, 14 and Schedule II & 12 of the Manufacture; Storage and Import of Hazardous Chemicals Rules, 1989 and Rule 5,7,9 and 10 of the Chemical ' Accidents (Emergency Planning, Preparedness and Response) Rules, 1996 also provide for on-site and off-site emergency plans., as under:

7.3 On-site Emergency Plan :

The plan should include the following information:

7.3.1 The Purpose and Policy :

The purposes of this plan are :

1. To protect persons and properly of your factory in case of all kinds of accidents, dangerous occurrences (Rule 103, Gujarat Factories Rules), emergencies and disasters happening in or affecting your plant at any time.

2. To inform people and surroundings about above happening if it is likely to adversely affect them.

3. To inform authorities including helping agencies (doctors, hospitals, fire, police, transport etc.) in advance, and also at the lime of actual happening.

4. To identify, assess, foresee and work out various kinds of possible hazards, their places, potential and damaging capacity and area in case of above happenings. Review, revise, redesign, replace or reconstruct the process, plant, vessels and control measures if so assessed.

5. To work out a plan with detailed instructions to cope up with above happenings, based on your personnel, equipment and records. Necessary requirements shall be added if not already available. Levels of hazardous substances shall be minimised to the extent possible. Establish machinery for rescue and recuperation operations, total loss control and prevention of harms and recurrence of above happenings. Ensure that absolute safety and security is achieved within the shortest time. Pv~reventior22 and regular maintenance will be useful in this regard..

Each factory shall have to prepare its own plan depending upon own hazards, probable emergencies, personnel, equipment, resources, nearby outside agencies and new requirements if any. Some model guidelines are given below. You may add more points or rearrange as per your own requirement and work out the details.

7.3.2 Site Plan of the Factory and Surrounding :

Prepare a plan of the factory premises and surroundings showing therein the areas of various hazards such' as fire, explosion, toxic release etc., and also location of assembly points, fire station oi equipment room, personal protective equipment room, telephone room, first aid or ambulance room, emergency control room, main gate, emergency gates, normal wind direction, north direction, outside fire station, police station, hospital and other services. Mention their distances also.

7.3.3 Types of Overall Emergencies :

Describe types of emergency and how it can arise in or near your plant. Fire (small and big), explosion, toxic exposure, strike, storm, flood and other hazardous possible situations shall be described with reasons. Sources of hazard from outside or neighbouring plants, tanks, structure etc. shall be mentioned. Effect of prevailing wind and population density likely to be affected shall also be considered. Following table shall be drawn up.

Sr. No.	Type of emergency including disaster (Major class)	May arise due to	At (Place)	People and area likely to be affected
1	2	3	4	5

7.3.4 Assessment of In-plant Hazards :

Give details of assessment of in-plant hazards and control measures provided in the following tables:

A. Storage Hazards and Controls :

Sr. No.	Name of the hazardous content and quantity	Type of hazards possible (fire, explosion, toxic exposure etc.)	Place	Control measures provided	Incharge person, phones & address
1	2	3	4	5	6

B. Process Hazards and Controls :

Sr. No.	Name of the hazardous process, operation or situation	Unsafe parameters (Pressure, temp., flow, content, hazardous situation etc.)	Type of hazards possible (Run away reaction, bursting, gassing etc.)	Place	Control measures provided	Incharge person, phones & address
1	2	3	4	5	6	7

C. Other Hazards and Controls :

Sr. No.	Name of the hazards	Reasons of the hazards	Type of hazards (effects possible)	Place	Control measures provided	Incharge person, phones & address
1	2	3	4	5	6	7

D. Inspections, Maintenance and Monitoring :

Sr. No.	Name of the FEE, PPE, scrubber, safety devices and other equipment	Their locations	Period of Inspection	Incharge person, phones & address	Last date of inspection	Date of inspection and Remark

1	2	3	4	5	6	7

7.3.5 Emergency Organisations and Functions :

Prescribe the constitutions and duties of : (1) Alarm raiser (2) incident (spot) controller. (3) Site main controller (Chief Co-ordinator). (4) Emergency team including engineers and experts. (5) Fire fighting team. (6) Gas control team. (7) First-Aid and Health care team. (8) Ambulance and evacuation team (9) Safety officer and (10) Security officer.

Fix names and designations of Head, Deputy and members (as per need) of each of above team (to be informed in chronological order) in all shifts of working days and on holidays. Their names, day and shift shall be displayed on the main notice board and also with the main telephone operator and chief executive on duty. In a small factory employing less workers these duties shall be well distributed. In a small factory only requisite teams may be formed and some duties may be combined.

Following table shall be drawn up :

Sr. No.	Name of the team (Fire, gas, Medical etc.)	Names of Head, Deputy and members with address	Their telephone numbers		Duties and functions of the team	Equipment to be carried by the team and their location
			Off.	Resi.		
1	2	3	4	5	6	7

Members of above teams shall be available during all shifts and holidays. Protective equipment, lifting gears, fire control points etc.; shall be sufficient in numbers and their locations shall be well informed. Necessary vehicles shall be kept ready to shift persons 'in case of emergency.

Main functions of the fire and toxic gas control teams are as follows:

In Case of Fire:

1. All persons are responsible to report section incharge about details of any incident of fire (slight, minor, major etc.) and shall act by all available means to prevent/control it till it is possible. The section-in-charge will work as incident controller.
2. The incident controller shall (a) Order the 'Fire Team' to control it with all its available means. (b) Assess the nature of fire and report in details to the site main controller.
3. The site main controller shall (a) Take all actions to remove/control the fire. (b) Ask the mutual aid services to be ready on demand, (c) Take help of mutual aid services to fight fire, if it is uncontrolled. (d) Report the off- site fire fighting services for help and action, (e) Report to control room for necessary action, (f) Co-ordinate with offsite fire services to control the fire.

In case of Toxic Gas or Liquid Release:

1. All persons shall report about toxic gas or liquid release to section-in charge and shall act to control or reduce it till possible. The section-in-charge will work as incident controller .
2. The incident controller shall (a) Order the 'Gas Team' to control it with all its available means. (b) Immediately report to the site main controller about the type and possible cause and its likely

effect to the people and property, (c) Inform the site main controller for all likely precautions to be taken to reduce its effect. (Isolation, fire fighting services, mutual aid etc.)

3. The site main controller shall (a) Order to all section ;n-charge to control/reduce toxic release by all possible means.(b) Ask Gas Team and fire -fighting services of the factory for necessary control and evacuation in the plant, (c) Report mutual aid agency for help. (d) Operate alarm to warn the surrounding people before it is likely to effect, (e) Report off site fire services.

Similarly duties (functions) of others shall also be described.

7.3.6 Telephone Operators' Guide :

Telephone is the essential communication system. Tabulate all your internal telephone numbers and outside emergency numbers for information and help. If any telephone is torrid not working at a time, a speedy messenger shall be sent. Formulate table-A for all internal phones and table-B for outside emergency phones.

A. Internal Phones :				
Sr. No.	Name of the Department	Phone No.	Main persons available	Residence phones if any
1	2	3	4	5
B. Outside Emergency Phones :				
Sr. No.	Name of the Dept. / Service	Phone Numbers		Address
		Off.	Resi.	
1	2	3	4	5

In table-B, phones of your top executives, fire, ambulance, transport, hospitals, doctors, ESIC, Red Cross, Police, Home guards. Factory Inspectorate, Collector, experts, surrounding factories, power, water, gas, GIDC, Pollution Board and other Govt. authorities, helping associations and institutions etc. shall be included.

Who shall inform the Govt. authority and others that shall be prescribed. Statutory information, if any, shall be sent immediately.

The telephone operator shall give exact information of the place, nature and severity of the emergency and shall not disconnect till the message is repeated at the other end. He shall first hear the message without any interruption and record it. When the message is over, he shall ask the missing links or further information required.

7.3.7 Emergency Shutdown Procedure :

Looking to the gravity of emergency, if it seems necessary to shut down the process or plant, detailed instructions shall be laid down for plant/area.

Following table shall be prepared for each Shed/ Department/Area:

Name of the Plant/Shed/Dept/Area :

Sr. No.	Location & Phone	Necessary shutdown procedure (action)	Generally by whom	Remark

1	2	3	4	5

7.3.8 Link with Off-site Emergency Plan :

To deal with the emergencies extending outside the factory premises and affecting neighbouring area, off-site emergency control procedure and public warning procedure shall be laid down and followed. Information required by the Govt. authorities shall be furnished to make and update the Off-site Emergency Plan.

7.3.9 Pre-information to Doctors and Hospitals :

Antidotes, medicines and remedial measures shall be conveyed to surrounding doctors and hospitals who will verify them before their use.

When any affected person will be sent, information regarding type, time and duration of exposure and antidote shall also be sent.

7.3.10 Printed Plan, Copies and Rehearsal:

The on-site emergency plan so prepared shall be documented in a .typed or printed form in sufficient copies to give to all concerned for knowledge, study and easy follow up. Written notices (emergency instructions) shall be displayed at necessary points. Merely understanding the plan will not be useful, safety is an acquired talent which needs regular exercise. Therefore, the emergency plan shall be rehearsed and practised at regular intervals to test efficiency of personnel, equipment, co-ordinated efforts and to increase the confidence and experience to operate such plan successfully. The personnel shall be properly trained for tills purpose.

7.4 Off-site Emergency (Disaster Management) Plan :

7.4.1 Purposes of the Plan :

Briefly they can be stated as-: (1) To save lives and injuries (2) To prevent or reduce property losses (3) To prevent or reduce damage to environment, and (4) To provide for quick resumption of normal situation or operation.

For further details the purposes are narrated as under:

1. To protect persons and properties of the factories in general and the affected community as a whole.
2. To identify, assess, foresee and work out various kinds of probable hazards, their place, potential, damaging capacity and area in case of all accidents, dangerous occurrence (Rule 102, Gujarat Factories Rules), emergencies and disasters happening in or affecting the jurisdiction at any time. In this regard it coincides with the purpose of on-site emergency plan of a factory, and will go through the on-site emergency plans of all factories in the jurisdiction and will guide or suggest the missing aspects if any. The On-site Emergency Plans will be considered in advance while making and operating this Disaster or Off-site Emergency Plan. Thus on-site and offsite plans together will be single and co-operative 'package' for the common purpose of fighting the emergency. Modifications in the plans and reduction in quantity of materials may be suggested if necessary.
3. To make explicit the inter related set of actions to be undertaken in the event of an industrial accident posing hazards to the community. The plan must be both factual and action-oriented.

4. To inform people and surrounding about emergency and disaster if it is likely to adversely affect them. Machinery will be established for this purpose to guide the people in proper way.
5. To plan for rescue and recuperation of casualties and injuries. To plan for relief and rehabilitation.
6. To plan for evacuation, safe assembly points and transportation required.
7. To plan for prevention of harms, total loss control and recurrence of disaster. It will be ensured that absolute safety and security is achieved within the shortest possible time.
8. To contain, limit, localise and minimise the loss and damage to persons, property and environment arised from the accidents on road or industry, transport, storage or otherwise. To plan to decrease the potential levels of risk.
9. To prevent the spread and rehappening of the disaster.
10. To plan for review, rectification or modification of this Disaster Plan on the ground of actual experience.
11. To plan for communication meeting with industries, authorities, experts, institutions, doctors, hospitals etc.
12. To prepare a site plan, identifying industries, hazardous points, control points, assembly points, hospitals, dispensaries, fire station, police station, railway station, bus station, transport points, roads and all other requisite details.
13. To verify the information given by the industries to comprehend dangers and to arrange for adequate personal protective, fire fighting and emergency equipment.
14. To establish command structure and to identify the respective roles of the senior personnel of various service groups, viz. police commandos, experts-group, para medical group, toxicity control and de-contamination squad and various authorities of water, power, gas, health, labour, environment, revenue, explosive, pollution control, press, post, telephone, wireless, radio, TV, railway, transport and social services etc. Necessary representatives of employers and employees shall also be incorporated. Various organisation, their duties, equipment, implementation procedure and actions on-site and off-site, warning system, communication system, co-ordination system, control centres, key personnel shall be prescribed.
15. Plan to carry out training programmes in safety, health and environmental protection for the concerned parties. Necessary publication will also be useful.
16. To maintain full liaison between all parties to this plan, industries, emergency services etc.
17. To plan for the antidotes, remedial medicines and equipment in the hospitals and carry out research for them for latest and effective measures. Sufficient stock and mutual aid scheme will be useful.
18. To provide for continuous monitoring system for essential parameters of pollution to judge malfunctioning at the initial stages and warning systems at appropriate places. Meteorological information regarding prevailing weather conditions, wind velocity and direction, rain and flood data for such data-collection.
19. To appoint a record keeper, historian and staff to collect information on the cause of disaster and to maintain the record thereof and also of the plan proceedings.
20. To carry out mock implementation and rehearsal of this plan to ensure its efficacy, test and response, interaction and co-ordination of operators of various service organisations, evaluate the effectiveness and adequacy of the equipment and to gain experience and confidence to implement the plan. The finalised Disaster Plan shall be given to all concerned for implementation and rehearsal.

7.4.2 Plan of the Jurisdiction with Locational Layout:

Like on-site emergency plan, a map or plan of the jurisdiction (area) with locational details shall be prepared and all necessary points shall be shown for guidance.

7.4.3 Risk Assessment:

Risk assessment is most essential before designing any off-site emergency plan. Hazardous factories and their hazard identification, other hazard prone areas and general and specific risks, , transportation risk, storage risk, pollution risk by air and water pollution, catastrophic risk such as disasters, natural calamities, acts of God, earthquake, landslide, storm, high wind, cyclone, flood, scarcity, heavy rain, lightening, massive infection, heavy fire, heavy explosion, lava/ vulcano, heavy spill, toxic exposure or pollution, environmental imbalance or deterioration etc.; risks from social disturbances such as war, riots, sabotage, bomb-threats, massive strike, great mischief, damaging indiscipline etc., and risks inferred from the past accidents must be considered while carrying out risk assessment for a particular area (viz. district) for which the off-site emergency plan is to be prepared.

Types of disaster to

Sudden Natural	Sudden human-made
Avalanche	Structural collapse
Cold wave	Building collapse
Earthquakes	Mine collapse or cave-in
Floods	Land disaster
Flash flood	Sea disaster
Dam collapse	Industrial/technological
Volcanic eruption	accident
Glowing avalanche	Explosions
Heat wave	Chemical explosions
High wind cyclone	Nuclear explosions or
Storm	thermonuclear
Hail	explosions
Sand storm	Mine explosions
Storm surges	Pollution
Thunder storms	Acid rain
Tropical storms	Chemical pollution
Tornado	Atmospheric pollution
Insect infestation	Chlorofluoro carbons
Landslide	(CFs)
Earth flow	Oil pollution
Power shortage	Fires
Isunami & tidal wave	Forest/grassland fire

Long-term Natural	Long-term human made
Epidemics	National (Civil Stage,
Drought	Civil War)
Desertfication	International
Food shortage or crop	(War like encounters)
Failure	Displaced population
	Refugees

Different groups or comities are formed to do different emergency functions as under :

7.4.4 District or Central Control Committee (DCC or CCC) :

As the off-site emergency plan is to be prepared by the Government, a Central Control Committee or Group shall be formed under the Chairmanship of the area head. For example we assume a district structure and District Collector (is the Chairman of the District Control Committee (DCC). Other officers from police, fire, factory, medical, engineering, social welfare, publicity, railway, telephone, transport and requisite departments shall be incorporated as members. Some experts will also be included for guidance. A table of their names, addresses and telephone numbers shall be prepared.

The functions of this committee should be :

1. To work as main co-ordinating body constituted of necessary district heads and other authorities with overall command, co-ordination, guidance, supervision, policy decisions and doing all necessary things to control the disaster/ emergency in the shortest time.
2. To take work from subordinate committees. If any committee is not functioning at any time, the Chairman shall form a new committee.
3. To take in or relieve members to the DCC or other committees as per need or Government's directions. This will be done by the Chairman of the DCC.
4. To prepare, review, alter, update or cancel this plan and to keep it a complete document with all necessary details. Separate office and staff may be appointed by the Chairman for co-ordination and well functioning of the plan.
5. To take advice and assistance from experts in this field to make the plan more successful.
6. To set in motion all machinery to this plan in the event of disaster causing or likely to cause severe, heavy or massive damage to public, property or environment or as per the direction from the Government. The plan will be executed to control the situation, remove the hazards, save the lives, losses etc. and provide shelter, medical help etc. in the shortest possible time.
7. All members of the Committee shall be reportable to the Chairman and will act with high integrity, well discipline, quick response, sincerity and best co-ordinated efforts. They will attend meetings, prepare records and act in the direction of smoothening the work. The member secretary will act as advisor to the Collector who will conduct all co-ordination work as a District Head of all offices.
8. On receiving information of disaster or emergency from any source, the member to the plan will inform the Chairman or his .subordinate in his absence.
9. On receiving such information the Chairman shall take quick decision whether to operate this plan or not.
10. The Chairman shall immediately inform all secretaries of different committees to be alert and ready and will give necessary order to concerned secretary/members to rush to the spot for their respective work. Only necessary part of the plan will be operated.
11. Public will also be informed about declaration of disaster and necessary instructions for them.
12. The Incident Control Committee, Traffic Control Committee and Press Publicity Committee will first be informed as they are needed first.
13. All committees shall work as per their function and duties and as per their best judgement, knowledge and machinery to control the situation within the shortest time and without creating new hazard.
14. The Chairman shall form a Communication Committee (CC) consisting of his representative and members from Telephone, Information and Railway Departments to use their hot and fastest telephone lines (actually the Collector must have such hot lines) for speedy communication. The CC will carry out all communication with necessary agencies. The CC shall work continuously till the disaster is over and the Chairman disperses it.
15. The DCC will continue the execution till the disaster is over and normalcy noticed. Evacuated, injured or badly affected people will be given necessary help even after the disaster is over. Public will be informed about restoration or resumption of normal situation and cessation of declared disaster. Then the DCC will stop its operation.

16. All committees will prepare and keep ready teams of necessary persons, equipment, instruments, vehicles etc. to carry out their functions speedily, efficiently and to work under their control.

7.4.5 Fire Control Team (FCT) :

Duly qualified and well experienced members shall be taken in this Fire Control Team.

Function and duties of FCF should be :

1. To fight fire, control it and quench it completely. If uncontrollable, to stop its spread and to report to the Chairman for further help from outside. The team should have walky-talky or similar instrument to talk with members and directly with the headquarters.
2. The members here are incharge of fire stations. Therefore, they have their crews, fighters and equipment ready. They should always check that whether their fighters, equipment, staff etc. are of required size, type, number etc. and they are capable of quenching any type of fire.
3. On receiving information from the Chairman, the FCT Secretary or leader will instruct other members also and they will reach immediately to the spot and will extinguish the fire completely. They will not leave the place without the permission of Secretary or Chairman and will also work with outside fire team if it is required to call and such team is working in joint efforts.
4. With the help of Utility and Engineering Services Team the damaged area due to dire or explosion will be made clean and accessible. Power, water, heavy vehicles, diesel pumps etc. will be used as per need.

Flammable Releases :

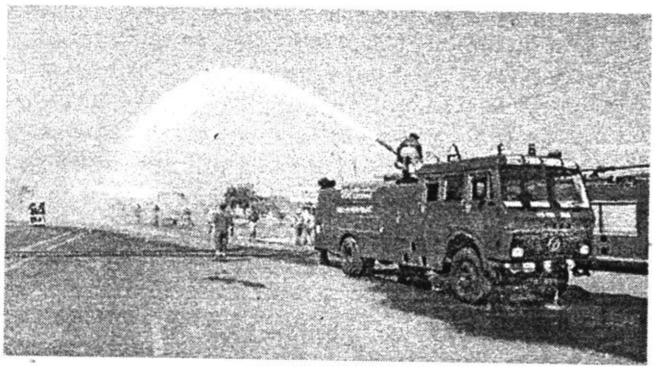
The following examples show how events involving flammable materials may need different planned responses.

(a) A major fire, but with no danger of an explosion e.g. fire in an oil storage tank. The hazards would be prolonged high levels of thermal radiation and smoke. It is unlikely that anyone outside the site would be affected immediately. Only houses close to end directly expose to severe thermal radiation and would need to be evacuated. In some cases it might be desirable to evacuate those areas severely affected by smoke.

(b) A fire threatening a major item of plant or a storage tank containing hazardous 'materials. As part of the on-site assessment the consequences of such an event should have been estimated and the area that it might be necessary to evacuate, determined. Hence the appropriate response might be to evacuate those potentially at risk

(c) A fire similar to (b) above, but developing too quickly to allow evacuation. The best possible response might be to advise people to remain indoors away from windows and shielded from line of sight of the fire. Evacuation should NOT be attempted if there is a significant risk that a fireball or BLEVE could occur while the people were in the open.

(d) For some major catastrophic events that occur without warning, it may not be possible to take prior emergency action. However most such events are of very short duration. The role of the emergency services would be rescue, treatment of the injured, extinguishing secondary fires, etc. If such an event were to occur it might well be that majority of people off-site would be indoors and receive only relatively minor injuries.



Fire Stations and Equipment : Details of all fir(equipment should be kept in an Annexure. Fin fighters/tenders, portable fire extinguishers, fire pump; and engines, hoses, flanges and couplings, crosses asbestos clothing, water jel blankets, risers, ladders reels etc. all necessary equipment including self breathing apparatus shall be included in this Annexure. The FCT will verify this. It may consult TICT (Part 74.6) and DCC (Part 744) for this purpose also

7.4.6 Toxic Incident Control Team (TICT):

Details of the team members shall be tabulated Duly qualified, experienced, expert and responsible officers should be the members of this team. Expert on chemistry, chemical engineering, health and hygiene, safety etc. are most useful. Officers of Police Power, Pollution Control, Revenue etc., are also necessary for incidental work. If such experts are no available in Government, they should be incorporated from the private sector within the district.

Functions (aims and objectives} of this team and duties of the members should include :

1. Main function of this team is to control the gas leakage, poisonous spill and air or water pollution. Any toxic gas or its air mixture, vapour etc. or spill of dangerous goods-solid, liquid or gas, poisonous spray, flow, water, soil, or environmental pollution severely affecting the jurisdiction are the main subjects of this committee. The members shall make all preparations to control such toxic exposures.

2. This team is headed by the secretary or a team leader. The District Collector is common i.e. only one Chairman of all such teams. All members are reportable to him. They will act under his guidance and report him about their work and findings. The Secretary will work in advisory capacity. The Secretary will keep necessary Annexures at his residence also.

3. The team will keep the list of toxicity control equipment. Many small factories, though of hazardous nature, cannot afford all such equipment because of their high cost.

4. The team will maintain a crew (group) of well trained persons with all safety equipment necessary and with tools, vehicles, etc. to detect, control and' stop completely all types of toxic exposures. This crew will accompany the team while going to combat the situation. The team will select such persons and maintain the list of their names, address, phones, arrangements to -call, and places of control equipment etc.

5. On receiving information from the Chairman to, rush to the place of disaster, the secretary and other members will reach the place with crew (in para-4) accompanying or just following and try to control the situation. They will find out the source of toxic exposure and will stop, close or remove it to a safer place if possible. They will also try to neutralise, inactivate or detoxicate the toxicated zone, localise and limit the spread of disaster, stop further development of chain reaction or chain of disastrous events and decrease the levels of material causing disaster.

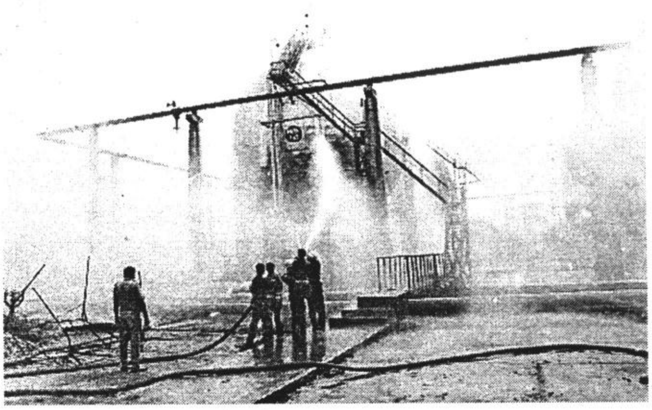
6. The team will advise about the evacuation of people or staying in position whichever and wherever necessary. The members of evacuation team will act accordingly.

7. After the situation is controlled and the danger is removed, the team will record the causes of accident and suggest the measures immediately necessary to return to the safe position and subsequent remedial measures for prevention of accident. The team will submit this report to the Chairman who will send order of 'compliance. The concerned Government officers will also take necessary action under their respective powers.

8. With the help of Utility and Engineering Service team the exposure/spillage area will be made clean and accessible. Power, water, heavy vehicles, diesel pumps etc. will be used as per need.

9. If the team finds that the disaster is uncontrollable by them, they will report the Chairman for external help from the Government and other agencies. The TICT should have walky-talky or similar instrument to talk with the members or directly with the head-quarter. The Chairman will immediately arrange for such external help available from wherever possible.

Toxic Release Control:

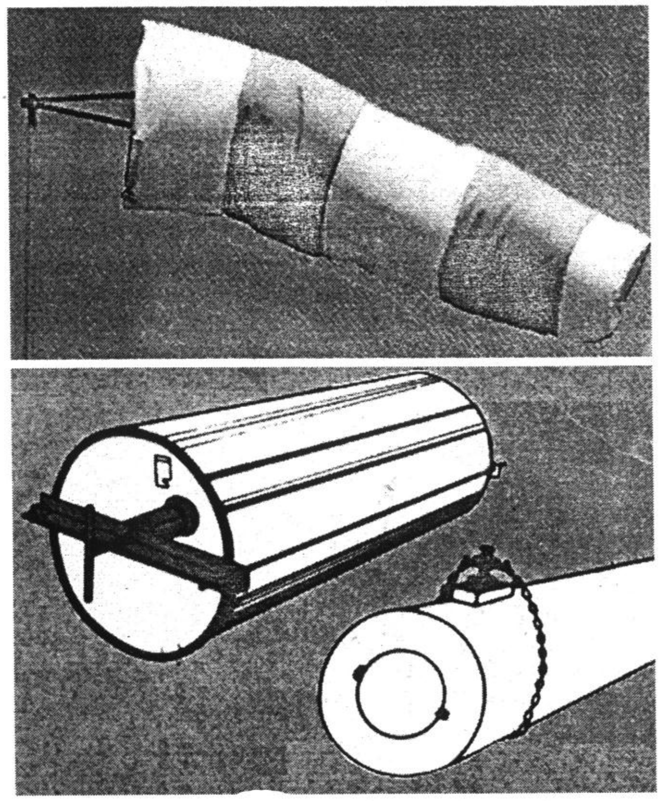


The following examples show how events involving toxic materials may need different planned responses.

(a) A slow or intermittent release e.g. through a leaking relief valve. It would be unlikely that anyone outside the site would be severely affected immediately, although many of the notifiable substances have irritant properties or an unusual smell. If there were reason to foresee that the release would not be controlled quickly, or would grow with time, it might be desirable to evacuate those people nearest to the site of release and most closely downwind of it, provided that this evacuation would, increase their safety.

(b) A fire or mechanical damage that threatened an installation containing toxic material. If the fire could not be controlled and if there was likely to be a reasonable period before over pressurisation or plant failure occurred, evacuation might be appropriate, 6nce again priority should be given to those nearest the plant (in all directions) and those in an appropriate arc, e.g. 30°, downwind.

(c) Rapid event with a limited duration e.g. the fracture of a component that could be isolated within reasonable time. Incidents that grow and are rapidly controlled should not be meet by evacuation. Any toxic cloud format would be limited in size and would be likely to drift past a particular spot relatively quickly. The best place for people in the area would be indoors, upstairs, with windows and doors closed.



(d) A major event leading to a sudden release of a large quantity of a toxic substance, which would form a large toxic cloud e.g. release to atmosphere of most of the contents of a storage vessel through the failure of a tank shell, man-hole cover etc. Although the probability of such an event occurring is very low, the consequences would be severe for people living close to the incident and in the path of the cloud. The role of the emergency services would be .rescue, treatment of injured, making safe the affected areas etc. The major difference in releases of toxic and flammable material is the toxic clouds tend to be hazardous down to much lower concentration than flammable clouds and therefore may remain hazardous over greater distances, while travelling with the wind. The consequences arising from release of toxic material, drifting at perhaps 300 meters a minute and dispersing slowly, are difficult to predict. In every case, however, the hazard is greatest close to the source and near the downwind plume. Unless there is a delay, as in (a) or (b) above, the best course might be NOT to attempt evacuation. For those who were not evacuated, but were then exposed to a prolonged release, the chances of survival would diminish with the passing of time. The Emergency Coordinating Officer (in-charge of off-site plan)

Controller of the factory from which the emergency is arised or the nearby factory in case of emergency outside the factory premises, would have to make the quick decision when and how to attempt rescue.

On hearing the major emergency alarm key personnel should report to the Emergency Control Centre or other designated places. Every else should report to predetermined place, viz. their normal place of work, an assembly point or toxic refuge as appropriate to await further instructions.

On hearing the major emergency alarm the Incident Controller (or Deputy Incident Controller in his absence) will contact the Emergency Control Centre to send necessary help at the place of incident. If necessary, he will telephone at places to call essential workers. With the help of essential workers, he will try to contain and control the incident. He may direct to safely close down the plant if necessary. He will inform the action on site to the Site Main Controller and will work under his direction and his own best judgement depending on the situation. He will guide the own fire fighting team and the outside Fire Brigade regarding type of action, extinguishing or controlling material and equipment necessary. He will organise the help from all expert teams as may be necessary. He will prevent the spread and control the situation within the shortest possible time.

Non-essential workers will remain in their plants or go to the assembly points as per direction to them from the Emergency Control Centre or the Incident Controller.

Outside agencies will help and work in consultation with the Incident Controller.

Toxicity Control Equipment : A list of such equipment including personal protective equipment shall be maintained. This list is for the ready use of the TICT. It may be expanded in future for more equipment and more details. As small canister gas masks may not be much useful in higher concentration of toxic exposure, self breathing apparatus and emergency kits must be kept in sufficient number.

7.4.7 Traffic Control, Law and Order, Evacuation and Rehabilitation Team (TERT):

This team is headed by the District Superintendent of Police (DSP, the Police Head) as Secretary for overall control, supervision and guidance and all other Dy. S.P., P.I. and PSI of main police stations as members. Heads of Highway Police Petrol, Homeguards and SRP may also be added if the DSP thinks fit and needs their help.

Functions and duties of this team should be :

1. To control traffic towards and near the place of disaster, to maintain law and order, to remove mischief-mongers and law-breakers, to evacuate the places badly affected or likely to be affected, to shift the evacuated people to safe assembly points and to rehabilitate them after the disaster is over and safe signal is given.
2. The police has to identify the dead, to deal with casualties (including post-mortem procedure if necessary) and inform relatives of dead or injured.
3. On receiving information from the Chairman to rush to the place of disaster, the Secretary (DSP) with necessary staff will immediately rush to the place and make arrangement for necessary functions. He will work in consultation with the Secretaries of TIGT and FCT for the purpose of area to be evacuated or to maintain 'stay-in' position. He may consult the Chairman for further help if necessary and will report the position and functions being carried out.
4. Necessary vehicles, wireless sets, and instruments for quick communications shall be maintained and used as per need.
5. A list of all police control points shall be maintained. All details should be inserted in it and it shall be kept up-to-date and handy.
6. The Secretary may prepare a detailed plan based on his staff and machinery and keep up-to-date to carry out functions mentioned earlier. Such plan will be approved by DCC and then, shall be used for faster control.
7. The help of Utility and Engineering team may be taken, if necessary for the purpose of making the roads and area clean, removing any structure, incidental work for evacuation and rehabilitation, use of water, power, heavy machinery etc.

Police Stations and Chowkies : All -Police Stations, Outposts and the control points including Highway Petrol (Control) points shall be included in an Annexure. It shall be maintained at all such points and at the residences of all members for intercommunication and help. The Secretary may revise it and keep up-to-date.

Assembly Points : These points are intended to accommodate and keep persons evacuated because of the disaster. They will be kept here temporarily till they themselves go elsewhere or till the disaster is over, their original places are made safe and they shall be sent back to those places. This work of bringing them to assembly points and to shift them back for rehabilitation shall be done by TERT who can have help from Welfare, Restoration and Resumption team. Big buildings of schools, colleges, wadies, community halls, social or charitable places, clubs and other institutions may be used for this purpose. Care shall be taken that least disturbance or damage may be caused to their persons, property or daily working. Their previous consent shall also be obtained. Tents may be erected if necessary. People brought to the assembly points are taken care by the Welfare team.

Transport Centres and Vehicles : A list shall be maintained of vehicles which may be needed for the purpose of evacuation, shifting of people and to carry back for their rehabilitation. Vehicle Centres, type, capacity etc. should be mentioned. This table also be kept up-to-date by the TERT. The centres and vehicle owners shall be informed the purpose of their inclusion.

Evacuation Criteria:

For evacuation the following criteria are useful.

An early decision will be required in many cases on the advice to be given to people living 'within range' of the accident-in particular whether they should be evacuated or told to go indoors. In the latter case, the decision can regularly be reviewed in the event of an escalation of the incident. Consideration of evacuation may include the following factors :

(a) In the case of a major fire but without explosion risk (e.g. an oil storage tank), only houses close to the fire are likely to need evacuation, although a severe smoke hazard may required this to be reviewed periodically;

(b) If a fire is escalating and in turn threatening a store of hazardous material, it might be necessary to evacuate people nearby, but only if there is time; if insufficient time exists, people should be advised to stay indoors and shield themselves from the fire. This latter case particularly applies if the installation at risk could produce a fireball with very severe thermal radiation effects (e.g. LPG storage);

(c) For releases or potential releases of toxic materials, limited evacuation may be appropriate down wind if there is time. The decision would depend partly on the type of housing 'at risk'. Conventional housing of solid construction with windows closed offers substantial protection from the effects of a toxic cloud, while shanty houses which can exist close to factories, particularly in developing countries, offer little or no protection.

The major difference between releases of toxic and flammable materials is that toxic clouds are generally hazardous down to much lower concentrations, and therefore hazardous over greater distance. Also, a toxic cloud drifting at, say, 300 meters per minute covers a large area of land very quickly. Any consideration of evacuation must take this into account.

7.4.8 Medical Help, Ambulance and Hospital Team (MAHT):

This team is consisted of doctors for medical help to the injured persons because of the disaster. Injury may be of any type : fire, gas effect, acid burn, poisoning, liquid-spray, swallowing, fracture, skin irritation, damage to target organ, radioactive effect etc., through skin or eye contact, inhalation, ingestion, mucous membrane contact etc. Such injuries may be mostly due to chemicals. Therefore doctors with the knowledge of occupational health, hygiene and effect of such hazard parameters and treatment for such injuries are most useful. As such doctors are rarely available, we have to mobilise and utilise all available doctors in the area. Members of ambulance centres, blood-bank runners, antidotes and medicines traders etc. may also be taken in. The MAHT may expand the list for this purpose.

Functions and duties of this team include :

1. To give medical help to all injured as early as possible.
2. Civil Surgeon, is the secretary or team leader who will organise, his team. He may take help from the District Health Officer (DHO), and other surgeons, consultants and experts.
3. On receiving information from the Chairman to rush to the spot, he will immediately inform his team and will proceed with all necessary equipment, medicines etc. as early as possible. The Chairman, shall simultaneously inform DHO and DHO will also start similarly. Civil Surgeon and DHO, both, will co-ordinate their efforts with the help of other doctors they think necessary.
4. First-aid and possible treatment shall be given on the spot or at some convenient place or assembly points and the patients may be advised to shift to the hospitals for further treatment. Ambulance vehicles shall be kept ready and used for this purpose.
5. All efforts shall be on war basis to save maximum lives and to treat maximum injuries. The Secretary shall employ' sufficient doctors, equipment etc. for this purpose.
6. All members shall increase their knowledge to treat health hazards due to various chemicals.
7. Continuity of treatment shall be maintained till the disaster is controlled and the flow of injured is stopped. The secretary shall manage for this.
8. Sick and injured persons kept at assembly points shall also be. treated for medical help.
9. The Secretary shall report to the Chairman of work done and for further help if necessary. His team will leave the place only after the Chairman's permission.
10. The Secretary may prepare a detailed plan based on his staff and machinery and keep uptodate to carry out functions mentioned above. Such plan will be approved by the DCC and then shall be used for better treatment.

Doctors, Hospitals, Health Centres, Blood Banks etc. : A list will be maintained for ready-reference of MAHT and others. The MAHT may modify this to include more details.

Ambulance Centres and Vehicles : This will also be listed for the use of MAHT who may modify it to include more details. The whole Disaster Plan aims mostly to protect human life and injury. Therefore this team will play the vital role.

7.4.9 Utility and Engineering Services Team (VEST)

Without the help or regulation of. utility services of water, power, gas, fuel, coal, steam etc. and that of engineering services of special vehicles, tools, equipment and trained team, efforts of fighting the disaster will not be succeeded. Therefore members of this team should be selected from such departments or services and listed. The Executive Engineer (Road and Buildings), Executive Engineer GEB, Municipal Commissioner or Chief Officers of Municipalities, Officers of GIDC, Transport, S.T., Railway, Boiler and private workshops are included. The list may be modified by the DCC if necessary.

The functions and duties of this UEST should be:

1. To check, regulate, divert or stop the flow of electricity, water, gas, petrol, diesel etc. for the purpose of cutting of the source of danger or to supply them for better control, to run diesel

engines and pumps etc. or to divert them for urgent need or to help the victims, to run vehicles and fire fighters to control disaster, to supply lift, hoist, crane, bull-dozer, heavy trucks, tankers, tractors, tools, labour etc. wherever necessary for the speedy control of disaster and also for the subsequent services necessary to restart and restore the original activities. It shall be ensured that the loss will be minimum. The team may add more functions and duties for varieties of engineering and utility services.

2. The UEST will keep up to date lists of heavy vehicles, power, water and gas centres and may add more details if necessary.

3. The UEST may also work out a plan to coordinate and regulate all such services for speedy execution and such plan shall be approved by the DCC.

4. Various trained teams will be maintained for different jobs. Lists of such teams, workers, vehicles, equipment, machines, tools, their incharge etc. shall be maintained to accompany.

5. On hearing instructions from the Chairman to go to the place of disaster or other control place, the Secretary or team leader will give necessary instruction to respective member and both will go there with their teams, vehicles, equipment etc. as per need. They will carry out necessary functions and report to the Chairman for work being done or further help from outside if necessary. The members will be reportable to the Secretary and the Secretary to the Chairman.

6. After the work is over all teams, vehicles, equipment etc. shall be returned to their original places and well maintained for reuse. The work shall be carried out on war-basis without wasting the time.

7. Utilities to run the vehicles, machines and services shall be preserved in sufficient stock.

8. The UEST will maintain liaison with TICT, FCT, MAHT and WRT for area of work and high need centres. Help of workers of WRT may be taken in exceptional cases and with permission.

Heavy vehicles, lifts, bull-dozers etc. : Its lists shall be maintained.

Power Control Centres : This is the list and details of GEB and other power stations, sub-stations, distributing and control centres. Further details with map shall be maintained up-to-date by UEST.

Water Control Centres : This is the list and details of all big water tanks and pump-rooms of GIDC, Municipalities etc., canals, reservoirs, dams and all big water control centres. Further details with map shall be maintained up-to-date by UEST.

7.4.10 Welfare, Restoration and Resumption Team (WRT) :

At the time of disaster many people may be badly affected. Injured people shall be treated by MAHT but those not injured but displaced, kept at assembly points, dead, those whose relative or property is lost, houses collapsed and in need of any kind of help due to disaster shall be treated by this WRT. Therefore the officers of such departments and welfare institutions arc included here

Functions and duties of this team should be :

1. To find out persons in need of human help owing to the disastrous effect. They may give First-aid from doctors. They will serve the evacuated people kept at assembly points. They will arrange for their food, water, shelter, clothing, sanitation, cleaning up the area, washing, urinals, latrines, bedding, lighting, vehicles or guidance to reach to railway or bus stations, hospitals and other

needful or useful places; for removal and disposal of dead bodies, for help to sick, weak, children and needy persons for their essential requirements etc.

2. The team will also work for restoration of detached people, lost articles, essential commodities etc. The team will also look after the restoration of government articles. Such help may last for some time even after the disaster is over.

3. The team will also ensure that original activities, services and systems are resumed again as they were functioning before the disaster. This is the last activity of this Disaster Planning. The operation/execution of this Plan will be stopped only when this team certifies that the disaster is over and it is verified that all possible activities and services have restarted or resumed and the public life is safe and normal. The team will decide the details for this purpose and will work out a plan of check points. The plan will be approved by the DCC.

4. In carrying out above functions, help will also be taken from various social and voluntary organisations like Red Cross Society, Scout, NCC, Homeguards, Rotary Club, Lions Club, Sports Club, Junior Chambers, Youth Hostels, and so many servicing societies, unions and associations.

5. On receiving information of disaster from the Chairman, the Secretary or team leader will inform all members and organisations to reach to the spot. He will systematically organise and coordinate their work so that no overcrowding, overlapping, duplication or deficiency is noticed.

6. This team will arrange its own vehicles or vehicles of above organisations. Volunteers of different organisations may use their own vehicles. If the vehicles kept for other teams to this Plan are free or permitted, they may be used in exceptional cases.

7. The WRT will work under the supervision of its secretary who will report to the Chairman for work being done and further help if necessary.

Social and Voluntary Organisations : The names, addresses, telephone numbers of members and type of help available from such organisations etc. are to be kept ready.

7.4.11 Press, Publicity and Public Relations Team (PPPT)

The public has right to know about the disaster and the steps being taken to control it. This should be clone through proper channel so that correct information can be given and hearsay or distorted and exaggerated stories do not spread. For this purpose and others this team is formed. Director of Information should be the secretary or team leader and some elected members should also be included for public relations. The team may co-opt more members with the approval of the DCC.

Functions and duties of this team should be :

1. On hearing from the chairman about disaster, die secretary will form a cell in his office for disaster news. He will consult the Chairman about the policy of the news and will follow it strictly.

2. Periodical press-notes will be prepared and given to the news-men, news-agencies, radio. Television etc.

3. The members of the team shall meet frequently for co-operation and good public relations. .

4. Only correct and requisite news shall be given and panic, rumours, hearsay and wrong stories shall be ruled out.

5. All work regarding listing of dead, publishing their number or names if necessary and keeping their record will be done by this team. The family members of the deceased shall be informed.

6. The mediamen may be brought to the area affected or area of work but they will not be permitted to go where safety does not permit.

7. With the help of MP, MLA, Presidents of District Panchayat, Municipalities and other local bodies, respectful leaders and representatives of the people, good public relations shall be maintained for peace, harmony and co-operation from all sides.

8. The committee will also prepare the reports to be sent to the Government.

9. A record shall be prepared and maintained about all facts starting with the disaster till the final resumption of situation. All facts, causes of disaster, account of works done, remedial measures and important aspects shall be preserved as a record.

10. Public will be informed about the start and the end of the disaster with the help of vehicles and instruments.

Vehicles and Public Warning Instruments: A list of all government vehicles immediately available at the call of the Collector are listed here with their departments, phones, addresses etc. Instruments like loud-speaker, walky-talky, cell-phones etc. should be listed. These vehicles and instruments shall be used to give information and instruction to the public. Mostly they shall carry government officers, mediamen, press-reporters, etc. moving for the purpose of the cooperation and co-ordination of all control measures. The PPPT may revise this list for more details and will keep it up-to-date for its functions.

All eight teams classified and described above are important for their valuable functions. A rehearsal shall be carried out to check the usefulness and efficiency of their working and to increase their confidence and experience for such collective work.

7.4.12 Role of the 'Mutual Aid' Agencies :

Various types of mutual aid available from the surrounding factories and other agencies should be utilised, as per need, as a part of the on-site and offsite emergency plan.

Trained staff, equipment, instruments, materials, vehicles, doctors etc., can be available from nearby factories. Agreement with them may be expressed or implied.

7.4.13 Role of the Factory Inspectorate :

The Factory Inspectors are likely to want to satisfy themselves that the organisation responsible for producing the on-site plan has made adequate arrangements for handling emergencies of all types, including major emergencies. They may wish to see well-documented procedures and evidence of exercises undertaken to test the plan.

In the event of an accident, the Factory Inspector will assist the District Emergency Authority (Collector) for information and help in getting mutual aid from surrounding factories.

Factory Inspector may wish to ensure that the affected areas are rehabilitated safely. In addition, they may require items of plant and equipment essential for any subsequent investigation to be impounded for expert analysis, and may also want to interview witnesses as soon as practicable.

The communication system between the factory and various above role playing authorities must be effective. Ineffective public telephone system will not be useful in emergencies. Therefore it should be improved and other effective system like duplex (two-way) radio telephone, wireless set, hot line, cellular phone, emergency lead vehicles etc. should be maintained between important organisations.

E X E R C I S E

1. State, Explain, Mention or Discuss

1. The meaning and types of Safety Appraisal system.
2. Concept of Damage Control and its benefits.
3. Concept of Total Loss Control and its management.
4. Purpose, benefits and procedure of Job Safety Analysis.
5. Job Safety Analysis by giving one example.
6. Safety work permit, its objects, types and content.
7. As a Safety Officer you are told to design a safety work permit. Design one format.
8. Meaning, usefulness and types of SOP.
9. Elements of ISO 14001 OR Advantages of OHSAS 18001.
10. Meaning, objectives and types of Safety Inspection.
11. Meaning and content of Safety Checklist.
12. Meaning, technique and benefits of Safety Sampling.
13. Purposes, process and types of Accident Investigation.
14. As a Safety Officer, you have to design an accident investigation report. Develop one such format.
15. Importance of keeping the records of all the accidents. Prepare a standard format which can be used for keeping records in a uniform way.
16. Types of hazards and their detection techniques.
17. Risk assessment procedure.
18. What is HAZOP? Explain its stages, procedure, objective, team and sequence of working.
19. DOW and MOND index.
20. What is Reliability and Reliability Engineering? State application of reliability engineering.
21. Concept of MAH and its main Objectives.
22. Criteria for the Plant to be under MAH.
23. Role of MAH management of a Plant.
24. Role of Authorities OR Workers OR Public for MAH control.

25. Content of Onsite Emergency plan OR Off Site Emergency plan.

2. **Write Short Notes:**

1. Safety Appraisal System and its content.
2. Safety Inventory System OR Electrical Isolation permit.
3. Product Safety OR Safety Tag System.
4. Hot work permit OR Vessel entry permit.
5. Incident Recall Technique
6. Critical Incident Review Technique
7. Procedures Analysis
8. Methodical Analysis
9. Technique for Human Error Rate Prediction (THERP)
10. PERT and CPM
11. Safety Codes and Standards including ISO 14001 & OHSAS 18001

CHAPTER – 20

Safety in Engineering Industry

THEME

1 NEED OF SAFETY IN ENGINEERING INDUSTRY

Man and Machine are two important ingredients of Industrial Safety. Man needs machines which many times bring hazards and accidents. This has created the need of industrial safety. It is most important to eliminate or minimise the contact between men and machines. Machines are the product of engineering and therefore engineering occupies the pioneering place in industrial safety. Without engineering industries, no machine, no guard and no mass production is possible. The history of machine is old and interesting. In Chapter-7, Part-1, old engineering branches of India are mentioned and another historical part is given in Chapter-33. Weapons and vehicles expected by Yajurveda and fixed and movable machines in Kautilya's times were not possible without engineering industry. Modern engineering technology is much advanced and many other industries are dependent on it.

In 1981 out of 72,40,000 workers employed in all factories in India, workers employed in engineering factories (i.e. in NIC group No. 32 to 37) were 24,41,000 i.e. 33.71% Thus about 30% labour force is employed in engineering industry in our country.

In USA, deaths due to machinery are reported, by Accidents Facts. 1997. as under :

Year	1992	1993	1994
Out of	86777	90523	91437
Deaths due to machinery	1037	999	970
Percentage	1.19%	1.10%	1.06%

Table 5.8, chapter-5, causes I to 3 state that there were 28% and 23.64% injuries in engineering industry in 1990 and 1991 respectively.

From Table 5.6, it can be concluded that 31.65% fatal and 23.40% non fatal injuries in India, in 1992, were in engineering processes.

Table 5.22, last row Causation No. 101 to 112 and 122 give total 5008 accidents out of 15683 i.e. 31.93% accidents due to machinery, in 1994, in Gujarat.

Table 5.20 shows fatal accidents as 9.8% in 1996 and 20% in 1997 in engineering industry in Gujarat.

Thus a share of accidents in engineering industry is about 25 to 30% which needs attention.

2 STATUTORY PROVISIONS

Sections 14, 21 to 26,28 to 35, 87, 88 and Chapter IV-A (Sections 41A to 41H) of the Factories Act 1948 and rules made under these sections by the Gujarat-Factories Rules provide safety measures for engineering machinery, processes and accidents. Their details are readily available from the statute book and therefore they are not reproduced here. In short, these provisions are for the safety from dust, machinery in motion, power cutting devices, self-acting machines, casing of new machinery, hoists and lifts, lifting machines, revolving machinery, pressure plant, floors, stairs, means of access, pits, sumps, floor openings, excessive weights, protection of eyes and hazardous processes in ferrous and nonferrous metallurgical industries and foundries, coal industries, grinding or glazing of metals, electroplating of metals, sand or shot blasting and stone or silica processes. Provisions of Rules 54 and 102, GFR are also important.

Under rule 54, schedule 5 for centrifugal machines, schedule 6 for power presses and schedule 7 for shears, slitters and guillotine machines are important. See Part 4.4 of Chapter-14 for details.

Under rule 102, Sch. 24, 25 and 26 provide detailed safety measures for welding/cutting, pottery and foundry operations.

See Part 5.1.3 for Sch. 26, and Part 7.1.3 for Sch. 74 for p-a.s welding and cutting.

3 INDIAN STANDARDS

There are numerous IS for various metallurgical and foundry operations, hand tools, portable power tools, machines, mad-line tools etc. A few are mentioned below:

Abrasive wheels 10489
Agitator equipment 9522
Air compressor, 6430, selection 6206, testing 5456
Air conditioning. Safety code 659, terminology 3615
Alloy brazing 2927, steel casting grinding media 6079
Aluminium forging 734, heat treatment of 8860
Aluminising hot dip coating 6697,8508
Anodising 7088
Arc welding 8804

Bag filling machines 9776
Ball mill 4642
Band saw for metal cutting 5030
Belt for pulleys 8531,V- belt 2494,10022, drives 2122, 7923
Blast furnace 8953, 9959
Blasting drilling safety code 4081

C- hook 4164, 3813
Chain driving 1927
Chimney design 6533,1649,4998
Chipping hammer 4915, chisel 402.
Coal cutting m/c 3869, cutting tools 5775, Pulverisers fire safety 2595
Cold forming 5986
Compressed air safety code 4138, air receivers 7938 steel cylinders 8198
Coolant for machine tools 2161
Cooling forging 6272, towers 8581
Copper forging 6912
Corrosion of metals 3531, protection 8062,8629
Cutting tools 10412

Die castings 1655, die forging 9684, die sets press working 10068, dies cutting 1859, rolling 8405, 5702
Drawing office layout and planning 5197, engineering drawing practice 696
Drilling machines portable 5441, bench type 2426, pillar type 2425, radial 6893
Drop forging 5518

Electroplating 3658, 2679,1986,7453
Engineering table hand book SP-6 and 8
Erection of steel work, safety 7205
Ergonomics 10224

Fabrication 7215, 6916
Fan, ventilating 2312, pedestal 1169
Feed for machine tools 2219

Ferrous castings 4843, 7001
Film safety 5431

Warehousing fire safety 3594.
Water - for industry, tests 1622, 3025, 3550, for boilers 10390,1680,1813
Weigh bridges for bulk handling 9777
Weighing machine - automatic 1437, platform 1435, electronic 9281> totalizing 3960
Welding - electrical and gas cutting, safety 818, resistance spot welding 819, fire precaution 3016, procedure approval 7307, 7310, 7318, arc rectifier type 4559, electric 2641 and cutting 812, 6016 arc 6008, cables 9857, welding equipment for eye and face protection 1179, oxyacetylene 1323, protective filter 5983, welder's handbook SP - 12
Wire - drawing 1137, 4913, 9888,
Worm gears - glossary 2567, selection 7403
Zinc alloy die castings 742, electroplating 1073

4 INTRODUCTION TO HOT AND COLD PROCESSES :

4.1 Types of Hot and Cold Processes :

Metallurgical processes are of two types : Hot and Cold processes.

Hot processes are employed to melt ore to make metal, to refine metal and to mould metal in the required shape, section or grade, to make alloy, to weld or cut metal parts and to make tools, equipment, building materials, machine parts, structural parts etc. Fuel-fired or electric furnaces are used for these purposes. Chemical energy of fuel (gas, furnace oil, LDO, wood, coal, lignite, waste etc.) or electric energy is converted into heat in such furnaces. Hot processes include melting, refining, smelting, moulding, forging, hot rolling, welding and cutting, brazing and soldering operations.

See Part 5 for hot working of matal.

Cold processes are employed to further reduce or change the shape, size or section of the hot rolled, forged or moulded metal parts, cut into pieces, drill, bore or grind surfaces, press, punch slot, shear, cut, bend or shape the metal parts' A variety of machines and machine tools are used for these purposes. Hand and foot operated presses, power presses, hydraulic or pneumatic presses, shearing machines, press brakes, cold rolling mills, forming rolls, wire drawing machines and various machine tools like lathe, boring m/c, grinding m/c and modern computerised controlled machines are used in engineering industry.

See Part 6 for cold working of Metal.

4.2 Types of Furnaces, Uses and Safety Measures :

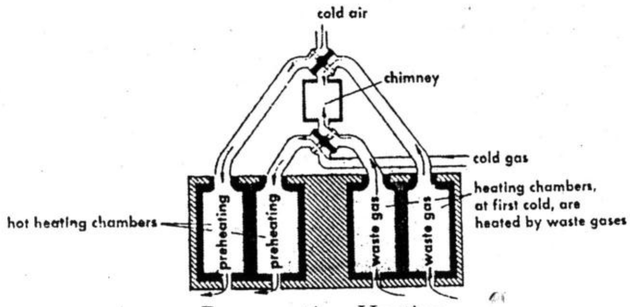
They are classified as under-

(1) Classification based on Structure :

Technologically metallurgical furnaces are classified as melting or heating furnaces.

Melting furnaces are employed to make metals from ores and remelt metals for obtaining the desired properties. Materials processed in melting furnaces change their state of aggregation.

Heating furnaces are employed to heat materials for roasting (limestone, magnesite, refractories, potteries etc.) or drying (foundry moulds, ore, sand etc.) and also for increasing the plasticity of metals before plastic working. They are also used for heat treatment of metals to change the metal structure. Materials processed in heating furnaces remain in the same state of aggregation.



Regenerative Heating

Furnaces may be regenerative or recuperative according to the method the heat of waste gases is utilised.

(2) Classification based on. Heat Generation :

Furnaces are also classified according to the principle of heat generation i.e. either fuel-fired furnaces where heat is generated from chemical energy of fuel or electric furnaces where heat is generated from electric energy.

In fuel-fired furnaces heat is generated by burning fuel on the furnace hearth. They are of two types : flame furnaces and shaft furnaces. In flame (reverberatory) furnaces, the material to be burnt occupies only a small portion of the reaction chamber volume, the rest being occupied by flames and combustion products. In shaft furnaces, all the space is filled with loose charge materials which include lumpy solid fuel.

In steelmaking furnaces (converters), the chemical energy of molten metal is also converted into heat through combustion of impurities present in them. The heat evolved is evenly distributed over the whole mass of the molten metal.

Heat for refining the bath to produce steel is derived from the oxidation of carbon and other elements and no external source of heat is required.

In oxygen process steelmaking furnace, initially oxygen is blown on to the surface of a bath of molten pig iron and steel scrap.

Types of electric furnaces are : (a) Electric-arc 2. and plasma furnaces, single, two or three phase 3. furnaces (b) Induction furnaces (c) Dielectric heating plants (d) Resistance furnaces and (e) Electron-beam furnaces, i.e. micro-wave and infra-red.

(3) Classification based on Operating Mode :

Heat transfer from a heat carrier (flame, electric arc) to the surface of material is mainly through thermal radiation and convection.

Heat transfer from the surface of material into the depth of material occurs predominantly by conduction. But with heated liquids, convective heat transfer is also possible.

Convective mode is typical of low-temperature heat-treatment and drying furnaces. This mode is also employed in heating baths in which a hot liquid is the heat carrier.

Layer wise mode is used in the processing of lumpy materials mostly in shaft furnaces. In such layer wise mode, all three kinds of heat transfer - radiation, convection and conduction - are interlinked so closely that practically cannot be separated from one another. There are three types of layer - dense (filtering) layer, fluidised bed layer and suspended layer of the processed material.

Modern complex thermal plants are usually composed of furnace proper (reaction chamber, burners, electrodes or resistors) and auxiliary equipment (waste gas heater, ventilator, exhauster, stack, valves, gates etc.).

Others:

So far we have discussed the types and uses of furnaces. It is relevant to consider kiln used for cement, lime, ceramic (brick, tile, refractory) and drying purposes and ovens for drying (moisture removal), curing, baking, decorating and solvent evaporation (paint drying).

Hazards and Safety Precautions :

Main hazards while working with furnaces, kilns and ovens are as under :

1. Burns due to contact with hot surfaces.
2. Burns due to contact with hot product, fuel or electricity.
3. Splashing or bubbling of molten metal.
4. Contact of cooling water with the molten metal or slag (e.g. induction furnace) and explosion due to sudden steam generation.
5. Fire or explosion due to leakage of fuel.
6. Carbon monoxide from fuel gas or products of combustion.
7. Explosion due to hydrogen.

Precautions to be followed are as under :

1. Good insulation over hot metal surfaces.
2. Protective clothing for head, face, hands and feet.
3. Respirators, safety eye glass (plain or tinted) for protection against dust, fumes, toxic gases and glare.
4. Exhaust hoods and fans to draw dusts, fumes, gases etc.
5. Good ventilation to vent off hazardous waste generated from scrap charged, alloys and fluxes.
6. Hot work permit before allowing any worker to enter any hot chamber. Ensurance of cooling, fresh air ventilation and lighting necessary.
7. Interlocking to cut off fuel supply in case of flame failure.
8. Precautions while lighting fuel or burner to prevent flash back, fire or explosion.
9. Training and awareness programmes for workers.
10. Provisions of drinking water and shielding to avoid heat disorders.
11. Flameproof electric fitting with solvent drying ovens. PPE against eye and skin irritation or respiratory disorders.
12. Precautions against free silica, asbestos etc., while cleaning and maintaining furnaces. Area monitoring and medical surveillance of such hazardous exposures.

4.3 Steel Manufacture, Hazards and Safety Measures :

Iron occurs very abundantly constituting about 4.7% of the earth's crust. It is the fourth in abundance (first three are oxygen, silicon and aluminium) amongst all the elements. Amongst metals, its abundance is second only to aluminium.

The most important iron ores are iron oxides, carbonates and sulphides.

Three commercial varieties of iron are cast iron, wrought iron and steel. They differ in their carbon and phosphorous content.

Cast iron is the least pure form of iron containing 2.5 to 4.5% carbon with some sulphur, phosphorous, silicon and manganese.

Wrought iron is the purest form of iron containing less than 0.5% carbon and other impurities.

Steel comes in between cast iron and wrought iron. It contains 0.02 to 1.5% carbon and some manganese. Hardness of steel increases with increase in carbon content. Sometimes other elements such as chromium, silicon, nickel, tungsten, vanadium and molybdenum are added to make special steel. Main three grades of steel are as under :

Low carbon (mild) steel - 0.02 to 0.3 % carbon
Medium carbon steel - 0.3 to 0.7 % carbon
High carbon steel -0.7 to 1.5 % carbon

There are many special purpose types of steel in which one or more alloying metals are used, with or without special heat treatment. Some special alloy steels are given in Table 20.1.

Table 20.1 : Some Special Alloy Steels

Sr. No.	Name	Composition	Properties	Uses
1	Chrome steel	2-4% Chromium	High tensile strength.	Ball bearing, cutting tools such as files.
2	Tungsten steel	10-20% Tungsten	Retains hardness even at high temperatures.	Cutting tools for high speed lates.
3.	Stainless steel	18% Chromium & Nickel	Resists corrosion.	Utensils, ornamental pieces.
4.	Manganese steel	10-18% Manganese	Very hard and resistant to wear.	Grinding machinery, safes
5	Nickel steel	2.5-5% Nickel	Resists corrosion, hard and elastic	Wire cables, gears, drive shafts.
6	Molybdenum steel	0.3-3% Molybdenum	Retains corrosion even at high temperatures.	Cutting tools and axles.
7	Invar	36% Nickel	Practically no coefficient of expansion.	Meter scales and pendulum rods.
8.	Silicon steel	15% Silicon	Extremely hard and resistant to acids.	Pumps and pipes for carrying acids.

Carbon steel is the most common, cheapest and most versatile metal used in industry. It has excellent ductility, permitting many cold-forming operations. It is also very weldable. It's normal tensile strength 345 to 485 MPa (50000 to 70000 Ibf/ in^2) permits good ductility. Higher strength is achieved by cold work, alloying and heat treatment.

The temperature at which steel begins to undergo creep, is important. The threshold temperatures at which creep begins are :

Mild steel	-	400 °C
Low alloy steel	-	500 °C
Austenitic stainless steel	-	600 °C

Steel production is an index of national prosperity and the basis of mass production in many other industries such as construction, engineering, automobiles, shipbuilding etc.

4.3.1 Manufacture of Steel :

Steelmaking started in 1855 with the invention of melting process (Bessemer), open hearth process (1864) and the electric furnace (1900). Thereafter the LD (Linz-Donowitz) process by oxygen lance, made it possible to manufacture high quality steel with low production cost.

For large scale production of steel three methods are employed:

1 The Bessemer Process.
2 The Open Hearth Process.
3 The Electric Furnace Process.

These methods are based on removing impurities from pig iron and then adding calculated amounts of carbon, manganese, chromium and other elements.

Forth method, known as Cementation Process is used to manufacture steel in small quantities. It is based on the addition of carbon to wrought iron.

(1) **In Bessemer Process** molten pig iron taken directly from the blast furnace is run into Bessemer converter which a pear-shaped furnace is having holes to blow air at bottom and mouth at top. It can be tilted on horizontal axis.

As the air passes upward through the molten metal, it oxidises the impurities (manganese, silicon, carbon) present in the pig iron.

$$2Mn + O_2 \rightarrow 2MnO$$
$$Si + O_2 \rightarrow SiO_2$$
$$2C + O_2 \rightarrow 2CO$$

MnO and SiO_2 combine to give manganous silicate slag

$$MnO + SiO_2 \rightarrow MnSiO_3 \text{ slag}$$

CO burns with a blue flame at the mouth of the converter. When the whole of carbon is oxidised, the blue flame dies out. The requisite amount of carbon is then added to convert iron into steel. At the end, the converter is tilted to pour out the molten steel.

If cast iron, from which steel is to be obtained, contains much phosphorous, the converter is lined with lime (CaO) and magnesia (MgO) instead of silica. Some lime is also added to the charge. The P is oxidised to P_2O_5 which then forms a slag of calcium phosphate.

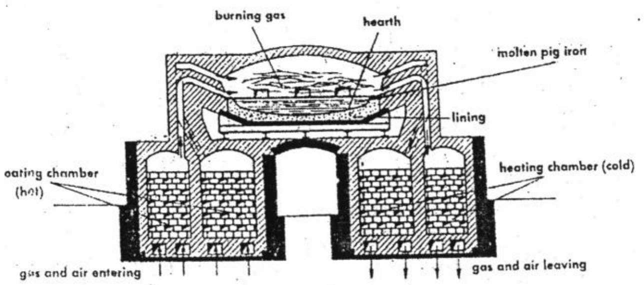
$4P + 5O_2 \rightarrow 2P_2O_5$

$3CaO + P_2O_5 \rightarrow Ca_3(PO_4)_2$

The slag is ground and used as a fertiliser.

(2) In Open Hearth Process, a mixture of cast iron, scrap iron, iron ore and lime is melted in an Open Hearth furnace. The hearth is lined with silica (SiO_2) or calcined dolomite (CaO.MnO) depending on the nature of the impurities (C, Si, S,P) present in cast iron. Heating upto about 1500 °C is continued for 8 to 10 hours. Impurities get oxidised and then react with lime to form slag.

$SiO_2 + CaO \rightarrow CaSiO_2$ slag
$P_2O_5 + 3CaO \rightarrow Ca_3(PO_4)_2$ slag



Open Hearth Furnace

Samples are taken from the hearth from time to time and analysed. The carbon content is adjusted and other metals may be added if special steel is to be made. The finished batch of molten steel is removed by tilling the hearth.

Advantages of the Open Hearth Process over the Bessemer Process are:

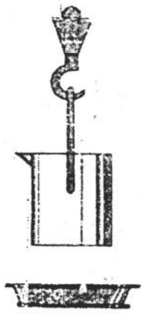
1. Steel obtained is of better quality.
2. Fuel economy by regenerative system of heat economy.
3. Product composition and temperature can be well controlled.
4. Scrap and iron ore can be directly changed into steel.
5. No loss due to air blast through the molten metal.

(3) The Electric Arc Furnace Process : This process involves the setting up a carbon arc. Electrodes are held vertically and the charge of cast iron, scrap iron and iron ore (haematite), mixed with fixed quantity of lime is added in between.

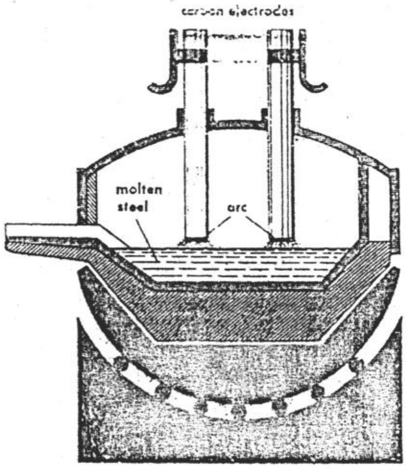
The furnace is usually lined with dolomite. Impurities (C, Si, S, P) are oxidised. Phosphate and other slag (being lighter remain at die top) are poured off by tilting the furnace. After this a charge of coke, lime and sand is added.

$CaO + FeS \rightarrow FeO + CaS$ slag

FeO is reduced to metal by coke (carbon).



Ladle



Electric Arc Furnace

As phosphorous and sulphur are almost completely removed, the steel obtained is of good quality. High grade alloy steel can also be obtained by adding requisite alloying metal.

(4) Cementation Process : Bars of wrought iron surrounded by carbon, are heated in "fire brick boxes over 1000 °C for about 10 days. The carbon from the iron surfaces diffuses towards interior and converts iron into steel. Blister steel formed is melted in graphite crucibles till removal of blisters. Other metals are added to confer hardness, tenacity and resistance to corrosion. The steel obtained is known as Cementite Crucible Steel and used to make high grade tools such as razors, chisels etc.

4.3.2 Hazards and Safety Measures :

Main hazards in steel manufacture are as under:

1. Burns due to molten metal, its splashes while tapping, pouring, tilting, falling of ladle and sparks or spatters.
2. Explosion in metal or slag due to water insertion and spattering of hot material over a wide area.
3. Explosion risk in storage, transport and use of oxygen.
4. Accidents due to heavy transport of locomotives, wagons, bogies and rail mounted furnace chargers.
5. Breakage or failure of lifting machines, tackles, ladles, ingots, overhead travelling cranes and unsafe access.
6. Obstructed floors, platforms and stairs with materials and implements.
7. Accidents due to material handling.
8. Poisoning due to Carbon monoxide in fuel gases (converter gas 68-70%, blast furnace gas 20-30% and coke oven gas 5-10%) or its leakage from the furnace, pipelines, water-seal valves, repair work.
9. Excessive heat, heat-stroke and heat cramps (lack of salt due to excessive perspiration) to the workers.
10. Dust generation e.g. sintering near furnaces and in ingot-making.
11. Dense fumes while using oxygen lances or its use in open hearth furnaces.
12. Risk of silicosis to men engaged in lining, relining and repairing furnaces or ladles with refractory bricks which may contain 80% silica. Silicate content causes pneumoconiosis.
13. Eye and ear damage due to glare, high noise of blowers and electric furnaces.

To protect the workers from above hazards, following safety measures are necessary :

1. Engineering measures like guarding and fencing of dangerous machine parts, floors, stairs and platforms, lifting machines, tackles, transport vehicles and safe work practices.
2. Good ventilation, lighting and housekeeping.
3. Efficient exhaust ventilation for removal of dusts, fumes, gases etc.
4. CO detectors should be used to ensure safety: Self breathing or air line respirators should be worn while doing this manually. Fixed CO detectors with alarm are desirable at crucial points.
5. Cold drinking water and salt to worker' working in very hot environment.
6. Rotation of workers after short duration work in hot processes.
7. Ergonomic design of man-machine-environment relationship.
8. Pre-employment medical examination to select suitable persons for hard or hot work, crane work etc. TB disqualifies from work with refractory materials and heart diseases, obesity and chronic gastroenteritis disqualify from work in hot environment.
9. Periodical medical examination of worker; exposed to heat stress, dust and high noise.
10. First-aid centre with necessary medical facilities
11. Safety organisation including safety committees accident investigation and discussion, safety programmes and workers' training is essential
12. Use of personal protective equipment by workers exposed to excessive heat, noise, dust and hot materials.

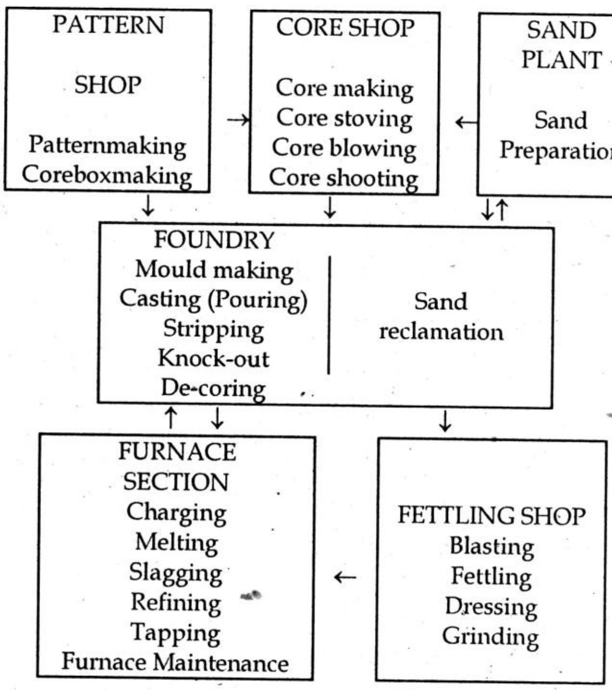
5 HOT WORKING OF METALS:

Hot working of metal includes foundry operations, forging operations and hot polling operations. They are discussed below in brief.

5.1 Foundry Operations :

5.1.1 Flow Sheet;

Foundry process consists of melting metal, sand preparation, core making, pattern making, mould making and then pouring molten metal into a moulding box which is made to the outside shape of a pattern of the article required and contains, in some cases, a core which will determine the dimensions of any internal cavity. A schematic flow chart is shown below:



In course of time foundry process is modemised and mechanised. Wooden patterns are replaced by metal or plastic ones. A wide range of alloys are used as base metal castings. The traditional cast metals, iron, steel, brass and bronze, now contain aluminium, titanium, chromium, nickel, magnesium, beryllium, cadmium, and thorium. New techniques for mould and core making are utilised. In die casting a light alloy is forced into a metal mould under pressure of 70-7000 kgf/cm2 In investment casting, wax pattern with refractory mould is used.

The metal or alloys are melted and prepared in a furnace viz. Cupola, rotary, reverberatory, crucible electric arc, channel or cordless induction type. After metallurgical or chemical analysis, the molten metal is poured via a ladle or directly, into the assembled mould. When the metal has cooled, the mould and core material, if present, are removed (stripping or knockout) and the casting is cleaned and dressed (despruing, shot blasting, hydro - blasting and other abrasive technique). Certain castings may require more finishing, heat treatment, welding, grinding or painting.

Generally an iron foundry comprises six sections:

1. Moulding.
2. Core making.
3. Metal melting and pouring.
4. Knock - out.
5. Fettling, dressing, finishing and
6. Miscellaneous.

The hazards and safety measures in these sections and others are explained below.

5.1.2 Health Hazards and Safety Measures :

They are given below in a Table.

S.No.	Hazards	Safety Measures
(1) Moulding (Preparation of sand, additives and mouldind boxes) :		
1.	Health hazard due to sand, free-silica,	Good housekeeping, local exhaust

	silicones and zircon. Silicosis. Silica dust in sand handling, shakeout and slinging operation.	system on mechanised plant, vacuum cleaning.
2.	Irritation or dermatitis due to Phenolic resins in thermosetting process	Washing with hot water, medical attention on ingestion. Barrier creams.
3.	Asthmatic symptoms due to Methylene biphenyl isocyanate (MBI) used in cold self setting process.	Protective goggles, local exhaust ventilation while dealing with hot sand resin mixture. Clean the storage vessel for 24 h with 5% sodium carbonate solution.
4.	Skin and eye irritation due to sodium silicate in the gas (CO_2) hardened moulding process.	Emergency shower, eye wash bottle, - barrier cream, precaution against CO_2 cylinders.
5.	Fire risks due to isopropyl alcohol sprays on mould surface for better finish. Dermatitis due to such solvent.	Fire retardant protective clothing, hand protection, ventilated booth to prevent organic vapour exposure. No smoking.
7.	Strain due to lifting and shifting of heavy moulding boxes.	Avoidance of excessive weight and using mechanical lifting device.
8.	Hazards of moulding machines and jolt.	Two hand controls, dual safety squeeze controls and knee valve jolt control.
(2) Coremaking (Inserting core of sand and binder into mould) :		
1.	Harmful fumes form core baking oven.	Well maintained chimney.
2.	Pneumoconiosis due to dusting in handling finishing cores.	Dust mask and hand protection to avoid abrasion.
3.	Toxic and fire / explosion hazard where amines are used.	Ample water for washing, FFE, hood extractor to remove fumes.
4.	Core blowing machines, sand blows, hand trapping between core box and ram	Parting lines with dike seal, two hand controls for one operator and four hand controls for two operators, core boxes with handles.
(3) Melting and Pouring (Furnace melted metal is poured into a moulding box through ladle) :		
1	Work near Cupola Furnace-toxic effect of carbon monoxide	Breathing apparatus to b kept ready, emergency work under supervision; Natural and mechanical ventilation.
2	Repair work in furnace	Safety helmet, safety belt while working at height or depth.
3	Tapping i.e. transferring molten metal to a ladle, radiation	Goggles and PPE, refractory or sand floor, care in opening jammed doors, spillage cleaning, mechanical material handling, dry sand to chill hot run-outs.
4	Health hazards due to acrolein, Aluminium, antimony, beryllium, chromium, fluorides, iron oxide fumes and dust, lead, magnesium, manganese,	Local exhaust ventilation \ air dilution by general ventilation, FFE, respirators, aluminium screens against radiant heat, wetting agent,

	phosphorus, SO_2 resins, coal, silica	precautions against lead poisoning, dust explosion and fire, good sanitary facilities, personal hygiene, separate lunchroom and non-contaminated drinking water.
(4)	**Knock- out operation (Removal of rough casting, cores, runners and risers from the moulding box) :**	
1.	High noise over 90dB.	Reduce the noise or use ear plugs or muffs.
2.	Hot sand, dust and metal being separated.	Eye protection and other PPE necessary.
3.	Crushing or breaking of hands / feet etc.	Safety. shoes, gloves, caps etc.
4.	Dust hazard near knock-out grill.	Fine water spray (mist) over the knock-out grill.
(5)	**Fettling, Dressing & Finishing (Stripping away unwanted metal by grinding, blasting, chipping) :**	
1.	Noise of metal hammer for knocking.	Replace metal hammer by rubber covered hammer.
2.	Throwing fragments of hot metal.	Eye and face protection.
3.	Noise of rumbling barrels. (this is prohibited).	Noise enclosure to barrel with local exhaust ventilation.
4.	Pneumoconiosis due to sand blasting.	Sand blasting should be replaced by water or iron or steel shot blasting in a fully closed system with dust extraction system. Wear Blaster's helmet. Warning notice, blasting in separate room. Airless shot blasting is also used.
5.	Hazards of abrasive, polishing and buffing equipment.	Safe operation of machine tools, eye, face, hand and foot protection.
6.	Dusting from dry abrasive wheels.	
7.	Flying objects from cleaning and chipping.	
	(6) Miscellaneous (Pattern making, painting etc.) :	
1.	Noise in pattern making shop.	Reduce noise or provide ear protection.
2.	Hazards of wood cutting and finishing machines.	Guarding and safe operation.
3.	Wood dust from sawing.	Local exhaust ventilation.
4.	Electrical work	Electrical equipment I must be earthed and operated safely. Use PPE. Training for respiratory resuscitation.
5.	Painting, Fire hazard from flammable fumes.	Speedy fume removal. No smoking. Use such paint in small quantity or use water base paint.
6.	General dusting.	Vacuum cleaning, local exhaust system at the point of origin. Water

		and compressed air cleaning (not during or before melting and pouring but after drying only) No misuse or playing of compressed air hose. Vacuum methods are preferred to compressed air cleaning.

5.1.3 Schedule 26, Rule 102 of the Gu)arat Factories Rules, 1963:

1. Applicability:

This schedule is applicable to production of iron, steel or non-ferrous melting and casting by moulds of different materials including the process of shall moulding, die-casting, pressure die-casting, centrifugal casting, continuous casting and making ingots, billets, slabs etc. and the stripping thereof.

It is not applicable to melting and manufacture of lead, electric accumulators, printing press, smelting process, steel ingots, soldering, melting and casting of lead or lead-based alloy to make ingots, billets, slabs etc.

2. Definitions:

Dressing or fettling operation includes stripping and other removal of adherent sand, cores, runners, risers, flash and other surplus metal from a casting to make the surface clean and 'smooth but does not include machining or knock-out operation.

Knock-out operation means removing castings from moulds and also stripping, coring-out and removal of runners and risers.

Pouring aisle means an aisle leading from a main gangway or directly from furnace to where metal is poured into moulds.

Foundry is a place where production of iron, steel or non-ferrous casting (not the production of pig iron or steel ingots) is carried out by. using moulds, including process of shell moulding, centrifugal casting, die casting, preparation and mixing of materials, preparation of moulds and cores, knock-out and dressing or fettling operations.

3. Parting Materials:

Material containing more than 5% silica and dust or matter deposited from fettling or blasting process shall not be used as a parting material.

But natural sand, zirconium, calcined china clay, aluminous fireclay, fused alumina, sillimanite and divine can be used as parting material if free from silica.

4. Store, Floor and Cleanliness :

1. Moulding boxes, ladles, patterns, plates etc. shall be placed without unnecessary risk.
2. Racks, bins and suitable receptacles to be used to put heavy articles.
3. Floor of even and hard surface.
4. Wall height upto 4.2 mt or more should be effectively cleaned once in 14 months.

5. Safe and adequate space for manual work involving molten metal. It should be free ffom obstruction.

5. Gangways and Pouring Aisles :

Gangways should be of even surface, hard material and free from obstruction. Their minimum width should be as under :

If not used to carry molten metal - 0.92 m.

If used to carry molten metal

1. Where truck ladles are used - 0.6 m wider than the overall width of the ladle.
2. Where hand shanks are carried by I or 2 men - 0.92 m.
3. Where hand shanks are carried by more than 2 men - 1.2 m.
4. Travel in both directions by men carrying hand shanks -1.8m.

Pouring aisles should also be of even surface, hard material and free from obstruction. Their minimum Width should be as under -

1. Molten metal carried by I or 2 men per ladle - 0.46 m.
2. If mould remains at 0.51 m height from the floor - 0.6 m.
3. Molten metal carried by more than 2 men per ladle - 0.76 m.
4. Molten metal carried in crane trolley or truck ladle - safe width.

If the workroom or floor is made of sand, above width restriction is not applicable.

6. Work Near Cupolas & Furnaces :

Safety distances of 4 mts. from the delivery spout or 2.4 mts. from ladle are suggested to work near molten metal.

7. Dust and Fumes :

Open coal, coke, wood or stoves may be used if their fumes have safe discharge.

Knock-out and fettling or dressing operations to be carried out in a separate room or under effective local exhaust ventilation.

Ventilation plant should be properly maintained, examined weekly by a responsible person and yearly by a competent person with its report in Form No. 26-A.

8. Protective Equipment:

Hand gloves suitable for hot work or rough work, approved respirators, suitable footwear or gaiters for risk of burns and screens for safety against flying material shall be provided to the workers. Storage accommodation shall also be provided.

9. Washing and Bathing Facilities :

1. Wash place under cover with 0.6 m length for every 10 persons, or stand pipes spaced at least 1.2 mts. apart.
2. At least 50% of wash places should be in the form of bathrooms.
3. Sufficient supply of clean water, towels, nail brushes and soap.

Above facilities should be in charge of-a responsible person and in clean and orderly conditions.

10. Medical Examination:

1. Appointment of a qualified doctor approved by the CIF, with medical facilities given to him.
2. The Certifying Surgeon shall examine a worker within 15 days of his first employment. Allotment of work only after fitness certificate in Form No. 27-A by the Certifying Surgeon (CS).The first test includes pulmonary function test and chest X-ray.
3. Re-examination by the CS every year. Record in Form No. 20.
4. Re-employment of unfit person if the CS declares him fit.

11. Other Provisions:

1. Knocked out burnt sand and other waste to be disposed off safely and quickly.
2. Dross and skimming removed from the furnace shall be placed forthwith in suitable receptacles.
3. Material and equipment left out of doors should not cause risk. Safe means of access, road ways and path ways should be properly maintained.

5.1.4 Material Handling in Foundries :

Ladles should have sufficient strength but not excess weight. Proper balance of hand ladle if desirable. All crane, truck and trolley pouring ladle should have dog or gear mechanism and latch to prevent over turning. Bottom pouring ladles should have stopper mechanism. Preventive maintenance of hoists, monorail, cranes and conveyor to handle moulds eliminate manual handling accidents

Floors, Pits, Gangways and Aisles :

Foundry floors should be kept clean and in good condition and level. Drainage near melting unit is necessary. Water should be avoided here to avoid explosion hazard. To hold down dust, only required water should be used. In molten metal are passageways at least 0.5 m above floor level is safe Pit connected with oven or furnace and floor opening should have a cover or guard. Rail track should be flushed with the floor. Gangways and aisles should have sufficient width depending upon use of ladles crucibles, moulds and persons to travel.

5.1.5 Mechanised Foundry:

Here moulding is done by machine and casting cleaned by shot or hydro blasting. Built-in dust control devices reduce dust hazard. Airborne dust from sand transfer by open belt conveyor poses hazard for which exhaust hood over transfer point or conveyor are necessary. Conveying by pneumatic system provides dust-free system. Die casting involves permanent metal moulds and pattern making is replaced by engineering method such as die sinking wherein pattern making and sand hazards are removed but use of refractory material to coat the die or mould provides some degree or risk. Higher metal temperatures of steel foundry requires coloured lenses for eye protection, dust exhaust system and respirators for dust and lungs protection from silicon dioxide. Alloy founding may give off toxic fume of different metals. Furnace and flue cleaning may also provide toxic exposure. Magnesium foundry poses fire hazard.

Fumes of zinc and copper may cause metal fume fever. Pressure die casting machines present hazard similar to power presses. Mist of oils used as die lubricants and .toxic exposure of fire resistant fluid used in presses are another hazards. All such hazards of alloy founding should be properly controlled.

5.1.6 Non-destructive Testing (NDT) :

Use of X-ray equipment for non-destructive tests of castings is an old procedure. A permanent well shielded location for such tests is necessary. All personnel should wear film badges against X-ray exposure. Because of the different absorption values of different materials, radiographs can be made of objects through the use of X-ray, radium and cobalt60. The activity of radioactive materials is measured in curies. One millicurie is defined as 3.7 X 10' disintegrations of radioactive atoms per second. Radiation is measured by the amount of ionisation it produces in air and its unit is roentgen or milliroentgen. Permissible dose limits should not be exceeded. The pocket dosimeter shows the dosage the person has received during any work period. The film badges and dosimeters both must be used for protection against radioactive tests. Thorough washing with soap and water, protective equipment and never using contaminated clothing into clean areas are desirable for safety.

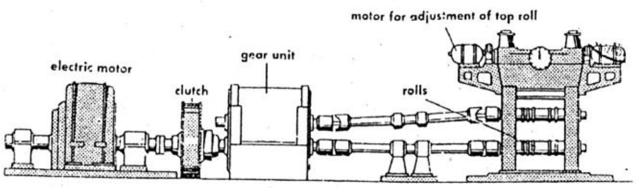
Non-destructive testing is mainly used for detecting cracks or determining the thickness or the quality of weld or metal parts. The methods used are radiography, magnetic particle, dye penetrant, ultrasonic, eddy current and other types.

Detailed information on the theory and practice of non-destructive testing methods is given in reference No. 5 at the end of this chapter.

For details see Part 15.5.2 of Chapter-18.

5.2 Hot Rolling Mill Operations:

5.2.1 Rolling Mill Operations :



Rolling mill with driving machinery

Hot or cold rolling mills cover a variety operations with ferrous as well as non-ferrous metals such as copper and aluminium.

In the rolling mill, the ingots from the soaking pits are first treated in the blooming or slabbing mill to produce blooms, billets or slabs. Then sheet and strip steels are rolled from slab, structural steel from blooms or billets and bars and rods from blooms or billets. In general, hot rolling is used for heavy sections and cold rolling to give desired surface condition with only slight reduction of section. After rolling and cooling if necessary, the product is cut to standard lengths and bundled for dispatch in the finishing department.

5.2.2 Hazards and Controls :

Harmful Gases from lead alloy rolling or cutting, gas cutters, or butt welding (ozone effect), pit furnace and reheating furnace need effective exhaust. Lubricating oil mist, cooling emulsions, degreasing agents for finishing operations, acids in pickling shops and ionising radiation in gauging and examining (nondestructive testing) of metals pose many health hazards. Medical precautions are desired.

In Hot Rolling, looping and lashing may cause burns and severing of lower limbs for which protective posts or other safety devices are necessary. Bridges under roller conveyors are required at crossing points. All hand tools and tongs to hold hot material should be well designed, frequently inspected and well maintained. Ring spanners and impact wrenches should be given to roll changing crews. Splash guards reduce the ejection of scale and hot water. Radiant heat levels may go upto 1000 Kcal/ 2 in hot rolling mills. The infrared radiation may damage upper respiratory tracts. Fans and blowers at hot working places should be so positioned as not to cause chills. Too chilled (less than 10°C) drinks are also not good.

5.3 Forging Operations :

5.3.1 Hazards and Safety Measures in Forging Operations :

Forging Process is used for the plastic deformation of metals and alloys, either hot or cold by applying the compressive forces. Hammer or impact forging exerts multiple forces while press or roll forging excretes single force. Hammer and drop forging are carried out on hot metal only, while press forging is also possible on cold metal. Forging may be carried out manually or mechanically.

Accidents in forge shops are generally due to hot and cold metal coming out, falls of the tup, accidental starting of the machine, crushing hazards, radiant heat, burns, high noise etc. Forge workers may suffer chronic rheumatism, digestive disorders (enteritis), inflammatory skin disease, respiratory trouble and hearing loss due to high noise and vibration.

General Safety Measures are : Good plant layout, uncongested machine and process layout, good housekeeping and ventilation, good draft to furnace and efficient exhaust of gases, water curtains and reflective or insulating screens for protection against radiant heat and hot air, local exhaust systems at the furnaces, cold air showers at hot work places, noise absorbent panels and deep and massive foundations to suppress vibrations. Rest rooms protected against radiant heat should be provided and equipped with air and water showers etc. Comfortable conditions are 19° to 24°C (not exceeding 27°C) air temperature, 30 to 50% relative humidity and 0.5 m/ s air velocity. Protective heat-resistant armlets, gaiters, aprons, safety footwear, eye and face shield, ear muffs or plugs to workers and their pre-employment and periodical medical examinations and safety training are also necessary.

Specific safety measures in forging operations are as follows :

Raw Materials :

In the sequence of forging operations the fist stage is receiving, storing and preparation of raw materials for actual forging process.

Receiving : Raw material, in bars of various lengths and shapes, is received by railway wagon or automobile truck. Unloading operations should be carried out safely under the experienced supervision. Mechanical lifting and carrying should be preferred.

Storage : Adequate storage facilities should be provided with overhead crane or hoist arrangement for safe mechanical handling. When piling is done in racks, retaining posts separating the different types of material should be used to retain maximum load. The bundles should be separated by tie timber of sufficient strength to prevent being crushed or broken. Spacers should be placed between bundles to facilitate the booking up of slings.

Handling : The handling of bar stock in storage areas creates specific hazards, which must be prevented. Most storage areas have overhead cranes and either the electromagnet or the sling suspension method to carry.

Electromagnet is permissible where the storage area is isolated from general manufacturing area or separated by walls and fences which will control exposure to plant-personnel not assigned to the handling operation. The magnet should be energised by a reliable constant power circuit, which is separate from the crane control circuit. Controls should be equipped with a switch that can be locked in position. The temperature of the magnet should be closely watched as its capacity drops as temperature rises. The magnet must be lowered to rest and power to magnet must be-off at all tunes, when the crane operator is not at the controls.

Shearing and Cutting : Most bar stock is reduced to forging multiples as per requirements of forging. Some multiples are cut by metal saws. Saw tables for bar stock must be substantial and should be provided with rollers or slides to assist in positioning for feed to the saw and for transferring cut multiples from the machine. Transmission parts should be adequately guarded. The wheels and all moving parts of band saws should be metal encased. Sliding or adjustable guards should cover the blade of circular saw and band saw with the exception of the point of operation.

Forging Furnaces:

Various types of furnaces are used to preheat metals before forging. The principal furnaces used are the box, pusher, rotary and slot type.

When lighting the oil fired furnaces, a lighting torch should be provided and placed on the furnace hearth near the burner opening where the mixture of oil and air will strike the torch flame. The operator should stand clear of the furnace openings so as not be exposed to possible flash back. With gas fired furnace, the charge and discharge doors should be opened and the furnace purged to remove any concentration of gas. Pilots should then be lit after which the burner may be turned on slowly, making sure that each burner is operating before proceeding lo the next. Furnace doors should be left open until the walls of the heating zone becomes a cherry red. If the furnace is not equipped with pilots, it should be ignited by means of a gas torch inserted through an opening in the furnace wall or burner block near the burner opening. This should be done before the burner valve is opened. Those assigned to light-up operations on either oil or gas fired furnaces should wear clothing that is free from flammable greases or oils to prevent setting it on fire. He should wear proper eye and a face protection (safety spectacle with side shades and a face shield) and a safety hat.

Both gas and oil presents fire and explosion hazards. Whenever the odour of gas is detected, checks should be made to locate the source. Only a gas detecting instrument or a solution of soap and water should be used. The use of any type of ignition only adds to the hazard already present by introducing the possibility of an explosion. Should a leak become ignited, do not attempt to extinguish it until the fuel source has been shut off. This will extinguish the flame as the fuel becomes exhausted. In addition to any safety valves which may be installed, all fuel lines should be equipped with easily operated manual valves installed at the floor level. They must be readily accessible and plainly identified. The floor area at the valve should be kept clear of stock or other material. Due to vibration set up by the impact of forging equipment, leaks in the fuel lines are a common occurrence in the forgeshop and should be repaired as soon as detected. Regular inspection schedules should be set up by the maintenance staff to locate and repair fuel line leaks.

Forging furnace should be shielded as much as possible to protect employees from radiant heat. This can be done by means of asbestos covered screens, metal shield backed by refractory material and stainless steel or aluminium sheets having radiant heat reflective qualities. A water or airline installed along the bottom of the furnace opening,, drilled with small holes in it, will help curtain the heat. Movable plates suspended from a rod across the furnace opening will help control radiant heat. These plates must be free to slide along the supporting rod so that operator as he needs, may move them back and forth at the furnace opening.

Electrical hazards around forging furnace exist due to the breakdown of wiring insulation because of exposure to heat and moisture. Prompt repair of defective wiring will reduce the hazard. Electrical cables should never be permitted to lie on the floor where they may be run by trucks, damaged by stock containers, dies or hot forging.

Furnaces should be equipped with safety disconnect switches that can be locked out when repairs are made. Carbon monoxide detectors with alarm, and other instruments which will reveal the presence of harmful gases should be used to check out a furnace before employees are permitted to enter. The fuel lines should be disconnected or sealed to prevent fuel running into the repair areas inside the furnace. Permit-to-work system should be adopted. There should be main safety switch in the primary power source ahead of fuses that can be. locked out.

Excess smoke from the oil fired furnaces should be exhausted by means of an exhaust-ventilation system and furnace hood. Cooling fans are necessary equipment in the forge plant but can be die cause of many serious accidents. The fan blades etc. should be adequately guarded with sturdy wire mesh guards. Up right conduit extension for electrical cable should be provided which would keep the cable off the floor. Fire extinguishers, suitable for oil fires, should be available for use in areas where oil is used. Rigid house keeping standards should be set up and followed. Oil absorbent compounds should be used on floors to reduce fire and slipping hazards.

5.3.2 Preventive Maintenance of Forging Machines :

Forging Hammers :

In most of the forge shops, drop hammers are used. These can be classified into board drop and air or seam drop hammers depending on the means or method of power transmission.

Treadle Guard : The operating treadle should be guarded to prevent accidental depressing of the treadle. It is important that the treadle guard be well designed to provide complete coverage and at the same time allow enough clearance for operator comfort and control of the treadle action.

Overhead Bolts : Because the steam or air drop hammer is a heavy impact machine , there are several internal and external stresses occurring in the hammer structure during -the forging process. Continued stress and vibration causes metal fatigue of the critical parts of the hammer. One cannot predict the life of these parts, so it is important that protective safety measures be taken to guard against the falling object hazard. Parts that frequently fail are head bolts, cylinder bolts, guide bolts, cylinder bolt springs, column bolts and gland bolts. These parts should be retained and prevented from falling by installing safety cables or chains.

Power Transmission Parts : In the case of board drop hammers, all exposed power transmission parts be well guarded. This includes the flywheel, drive belts, motor pulley and drive coupling etc.

Scale Shields : Complete confinement of scale is necessary if serious burns and eye injuries are to be prevented. Portable shields should also be used when driving out die or some block keys to prevent injuries by a die key flying out into the working area.

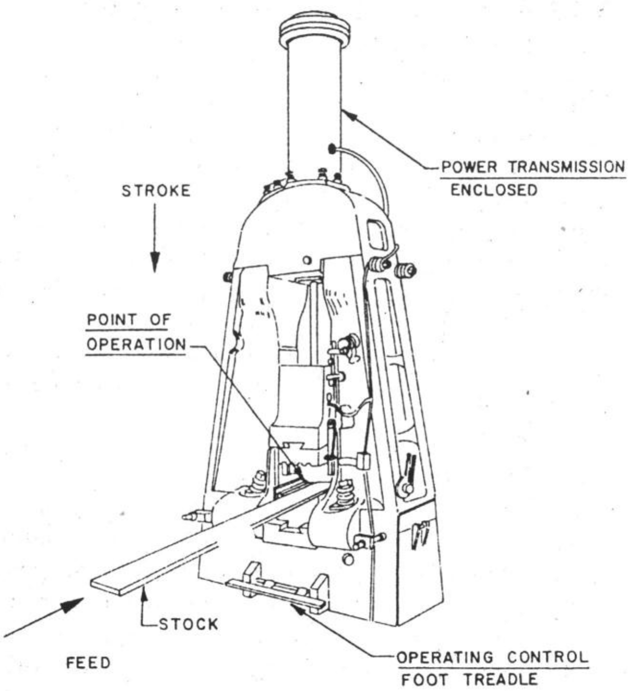
Safety Head : All steam or air drop hammers should be equipped with a safely type cylinder head designed to cushion the impact blow if the piston breaks or pulls out of the ram.

Start up Precautions : In starting a steam driven hammer, the exhaust valve must always be opened first and then die main steam valve. This must be done very slowly to prevent damage to the cylinder head. If it were opened rapidly, any water (condensate) in the cylinder could not escape as rapidly as the steam. Therefore, driving the piston against this water would put undue shock on the cylinder head. A full stroke of the piston must not be made until the water on both sides of the piston has been blown away. This is accomplished by taking short partial strokes.

Other Precautions : Air or steam valve should be closed whenever the hammer will not be used for considerable length of time. The ram, piston rod and dies are much more likely to be broken when cold.

Maintenance and Inspection : For complete dismantling and overhaul of a hammer as well as day-to-day maintenance, select tools and rigging equipment carefully. Because hammer parts are extremely heavy and bulky, employees must be fully trained in heavy rigging and repair work. A well planned inspection and preventive maintenance and accurate up-to-date records of replacement parts are necessary. Hammer equipment is usually hot and slippery thus creating a hazardous condition if proper facilities are not provided. Proper rigging equipment, hand tools, hoisting equipment, ladder and platforms should be available. Permanent platforms at overhead for hammer repair and adjustment areas are absolutely necessary.

Forging Press:



Forging and hot metal stamping

Due to its basic design, the forging press falls within the classification of power presses and hence hazards involved are similar to those of power presses. Therefore its maintenance is also similar to that of a power press. See part 6.2.2.

Trim Press:

Some forging have a rim of excess metal called flash. It must be removed by trimming (shearing) the metal either while it is still hot from forging operation or after it has cooled. This work is done in Trim Presses. Hazards and precautions involved are similar to power presses. See part 6.2.2.

Horizontal Forging Machines:

Horizontal forging machines are also called headers or up setters. These machines are designed for forging bolt heads etc.

Guarding : All parts of the machine except the feeding area should be entirely enclosed. Access doors may be cut into the enclosure in order to serve or lubricate moving parts. Movable section of guards should be interlocked so that the machine cannot be operated until every thing is in proper place. To prevent accidental tripping of the operating pedal, it should be enclosed.

Die Setting and Repairs : When dies are changed, repaired or adjusted, all power should first be shut off and locked out to prevent accidental starting. When the flywheel is completely stopped, dies open, and the header slide is completely back, the dies should be removed. Dies for new set up are usually lowered into the machine with a pry bar. It is good practice to make the set-up according to die layout.

5.3.3 Safe Work Practices in Forging Operations:

Stuck Forging:

In the event of stuck forging, the proper knock out tools and techniques should be applied. The tools should be made so that they are easy to handle and hook safely either around a die block or on the back of the die to prevent kick-back. They should bemade from soft steel and receive proper care, inspection and maintenance. Die liners, flash, wrenches or bars should never be used to remove stuck forging. Cold steel should never be placed between dies to dislodge stuck forging--

Suspended Chains and Trolleys :

Because forging operations require a great deal of stock movement (such as from furnace to hammer to press to conveyor) overhead trolley with suspended chains or tongs and hoist for heavy material are used to great advantage. Equipment including hoists, slings and chains should always be kept in good working order by periodic inspection and preventive maintenance schedules.

Props and Catches:

Props mid catches used during productions : Loose props should not be used. To support the ram between forging sequences on hammers, mechanical props or catches attached permanently to the hammers should be used. There are two main types: counter balanced props and fork catches. Fork catches have the merit of giving maximum engagement when supporting the ram, but they suffer from certain mechanical disadvantages and prone to failure, if not effectively maintained. Ends of the prop should be absolutely flat for better support.

Props used during die changing : With all types of hammers the ram has to be supported in a raised position during die changing, and the usual method employed is to use a prop. Every hammer should have its own die changing prop, which have an identifying mark on it and should be secured to the hammer. Props should be used during die changing in hammers with automatic or pneumatic hold-up gear. Accidents have occurred when the ram has been kept in raised position by held up gear (in case of steam or pneumatic hammer, by pressure). Inadvertent tripping of the hammer pedal has caused the ram to fall and serious injury to the person setting. An additional and much safer precaution is to switch off power or close securely all main supply valves on air and steam hammers and support the ram by a properly designed and maintained prop.

Tongs:

Tongs are the basic handling tool of the forging trade and, because of their tremendous impact force, they can cause serious accidents. How well the tongs are handled by the operator and how well they fit to the forgings are factors which control this hazard. Light weight tongs, properly fitted to stock or forging, are recommended. Tongs should be of sufficient length so that handles cannot kick back and cause injury. They must be handled and held properly to prevent finger and hand injuries. To help prevent forging or billets from being dropped during handling, the tongs bits must be properly fitted to the tong hold. When riot in use, tongs should be stored on specially designed tong-stand. Replacement tongs must be readily available to discourage employees from using worn out tongs.

Personal Protective Equipment:

Personal protective equipment for forge shop employees include safety shoes, leather leg guards, safety helmets, hand and arm protection, leather aprons, etc. Goggles with coloured or clear lenses, face shield or wire mesh face screen should be worn to help prevent face and eye injuries. Aluminised asbestos cloth overalls should be provided to furnace men to protect them from radiant heat. Ear muffs or ear plugs should be provided to forging crew to protect them from noise.

5.3.4 Safety in Use, Handling, Storage and Changing of Dies :

Die Design : Proper die design incorporates the safety needs of all operations. The size of the blocks selected for a die is dependent on the size of the hammer and on the type and number of impressions. Selection of too small a block increases the hazard of breakage and injury during forging. Danger of loosening or breaking of dies increases, if the striking surface is not held to a total area, which is in direct proportion to the size and stroke of the hammer in which it will be used. Narrow areas of striking surface should be avoided to reduce the possibility of cutting the metal which might overflow the gutter. Gutters should be adequate to completely contain the access metal, or flash and prevent it from being forced on to the striking surface where it can be squirted like bullets from the die.

Die Making and Die Sinking :

Probably the most important single factor for safety in die making is the establishment of definite uniform standards. These reduce operational hazards and avoid unusual or makeshift practices.

Die Making : Machine should be adequately guarded. Turntables are recommended for each bench for easier manually turning of the die blocks.

Die Handling : Hooks, eye or other devices for handling should not be attached to forging die as they break off under constant forging impact. Holes in opposite sides of a die block into which a pin is inserted for lifting with a sling is the desirable method. The pins should be of uniform size and sufficient length to provide slings with pins built into the sling assembly to prevent use of make shift pins in lifting blocks.

Die Storage : The storage of dies should provide a smooth and level base area with ample space between rows for mechanical handling equipment and easy access without undue die movement. Compartments for die storage racks should provide space for the largest and heaviest dies to be stored on the lower tiers and graduated with the smallest and lightest dies on the upper tiers.

Removal and Set up of Dies :

Key Driving : Extreme care should be taken when driving die key either in or out. Severe injuries as Well as strains and bruises can result from improper or careless handling. Correctly tapered key made of medium carbon steel, properly heat treated, should be used. Regular inspection for mushroom ends or other defects should be made both before driving and promptly after removal. Die key should be designed to protrude only a safe distance to permit driving from both front and back. When using a pneumatic key driver or suspended key ram, one man should direct operations. The immediate area should always be clear of both unused equipment and unnecessary personnel, because there must be sufficient clearance for necessary equipment and personnel for safe and efficient driving.

Dowels : Dowels should be properly designed and maintained. Dowels should be driven in tight mushroom head.

Die Repair : Die repairmen are subject to the hazards like burns from hot dies, danger of flying sparks, lacerations from die or tools, strains and bruises from improper handling of dies. To ensure safe operations, adequate space and equipment should be provided. Safety glasses and safety shoes must be worn at all times. Proper handling facilities should be installed. Repairing dies under a hammer should be discouraged.

6 COLD WORKING OF METALS

6.1 General:

There are thousands of metal working machines, machine tools and methods for variety of machine operations for general and special jobs which require individual guard design, treatment and different principles. The safety aspect of all such machines cannot be covered in one chapter. Therefore some common principles and methods of guarding are discussed below. An efficient engineering design and application are most

The five functional methods of cold working of metals are pressing or punching, shearing or cutting, rolling, bending and hammering.

1. Pressing or punching consists of forming, shaping, cutting or assembling metal by means of tools or dies attached to plungers or other moving parts. Various types of power presses, hydraulic presses and pneumatic presses are included here.

2. Shearing consists of cutting metal by the shearing action of movable knives. They may have straight or bevel edged blade. Shearing action may be of a guillotine knife, the sliding action of

scissors or the rolling action of rotating disks. Squaring shears, plate shears, guillotine shears, alligator shears, rotary shears, circular shears, *disc shears and rotary slitters are included here.

3. Rolling consists of forming or shaping, drawing or reducing the thickness of metal by bringing it in contact with revolving power driven rolls. Bending rolls, straightening rolls, corrugating rolls, heading rolls, flanging rolls, wire drawing and hot or cold rolling mills are included here.

4. Bending (braking) consists of bending or forming sheet metal by means of a tool or die usually actuated by a ram. Some brakes operate like press and some like a guillotine shear. Brakes are known as press brakes or apron brakes and are also identified by their operation e.g. folders, flanger, corrugators or crimpers.

5. Hammering consists of forming, shaping or breaking metal by means of gravity or power operated plungers which may or may not be fitted with a die, the metal to be formed resting on an anvil or a die. The plunger may be raised by mechanical, steam, hydraulic or pneumatic power.

The most dangerous part or zone is the point of operation and the purpose of point of operation guarding is to prevent injury to the operator at the part of the machine where above mentioned operations are carried out. Seven principles of such guarding are :

1. Design and construct tools so that the guards may not be needed.
2. Provide enclosures/covers and barricades.
3. Provide mechanical feeding device.
4. Provide device that prevents or interrupts the movement of tools when the operator is in the danger zone.
5. Provide remote control operating mechanism.
6. Provide device (guard) that removes the body part safely from the danger zone
7. Combination of these devices to achieve full protection.

For types and selection of guards see Part 4 of Chapter-14 on machine guarding. They indicate the principles of safe machine design. Individual motor drive, elimination of manual operation in hazardous zone, safe location, safe arrangement and position of machines and their dangerous parts, guarding of prime mover and transmission mechanism, ergonomic design and follow-up of statutory provisions and Indian standards are all useful to prevent machine accidents.

We saw that the point of operation is the dangerous zone which requires effective guarding. The best course is to provide fully automatic feeding and ejecting device at such point so that the man-machine contact is avoided. A hopper, magazine, feed roll or similar device should be designed and applied. If this is not possible, provide semiautomatic feeding device viz., a chute, slide, sliding die, dial or similar device which feeds to the point of operation. If this is also not possible, a manual feeding may be permitted with appropriate guarding and precaution. Automatic feeding and automatic ejection of the material will allow the danger zone to be fully enclosed (as the operator does not need to place his hands there) and full concentration on production (as no fear of injury), lhus increasing safety and productivity both.

6.2 Presses, Shears and other Machines:

6.2.1 Hand and Foot Operated Presses :

Non-power presses are generally hand or foot (kick) operated and are used for blanking, forming, punching etc., mostly on metal, but also on leather, card board plastics and pastry. An accident may take place if the operator's attention is distracted, the work is jammed in the die, the ram descends due to slackness in guides and insufficient frictional resistance, mistake of one operator if two operators work on the same press. Their safety devices include:

1. Closed tools, fixed guards and restricted stroke.
2. Interlock guards.
3. Pendulum and sweep away device.
4. Automatic device which arrests the ram.
5. Two hand control.
6. Firm foundation and mounting of the press.
7. Sufficient spacing or screens to prevent other workers coming into contact with moving parts.
8. The ram should not descend due to gravity.
9. Regular inspection and maintenance and
10. Good training and supervision.

6.2.2 Power Presses :

See Fig. 14.8 in Chapter 14.

For Schedule 6 u/r 54 of the GFR on Power Presses see Part 4.4 of Chapter-14.

Power presses are used in metal pressing, riveting, coining, assembling, staking, burnishing, trimming, sizing, flattening, bumping, embossing, homing, forcing, flanging, bending, straightening swaging, planishing, punching, extrusion etc. The power may be mechanical, hydraulic or pneumatic.

Types of Guards recommended for Power Presses are as under :

1. Starting and stopping mechanism to prevent over running of the press or descent of the ram during tool setting etc. A brake to stop ram in upper position and -an arrestor brake to arrest the movement of crank shaft and flywheel are also necessary.

2. Protection of tool and die by means of a fixed guard with a slip plate to enclose the front and sides of the tool, fixed guard surrounding the die with back tunnel for falling the pressed article to the rear, a feeding device through chute or otherwise at the bottom of the die guard, an efficient automatic or interlock guard in place of a fixed guard if the fixed guard is not possible

3. Fixed die-enclosure guard.

4. Fixed barrier guard to allow ready access to the die. The pivoting or sliding section must be interlocked with the press control to prevent operation of the machine when the section is open.

5. Adjustable barrier device attached to the frame of the press and which can be adjusted for dies of almost any size.

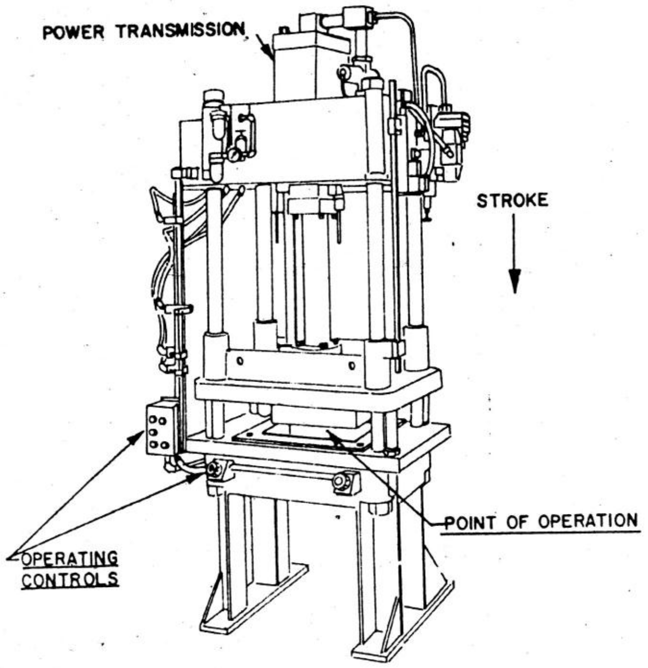
6. Gate or movable barrier device to enclose the point of operation before the clutch can be engaged.

7. Auxiliary point of operation device.
8. Two hand tripping device requiring constant pressure till the slide has reached the bottom of the downstroke.
9. Sweep device to push hands out of the point of operation zone. Such device is activated by the slide through linkage and may have a single or double arms.

10. Pull-back, pull-out or pull-away device to pull back hands as the slide descends. Such device should be adjusted to each job because of variation.
11. Electric or electronic device to prevent the pressure from cycling. Such device can be used only on presses having friction clutches with brakes to stop the press at any point of slide travel. It is not effective on punch presses with positive clutches because no device can prevent completion of the cycle once it starts.
12. Photo cell device operating on interruption of light beam near the dangerous zone.
13. Pedal guard over the foot pedal or switch button. A spring closed door requiring positive pressure in such guard provides further safety.
14. Instead of foot pedal, if the hand lever is used, a spring latch to prevent accidental or premature tripping, should be provided. If there are more than one operator, the hand lever should be interlocked.
15. A press with a positive clutch should have a single stroke attachment which disconnects the pedal or operating lever after each stroke.
16. When the press is used on continuous operation by making the single stroke or non repeat device inoperative, the die should be completely enclosed regardless of the method of feeding and ejecting device to avoid use of hands between die and punch. The six semiautomatic feeds are chute (gravity and follow), plunger, slide or push, sliding dies, dial and revolving dies. The best method of ejection is usually pick-up fingers or compressed air.
17. Hand feeding tools such as vacuum cup, tong, magnetic rod etc. to put and take small parts to and from a punch press.

6.2.3 Hydraulic and Pneumatic Presses:

The hazards are similar to those of the power presses. Some particular hazards are: sudden dropping of the slide due to power failure or breaking of a pressure line, defective dual controls, leaking valves, air pressure built up between dual controls in wiring etc.



Hydraulic press

Control measures are :

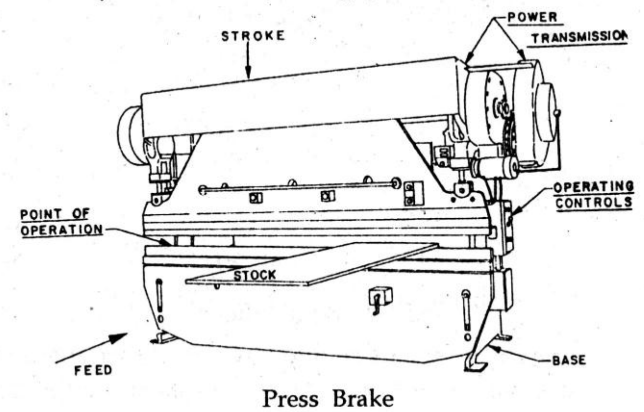
1. Limiting slide travel by means of a cylinder designed for short travel, by die or jig and fixture design or by auxiliary stops.

2. Fixed barrier guards.
3. Movable barrier guards.
4. Electrically controlled and air operated solenoid valve holds the slide in an up position in case of power failure.
5. Interlock guard to stop closing movement of the tools.
6. In case of Die-Casting Presses, to avoid trapping and splashes by molten metal, a sliding cover is interlocked with hydraulic or pneumatic power. A mechanical scotching device to restrain the platens from closing when the interlock sliding shield is open and guard operated electrical switches linked to the solenoid of the main platen cylinder control valve are also necessary.
7. Plastic Moulding Presses are of two types injection and compression. In case of injection moulding press, a sliding cover on vertical parting (dies) surfaces and in case of compression type an interlocked scotch (a heavy struck or a hook type) are necessary to avoid trapping between dies.
8. Rubber Moulding Press is compression moulding type and an interlocked guard is necessary to prevent trapping.
9. Bailing press needs a hinged guard interlocked with the driving power. .
10. Pie and Tart press used for moulding and filling pastry for pies and tarts, a hinged guard for protection against operating ram, electromechanical brakes on motor and blanking of gaps near tops of the moulds are necessary.
11. Brick and Tile presses need interlock guards or photoelectric safety device. In case of mechanically fed presses, a tunnel guard near delivery opening is necessary.

6.2.4 Press Brakes :

A Press brake is a type of power press used to cold-form angles, channels and curved shapes in plate, strip or sheet metal stock. It is also used for punching, embossing, corrugating, notching and other operation. Typical hazards are :

1. Crushing between the punch and the die or between the work being bent and the ram.
2. Cuts from contact with stock being processed.
3. Injuries from handling punches and dies.



Press Brake

Control devices are:

1. A front horizontal work rest cum distance .guard (this may be a fixed, automatic or interlocked guard) adjusted to coincide with height of die and supporting brackets and fall back device on rear side to stop the material being fallen.

2. Photo electric device in addition to fixed, interlock or automatic guards.

3. Worn punches and dies should be retooled or discarded as they give excessive strain on the press.

4. Instruction and training of operators.
5. Periodic inspection and well maintenance of parts in good working condition.

6. Starting devices such as two-hand switches or levers, treadle bars, foot switches. Foot controls should be covered by stirrup guards to prevent accidental tripping.

7. Reverse control with the start switch to use when tools become frozen.

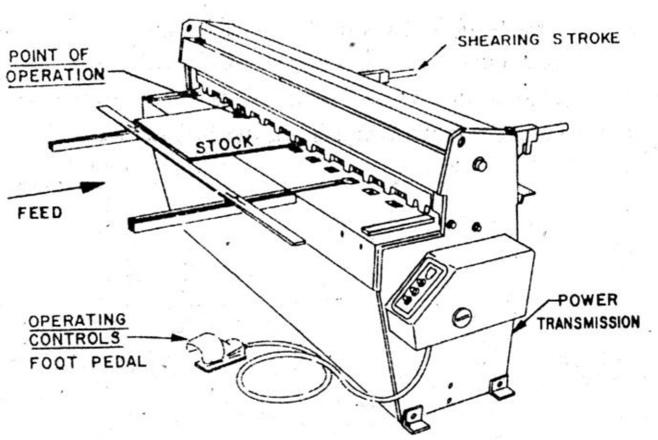
8. Soft metal pliers, rather than fingers, should be used to feed small parts to the press. Fingers should not be brought within 10 cm of the point of operation.

9. Positive over-run stop device, single stroke device and elimination of treadles by a shrouded pedal to prevent inadvertent operation.

10. Operators should be instructed to test operate the machine before start of each shift. They should be well trained and well informed of the work.

6.2.5 Metal Shears and Slitters:

For Shears, Slitters and Guillotine Machines under Schedule 6, rule 54, GFR, see Part 4.4 of Chapter-14.

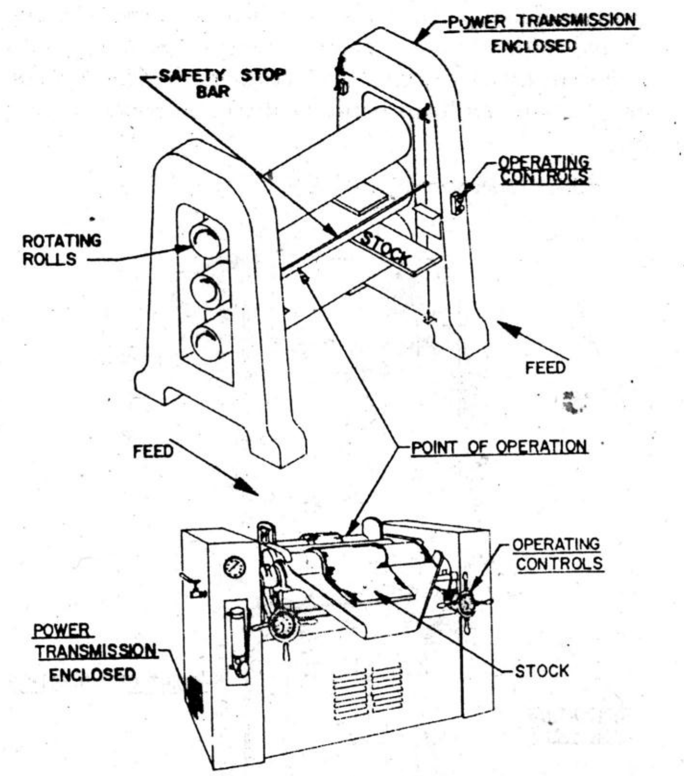


Sheet Metal Shear

Squaring shears should have fixed barrier guard placed at least 12 mm away from the shear (knife) and not more than 10 mm above the table or it may be a self adjusting barrier which will automatically adjust itself to the thickness to be cut with a limit of 8 mm above the table. The guard should extend across the full width of the table and it may be slotted, perforated or set at an angle to permit good visibility of the cutting line. The hold-down can be guarded separately or as a part of the knife guard. The back of the knife should also be guarded and chutes or slides should be attached to catch the work without reaching close to the knife. The entire length of the treadles should be provided with fixed guard allowing only a gap for the operator's foot. To avoid accidental tripping of the shear, an extra foot latch may be attached to the treadle.

Alligator shears are used in forging operations. For cutting rods and bar stock to length, the alligator shear operates continuously and the operator must be trained to time his movement with the opening and closing of the cutter. An adjustable guard should be set close to prevent the fingers from entering the danger zone.

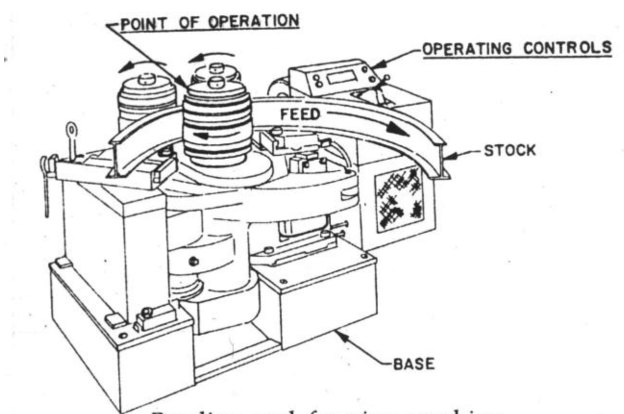
6.2.6 Forming Rolls:



Forming rolls and calenders

The nip point (full length) between the rolls should be guarded utilising a feed table. A special purpose feeding device (channel type) can be easily installed to feed short pieces. Reverse electric switches or emergency tripping bars are also useful. Brakes are necessary if the rolls continue to revolve after power has been cut off.

6.2.7 Bending and Forming Machine :

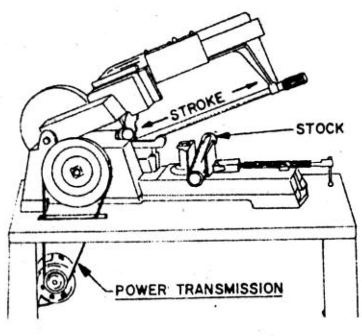


Bending and forming machine

This power driven machine is used to band preformed stock (ie. plate, bar, tube, pipe etc.) into desired shapes. Forming and banding are performed by dies, banding punches or other tools.

Hazards are - trapping in dies or in-running nips of rollers, sharp corners of materials, slipping due to lubricants and heating due to friction of motion etc.

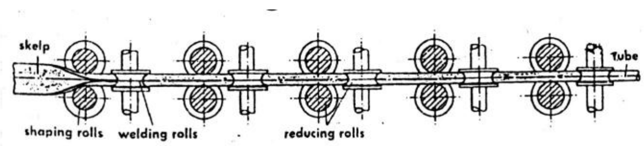
Point of operation should be guarded. Power transmission parts should be enclosed. Safety stop sweech is necessary and accidental restarting should be prevented.



6.2.8 Metal Cutting Machine :

Metal cutting machine has a blade (hacsaw) which works horizontally and cut the stock (bar, rod, plate, pipe, tube etc.). Coolant or lubricant is necessary. Hazards and control are similar to wood cutting machine. Guard is required to protect the moving blade and transmission machinery. See part 4.4 of Chapter 14.

6.3 Cold Rolling Mills :



Cold rolling for welded tube

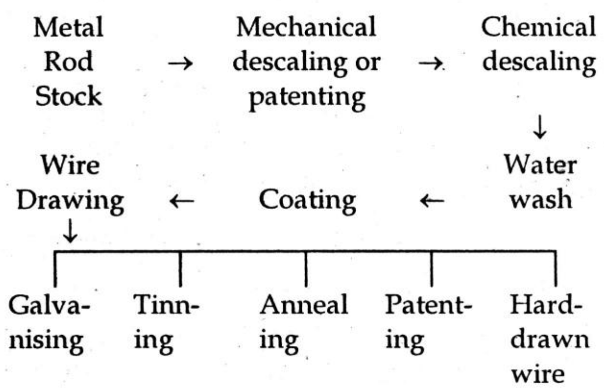
In Cold Rolling nip guards on rolls are necessary to avoid trapping. Dangerous parts of shearing, cropping, trimming and guillotine machines should be securely guarded. Oil spillage on floors should be cleaned. Gratings, absorbent materials and non-slip boots are necessary. Fire protection in plants containing hydraulic equipment is necessary. Accidents due to material handling should be avoided by methods stated in Chapter-15. Good housekeeping and good illumination are also essential. Hard hats, safety shoes, gaiters, gloves, goggles etc. should be worn.

Noise is at many places such as gearbox of rolls and straightening machines, pressure water pumps, shears and saws, throwing of metal products. Planning at design stage to segregate such noise zone is essential. Sound proof and heat radiation proof cabins for operators and crane drivers increase safety as well as efficiency. If technical control of noise is impossible or insufficient, ear protectors should be given to workers.

Vibration due to percussion tools and recoiling and rebounding effect of the material introduced into the gap between the rolls may cause health hazards for which engineering control is the only best remedy. Other measures are less effective.

6.4 Wire Drawing Operations :

The usual meaning of wire is a coiled metallic stock up to 3/8 inch cross sectional width. Wire drawing is cold working in which semi-finished metal rod stock is transformed into wire of smaller diameter and perfectly round cross-section by pulling it through a die or dies. The operational diagram is shown below.



Annealed or patented wire can further be subjected to acid clean, water wash, coating and redrawing. At the end the wires kept into wire stock or used for products. Drawn wire may be galvanised or tinned before delivery. During wire drawing operation either the wire is passed through dry lubricants (soap or sodium, calcium or aluminium stearates) or wet lubricants (soap solution, paraffin etc.) in which the dies are fully immersed for maximum lubrication and cooling which also gives a bright clean finish.

Hazards are acid splashes, burns, cuts, bruises, falling forging bodies in to eye, skin diseases due to acid, dusts, scale and lubricants and lead poisoning due to lead baths which are not covered or have no fume extraction.

Preventive Measures include guarding of dangerous moving parts, drive, nips, wire pulley nips and feed points by screens and barriers (adequate to contain a broken wire), enclosure of dangerous chemical processes, removal of fumes and dust by exhaust ventilation, use of personal protective equipment (safety helmets, goggles, face masks, gloves, aprons, footwear), safe material handling, training, barrier creams and medical examination of workers.

6.5 Machine Tools :

Classification, uses and safety aspects of machine tools are important.

6.5.1 Definition and Classification of Machine Tools:

A machine tool is a machine for making articles of a given shape, size and accuracy (according to the blueprints) by removing metal from work pieces. Machine tools are factory equipment for producing machines, instruments and tools of all kinds. Machine tools are classified as (1) Lathes (2) Drilling and boring machines (3) Grinding, Polishing or Finishing machines (4) Combination machine tools (5) Gear and Thread cutting machines (6) Milling machines (7) Planning, Shaping, Slotting and Broaching machines (8) Cutting off machines and (9) Miscellaneous machines.

CNC (Computer Numerical Control) machine tools are used for doing multi operations. CAD (computer aided design) and CAM (computer aided manufacturing) technique gives fully automatic machine tools operations.

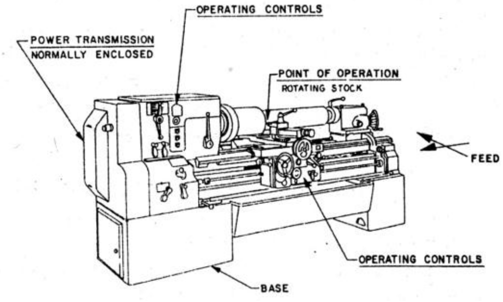
Machine tools may cause less serious accidents than do metal-forming machines, but, because of their greater use, their accidents may exceed in number.

6.5.2 Safety in Use of Machine Tools :

Machine-wise hazards and guards are explained below.

(1) Turning Machine (Lathe) :

Turning consists in shaping a rotating piece by revolving it against a cutting tool, thus producing a



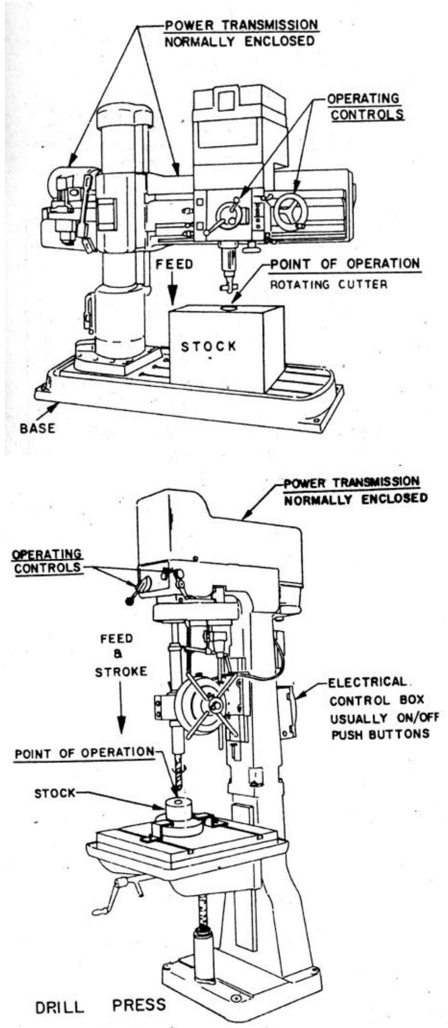
cylindrical surface. Machine tools coming under this category include all forms of metal-turning lathes including automatic screw machines. Some hazards and suitable guards are as follows :

S. No.	Hazards	Guards / Controls
1	Contact with projections of face plates and chucks.	Head-stock guard. Chuck guard.
2	Contact with projections of the dogs and projecting set screws.	Counter sunk screws.
3	Flying metal chips, long burrs and tunings.	Enclosure guard, portable perspex screen guard, use of chip breaker tool.
4	Hand braking of machines.	Foot pedal brake with trip switch, pneumatic chuck and feeding tools for small jobs.
5	Filling and emerying without a holding device.	Automatic emerying. Emery holder.
6	Gauging the job while machine is in motion.	Dial indicators. Tight fitting clothing.
7	Cleaning chips in motion	Safety hook / brush.
8	Projection of the work or stock beyond machine.	Tube guard. Bar stock guard.
9	Flying off the job.	Full enclosure guard.
10	Inserting blanks and removing die processed part without stopping.	Spindle jaws, mechanical feeding device and safe fixture.
11	Splashing of coolant resulting in slipping hazards and dermatitis.	Splash guard, pan and enclosure guard mounted on rollers. Floor mats.
12	Flying chips of cast iron, brass and other non ferrous metals.	Chip guard. Goggles or face shield.
13	Pulleys, belts, ears, setscrews.	Fixed guards Hinged guard.
Turrets & Capstan Lathes :		
14	Counter weight falling and bar flying through turret head.	Tube guard. Blank off hole.
Multispindle Lathe :		
15	Collecting component while just martin off.	Wire mesh. Spoon collectors.

16	Parted component comes in between tool and the first spindle.	Sharpening tools properly

(2) Boring or Drilling Machines :

Boring or drilling consists of cutting a round hole by means of a rotating cutting tool. Machines ir this class are vertical or horizontal, fixed or portable drills, reamers, honors. Some hazards and guards are as follows :



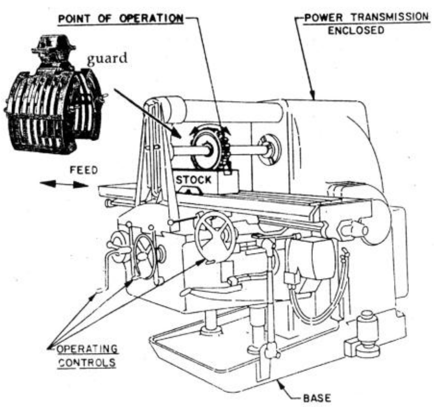
Vertical boring machine

S. No.	Hazards	Guards / Controls
1.	Spindle contact.	Sleeve guard.
2	Tool and chuck.	Telescopic drill guard, combined drill & check guard.
3	Unclamped job and breakage of tool or struck by the job.	Clamp the job. Use iron plate (L section) for a big job.
4	Hair and loose clothing in contact with revolving spindle and bit.	Cage type guard. Cap. Tight fitting clothing. Gloves neckties long sleeves not permissible.
5	Sweeping chips by hand.	Brush.
6	Belts, pulley, gears, setscrew.	Fixed guards
7	Flying particles	Barrier guard, Goggles.

8	Rotating horizontal table.	Surrounding machine guard.

(3) Milling Machines:

Milling consists of machining a piece of metal by bringing it into contact with a rotating cutter with multiple cutting edges. Machines in this class are vertical or horizontal milling machines, planer-type milling machines, gear hobbers and special machines using one or more milling cutters with other tools. According to one survey @ 66% of all milling machine accidents occur when operators load, unload or make adjustments while machine in motion. Some hazards and guards are as follows :

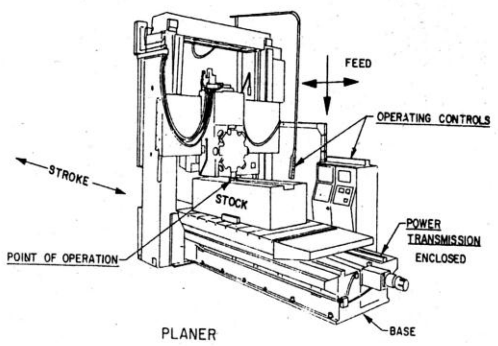


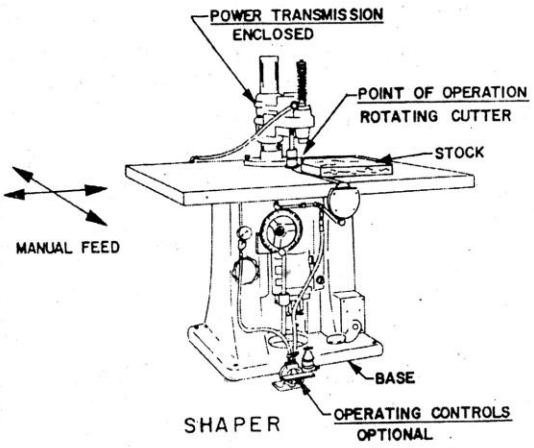
Horizantal milling machine

Sr. No.	Hazards	Guards / Controls
1.	Revolving cutter	Jaw type interlocked or adjustable guard, or a self closing guard which automatically close when the job tables moves backward and opens when it moves forward for operation. The guard may be transparent if visibility is required.
2.	Removing chips and swarf cleaning by hand and using rag to clean oil while it is running.	Brush, magnetic sweep, cleaning after stopping the machine. Long sleeves to be avoided.
3.	Failure to clamp the work properly.	Permanent magnetic plate fitted on the bed.
4	Failure to draw the job back to a safe distance while loading or unloading.	Fixed guard.
5	Tightening or loosening arbor nut and other parts.	Use proper spanners. Education and training.
6.	Power drive pulley, belts, gears etc.	Closed housing or fixed guard and start / stops switch within reach.

(4) Planning & Shaping Machines :

Planning consists of machining a surface by moving the work (job on bed) back and forth under a stationary cutting tool. In shaping the work is held stationary under a reciprocating tool. Machines in this class include planers, shapers, broachers, slotters and key seaters.

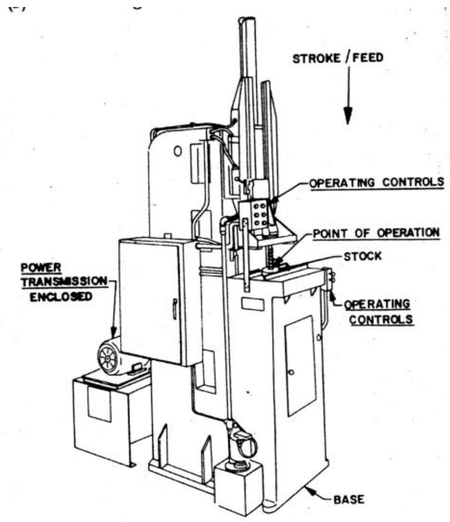




Some hazards and guards are as follows:

Sr. No.	Hazards	Guards / Controls
Planners :		
1.	Bed traveling within short distance from fixed object.	Fixed guard or fencing to prevent entrapping within 45 cm (section 25, F.A.) All gaps to be guarded.
2.	Falling material from the table or bed.	Fixed or self adjusting table guards on sides. Job clamping device.
3.	Pulley, belts, drives and reversing dogs.	Fixed guards, starting and stopping device.
4.	Flying particles.	Aprons, goggles side runway for large planners.
Shapers :		
1	Speed changing and other drives	Fixed or hinged guards.
2.	Flying and removing chips.	Aprons, goggles, brush.
3.	Flying jobs.	Clamping device.
4.	Moving ram and tool	Transparent shield for tool. A retriever to the limit of the stroke of ram channel.
5.	Reversing dogs.	Fixed guard.
6.	Other as for planners.	As for planners and stated above.

(5) Broaching Machine

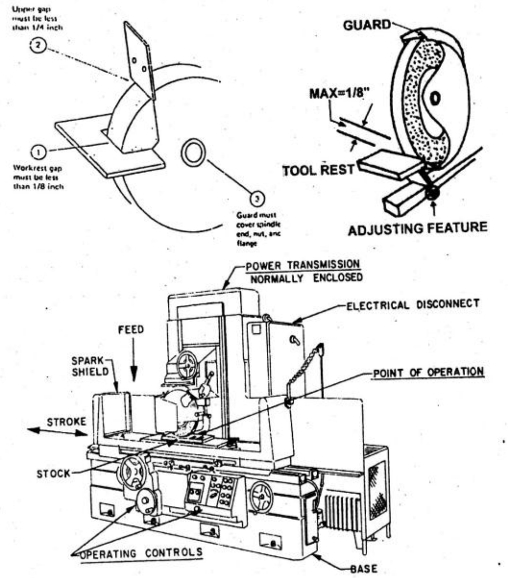


Broaching machine

(6) Slotting Machine

Slotting machine is like a shapping machine Tool may work vertically or horizontally. Hazards and controls are similar to that of shapping machine. Se(part 6.5.2 (4).

(7) Grinding Machines:



Surface grinder

Grinding consists of shaping metal by bringing it into contact with a rotating abrasive wheel. Grinding may be internal or external, flat, cylindrical or centerless. Polishing, Buffing, honing and lapping are also considered as parts of the grinding process.

Main causes of accidents are wheel breakage due to hidden or undetected cracks, mechanical shock, over or loose tightening, unchecked traverse of the work on to the side of the wheel, over speeding, incorrect selection of wheel, excessive heating, excessive work pressure and eye or face injury due to flying particles.

Some hazards and guards are as follows :

Sr. No.	Hazards	Guards / Controls
1.	Flying particles, Coolant and lubricants.	Goggles or face shields. Eye shield attached with the machine frame.
2.	Dust generation.	Local exhaust ventilation.
3.	Bursting of the wheel.	Protection hood (wheel guard) and protection of flanges. Chucks or bands. No over speeding. Avoid grinding on the side of the wheel. Compliance of sec. 30, Factories Act.
4	Accidental contact with the running wheel.	Tool or work rest and its proper adjustment to avoid contact and trapping.
5	Portable grinders.	Wheel guard. Electrically earthed and fully safe. Shock-proof gloves.
6	Belt drive and other dangerous parts.	Fixed guard

Main precautionary measures are as under:

1. Selection of a right wheel for right speed and right diameter. With the same rpm, peripheral speed increases as wheel diameter increases and centrifugal force increases as peripheral speed increases. Due to excessive centrifugal force, the wheel may break. Therefore peripheral speed (m/ s or f/m) is most important and a grinding wheel should be selected based on its peripheral speed.

2. Ring test is carried out by a qualified person to check any crack in the wheel.
3. Speed test before installing wheel. Test speed should be 1.5 x service speed. Testing should be on special stands.
4. The wheel should never be rotated at a higher speed than that stamped on it.
5. Wheel guard (hood) should be fastened securely to the grinding head to protect against flying fragments or coolant if any. An adjustable tongue or a movable wheel guard is necessary to restrict wheel exposure to 6 mm.
6. Abrasive dust and slurry removal equipment should be in good repair. Dust generating equipment should be in a separate room.
7. Electrical earthing, bonding and on-off switch in easy reach.
8. Proper storing in dry area . Use special racks, shelves or boxes according to the shape & size.
9. Proper dressing of the wheel.
10. Use wheel washer and flanges of correct size and equal diameter (at least 1/3 dia of the wheel).
11. Avoid overtightening or loose tightening. Use proper tool. Proper mounting to avoid internal stresses. Use mounting blotters supplied with wheels.
12. Check spindle threads so that the nut is not loosened on revolution.
13. Use spindle of correct diameter.
14. Balance the wheel to avoid vibration. Balance before installation.
15. Apply the work slowly and gently. Do regular lubrication.
16. Avoid side grinding, over speed and cleaning, adjusting or gauging while the machine is in motion.
17. Wheel exceeding dia 15 cm or speed 50 m/s should have a strength-test mark.
18. Adjust tool rest properly.

A checklist of the following type should be used by a grinder or maintenance man.

Checklist for a Grinding Machine

Name of the m/c : Identification No. Location& Department: Type & Use: Size _________________ RPM _________________ Peripheral Speed _________________

Item	**Tick if ok**
Wheel guard :	
Securely fastened	☐
Properly aligned	☐
Tongue adjusted (to minimize guard clearance)	☐
Tool rest :	
Within 3mm of the wheel	☐
Properly tightened	☐
Speed :	
Legal notice displayed	☐
Wheel selection correct	☐
Drive guard :	
Pulley-belt guarded	☐
On-off switch :	
Properly working	☐
Within easy reach	☐
Flanges :	
Equal size	☐
Correct dia (1/2 wheel dia)	☐
Wheel face :	
Dressed evenly	☐
Well lighted	☐
Frame & Foundation :	
Securely mounted	☐
No vibration	☐
Goggles / Face Shield :	
Clean	☐
In place	☐
Unscored	☐

(8) CNC Machine :

Numerical Control of a machine tool means automatic control of its operation under a programme expressed in numbers or symbols which determine values and kinds of displacement of operative members of the machine. Such machine tools are known as NC machine tools. When their control is computerised, they are known as Computerised Numerical Control (CNC) machine tools.

The change-over from job to job in NC machine takes less time than other type of automatic machine where this is done by changing cams or templates, displacing stops, limit switches etc. Such automatic machines are also programme-controlled, but their setting up is complicated. They are advantageous only in mass and batch production.

The main feature and advantage of NC machine tool is the simplicity of changing over, which makes it possible to develop economically effective systems of automation for small-batch and single piece production. Programme can be fed directly in the machine for limited volume, or it can be prepared outside the machine for unlimited volume. In the second method, information is stored in the storage medium like punched tapes, magnetic tapes, wire discs, or drums, paper tapes, punched cards, films, and in the movement of storage medium, this information is successively read out and is employed to control the movements of the machine operative members. The storage medium is usually prepared outside the machine by applying computing technology (computers) and special devices for recording the programme. CNC system can be employed for lathes, milling machines, drilling, boring and other machines with automatic tool changers which make it possible to increase output, reduce rejects and inspection operations.

The decimal system or binary system of noting numbers is used to represent machine part movement. The displacements are specified in pulse systems with the number of pulses coded. The information can be recorded, for instance, in the form of holes on a punched tape. In computer system, electronic media is used to give number, code, symbol and graphic to store and translate information for automatic machine movement.

The basic components of CNC system are :

1. CNC (computer numerical control)
   It contains
   a. CPU (central processing unit)
   b. PLC (programmable logic control)
   c. Inputs/outputs
   d. Memory
2. Axis and spindle control
   It contains
   a. Servomotor for axis
   b. Power motor for spindle
   c. feedback for drives
3. Positioning display system
   It contains
   a. Position sensors
   b. Processing of sensors
   c. Display unit

The function of the CNC system is to take the commands in the form of a program or by manual data entry and to give command to the motors to achieve the required position movement. It also stores the programs, controls the logic functions of the machine and checks all inputs/outputs. To take care of the functions it has following components :

Safety & Maintenance :

Many tools are fitted in an auto tool changer which operates suddenly as per the programme. Therefore all moving mechanism of a CNC machine should be totally enclosed in a plastic cover to afford safety and visibility. Such covers should be so interlocked that inner parts will not start till the cover is closed and will not open till the inner parts are stopped. Limited openings for the job insertion, machined part ejection and scrap removal are permitted. Any manual control, if required, should be remote. Machine should not start inadvertently. Necessary trips and locks are provided for built-in safety. Electrical double earthing, start-stop switches in easy reach, sound foundation to eliminate vibration, automatic lubrication system, mono-rail and chain pulley block to handle heavy machine part or the job, numerical display system, sufficient surrounding space for work and maintenance and protection of computer system are basic safety requirements. Tool magazine operating at a height as in case of steel plant, are considered safe by position. Machine operators should be qualified and well trained for the operation of machine and the job.

6.6 Selection and Care of Cutting Tools:

Cutting tools are fitted to machine tools for required operations on the job.

Selection of a right machine and right cutting tool for the job is essential. From a variety of lathes single or multi operation, turret, spinning, screwing etc. - a particular one is to be selected depending on the type of operation to be carried out.

Similarly selection of a drill for small holes, boring machine for big holes, planning machine for a big sized and heavy job, slotting or shaping machine for small jobs, metal saw (circular) or gear cutter milling machine for specific work, internal, external or centreless grinding machine and selection of buffing or polishing machine need special knowledge and experience.

Cutting tools should be stored and used carefully. Their sharp edge is to be protected to avoid injuries and sharpened for easy cutting. A tool rack should be provided for classification, easy placement and preservation. Tools store area should be dry and protected from raining, fumes, gases and other chemical effects. It should be well ventilated and lighted. Proper stools or ladders should be provided to prevent fall of tools while putting or taking from the racks. Passageways should be more than a meter wide.

While fitting the cutting tool to a machine, necessary hand tool or equipment should be used. Chucks and fixtures should be properly positioned and tightened. Alignment of tool centre is important. Tool guard is necessary to prevent injury in case of its breakage. Cutting tools should be regularly inspected for defects, dressed for proper cutting angle and sharpness of the edge. Broken and unsate tools should not be used. Tool and tip metal should be properly selected.

6.7 Safe Operations and Maintenance of Machines:

See Chapter-14 for general principles of machine guarding. They are equally applicable to cold working of metals including machine tools. Some instructions for safe operation and maintenance are as under :

6.7.1 Safe Operation of Machines :

1. Operators should be well trained for machine operation.
2. Trained supervision should be provided.
3. Safe work procedures should be followed to avoid short-cuts and chance taking.
4. Dangerous parts must be properly guarded.
5. New machine, equipment or tool should be inspected before use.
6. Running machine should not be left unattended. It should be shut down in a safe mode. Off switch should have locking device. Machine under repair should have tagging and warning notice.
7. Operators should not wear loose-fitting clothing, loose sleeves, neckties and metal jewellery. They should not lean over rotating parts.
8. Operators should wear eye and head protection. They should run the machine at proper speed.
9. Gagging, callipering and manual adjustment should not be carried out while machine in motion.
10. Open hands should not be used to clean scraps and chips. Brushes, vacuum cleaner or special equipment should be used for that purpose.
11. Proper hand tool should be used and job should be properly fitted in the machine. Constant watch for proper machining is necessary.
12. Compressed air should not be used to blow chips from machine or clothing. If it is to be used, nozzle air pressure should be less than 20 psig.

13. Planned maintenance system (PMS) includes post inspection repairs, routine servicing and overhauling, periodical inspections and scheduled repairs. A widely used PMS cycle is GIRIRIMIRIRIMIRIRIG where G, I, R & M indicate general overhaul, inspection, routine repairs and medium repairs.

6.7.2 Total Productive Maintenance (TPM) :

It is a philosophy which brings results when practiced. Motivates people to come together, builds team sprit with pride of ownership. A person strategy for achieving excellence in business through complete cultural age.".

Dr. Doming gave birth to concept of TQM in 1970 after World War II, which had a great influence on Japanese Industry. TPM is evolved from TQM.

It becomes popular in manufacturing industries.

TPM was brought to India in 90's and successfully implemented in many industries.

Objectives:

1. To maximize Overall Equipment Effectiveness through total employee involvement.
2. To improve the Equipment Reliability and Maintainability &: this will improve Quality & Productivity.
3. To cultivate the equipment related expertise among operating personnel.
4. To create anenthusiastic & lively work Environment and culture.

Benefits:

TPM encompasses a powerful Structured Approach to change mind set amongst people marking a visible change in the Work Culture of the Company.

1. Zero Defects.
2. Zero Breakdowns.
3. Zero Customers Complaints and,
4. Zero Accident.

Purpose of TPM:

It involves everyone from top to bottom to make the Organization Efficient & Effective with

1. Lowest Cost.
2. Zero Waste, and
3. Excellent Quality with,
4. Zero Accidents.

It guarantees improved results, visibly transforms the work place, and raises the level of knowledge and skills of the employees.

TPM Parameters:

Effectiveness of TPM in industry is reflected by improvement in following parameters:

P - Productivity of Enhancement.
Q - Quality Improvement.
C - Cost Control.
D - Delivery in time.
S - Safety.

M - Morale.

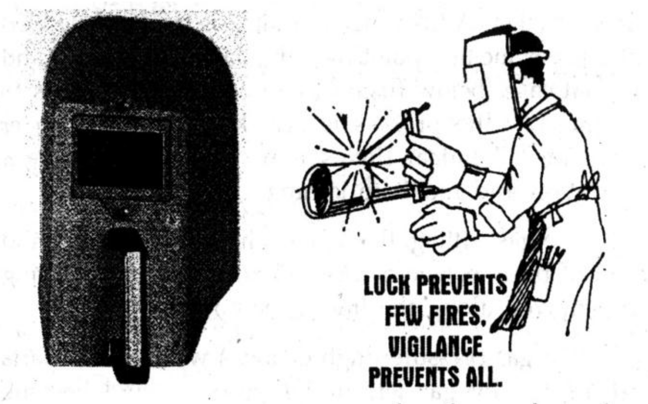
Pillars of TPM are -

1. Autonomous Maintenance (Jishu-Hozen)
2. Focused Maintenance (Kobestu-Kaizen).
3. Planned Maintenance. .
4. Quality Maintenance.
5. Development Maintenance.
6. TPM in administrative & support departments.
7. Education and training.
8. Safety and environment Management.

7 SAFETY IN OTHER PERATIONS

7.1 Welding and Cutting Operations :

Welding and cutting operations are frequently used in construction, demolition, repair and maintenance works. The equipment may be permanently installed or portable. Hazards of permanent installation .can be minimised by safe design and therefore a fixed welding shop is more desirable than portable moving welding work. Where the work pieces are very heavy or not movable or at height or depth etc. portable equipment is the only convenient device.



Welding is a process to unite pieces of metal at joint faces by heat or pressure or both and sometimes use a filler material. Cutting is a process to remove the metal by the chemical reaction of the metal at high temperature. In both these operations, the common factor is high heat energy and high temperature for melting or fusing of metals.

The three common sources of heat are :

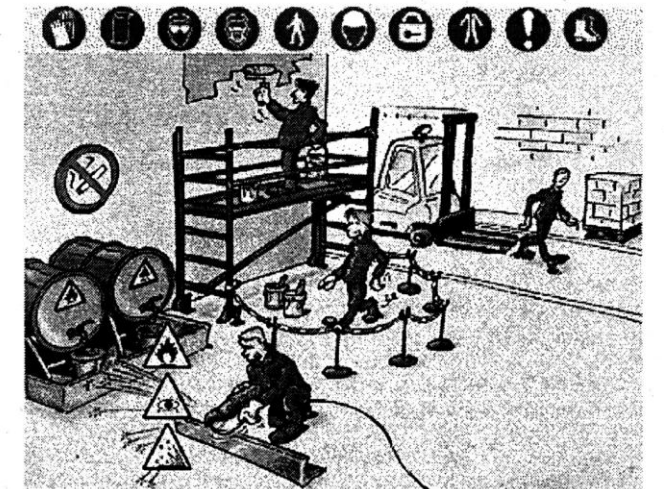
1. Flame produced by combustion of flue gas with air or oxygen (Gas Welding)
2. Electric arc, struck between an electrode and a work piece or between two electrodes (Electric or Arc Welding)
3. Electrical resistance offered to passage of current between two or more work pieces (Resistance welding including spot, steam, projection and butt welding).

Other processes are atomic hydrogen welding, electron beam welding, electro slag welding, flash welding, friction welding, laser welding and drilling, metal spraying, plasma arc welding, plasma arc spraying, tungsten arc cutting, spark erosion machining, stud welding and thermit welding.

7.1.1 Welding and Fire Safety :

Nearly six percent of all industrial fires are started because of unsupervised welding repair jobs without a permit-to-work system.

Common Causes of Fires in Welding and Cutting



Fire originates from a heat source and feeds of combustible materials. Welding operations produce sparks which can travel long distances, particularly if the welding torch is not adjusted properly. The hot slag of burning metals may drop down as globules which retain their heat for a very long period and can start a fire long after the welding job is completed. Similarly, application of heat during welding to a closed vessel, pipe or tank can result in an explosion if the vessel contains flammable liquids or gases. An empty vessel that had contained a flammable material is more dangerous than one fully filled with flammable material, because it may be full of invisible vapours.

Electric arc welding involves passage of very large quantities of current, often running into hundreds of amperes. The passage of electric current itself creates heat and therefore cables, junctions, switches and other electrical appliances must be of adequate current carrying/breaking capacity.

Precautions for Preventing Welding Fires:

(A) Before Welding-

1. Work Permit: Make a thorough inspection of the workplace. Ensure that it is safe for welding operations. Issue a written permit as shown below for commencement of welding work, especially when contract workers are involved.

Permit for Cutting and Welding with Portable Gas or ARC Equipment

Date ____

Building ____

Department ___________________________________ Date __________

Place or Location ____

Work to be done ____

Special Precautions ____

Is fire watch required?

The location where this work is to be done has been examined, necessary precautions taken, and permission is granted for this work.

Permit expire ____

Signed_____________
(Individual responsible for authorising welding and cutting)

Time started _______________ Completed _____________

2. Check if the area contains flammable liquid/ gases. Ensure that there are no floor openings, open windows nearby or any such ready access through which sparks can pass and fall on combustible materials. (In one such case, flammable vapours on the ground floor 7 mt below, were ignited due to a welding spark fallen from that height and the welder died due to burn injury).

3. Examine whether the job can be welded outside the premises and brought back.

4. If not, remove all combustible materials to a safe distance of at least 20 feet.

5. Sweep the floor and the area nearby and remove all waste materials.

6. If any of the combustible materials cannot be removed, cover it with non-combustible coverings like metal sheets or asbestos curtains.

7. If the floor itself is combustible, cover it likewise and wet it before starting welding work.

8. In case welding or cutting has to be done on a vessel, pipe or other container which contains or had earlier contained flammable liquids, ensure that a detailed 'permit-to-work' procedure involving isolation, blanking, purging, inerting methods is followed. Consult the Indian Standard 3016 for additional details.

(B) During Welding

1. Use portable screens, booths or partitions to minimise the spread of sparks.
2. Keep an observer ready with a portable extinguisher (dry powder), water buckets etc.
3. Ensure that gas cylinders, hose pipes, torches and other appliances are properly selected, installed and used.
4. In case of electric welding, check the connections, cables and earthing in particular.
5. Ensure that the welder uses appropriate personal protective equipment like goggles, gloves, boots, spats and if necessary an approved respirator.
6. Do not leave electric circuits on, or blow-torches burning when the welder has to take a tea break or has to be away for any reason.

(C) After Welding

1. Inspect the area for sparks or smouldering materials. If you find any, remove and extinguish them.
2. If any portable extinguisher has been used, replenish it.
3. Gas cylinders, blow-torches etc. should be returned to the stores or kept at the authorised place.

7.1.2 Gas Welding and Cutting :

In gas welding, oxygen or air and a fuel gas (acetylene, hydrogen, LPG or propane, butane, coal gas, natural gas or their combination) are fed to a blow pipe (torch), usually hand held in which they are mixed prior to combustion at the nozzle. The heat melts the metal faces of the parts to be joined causing them to flow together. A filler metal or alloy is frequently added at a lower melting point than the parts to be joined and in that case (below fusion temperature of the parts to be joined) the process is also known as brazing or soldering. Chemical fluxes may be used to prevent oxidation and facilitate joining.

In gas cutting, the metal is heated by a flame and a jet of pure oxygen is directed on the point of cutting and moved along the line to be cut.

In gas pressure (high or low) welding, the parts are heated by gas jets under pressure, and become forged together.

Safety in handling Cylinders :

1. Do not tamper with the numbers or marks stamped on the cylinders.
2. Do not drop cylinders or let them strike violently.
3. Do not lift cylinders with an electro-magnet. In case cylinders are to be lifted by lifting device, they are to be slung in suitable cradles or platforms. Do not use slings.
4. Do not tamper with the safety device in the valves or cylinders.
5. Do not use oil or grease as lubricants on valves or attachments.
6. In case the regulator or cylinder valves have frozen, wash with hot water, never by a flame.
7. Never transport cylinders with regulator and hose attached unless a proper trolley or carrier is used. While transporting, the cylinder valves should be shut.
8. Do not drag cylinders. They may be rolled on the bottom edge.
9. When the cylinder is not in use, keep the metal cap in place to protect the valve.
10. Before returning empty cylinders, mark them EMPTY
11. Always consider cylinders full, if not definitely known.
12. When in doubt about the proper handling, consult supplier.

Safety in Storage of Cylinders :

1. Ensure that the cylinders are stored properly. Store rooms should be dry, well ventilated and away from oil, or other flammable substances.
2. Store empty and full cylinders separately.
3. Store room should be fire proof and the lighting or electrical switches should of flame- proof type.
4. Oxygen cylinders should be stored away from the cylinders containing combustible gases, preferably in separate rooms. If stored in the same room, they should be kept far apart (6m) or have a non-combustible barrier in between of at last 2 mt height.
5. Acetylene cylinders should always be stored upright.
6. Cylinders are not designed for temperatures in excess of 55 ° C (130 ° F). Accordingly, they should not be stored near the sources of heat, such as radiators, furnaces, etc.
7. Cylinders stored in the open should be protected from the effects of sun and rain to prevent corrosion.
8. Cylinders should be stored away from elevators, stairs, or other such places where they can be knocked down or damaged by passing or falling object.

The Gas Cylinder Rules and following IS should be followed.

IS:818 Code of practice for safety and health requirement in electric and gas welding and cutting operations.

IS: 1179 Equipment for eye and face protection during welding.
IS: 3016 Fire precautions in welding.
UK HMSO Booklet Welding and Flame-cutting using compressed gases.

Safety in Regulators and Hose connections:

Regulators or reducing valves are used on both oxygen and fuel gas cylinders to maintain gas supply to the torches at correct pressure. Care has to be taken to see that the regulator chosen is the correct one for the gas contained in the cylinder. In order to prevent attachment of oxygen regulators to the fuel gas cylinders or vice-versa, the connection for oxygen cylinders are made with right hand threads and those for acetylene cylinder with left hand threads. A regulator is a delicate instrument and has to be handled carefully and not dropped. Leaky regulators should be withdrawn from service immediately.

Oxygen and fuel gas hoses should be of different colour or otherwise identified and distinguished from each other for proper connection on the torches. Red is generally recognised for fuel gas and green or black. hose is used for oxygen. One type of gas regulator should not be used for another type of gas.

Safety in using torches :

1. Set the regulators to the recommended working pressure.
2. Keep the blow pipe nozzle away from any source of ignition until the fuel gas is flowing 'freely from the nozzles.
3. A spark lighter is recommended for lighting purposes.
4. Clean the torch at regular intervals.

Sometimes a protective system is provided in the fuel gas piping to prevent -

- Back flow of oxygen into the fuel gas supply system
- Passage of a flash back into the fuel gas supply system
- Excessive back pressure of oxygen in the fuel gas supply system. Such system (back pressure valve, non return valve) must be checked for its effective working.

7.1.3 Schedule-24, Rule 102, Gujarat Factories Rules, 1963 :

Welding/Cutting Operation with the use of LPG/ Acetylene/Argon:

Safety measures prescribed in this Schedule are:

1. Gas cylinders, filled or empty, shall not be stored in a room where welding or cutting work is to be carried out.
2. Cylinder in use shall be kept in vertical position and tied to prevent its fall.
3. Source of ignition including smoking is prohibited near flammable gas cylinder except which is in use.
4. Cylinders shall be stored at more than 10 m from source of ignition or excessive heat.
5. Standard pressure regular and second non-return valve to prevent back flow shall be used.
6. Standard torch with non-return valve shall be used.
7. Suitable fire extinguishers shall be kept ready near welding/cutting place and gas cylinder storage.
8. Pipe lines shall be colour painted for identification of each gas.
9. Welding/cutting is prohibited in explosive atmosphere.
10. Welding/cutting zone shall be cordoned by screens of 7 ft (2.15 m) height where persons other than welders and their helpers are working or passing.

11. All welding/cutting equipment shall be examined by a competent person in a period of 15 days.
12. Welding/cutting work shall be carried out by specially trained workers.
13. A log book of examination of equipment and a register of trained workers shall be maintained in the forms directed by the Inspectors.

7.1.4 Arc Welding (Electric Welding) :

In this process, an arc is struck between an electrode and the work pieces, which are connected to an AC or DC supply. In this usual process, the welder 'strikes an arc' by touching his electrode to the work piece and causes a "short-circuit" stripping electrons from gases in the surrounding air, ionising it and producing the arc. A temperature of about 4000°C is obtained and the work pieces fuse together. In this type of welding, new metal is fused, either by melting the electrode or by melting a filler rod which does not carry any current. Sometimes some inert gas or a solid flux is also used to shield the weld from oxidation. The operations also include chipping of slag, etc. from the weld.

The current used for electric arc welding may be direct or alternating but the voltage has to be low and consistent. The voltage of 100 between electrode and work should not exceed for hand welding. The supply of current for electric welding would require a generator or transformer of suitable voltage. The commercial 'main supply' (230V) is not suitable on account of the voltage and also it may not be permissible to earth the circuit at points other than approved by the supply authority. Any transformer used for giving supply of current for welding should be double wound to ensure complete isolation of welding circuit from the main supply. The current used, with small diameter electrode on thin sheets for manual arc welding varies I between 10-50 Amps. With larger diameter electrodes, the current used is more. For manual welding, the welder should be able to withstand the heat and as such the current value should not exceed 500-600 Amps.

Hazards : The operations of welding and cutting are carried out at high temperatures which are source of "Fire" or Explosion. The liberation of the heat and energy into the work place can cause chemical and physical reactions which do not normally take place at room temperature. The reactions include the various types of radiation and release of various toxic gases, vapours, fumes, etc., which may affect the health of the workers engaged in the process and near by. Some hazards are :

1. Flying metallic sparks and molten metal. Some of these sparks consist of tiny shreds of extremely hot metal, sometimes molten, which may be hotter than 1000° F and may cause painful burns on exposed skin. These sparks are also source of fire or explosion hazard, in case flammable materials are near by.
2. Hot surfaces of the work pieces after welding or cutting may cause harms to unsuspecting persons.
3. Flying materials while chipping the weld.
4. Enrichment of Oxygen (due to leakage from Oxygen cylinder) radically changes flammability.
5. Glare which comes when the arc is struck or the torch is lit. It affects the optic nerve at the back of the eye. Special eye glass (screen) is required.
6. Thermal heat radiation from welding can cause headache, fatigue and eye damage.
7. Infra red radiation. Some of the IR is stopped by the upper layer of the skin but part of the radiation penetrates the exposed skin and may cause serious skin burns or pigmentation. Since eye has no absorbing layer, it can be severely damaged by this and may cause "heat cataract".
8. Ultra-violet radiation may cause skin burns and prolonged exposure may lead to skin tumours. Inert gas shielding is a strong source of UV radiation.
9. Workers on the shop floors may be exposed to noise due to welding, cutting or chipping operations.
10. Fall of materials and equipments during operation.

Electrodes and Holders : Electrode holders are used to connect the electrode to the welding cable supplying secondary current. In order to prevent accidental striking of an arc they should be fully insulated. Holders should be capable of handling the maximum current required by the electrode. Electrode holders are liable to become hot during welding operations if they are not designed for the purpose, i.e. holders for light jobs are used for heavy work or if there is a loose connection. In case the correct size of holder is not available an additional holder should be provided so that one can cool while the other is in use. Dipping of hot electrode holders in water should be prohibited as it may expose the worker to electric shock.

Electric Shock : The work set up is such that the work is grounded and if the worker is not careful, he can receive electric shock. A welder may be exposed to the open circuit voltage while changing electrodes, setting up work, or changing working position. Danger is more in humid environment or if the welder is "sweaty". The risk of shock can be reduced by providing an insulating barrier between the worker and the ground of nearby metal objects, while changing electrodes. Dry leather gloves act as good insulator. It is also advisable to use shoes with rubber soles. The electrode holder should be sufficiently insulated between the handle and the bare part that grips the electrode. The welding cables should be of good quality to resist hard wear and inspected for insulation defects. Joints between cables should be by insulated connectors of equivalent capacity. The welding equipment must be safely earthed. There should be two distinct and different earthing circuits so that, in case if one fails, the other will afford protection.

7.1.5 Indoor Exhaust Ventilation :

Local exhaust or positive ventilation is not required in the spaces of 1400 m3 or over, provided: (a) Welding bays have unrestricted cross ventilation (b) Work is not carried out inside restricted spaces such as tanks and boilers (c) Every welder has about 280m^3 space.(d) Ceiling heights are more than 5m. (e) Process does not require the use of inert gas.

In case the above conditions are not met, mechanical ventilation at the minimum rate of 56m3/ min of air per welder is to be provided with a velocity in the direction of hood of 30m/min at the point of welding. The duct diameter and air flow volumes that would produce the control velocity using a 7 cm wide flanged section is given in the following table:-

Distance from arc or torch, fm.,	Minimum air flow, m^3/ min	Duct Diameter cm.
10 to 15	4.5	7
15 to 20	8.0	9
20 to 25	12.0	11
25 to 30	17.0	13

For hoods without flanges, minimum air flow shall be increased by 60 m"/min. I cm duct dia is based on relatively 1200 mt/min velocity in pipe.

7.1.6 Personal Protection :

For the safety and health of the workers, precautions have to be taken to safeguard against the various physical and chemical hazards. Maintenance of the equipment and proper care in the use, adequate ventilation etc. may reduce some of the hazards, but it may not be possible to eliminate all the hazards and hence the workers have to be supplied with suitable personal protective equipment. Since a helper is always posted near the place of work, he too has to be provided adequate protection.

Ordinary clothing may be sufficient to protect against UV and IR radiation, but some exposed areas such as face, wrist, neck, hands etc. would be affected. Asbestos/leather gloves may be useful to protect hands from electric shocks, heat and sparks.

Eye protection is the most irritical problem. Hence the measures have to be taken to stop flying particles, glare and the radiation. Since the welding temperature for various materials may be different, different types of shades may be needed for different jobs, and at the same time clear glass may be needed while chipping the weld.

If possible the welding operation in a shop floor be isolated and screened so that other workers engaged nearby are not affected. However, measures should be taken to protect the crane drivers and others from the hazardous fumes, rays etc., of welding operation.

To protect the workers from the toxic fumes, suitable respiratory protection should be provided.

Cotton apron if used by the workers maybe treated with fire retarding chemicals.

When there is a risk of materials falling on the workers, suitable hard hats may be provided. While doing electric arc welding, instead of holding the shield in one hand, it is advisable to wear a welder's helmet which protects the workers in many ways.

Refer Part-9 for further health & welfare measures.

7.2 Brazing, Soldering and Metalising Operations :

Such operations involve metal fumes because of heating. Inhalation of fumes (toxic or irritating) should be removed by local exhaust ventilation. Lead oxides and chlorides are released when soldering with lead-tin solder and zinc chloride flux. Lead oxides and formaldehyde are released when soldering with rosin core solder. Hazards of different types of solder should be known before starting work.. Hazardous contaminants should be measured by air sampling. Lead solder particles should not be allowed to accumulate on the floor or work tables. For protection against spattering of solder or flux, workers should wear faceshield or do the work under a transparent shield.

Respirators are required to protect against metal dust or fume while metalising or burning of metal. Hand gloves can protect against burns. Insulated, noncombustible holders can protect against fire and burns. Table cover should be heat resistant.

7.3 Finishing Operations like Polishing, Buffing, Cleaning, Shot Blasting :

Polishing wheels are made of leather faced wood or stitched canvas disks or similar material coated with abrasive glue on the periphery of the wheels.

Buffing wheels are made of disks of canvas, linen or felt with a coat of mild abrasive, tripoli or rouge.

Brush or scratch wheels are made of protruding wires and used to remove burrs, scale, sand and other materials.

While cleaning or finishing rough or ground jobs by air, sand or shot (metal) blast cleaning or polishing and buffing by rotating wheels, main hazard is dust (abrasive or metal) generation during such operations. It should be removed from the point of origin by an efficient exhaust system. Room dust (flying) should be collected by wall exhaust fans. Dust collectors should be cleaned regularly.

Shot Blasting by small metal balls (ferrous or nonferrous) is done through an air gun (jet). Pressurised air is passed through metal balls and they are shot blasted on metal plate, rough casting or any job requiring such shot blast cleaning. Because of air jet (force) surface is cleaned (corrosion removed) but metal and other dust is heavily generaged. It can spread and fly nearby. Therefore a close chamber is constructed and worker does this operation inside. For dust collection, powerful exhaust system with blower and dust collection chamber is required. The worker (blaster) wear full face protection and also use air line respirator to inhale clean air comming through it. Blasting chamber door should have glass window to watch worker inside. In case of difficulty he should come out. His medical examination for dust exposure and chest X-ray are necessary.

Sand blasting is prohibited.

Workers should wear eye protection and dust filters rather full face protection."

By pre cleaning of casting or machined part by keeping it in a rotating barrel, mill or abrasive chamber in close condition, subsequent dusting can be minimised.

The space around dust generating or cleaning process should be kept dry, clean and free from obstructions.

Solvent cleaning of metal parts pose fire and toxic hazard. Non-toxic or non-flammable solvents or cleaning agents like alkaline solutions are safe in this regard. Oil and grease should not be allowed to mix with cleaning compounds. Carbon tetrachloride and petrol are banned for cleaning purpose. Ventilation is needed to remove vapours.

Polishing and buffing wheels require :

1. Substantial stands and rigid mounting of wheels.
2. Guards to avoid contact with protruding nuts and the ends of the spindles.
3. Exhaust hoods to drive away the dust and flying particles. More than one branch pipe may be provided depending upon the shape and size of the pieces being worked.
4. Speed within the limit (15 to 35 m/s) when variable speed motors are used.
5. Avoidance of hand gloves.
6. A jig to handle the work against the wheel.
7. Not more than 3 mm clearance between the work rest and the wire brush wheel and use of leather or heavy canvas aprons, gloves and face shield while working on wire brush wheels.
8. Monitor procedures same as for grinding wheel.
9. No smoking while buffing or polishing as a spark pulled into the exhaust system might cause a fire.
10. No common exhaust systems for polishing, buffing and grinding operations because of the fire hazard.

7.4 Selection, Care and Maintenance of Equipment and Instruments :

Equipment and instruments for welding and cutting, brazing, soldering, metalising and finishing operations like cleaning, polishing and buffing require careful selection, use and maintenance for avoidance of hazards and accidents.

For protection against hot sparks, arc radiation and glare, fumes and gases, compressed gases, chipping slag, metal and abrasive dust and electric shock, goggles, helmets and shields should be worn by operators, welders and their helpers. These equipment should conform to IS. Welder's handbook SP-12, welding equipment for eye and face protection 1179, protective filter 5983 and IS guides for selecting the correct filter lens for welding and cutting operations, dust filters, gas respirators, breathing apparatus, protective clothing and other personal protective equipment must be referred. See Chapter-25 for such PPE and Chapter-26 for the First-Aid.

Sampling, identification and safe removal of gases, fumes and dusts by proper instruments and exhaust ventilating equipment are required first. Such instruments should be of good quality, well calibrated and properly maintained. They should be handled by trained personnel. Selection is dependent on job to be carried out, toxicity and concentration of gas or dust and working environment.

Welding equipment (e.g. torch) should not be used in a confined space. Welder's safe breathing zone requires at least 280 M3 space per welder and ceiling height more than 5 m. If natural cross ventilation is not sufficient, mechanical ventilation (local exhaust, local forced, roof or wall exhaust fans etc.) is necessary. They should be maintained efficient and with sufficient capture velocity. Welding partitions may be used to protect eyes of surrounding people.

As oxygen alone cannot burn, acetylene, hydrogen or other fuel gases are used with torches. For example, propane, propylene and their mixtures are used in gas cutting. Such gases are filled with pressure in metal cylinders. Therefore they should be safely handled. Foregoing Part 7.1.2 contains safety precautions for handling and storing of gas cylinders. See Part 8.4 of Chapter-18 also.

Manifolds are used to centralise gas supply at a rate higher than that of a single cylinder. Regulators, headers and distribution pipes are used therewith. They should be properly designed, erected and colour-coded. Oxygen manifolds should be located away from the source of ignition or flammable material. Leak detectors with alarm are desirable in manifold room.

Hoses and hose connections should be fully safe. Colour coding (e.g. red for fuel gas, green for oxygen and black for inert gas, see IS booklet) should be followed to avoid wrong connection. Special torch connectors with built-in-shut-off valves are available. Connections should be of ferrule or clamp type. Special tools for special threads should be readily available. External metallic covering on hose pipe is not desirable. Flashback devices (NRV) between torch and hose can prevent flashback into hoses and regulators. Burned hose section should be replaced by new one.

Gas torches should be of approved type. Cutting torches differ from welding torches in jet and valve design. Select proper welding head for mixture, tip or cutting nozzle according to the charts and screw it firmly into the torch. Do not use matches to light torch. Use a lighter. Safe operating procedure should be followed for welding or cutting.

In resistance or spot welding, point of operation should be guarded by enclosure, gate, two-hand control or similar safety guard. Back doors of machine and panels should be locked or interlocked. Control circuit should operate at low voltage (24 to 36 volts). A flash welding machine should have a shield or hood to control flash and fumes and a ventilating system to carry off the metal dust and oil fumes. Air or electrical foot switches should be guarded to prevent accidental operation.

In electric arc welding machine (AC or DC) current values should be kept minimum to avoid heating. Electric cables should be well insulated and automatic voltage controller should be used.

Electrode holders should be fully insulated to avoid shock or arc burn. Proper holder should be selected (heat resistant) depending on light or heavy work. Connections between cable and holder should not be loose. Hot holder should not be dipped in water for cooling. Bare electrode or holder should not touch the skin or wet clothing.

Holders for brazing and soldering operations should be made of noncombustible material and insulated to avoid fire and burn hazards. The best holder completely encloses the hot surface and so inclined that the weight of the iron prevents it from falling out.

Exhaust hood, duct, dust collector, fan etc. should be regularly inspected for choking, velocity, leakage etc. and kept clean for good working.

Gloves should not be worn by polishers and buffers to avoid dragging of hand. If the motors that drive polishing/buff ing wheels, have adjustable speed controls, the controls should be kept in a locked box and the speed shall be changed only by an authorised person.

While working on wire brush wheels, leather gloves, leather or canvas aprons and face shield should be worn.

Equipment and instruments should always be used in accordance with the manufacturer's instructions.

8 HEAT TREATMENT OPERATIONS:

After hot or cold working of metal, stress and strain are produced in the metal. Therefore heat treatment methods are required to remove these stresses.

8.1 Meaning and Types of Heat Treatment Methods:

Heat treatment can be defined as an operation of heating and cooling of metals in the solid state to induce certain desired properties into them. It is generally employed to improve grain size, machinability, mechanical properties e.g. tensile strength, hardness, ductility, resistance to wear heat and corrosion, magnetic and electrical properties or to relieve stresses in the metal produced because of cold or hot working. The common heat-treatment operations are annealing, normalising, hardening, tempering, carburising (case-hardening), cyaniding, nitriding, induction hardening and flame-hardening.

Heat treatment of rolled products are divided into two groups :

1. Processes involving holding for a long time at a specified temperature and slow cooling i.e. annealing and tempering.
2. Processes where metal is only heated in a furnace to a specified temperature and then cooled in air (normalising) or in liquid quenchers (hardening).

Some heat treatment processes are carried out with some chemical compounds as under :

Case hardening : Wrought iron is heated in contact with potassium ferrocyanide where the ferrocyanide decomposes into carbon which hardens the surface of wrought iron to make steel.

Nitriding process : Steel containing 1% aluminium is heated in atmosphere of ammonia at 550600 °C. Nitrogen dissociated from ammonia reacts with iron and aluminium to form on the surface, iron and aluminium nitrides which produce compact and hard surface.

Sintering and Heat hardening : Sintering refers to a process wherein fuel is mixed with the ore and burned on a grate. The product is a porous cake. Heat hardening or induration is done by combustion of gases passed through the bed to harden the pellets without fusing them together, as is done in the sintering process.

In addition to' agglomeration, carbonates and sulphates may be decomposed or sulphur may be eliminated. Non-ferrous sinter is produced from oxides and sulphides of manganese, zinc, lead and nickel. Heat hardening of green iron ore pellets is accomplished in a vertical shaft furnace, a travelling grate machine or a grate-plus-kiln combination.

8.2 Hazards and Safety Measures:

Hazards in heat-treatment are :

1. Burns due to high temperature heating (between 700 to 1100° C).
2. Hazards of chemicals like N_2, NH_3, NaCN, Na_2CO_3, NaCI.
3. Contact of quenching media like brine, water, oils, air and solution of NaOH or H_2SO_4 in water etc.
4. Hazards of various types of furnaces and temperature measuring instruments and electrical apparatus.
5. Handling of machine parts viz. steel castings, forging (shafts, axles etc.) springs, gears, wires, drills, screw taps, hammer dies, die moulds, high speed cutting tools and speed etc. for heat treatment purposes.
6. Lifting and travelling mechanism and their unguarded agency parts.
7. Dust exposure.
8. Hot surfaces and high air temperatures.
9. High humidity and air velocities.
10. High voltages and electromagnetic radiation.
11. High noise levels.
12. Infra-red radiation.
13. Excessive brightness of illuminated surfaces etc.

Control Measures are as under:

1. Exhaust ventilation to remove chemical vapours, fumes, gases, flammable or explosive dusts, vapours etc. An enclosing hood projecting over the entire tank and enclosed on two to three sides is preferable. A lateral exhaust (slots in top edge of the tank walls for horizontal air movement), convenient canopy hood, general room ventilation and a push-pull system (where out door air is blown across the tank into the exhaust hood) can also be employed. Exhaust hoods or slots should be so located that harmful fumes or dusts should not enter the breathing zone.
2. Flameproof or non-sparking fans and motors should be utilised in flammable area.
3. Monitoring of HCN or NaCN is necessary.
4. Excessive heat should be removed away.
5. Air supply to the furnaces should be uninterrupted and well controlled.
6. Adequate methods of storage, handling and disposal are desired.
7. Furnaces, ovens, dryers etc. should be gas fired or heated electrically. The use of solid or liquid fuel may be allowed in exceptional and justified cases.

8. Hardening tanks, quenching and pickling baths, shaft furnaces etc. should be projected about I m above the working level. If this is not possible, they should be fenced.

8.3 Hazards and Control from Treatment Media:

Part 4.3.1 explains that iron ore contains iron oxides, carbonates and sulphides, cast iron contains carbon with some sulphur, phosphorous, silicon and manganese, wrought iron contains carbon and other impurities, steel contains carbon and manganese. Table 20.1 gives percentage of chromium, tungsten, nickel molybdenum and silicon. In steelmaking processes it is also mentioned (in Part 4.3.1) that impurities of Mn, Si and C burn to give MnO_2, SiO_2, CO and $MnSiO_3$, furnace lining of SiO_2 and CaO.MnO give slag and in electric arc furnace phosphate and other slag is poured out.

Part 8.1 explains heat treatment with chemical compounds like potassium ferrocyanide, iron and aluminium nitrides, carbonates and sulphates and nonferrous sintering with oxides and sulphides of manganese, zinc, lead and nickel. Hazards of chemicals like N_2 NH_3, NaCN, Na_2CO_3, NaCI, NaOH, H_2SO_4 are also indicated.

Above chemicals behave as treatment media in the form of impurity, alloying material, furnace lining and chemical for direct reaction. NaCN may evolve HCN a poisonous gas. CO and NH_3 are also toxic. All metal waste and carbon, lime, phosphate, sulphate, chromium, nickel and cyanide waste are hazardous. It cannot be disposed off here and there. Cyanide being very toxic needs incineration i.e. controlled burning. Gaseous waste like CO and HCN should be passed through incinerator or flare and burnt. CO_2 is vented off through chimney.

Solid toxic waste should be treated to make less hazardous and then buried in permitted land with proper lining to prevent its penetration to spoil soil. From top it should be covered safely. Non-toxic slag/waste may be used for non-fertile land filling. CaO waste, because of its alkalinity, is useful to grow some plants (not all). Steel slag is used to make tough roads.

Liquid waste/effluent should be treated by appropriate chemical or biological methods and discharged with safe limits prescribed.

Special disposal methods should be employed depending on type of chemical, its concentration and biological effect.

Thus heat treatment operations should end in safe disposal-of final waste for the safety of people, bioculture and environment.

Health Precautions:

They include
1. Eliminate and prevent long time exposure to the hazardous fumes due to heat treatment.
2. Medical health check up of workers.
3. Provision and maintenance of effective controls for fumes and chemicals.
4. Use of personal protective equipment.
5. Training to workers and prompt supervision.

9. GENERAL HEALTH HAZARDS AND CONTROL MEASURES IN ENGINEERING INDUSTRY

Effects of dusts, fumes, heat, noise and vibration due to hot and cold working of metals and crush and other injuries due to machine tools are discussed earlier.

Foundry operations like sand handling, sand sieving, sand mill operation, mould making, core making, knockout operation, repair and relining of furnaces and ladles, and metal finishing processes like casting cleaning, fettling, chipping, brushing, air blast cleaning, dry grinding, polishing, buffing and shot/ sand blasting generate dust which contains silica. This may cause silicosis, a serious form of pneumoconiosis resulting in permanent lung damage. It is a notifiable disease under the Factories Act, Mines Act and the Workmen Compensation Act.

Iron dust is exposed to iron foundry workers, electric arc welders and workers doing dry grinding, buffing, polishing and shot blasting. Siderosis is caused due to inhalation of such iron dust (Iron oxide).

Coal dust is generated at furnace, boiler and coal handling work and may cause anthracosis i.e. coal workers' pneumoconiosis. This lung disease may result in more serious progressive massive fibrosis (PMF) leading to a premature death.

Engineering controls include exhaust hood, substitution of wet grinding for dry grinding, hydro blasting for sand/shot blasting etc. and built-in dust collecting devices with dust generating machines. In addition, workers should wear safety goggles and dust masks or proper respirators.

Medical controls include pre and post employment medical examinations including X-ray, sputum test, lung function test etc. Epidemiological analysis of dust exposure can provide a measure of efficacy of a dust control device.

High noise in pneumatic chipping, resistance welding and other engineering operations can cause auditory effects of hearing loss and occupational deafness (a notifiable disease) and non-auditory effects of change in heart rate, blood pressure and sweat rate, annoyance and disturbance in work and psychological and psychomotor effects.

Engineering controls for noise include substitution of quieter machinery, quieter process, enclosure to noisy equipment (e.g. silencer, noise insulators etc.) or/and enclosure to operators (soundproof cabin). Workers should wear ear plugs/ muffs where necessary.

Medical controls include pre and post medical examinations of workers, audiometric tests for hearing capacity and change of work area if necessary.

Painting and spraying on castings or finished parts evolve fumes which may be toxic and/or flammable. Proper spray painting booths with air suction and water curtain are necessary. Safety goggles, fume mask, hand gloves and apron should be worn. Dipping is preferred to spraying.

Workers working near excessive heat (e.g. furnaces, molten metal, glass blowing etc.) should be given cold drinks or water and heat protective clothing to reduce heat effect. Heat source should be shielded by insulation and reflectant or absorbent shields. Natural ventilation to allow cool fresh air, induced cool dehumidified air into hot workplaces and local blowers to give individual relief are useful for comfort.

For protection against skin effect due to cutting or lubricating oil, coolant etc., proper gloves, barrier creams and medical advice are necessary.

Health measures including general cleanliness, disposal of wastes and effluents, good lighting and ventilation, temperature control, dust, fume and gas removal, humidity control, drinking water, latrines, urinals and spittoons and avoidance of overcrowding, as expected under the Factories Act and Rules are the statutory requirements.

Welfare facilities should include washing and bathing facility, drenching showers, emergency shower, eye washer, sitting arrangement, cloak or change room, lockers, rest room, lunch room, canteen, creche, 'towels, soaps, first-aid centre and medical help etc.

E X E R C I S E

1. Explain, State, Mention or Discuss:

1. The need of Safely in Engineering industry.
2. Statutory provisions for Engineering factory.
3. Hazards and safety precautions while working on furnaces.
4. The manufacturing process of steel.
5. Safety measures for steel manufacturing.
6. Flow sheet for foundry operations. Explain by chart.
7. Section wise foundry operations, their hazards and safety measures.
8. Provisions of Sch. 26, Rule 102, GFR for foundary operation.
9. Types of accident in a forge shop and general safety measures required.
10. Specific safety measures necessary in forging operations OR in forging furnaces.
11. Machine guarding of Forging hammers.
12. Safe work practices in forging operations.
13. Safety in design and handling of forging dies.
14. What do you mean by cold working of metals?
15. Types of guards recommended for power presses.
16. Control measures for hydraulic and pneumatic presses.
17. Sequential operations of wire drawing process, their hazards and safely measures.
18. Hazards and controls of any three of the following machine tools(A) Lathe (B) Drill (C) Milling m/c (D) Grinding m/c
19. Safety measures while working on a grinding machine.
20. What do you mean by a CNC machine? Explain its safety and handling precautions.
21. Precautionary measures for preventing welding fires.
22. Safety aspects of Gas welding and cutting.
23. Provisions of Sch. 24, Rule 102, GFR for welding and cutting operations.
24. Safety in handling and storing of gas cylinders OR safety in regulators and hose connections.
25. Precautions against electric shock due to Arc welding.
26. Precautions while working on polishing and buffing wheels.
27. Hazards and safety measures of heat treatment operations.
28. Different types of media used in heat treatment methods, their hazards and controls.
29. General health hazards and control measures in engineering industry.
30. What PPE you will suggest for following operations.
    (a) Fettling work (b) Hot forging work (c) Polishing and buffing (d) chromium plating (e) Acid cleaning (f) Solvent washing (g) Electric welding (h) Noise due to hammer.

2. Write Short Notes on :

1. Type and purpose of furnaces.
2. Special alloy steels.
3. Bessemer OR Open Hearth process to manufacture steel.

4. Electric Arc Furnace.
5. Main hazards in steel manufacture.
6. CO hazards in steel furnaces.
7. Hazards and safety measures for moulding process OR melting and pouring process.
8. Floor condition in foundry OR Mechanised foundry.
9. NDT for casting.
10. Forging furnace, hazards and controls.
11. Stuck forging.
12. Tongs for forging operations.
13. Safety aspects of hot rolling operations.
14. Hazards and controls of Hot Rolling Mill.
15. Seven principles of guarding for cold working machines.
16. Safety devices for hand and foot operated presses.
17. Hazards and control devices of Press brakes.
18. Cold rolling mill-Hazards and control measures.
19. Classification of machine tools.
20. Causes of accidents and control measures for Grinding wheels.
21. Angles of guards for different types of Grinders.
22. Selection and care of Cutting tools.
23. Safe operation and maintenance of machines.
24. Common causes of fires in welding and cutting.
25. Electrode holder.
26. Hazards of Electric (Arc) welding.
27. Fumes in Arc welding and precautionary measures.
28. Welding in a confined space.
30. Buffing operation.
31. Ring test of a grinding wheel.

3. Explain the Difference between

1. Hot processes and Cold processes
2. Melting furnaces and Heating furnaces.
3. Fuel fired furnaces and Electric furnaces.
4. Cast iron. Wrought iron and Steel.
5. Kiln and Oven.
6. Flame furnaces and Shaft furnaces.
7. Knock out operation and Fettling operation.
8. Sand blasting and Shot Blasting.
9. Forge press and Trim press.
10. Hot rolling and Cold rolling.
11. Shearing and Hammering.
12. Power press. Press brake and Bending m/ c.
13. Shear and Slitter.
14. Machine tool and Hand fool.
15. Planing m/c and Shaping m/c
16. Broaching m/c and Slotting m/c
17. Machine tool and Cutting tool.
18. Two-hand control device and Photo cell device.
19. Die enclosure guard and Push (sweep) away device
20. Welding and Cutting.
21. Gas welding. Arc welding and Resistance welding
22. Polishing Wheel, Buffing Wheel .and Scratch wheel.

23. Case hardening and Nitriding.
24. Sintering and Heat hardening.
25. Siderosis and Anthracosis.

4. Comment on following explaining whether it is true or false ?

1. In melting furnace, materials being processed remain in the same state of aggregation while in heating furnace they change their state of aggregation.
2. Forging is a hot process only.
3. Rolling operation may be hot or cold.
4. Electric arc welding is possible by AC or DC both.

5. Explain the following terms :

1. Cementile crucible steel
2. Reverberatory furnace.
3. Cementation process.
4. Core making.
5. Cupola furnace.
6. Pouring aisle.
7. Parting materials
8. Die sinking
9. Trim press.
10. Alligator shear.
11. Forming rolls.
12. Machine tool.
13. CNC machine
14. Auto tool changer
15. Hand feeding tools.
16. Total productive maintenance (TPM).
17. Brazing or soldering.
18. Gas torch.
19. Heat treatment
20. NDT.
21. Siderosis
22. Safe peripheral speed.
23. Self acting machine.
24. Pickling process of metal.
25. Point of operation guard.
26. Treadle guard OR Scale guard (shield) of a forge hammer.
27. Work or tool rest.
28 Flash hack OR backfire.

CHAPTER – 21

Safety in Textile Industry

THEME

1. NEED OF SAFETY IN TEXTILE INDUSTRY

Clothing is the basic need for all of us and with the modernisation a want of more and more attractive (durable, shining, anti-crease and colourful) fabrics is increasing day by day. Therefore the foundation of textile industry is very old, ever changing and ever lasting. The continuous blow room line, replacement of mule spinning by ring spinning, rotor spinning, high speed shuttle-less and workerless looms and computerised processing machinery has rapidly changed the structure of textile industry and the mills not following such modernisation and automation are becoming sick in market competition. Yet it is a fact that the old textile machines are still in use in some mills. From safety point of view, such old and poorly guarded (and without built-in safety) machinery needs more attention.

Indian textile industry is the oldest one in the world. Cotton was invented and planted "by 'Grutsmad' Rushi some 20,000 years ago. Yarn and threads were manufactured by hands and cloth was woven by hand looms. A reference is published that a ginning machine made in India was sent to England. Dhaka's 'malmal' (the thinnest and lightest cloth) was famous. British rulers cut off the palms and fingers of Indian weavers so that they cannot compete with cloth from England. Dyeing by natural colours was also in use. Old Indian garments were white and colourful.

The textile mills established during 19th century in Lancashire and in New England initiated the Industrial Revolution and their cotton fabrics dominated the world markets for many years. Indian textile mill industry is also as old as the first Indian Factories Act 1881 and Gujarat is still leading in textile industries. Man made synthetic fibres such as polyamides and polyester are now blended with cotton and a trend of such artificial fabrics is increasing.

In 1979 there were 19728 cotton textile factories working with 1147000 workers and 3244 wool, silk and synthetic fibre factories working with 179000 workers out of total 135173 working factories with total workers 6797000 in India. This gives 10.33% textile (cotton and others) factories and 19.50% textile workers.

In 1999 estimated registered textile factories in India and Gujarat were ©16000 and 4000 respectively. Similarly estimated textile workers in India and Gujarat were @14 lakhs and 3.0 lakhs respectively.

Table 5.16 of Chapter-5 gives following figures of textile factories in Gujarat as on 31-12-2001.

NIC Code (for Textile)	Working Factories	Average Workers
17	2634	163714
18	170	9284
Total	**2804**	**172998**

This indicates there was 13.21% textile factories (cotton, man-made fibres, wool, silk, jute and textile products) and 19.07% textile workers in these factories in Gujarat in 2001.

Any estimate of unregistered textile factories is vague. Most of such weaving and texturising units employing less than 10 workers are many times more than the registered weaving factories. For example, against 100 registered factories, an estimate runs up to 10,000 unregistered (partitioned) establishments.

Therefore in want of correct and latest statistics, it seems difficult to figure out total textile factories and textile workers.

Table 5.6 (Chapter-5) gives following figures for textile industry in India for the year 1992 :

Accidents	Fatal 67, Nonfatal 33047, total 33114
Incidence Rate	Fatal 0.02, Nonfatal 8.55
Frequency Rate	Fatal 0.03, Nonfatal 14.80

Table 5.19 (Chapter -5) gives following figures for textile accidents in Gujarat :

Type of Accidents	1996	1997
Fatal	32	36
Nonfatal	3978	6967
Total	4010	7003
Percent of total textile & non-textile fatal & nonfatal accidents	35.62	58.02

Thus total textile accidents occupy nearly 35 to 55%- of all industry accidents in Gujarat. This indicates high need to control textile accidents.

US incidence rates for the year 1995, of some textile processes are as under :

Carpets & rugs	10.0	Yarn & thread mills	9.1

Knitting mills	8.2	Wool fabric mills	7.5
Manmade fabric mills	6.1	Cotton fabric mills	5.8
Textile finishing	7.8	Misc textile goods	12.0

Comparing with all manufacturing incidence rate 11.6, it indicates little higher proportion of accidents in textile industry in USA (Accidents Facts, 1997, NSC).

A case study of one good composite textile mill employing @3500 workers indicates following figures :

Year	1984	1985	1986
Total accidents	281	343	368
Due to unsafe conditions	135 (48%)	161 (47%)	156 (42%)
Due to unsafe actions	146 (52%)	182 (53)	212 (58%)
Mandays lost	2100	7276	3995
Frequency	32.78	40.25	45.04
Severity Rate	245.04	849.0	466.16

The department wise accidents in above study give following figures for the year 1986.

1.	Weaving	111	6.	Bleaching, Finishing Lab etc.	23
2.	Engineering	51	7.	Dyeing	22
3.	Contract workers	65	8.	Folding, Store, Office	15
4.	Spinning	53			
5.	Printing	28			
				Total	368

The causation wise accidents in above study gives following figures for the year 1986 :

1.	Striking against objects	103	6.	Fall from height	24
2.	Struck by falling bodies	48	7.	Burn by hot substance, chemicals etc.	16
3.	Cut by sharp edges knife, tools etc.	34	8.	Cut by bobbin shields	14
4.	Caught between objects	30	9.	Others	72
5.	Flying shuttles	27			
				Total	368

Another case study of 2100 accidents in II composite mills, carried out by the Central Labou Institute, Bombay gives following figures :

S. N	Department	Accidents	Percent
1	Spinning Preparatory & spinning	738	35.2
2	Weaving Preparatory & Weaving	1019	48.6
3	Finishing & other Departments	343	16.2
	Total	**2100**	**100**

Agency distribution is as follows

S. N	Agency	Accidents	Percent
1	Looms	617	29.4
2	Ring Frames	321	15.3
3	Other Machines	335	15.9
4	Material Handling	228	10.9
5	Working Conditions	202	9.6
6	Hand Tools	176	8.4
7	Hand Trucks and Transport Equipment	121	5.8
8	Chemicals	34	1.6
9	Others	66	3.1
	Total	**2100**	**100**

Above statistics ascertains that the textile industry is one of the biggest industries in India employing more than 20% of total labour force and contributing more than 50% of total industrial accidents thus highlighting the great need of safety and accident prevention in this industry. Heavy and numerous machineries, health hazards including machine accidents, shuttle flying, cut by bobbin shield, byssionosis, heat stress, humidity, high noise, fire hazards and higher number of employment also stress for the higher need of safety.

Almost 50% accidents occurring in textile industry are due to unsafe conditions. Therefore machine guarding and other safety conditions need much attention. The latest design of textile machinery having built-in safety, dust suction device and computer controls has eliminated many hazards of old machinery.

2 TYPES OF TEXTILE INDUSTRY

Cotton being the natural and old product, light, human body (particularly for hot days), cotton textile is pioneering and oldest industry. But with invention; of new fibres, natural and synthetic, it has, now become a mixed industry. The industry includes the spinning, weaving, knitting and finishing of all type; of natural, synthetic and artificial fibres. The machine; vary from handlooms of cottage industry to very expensive and intricate modern machines. Some are only spinning mills, weaving units or dyeing and finishing houses while some are composite textile mill; carrying out all operations at one place.

A classification of various types of the fibres is as follows :

- **Fibres**
  - **Natural Fibres**
    - Vegetable Origin
      - Cotton, From Seeds & Fruit, Kapok, Coir
      - Jute, From Bast, Flex, Hemp, Ramile, Sisal
      - From Leaf
    - **Animal Origin**
      - Wool, alpaca, mohair, goat, camel hair
      - Silk & other filament
    - **Mineral Origin**
      - Asbestos
        - Amphiboles, Actinolite, Amosite, Anthophyllite, Crocidolite, Tremolite, Serpentine, Chrysotile
      - Wollastonite
        - Zeolite, Sepiolite, Attapulgite
  - **Manmade Fibres**
    - Artificial Fibres (Natural Polymer)
      - Viscose rayon (artificial silk)
        - Cupra rayon, Filament and Staple fibre
      - Cellulose ester
        - Cellulose acetate, Cellulose triacetate
      - Protein fibres from milk, seaweed, maize-soya ground-nuts
    - **Glass & Chemical fibres**
    - Glass fibres made from borosilicate or calcio alumina silicate glass (Glass wool)
    - Synthetic Fibres (Petrochemical Origin) Polyamides (Nylon), Polyesters Polyolefins (Courlene), Polypropylenes Polyurethanes (Spendex fibres)
    - Polyvinyl derivatives (Acrylic Fibres)
      - Polyacrylonitrile, Polyvinyl chloride, Polyvinylidene chloride, Polyvinyl alcohol, Polytetrafluoro ethylene & related polymers (Teflon), Polyvinylidene dinitrile, Polystyrene and Miscellaneous.

All these fibres are used for various purposes such as garments, protective wears, ropes, carpets etc. They are the raw materials for various types of textile industries.

3 STATUTORY PROVISIONS

3.1 General:

Section 15 (Artificial humidification), 27 (Cotton openers) and 31 (Pressure plant) of the Factories Act are generally applicable to textile plants. The Gujarat Factories Rules has made some specific provisions by Sch. I & II under rule 54 and also under rule 68C & D,and Sch. 12, 23 & 27 u/r 102.

The statutory requirements are individual machine drive, belt shifting devices, inter locked covers for beaters, card cylinders, headstocks and dangerous parts, fixed fencing for dust chamber, beater grid bars, guards for lap and fluted rollers, nip guards for calendering machines etc., and a wall fencing with locked doors for the underground line shafts of ginning factories.

More details are provided by a substituted Schedule I under rule 54 of the Gujarat Factories (Amendment) Rules 1995. This schedule defines calendar, card, comber, combing machinery, rotary staple cutter, garnet machine, gill box, in-running rolls, interlocking arrangement, kier, ribbon lapper, sliver lapper, loom, starch mangle/water mangle, mule, nip, openers and pickers, paddler, plating machine, roller printing machine, continuous bleaching range, mercerizing range, sanforizing machine, shearing machine, singeing machine, slasher, stenter frame and warper. Safety requirements for these machines and other machines such as centrifugal extractors, rope washers, laundry washer, printing machines, plating machines, baling machines and flat work ironer are also prescribed. For details of Sch I & II u/r 54, see Part 4.4 of Chapter-14.

Rule 68C for polymerising or curing machine (fixing print by emulsion technique), requires thoroughly drying of printed fabrics, exhaust flap or damper, cutting off electrical heaters in emergency or solvent dropping, interlocking of the exhaust fan with main drive of the machine, thermostats to regulate temperature, explosion doors (flaps) to let off the fumes outside the workroom, weekly cleaning of filter gauge and exhaust dust, checking of V-belt tension, examination and a register therefore. See Part 3.3 for more details.

Rule 68D for thermic fluid heaters used to circulate hot oil in stenter and other drying machines, prescribes many provisions. See Part 10 of Chapter18 for details.

For Rule 68G, GFR, for Oven & Driers, see Part 27 of Chapter-23.

For Sch. 12 & 19 u/r 102, GFR, for chemical works, sets Part II of Chapter-23 and for Sch. 23 u/ r 102, for high noise, see Part 4 of Chapter-12.

Chapter-3 (Health), 4(Safety),5(Welfare), 6(Working hours), 7(Employment of young persons) and 8(Annual leave with wages) of the Factories Act are mostly applicable to textile factories as they are applicable to other factories.

Some relevant provisions of the Factories Act & Rules applicable to textile industry are mentioned below in brief.

3.2 Health Provisions :

Cleanliness (removal of cotton dust from work .area), disposal of waste and effluent from dyeing and printing processes, good ventilation, temperature and lighting, removal of dust and fume from dusty and heating area, artificial humidification required for cotton fibre strength, drinking water, latrines and urinals and spittoons are applicable health provisions under Chapter-3 of the Factories Act.

Artificial Humidification:

Section 15 of the Factories Act requires that water to be used to increase humidity of air artificially (mostly in spinning department) should be clean and from a source of drinking water.

Rules 19 to 29 prescribed u/s 15, require other details as under :

1. Artificial humidification is not allowed in spinning or weaving factory when room temperature exceeds 29.5°C (85°F) or when wet bulb reading of the hygrometer is higher than that specified in the schedule u/r 19 in relation to the dry bulb reading of the hygrometer at that time.
2. Provision of hygrometer.
3. Copy of schedule u/r 19 to be affixed near every hygrometer.
4. Temperature to be recorded in humidity register (Form No.6) at each hygrometer.
5. Specifications of hygrometer.
6. Thermometer to be maintained in efficient order.
7. Inaccurate thermometer not to be used without fresh certificate.
8. Hygrometer not to be affixed to wall etc. unless protected by wood.
9. No reading to be taken within 15 minutes of renewal of water.
10. Method of introducing steam for humidification (pipe dia < 2.5 cm , pressure < 5 Kg/Cm2 , jet projection < 11.5 cm , insulation thickness > 13 mm.)

Byssionosis is included in the third schedule of the Act as an occupational disease due to cotton dust exposures to workers. It is reportable u/s 89. For details see Part 10 of this chapter.

For monitoring and control of 'cotton dust' (TLV), new schedule 27, 'handling and processing of cotton' u/r 102 is added in GFR vide Notification dated 19-1-2006. It requires

1. Applicability to factories where any of the processes-opening of cotton bale, carding, combing of cotton, spinning of cotton yarn or cleaning of waste cotton - are carried out.
2. For removel of cotton dust, local exhaust ventilation is required on processes and machines where cotton dust is generated.
3. Workers should be given necessary PPE.
4. Six monthly madical examination for LFT, immunoglobulim test and any other test necessary.
5. Limit of cotton dust in workroom should not be more than 0.2 mg/m'\ Record of area monitoring should be available to the inspector.
6. Other control measures like vacuum stripping of cards and vacuum cleaning should be adopted.
7. High standard of houskeeping should be maintained.

3.3 Safety Provisions:

Section 21 of the Factories Act regarding general machine guarding is application to all textile machines.

Section 27 prohibits employment of woman or child in a cotton press room where a cotton opener works. If feed-end of a cotton-opener is separated by full partition, they can be employed on feed-end side. This is due to the risk of more flying cotton dust on delivery side and hit-injury when any revolving beater breaks or any solid material is thrown out on delivery side.

Hoist, lift and lifting machine provisions are applicable to those machines. Section 30 on revolving machinery is applicable to hydroextractor to remove water from wet fabric. The top cover of the revolving basket should be interlocked and safe working peripheral speed should not be exceeded.

Section 31 and rule 61 are most important for all pressure vessels to be used in a textile industry. Jet dyeing or beam dyeing vessels, ager, kier, drum washers, cooking-pans, drying cylinders, drying range, sizing cylinders, air receiver tanks etc. are all subject of this provision. Their design, construction, use and maintenance must be safe. They must be tested by a competent person periodically. Their safely devices like safety valve, pressure gauge, stop valve, drain valve and PRV or pressure regulator must be provided and maintained in a safe working condition. Steam traps and vacuum breakers are also essential.

Precautions against toxic or flammable gas and fire are also applicable to textile processes using solvent (eg. blancket cleaning) and cotton godowns.

Schedules I & II for detailed machine guarding u/r 54 are summarised in Part 4.4 of Chapter 14.

Rule 68C,GFR, provides following safety precautions for Polymerising and Curing Machines:

1. Printed fabrics shall be thoroughly dried before feeding to such machines (to allow less solvent in the m/c).
2. 2/3 portion of the exhaust damper/flap should always be open.
3. Infrared ray heaters shall be cut off while running the prints.
4. Electrical heater should have separate circuit and switch to isolate it at the time of emergency.
5. Leakage of solvent should not come in contact with the heaters.
6. Exhaust fan drive should be interlocked with main drive of the machine so that when exhaust motor stops, the machine (with heating device) should also stop. (Exhaust fan should start first before the fabric moves into the chamber).
7. Thermostat to regulate the temperature of the heater, not allowing it to go beyond the preset value.
8. Explosion flaps to be provided at top to let off the fumes in case of explosion.
9. Filter gauge and exhaust duct should be cleaned weekly. Vee-belt tension should be checked weekly.
10. Trained supervisor to examine the machine. A register to be maintained to enter all checks.

When thermic fluid heaters are used to circulate hot oil instead of steam in textile machines (eg. stenter for cloth drying) rule 68D, GFR, is applicable. See part 10 of Chapter-18 for details.

Rule 68E, requires suitable ladders, crawling board and work permit to prevent fall from fragile roofs..

Rule 102, Sch: 23 requires ear protection for noise level above 90 dBA, and -auditory examination every year. Weavers are mostly exposed to high noise. Sch. 27 requires protection from cotton dust.

Man-made Fibre (Cellulosic and noncellulosic) industry is listed in the First Schedule of the Act as a hazardous industry. Therefore while manufacturing such synthetic fibre. Chapter 4A of the Act and rules 68K to N, P and Q of the Gujarat Factories Rules are applicable. These provisions may be referred in statute books for details. Then Schedule 19 u/r 102 also becomes applicable for chemical work. Schedule 12 u/r 102 is applicable where acids or alkalis are used.

3.4 Welfare Provisions :

Chapter-S (Sections 42 to 50) of the Factories Act is fully applicable to textile factory. Washing facilities, first-aid appliances, canteen, lunch room and rest room, creche and welfare officers are required depending on number of workers employed.

Rules 68R to W of the Gujarat Factories Rules regarding health records, qualified supervisors, medical examination, occupational health centre, ambulance van and safety showers are applicable to hazardous processes in man-made fibre textile industry.

3.5 Cotton Ginning and Pressing Factories Act and Rules :

This old Act and Rules are applicable to cotton ginning and pressing factories.

Sch. 2, u/r 54, GFR requires wall or fancing for line shaft of gin machines. (Individually driven gins require separate guards.)

4 INDIAN STANDARDS

From a variety of IS on textile machinery, some are given below :

Textile motors 2972 (Part I for loom motors, Part II for card motors. Part III for spinning frame motors). Code for fire safety in cotton textile mills 3079, rings for spinning and doubling frames 3078, 6317, ring doubling and twisting frames 5938, 7614, ring frame, warp spindle 3698, tin rollers 838, metal travellers 3523, shaft bottom for cotton looms 833, shuttle blocks for automatic looms 9280, 9287, shuttles-classification of terms 8684, spinning frames-bottom rollers 2510, spindles 3934, top roller 3176, machinery nomenclature 6068, methods for identification of application classes of dyes on textile materials 4472 (Part I for cotton and cellulosic fibres, Part II for wool, silk and protein fibres. Part III for man-made fibres), natural fibres 2364, drafting in spinning machinery 4474, finishing machines, nominal widths 7952, treatment and disposal of effluents 9508, tolerance limits for effluents 2490 (Part I to 10), water for quality tolerances 201, twisting machinery 6068, warp bobbins 1724, warper's beams 9292, warp stop motion 3683, warp ring frame 3698, weavers 'beams 3165, weaving looms and preparatory machines 3199, weft pirns for shuttles 3265, winders-cone and cheese 8567, pirn 8568, winding rollers for finishing -machines 8304, wooden bobbins for ring doubling and twisting frames 7614, woven fabrics testing 9, 2977, 7903, 10100, yarn acetate and rayon filament 1229, blended 7866, polyester and polyamide 7703, 7867, cotton count determination 237, cotton winding cones 4888, twist determination 832, linear density determination 1226, textile conditioning 6359.

Cotton handloom colour fastness 6906, residual chlorine 2350, scouring loss determination 1383.

Dyes fastness 1688, Fibres, methods of identification 667, flammability and flame resistance test 11871, water quality tolerances 201, textile items made up, glossary 14281, processing glossary 9603, testing handbook SP'.15, textile terms - wool and animal fibres 11206, mmf 1324, natural fibre 232, woven fabrics 2364, textile belting 1891, floor coverings, flame resistance 12722, asbestos yarn 13362, electrical insulation and plastic laminate 13128.

5 FLOWCHARTS OF TEXTILE PROCESSES

5.1 Composite (Textile Mill) Flowchart:

It is essential to understand a textile process flow chart before proceeding towards the textile machines. Therefore it is shown below in Fig 21.1. General layout of a composite textile mill is shown in Fig. 21.2.

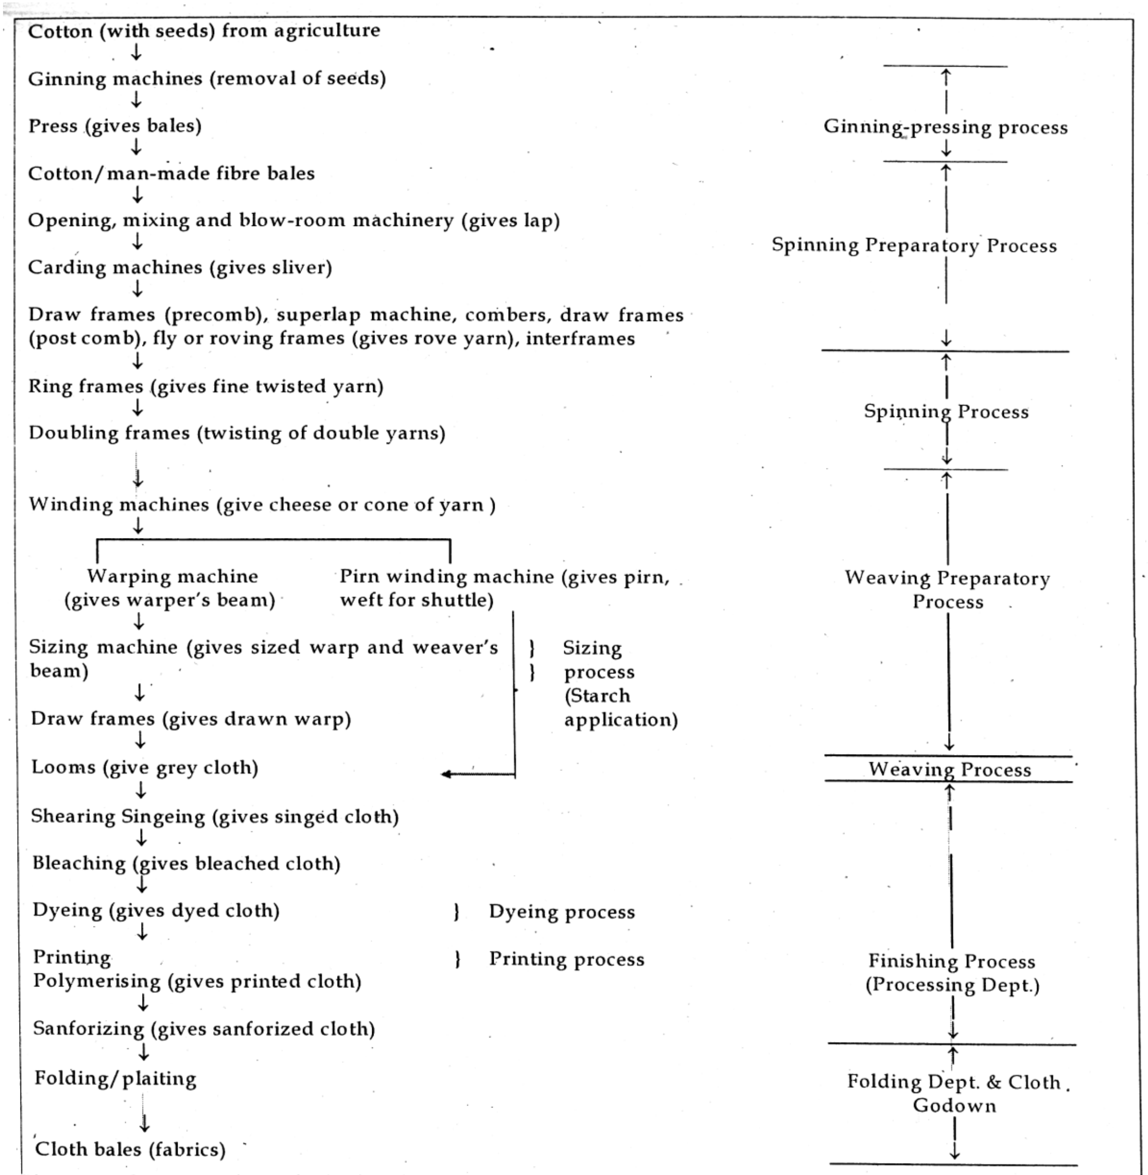

Fig 21.1 : Composite (Complete) Flowchart of textile processes

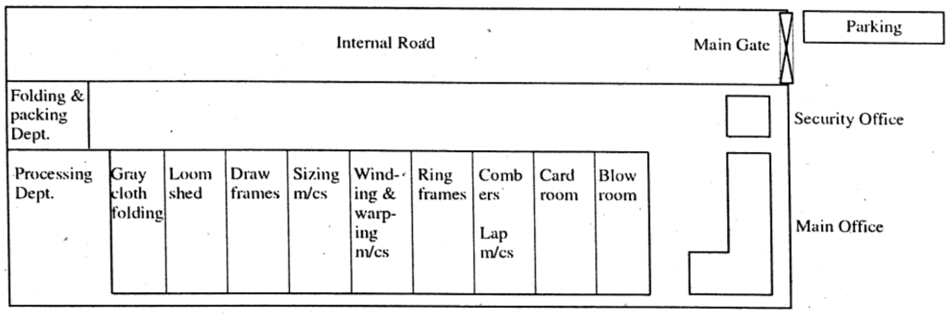

Fig. 21.2 Layout plan of a composite textile mill

Above flowchart is self-explanatory, yet some main processes are explained below :

Ginning : The fibres and the cotton seeds are separated by 'gin' machines in a ginning factory.

Pressing & Baling : The ginned cotton is compressed and packed into bales by cotton presses (mostly hydraulic) in a pressing factory. Generally ginning and pressing factories are combined and situated in villages where cotton is collected. The cotton bales are transported to a spinning mill or a composite textile mill. The cotton-seeds are separately collected. They are used to extract oil therefrom and also for cattle-food.

Schedule-2, rule 54, GFR is applicable to ginning and pressing factories while Sch-l is applicable to following processes.

Bale Opening and Scutching: In a blow room the bales are opened by bale openers, sometimes tinted in a tinting room for quality separation and mixed with cotton from other bales or man-made fibres through a hopper feeder. By a moving spiked lattice, beaters and a series of rolls the fibres are thoroughly mixed, cleaned and further opened by revolving beaters and air currents against a grid through which the dirt is separated. A cotton lap is formed and lap-rolls are sent to the carding machines

Carding : The fibres are made parallel to each other, remaining hard tuffs are broken and short thin fibres and impurities are removed. A sliver (flat untwisted rope) is formed and it is collected in cans.

Spinning : Through pre-comb drawing frames, sliver lap machines, comber machines, drawing frames and inter frames the sliver is converted into inter-end by drawing, drafting, combing and twisting processes. More slivers are passed through pairs of suitably spaced rollers, each pair revolving at a higher speed than the preceding pair. Further attenuation of the yam is accompanied by ring frames and doubling frames. Inter roving ends are converted into yarn of required count by drafting and twisting in the ring frame machines. A new method known as open-end or rotor spinning is most suitable for spinning coarse yarns and can replace not only the ring frame but some other initial processes as well. Texturising is done to synthetic yarn to reduce its denier.

Weaving Preparatory : In winding department yarn defect is removed and cheese and beam (by warping machine) are produced. Pirn bobbins are filled to put them in shuttles. Yarn singeing is carried out to burn off the projected fibres (hairs). Sizing (starch) process is carried out in sizing machines.

Weaving : After the weaving .preparatory processes, the warp threads (beams) and weft threads (pirn bobbins) are fed to looms to weave cloth. Various types of looms are used. New alternations to the shuttle for weft insertion are - rapier, water jet, air jet and ripple or wave shedding. The cloth is sent to the grey folding department for cleaning, mending, inspection and folding (plaiting) purposes.

Artificial humidification is employed in carding, spinning and weaving departments to reduce yarn breakage, because moist thread has relatively higher breaking strength than a dry thread. But high humidity causes discomfort. Therefore its regulation is required by hygrometers and by rules 19 to 29 under the GFR.

Finishing Processes : Here shearing - cropping, cloth singeing, piling, mercerising, drying, washing, desizing (removing starch by enzymes solution), scouring (removing fats and waxes by hydroxide solution), bleaching (by H,O, or Cl,>, dyeing (wide range of dyes available) and printing (screen or multicolour rotary printing) processes are carried out in sequence. The dyed or printed cloth is dried, smoothed and pressed. It may also be subjected to other treatments to improve its appearance or wearing qualities. It may be made waterproof, flame repellent or rotproof. Synthetic resins are used for these purposes. The finished cloth (fabric) is sent to finish folding department, for checking, sample cutting, folding and baling purposes.

Now we shall see the flowcharts of different types of fabrics.

5.2 Other Flowcharts:

To understand flowcharts of fabric manufacturing it is necessary to understand sequence or stages of manufacture from fibres to fabrics and then bleaching, dyeing, printing and other finishing processes on the fabrics.

The first stage in the production of a fabric is to clean and mix fibres thoroughly. The fibres are then generally straightened, but for the production of certain types of fabric they must be brought into a condition in which they are all parallel. The fibres are next drawn out into the form of sliver, which resembles a flat rope but with the fibres having no twist. Repeated drawing (extenuating) and twisting follow. This twisting is to give the resulting roving i.e. just sufficient strength to prevent breakage in its manipulation (extenuation). Thus a fine roving is produced which is finally twisted into yarn. The yarn is used to produce fabrics by either knitting or weaving.

It will be realised that for the carrying out of these manufacturing processes a wide range of different types of complicated machines and a great variety of methods are used. Such processes have taken more than two centuries to perfect and even now, partly owing to the increasing use of rayon and synthetic fibres, modifications are constantly being introduced.

Fibres are of two types - staple fibre and continuous fibre. Staple fibres are of certain lengths while continuous fibre is a very long filament made from chemicals. Continuous fibre can be cut to required lengths which may be short or long, for the purpose of mixing with other short or long staple fibres.

Short and Long staple Fibres :

Staple fibres are classified as short, medium or long. Normally less than 2 inch (5 cm) long are short staple fibres and longer than that are called long staple fibres. Wool is called short staple if less than 2.5 inch long and called long staple or worsted if more than 2.5 inch long. In short staple spinning process, gilling machine (gill box) is not used. In long staple process 'gilling' machinery is used to straighten the sliver. Carding is an excellent method for straightening and attenuating short fibres. Gilling is not satisfactory if the fibres are short. Therefore in the preparation of wool fibres for combing, it is preferred to straighten diem by carding if the fibres are less than about 9 inch (230 mm) in length and to gill if the fibres are longer, say up to 15 inch (380 mm) in length.

Long staple worsted wool, jute, coir and flex can be classified as long staple fibres, cotton as short staple fibre and man-made synthetic filament including -stretchable 'textured' yarn as continuous fibre.

Process flowcharts are shown from Fig 21.3 to

5.2.1 Process Flowchart of Short Staple i.e. Cotton Spinning and Finishing :

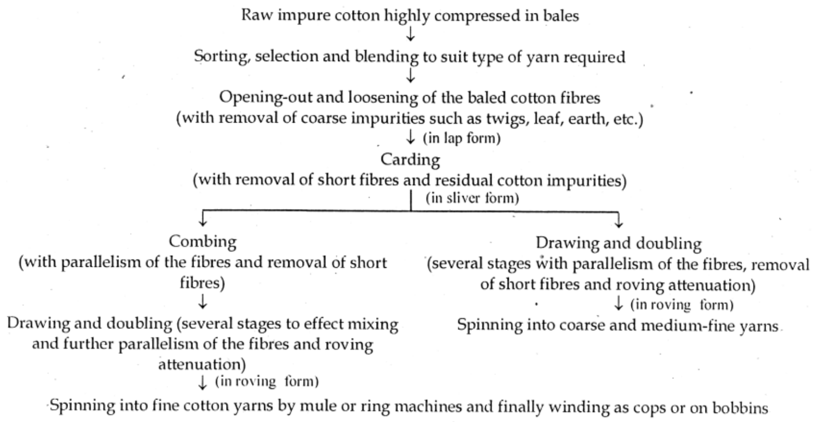

Fig 21.3 : Flowchart of Cotton (Short Staple) Spinning

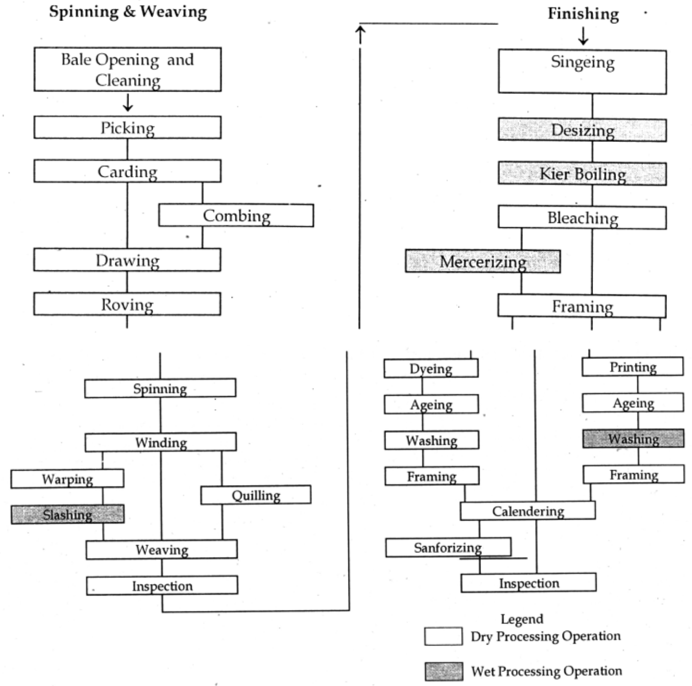

Fig. 21.4 : Cotton Processing Flowchart

5.2.2. Process Flowchart of Long Staple (i.e. Worsted Wool) Spinning :

Raw greasy wool

Sorting, selection and blending to suit type of yarn required

Opening-out and loosening of fibre packages

Scouring to remove grease and suint (sheep's dried perspiration)[1]
and carbonisation (if necessary) to remove cellulose impurities
(in lap form)

Carding

A complete flowchart of wool processing - spinning, weaving & finishing is shown below in Fig 21.6.

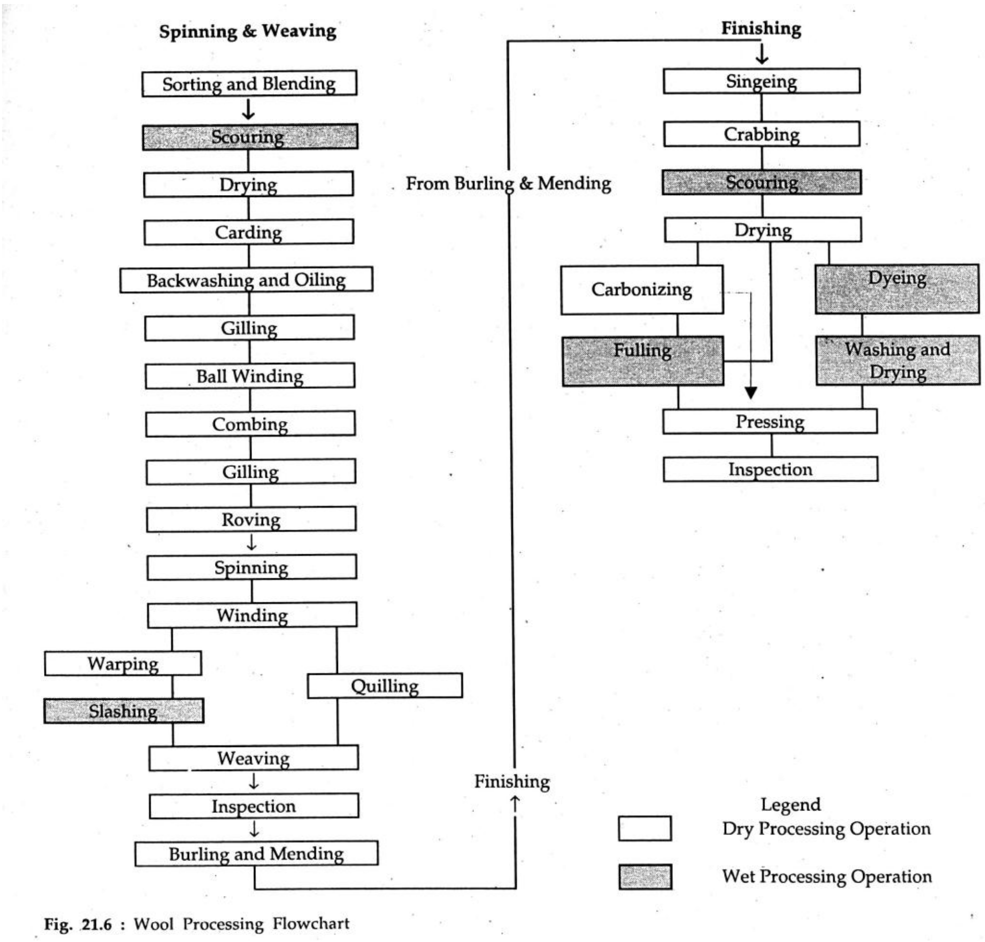

Fig. 21.6 : Wool Processing Flowchart

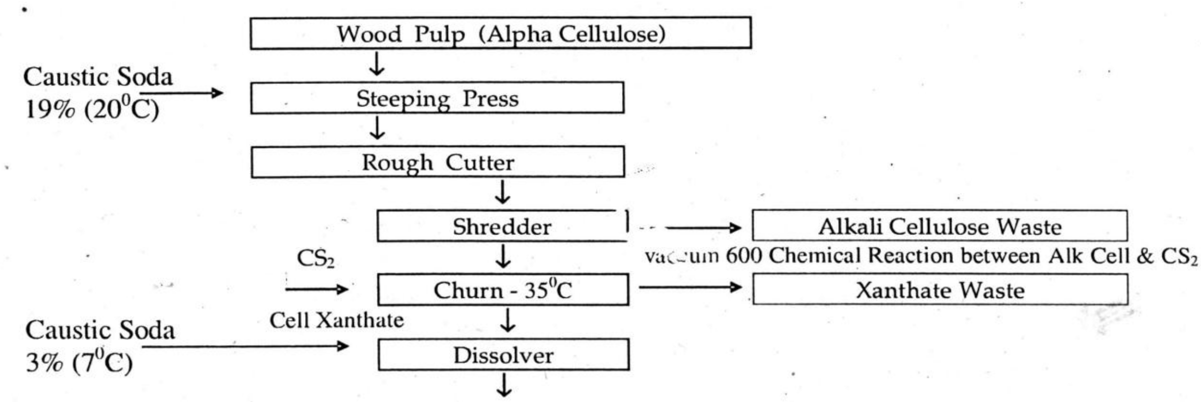
5.2.3. Process Flowchart of Viscose Rayon and Synthetic Fibre Manufacture :



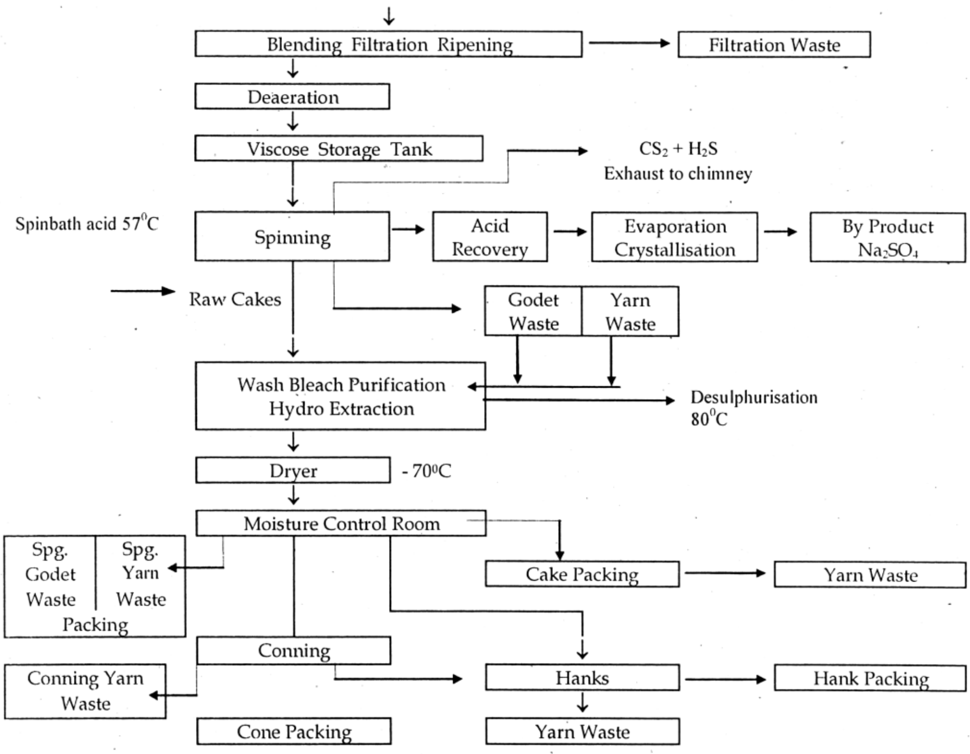


Fig. 21.7 : Process Flowchart of Viscose Rayon Manufacture

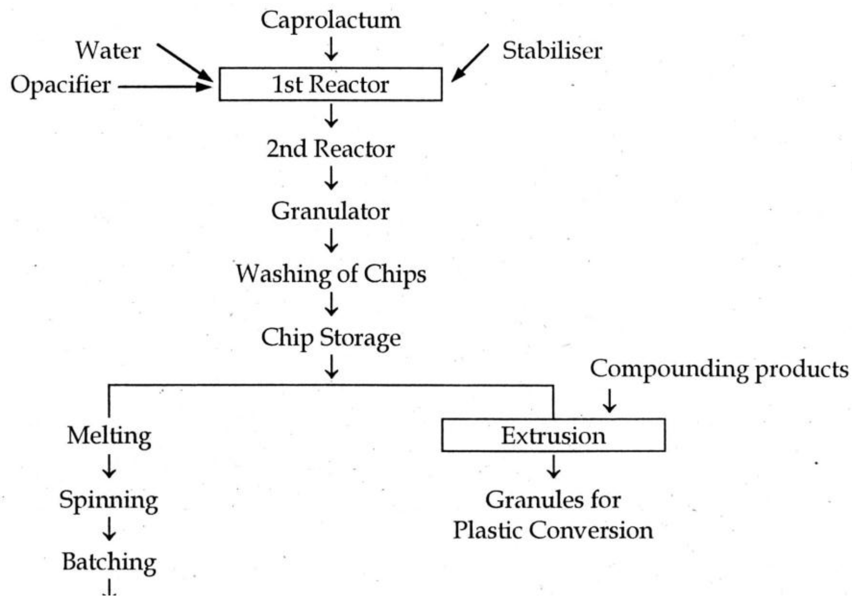
5.2.4. Process Flowchart of Spun and Filament Yarn :

(A) Manufacture of Nylon - 6.



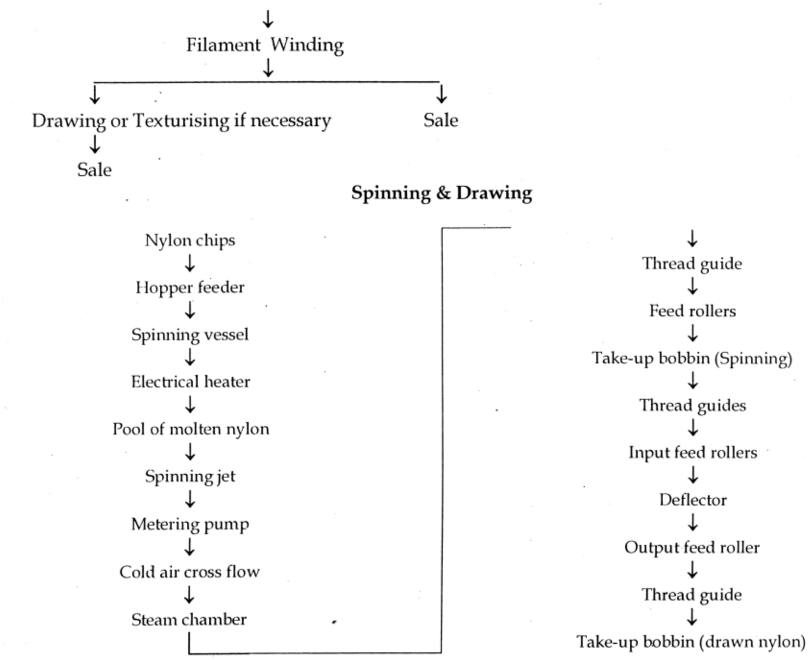


Fig 21.8 : Process Flowchart of Filament Yarn (Nylon-6)

Fig 21.8 : Process Flowchart of Filament Yarn (Nylon-6)

(B) Manufacture of Spun or Oriented Yarn (LOY, POY, HOY & FOY) :

Polyesters:

Polyesters were initially discovered and evaluated in 1929 by W.H. Carothers, who used linear aliphatic polyester materials to develop the fundamental understanding of condensation polymerisation, to study the reaction kinetics, and demonstrate that high molecular weight materials were obtainable and could be melt-spun into fibres.

Polyethylene Terephthalate (PET) is a fibre of great commercial significance, useful in cordage, apparel fabrics, industrial fabrics, conveyor belts, laminated and coated substrates, and numerous other areas. However, to engineer specific properties for special uses, many product variants have been developed and commercialised. These variants include alternative cross sections, controlling polymer molecular weight, modifying polymer composition by using co-monomers and using additive including delusterants, pigments and optical brightners.

High molecular weight polymer is used for high strength fibres in tyres, ropes, and belts. High strength and toughness are achieved by increasing the polymer molecular weight from 20000 to 30000 or higher by extended melt polymerisation or solid-phase polymerisation. Special spinning processes are required to spin the high viscosity polymer to high strength fibre. Low molecular weight fibres are weak but have a low propensity to form and retain pills, i.e. fuzz balls, which can be formed by abrasion and wear on a fabric surface. Most pill-resistant fibres are made by spinning low molecular weight fibres in combination with a melt viscosity booster.

Most of the textile fibres are delustered with 0.13.0% wt TiO, to reduce the glitter and plastic appearance. Many PET fibres also contain optical brighteners.

Manufacturing and Processing:

Terephthalic Acid (TA) or dimethyl terephthalate (DMT) reacts with ethylene glycol (EG) to form bis (2-hydroxyethyl) terephthalate [959-26-2] (BHET) which is condensation polymerised to PET with the elimination of EG. Molten polymer is extruded through a die (spinneret) forming filaments that are solidified by air cooling. Combinations of stress, strain and thermal treatments are applied to the filaments to orient and crystalize the molecular chains. These steps develop the fiber properties required for specific uses. The two general physical forms of PET fibers are continuous filament and cut staple.

Raw Materials :

For the first decade of PET manufacture, only DMT could be made sufficiently pure to produce high molecular weight PET. After about 1965, processes to purify crude TA by hydrogenation and crystallisation became commercial. In Japan, oxidation conditions are modified to give a medium purity TA suitable to manufacture PET, provided colour toners such as bluing agents or optical brighteners are added during polymerisation. Compared to DMT, advantages of TA as an ingredient are lower cost, no methanoi by-product, lower investment and energy costs, higher unit productivity, and more pure polymer because less catalyst is used. Catalysts are used in the transesterification reaction of DMT with EG and in polycondensation. Many compounds have catalytic activity. Divalent zinc and manganese are the prevalent transesterification catalysts. Antimony, titanium and germanium are the predominant polycondensation catalysts. Up to 3% delusterant is added to many PET fibre products to make them more opaque and scatter light; titanium dioxide is the most common delusterant. PET fibre blended with cotton for apparel frequently contains small amounts of fluorescent optical brighteners added during polymerisation.

Commercial production of PET polymer is a two-step process carried out through a series of continuous staged reaction vessels. First, monomer is formed by transesterification of DMT or by direct esterification of TA with EG.

In general, esterification is conducted in one or two vessels forming low molecular weight oligomers with a degree of polymerisation of about I to 7. The oligomer is pumped to one or two pre-polymerisation vessels where higher temperatures and lower pressures help remove water and EG; the degree of polymerisation increases to 15 to 20 repeat units. The temperatures are further increased and pressures decreased in the final one or two vessels to form polymer ready to spin into fibre. For most products, the final degree of polymerisation is about 70 to 100 repeat units. Average molecular weight is about 22,000; weight average molecular weight is about 44,000.

Spinning:

PET fibres are made either by directly spinning molten polymer or by melting and spinning polymer chips. A special, precise metering pump forces the molten polymer heated to about 290°C through a spinneret consisting a number of small capillaries, typically 0.2 to 0.8 mm in diameter and 0.3 to 1.5 mm long, under pressures up to 35 MPa (5000 psi). After exiting the capillary, filaments are uniformly cooled by forced convection heat transfer with laminar-flow air.

Following solidification, the threadline is passed over a finish applicator and collected. A spin finish is applied to reduce friction and eliminate static change.

It is convenient to classify commercial PET spinning processes according to the degree of molecular orientation developed in the spun fiber. Generally, the classification is a function of spinning speed. Low oriented yarn (LOY) is spun at speeds from 500 to 2500 m/min; partially oriented yarn (POY) is spun at 2500 to 4000 m/min; highly oriented yarn (HOY) is spun at 4000 to 6500 m/min; and fully oriented yarn (FOY) is spun at greater than 6500 m/min.

Drawing and Stabilisation:

Drawing is the stretching of low orientation, amorphous spun yarn {LOY) to several times their initial length. This is done to increase their orientation and tensile strength. Drawing in two or more stages is useful to optimise te'nsile properties and process continuity. Stabilisation is heating the fiber to release stress within the molecular chains melt and reform crystals and increase the level of crystallinity in order to stabilise the fibre structure.

Staple Processes:

In staple processing, the containers of combined spun ends are further combined to form a tow band and fed to a large drawline. The tow band is spread out into a flat band tracking over multiple feed and draw rolls. Crimping is the process by which two dimensional configuration and cohesive energy is imparted to synthetic fibres so they may be carded and converted to spun yarns. The tow band is cut to precise lengths using a radial multiblade cutter, normally 30 to 40 mm for blending with cotton, 50 to 100 mm for blending with wool and up to 150 mm for making carpets. Cut staple is packaged in up to 500 kg. bales at densities greater than 0.5g/ m3.

Safety and Environmental Factors :

Health & Safety : PET Fibres pose no health risk to humans or animals. Fibres have been used extensively in textiles with no adverse physiological effects from prolonged skin contact. PET has been approved by the U.S. Food and Drug Administration for food packaging and bottles. PET is considered biologically inert and has been widely used in medical inserts such as vascular implants and artificial blood vessels, artificial bone arid eye sutures.

Environmental Factors : PET materials are no dangerous to the environment and cannot contamination surface or ground water. During polymerisation, non condensible organic by-products are stripped from this process outflow streams and burned. Glycol and water are separated by refining. The water is treated in standard water spray facility. The glycol is reused The method from the DMT transesterification is refined and reused. Like all materials, polyesters should be

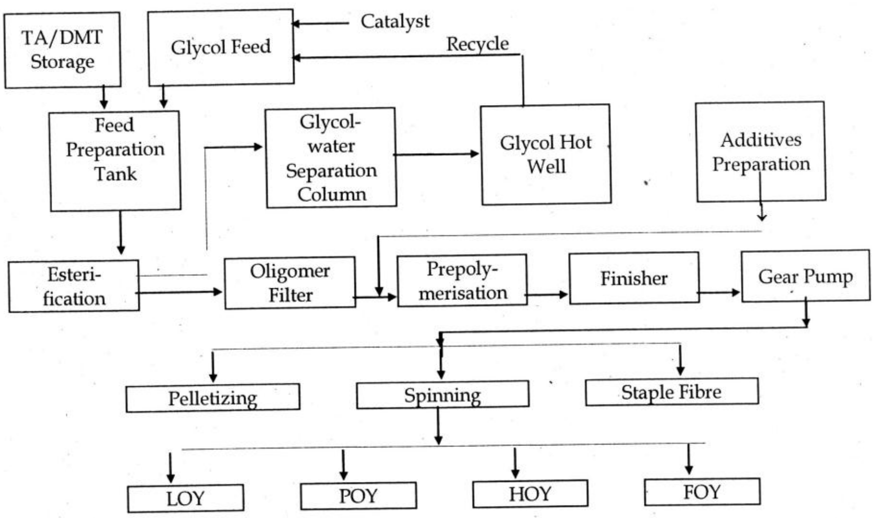

Fig 21.9 : Block Diagram for Polyester Manufacturing by Continuous Polymerisation Process

5.2.5. Jute manufacture :

The jute plant flourishes in hot and damp regions of Asia, mainly in India, Bangladesh, Pakistan, Burma and Thiland. Jute is a natural fibre and is used to make sack cloth, jute ropes, bags, camp beds, filter cloths etc.,

In 1820, jute was sent to England from India and was spun experimentally at Abingdon near Oxford. In 1822 Dundee mills in Scotland began spinning of jute. By 1850 the jute industry was well established.

In India and Bangladesh, the jute plants (Corchorus) are harvested with a hand sickle. Jute plant grows to 5 mt with a stalk diameter of 2 cm. The fibres are separated from the stem. The strands of fibre, as much as 2 mt long, are washed and hung up in the sun to dry. They are compressed into bales and sent off to the mills for spinning disposed of properly to avoid litter and can bi disposed of by landfill or incineration.

A key environmental advantage for PE" materials is the ability to recycle. Polyester materials especially bottles, can be separated from contammated materials such as aluminium caps and paper label and remanufactured by direct remelt extrusion into fibres for filling products or carpets or into layered constructions for good-grade bottles.

A block diagram of above mentioned process i «ihnwn in Pip- 21 9.

Small amount of mineral spindle oil is added into the fibre during conversion into yarn. Normal jute goods may contain upto 5% oil, but so-called 'stainless' yarns to be used for special purposes like wall coverings, cables etc., contain I % or less oil.

Jute Processes:

Raw jute is first passed through the softening machine. Oil and water emulsion is sprayed on to the jute. Sometimes sodium alkyl phosphate (Teepol) is also used. This process is known as 'batching'.

After preparation, the fibres are carded or combed, drawn and spun. Then cop and spool winding, weaving, finishing, croppong, cutting and lapping complete the processing.

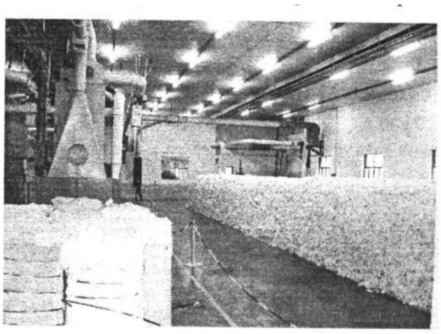
Bleaching and dyeing of jute is also possible. Dyestuffs used for cotton, are also useful for jute. The fibre has a special affinity for basic dyes, which provide brilliant effects even on unbleached base. The increased demand for rugs, mats and carpets require dyed jute yarns and fabrics suitable for these applications. Azoic and vat dyes give very bright and fast results but their high cost limits their use with jute. The tendency of jute to turn brown in sunlight is a permanent disadvantage. Hazards and Controls:

Machinery hazards are high as in case of cotton textile machinery. Main drives, gears, in-running nips of rollers or bowls, spindles and shafts, knives and cutters, flying shuttles etc. need efficient guarding. Fire may occur due to friction and heat. Water hydrants are necessary. Pesticides used in cultivation of jute may cause poisoning. Dust is given off in bale opening and spinning. Local exhaust ventilation is a must. Dermatitis gives skin trouble due to dust, batching oil, dyes etc. Excessive noise in weaving operation may cause hearing loss. Ear protection is necessary. Carrying heavy loads may cause strains. Medical examination of workers is necessary.

6 HAZARDS AND SAFETY MEASURES OF SPINNING PREPARATORY AND SPINNING PROCESSES

6.1 Opening and Blow Room Machines:

Purpose is to open cotton bales, to open and beat cotton to remove dirt/dust from it and to make it loose for the next process of spinning.



Types of machines used are :

1. Bale opener or breaker. Hard waste breaker, step cleaner. Super cleaner. Cotton opener - Porcupine or Chrighton opener. Roving waste opener. Scutcher, Combined opener and Scutcher Scutcher and Lap machine, Axi-flo, hoppel feeder etc. Tinting room is used to colour the cotton or synthetic fibres for their mixing.

2. Each machine should be driven by separate motor or by separate counter-shaft with fast and loose pulleys and efficient belt shifting device All main drives, counter drives and reductior gears shall be securely guarded.

3. All beater covers or doors giving access to any dangerous part of the machine should be interlocked or be securely fenced. Dirt door or desk door should have hinged or fixed grill as a guard and door for dirt/dust removal.

4. Dust chamber opening should be so fenced that while admitting light, prevents contact between any portion of a worker's body and the beater grid bars.

5. All belt and chain drives should be guarded.

6. In Roving waste opener, cage-wheel and side shaft wheel should be guarded.

7. In opener machine, door giving access to the nip between the lattice and the fluted guide roller of the lattice and evener rolls etc, be interlocked.

8. Inspection doors (covers) on trunkings should be properly situated and closed. If their location is dangerous, it should be changed or interlocked.

9. Spiked or fluted rollers which feed the materials from conveyors should be guarded. In-running nips of Feed and Calendar rollers must be guarded or interlocked.

10. Safe means of access i.e. catwalk, guard-rails, steps, ladders, hand-rails etc., should be provided on top of the machine where a worker has to work.

11. Lap rods - Lap stand should be proper. Lap rods should not fall out of it. Stacking of lap-rods should be proper

12. Knock-off lever - Its design or placement should be proper and the knock-off wheel should not hit a person.

13. **Unsafe actions :** The interlocks (micro-switches) on machines should not be tempered with. The supervision should he-proper for loading dead weight on a buckley opener, handling a guard, cleaning the inside of a buckley cage or bottom dust chamber collecting cotton or waste from near any revolving part, placing spiked lattice on a bale breaker, removing jam med material from rack and rack wheel, climbing the opener, feeding the lap on a scutcher and removing choked cotton through anopening in a pneumatic pipe.

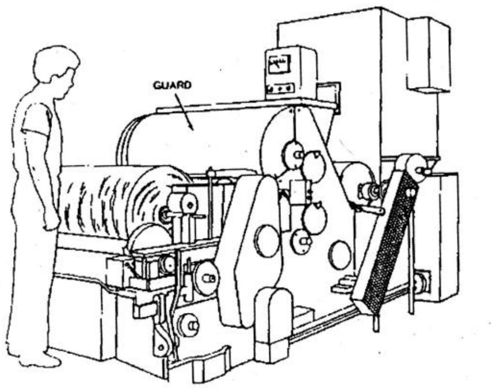
6.2 Carding Machines :

Purpose is to spin and open cotton fibres.

1. Spacing between the cards should be sufficent. All dangerous parts such as belts, ropes, pulleys, gears etc., should be securely guarded. Main drive shall be guarded.

2. The cylinder-doors must be interlocked (R. 54, Sch. 1) and effective. Stripping (cleaning cylinder) operation with open doors should be done by a trained man. The newer machines have safer stripping attachment.

3. The belt shifting devices for fast and loose pulleys should be properly maintained.



4. The nip between the plate-wheel and the side shaft wheel should be guarded.

5. **Coiler :** (i) Coiler head should not fall down (ii) Gears of the coiler box be guarded, (iii) The nip between the calendar roller wheel and the coiler back shaft wheel should be guarded or fenced.

6. **Licker-in :** (i) The access to the underside of the licker-in should be properly guarded by a hinged swing door or flap guard swinging back upwards to prevent contact while collecting dust (ii) The checking of the clearance between the licker-in and its casing while the licker-in is in motion must be prohibited (it may be done while the licker-in is stationary).

7. **Doffer & Comb Blade :** (i) Covers on doffer wheels should be closed, (ii) Work at or near the doffer cover and doffer comb blade must be done with care and properly supervised.

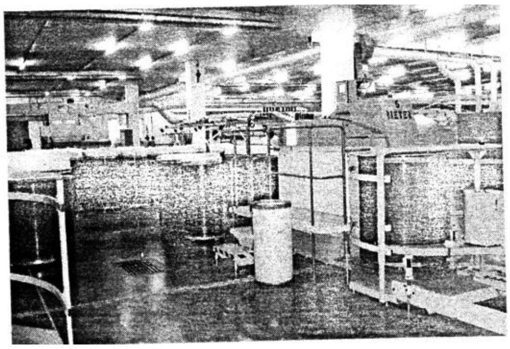
8. **High Speed Carding machine :** The in running nip between cross rolls should be securely guarded.

9. Mounting or dismounting of belt or rope and stripping and grinding operations should be done with care and should be properly supervised. It should be checked that while such stripping or grinding, the stripping brush is properly positioned so that it may not be loosened, the idler wheel and the umbrella wheel are properly fitted (so that they may not get loosed and fell down) (ii) Gauging the clearance between the flats and the card-cylinder should 130 done with the cylinder stationary (not rotated even manually) and by a standard angular gauge for this operation. It should be so supervised.

10. **Local Exhaust Ventilation :** Modern card machines have built-in local exhaust system with dust collection chamber to extract the cotton dust generating in the machine and to prevent its exposure in the work environment. This system should be efficiently maintained

6.3 Sliver and Ribbon Lap Machines:

Purpose is to make a sliver and lap from spinned cotton.



1. **Types of these machines are :** Sliver lap, lap m/c or lap-former, Derby doubler. Ribbon lap m/c etc. The main and counter drive shall be securely guarded.
2. **Nip** between the lap forming rollers (lap roller and fluted roller) should be guarded. It is desirable if it is interlocked (R. 54, Sch. 1).
3. **Ribbon lap m/c :** The lap drum and calendar drum gap should be interlocked.
4. **Sliver lap m/c :** Nip guard at the intake end of the calendar rollers necessary.
5. The carding slivers should be made parallel and combined to form a lap sheet suitable for feeding to a combing m/c.
6. **Unsafe actions :** Care must be taken during operations such as cleaning cap bars of a lap m/c, placing laps on lap rack, putting a lap rod on a lap stand, removing the chain drive from lap forming m/c, cleaning the ribbon of lap m/c and putting a lap end around a spool.

6.4 Combers and Drawing Frames :

Purpose is to comb (to make fibres parallel), pull and draw the fibres of lap of cotton.

1. Comber Machine : (i) The main drive shall have fixed guard (ii) The moving spiked cylinder should be interlocked, (iii) The cylinder covers i.e. hood of the comb near comber cylinder and the coiler covers should be fixed so as not to fall down and hit (iv) Hinged transparent guard to prevent contact with rotating segment i.e. nipper or gripper (v) Guard on top comb and detaching rolls (vi) Guard on calendar rollers and gears (vii) Interlock guard on coiler and draw-box gears.

2. **Drawing frames :** (i) Guards be provided on moving calendar rollers and gears (Nip between rollers should be covered), (ii) The gear wheels should be guarded or fenced, (iii) The head stock gearing must be guarded, (iv) The mango vacuum box of the top roller should be securely fixed, (so as not to fall down) (v) Sharp projections on the coiler bottom plate should be removed or rounded (vi) Off-end gear cover should be guarded.

6.5 Roving (Speed) Frames :

Roving means drawing of the first thread from the sliver. Purpose is drawing and twisting of fibres (thread).

1. **Types of these m/cs are :** Slubbing frames, inter frames etc. The main drive shall be securely guarded.
2. The head stock gearing (jack box wheels) should be interlocked. (R. 54, Sch I GFR).
3. **Slubber Frames :** (i) The driving bevel and bevel wheel should be guarded, (ii) The spindle shaft wheel should be guarded, (iii) Bobbin and spindle bevel gears should be guarded, (iv) The ratchet wheel should be guarded, (v) Work close to revolving flyers should be done only after stopping the flyers. It should be supervised so. (vi) Care should be exercised while handling of rollers and weights.
4. **Inter (Speed) Frames :** (i) The guard of the head stock gearing should be adequate or interlocked (ii) The stacking of bobbins on creel top should be done in safe manner, (so that the bobbins may not fall down) (iii) The height of creel top should be proper, (so as to reach easily). If not suitable, foot boards and hand holds should be provided (iv) Work close to rotating flyers should be done after stopping them (v) Draft rolls, draft gears, inter gears (jack box), cone drive and main drive should have guards.

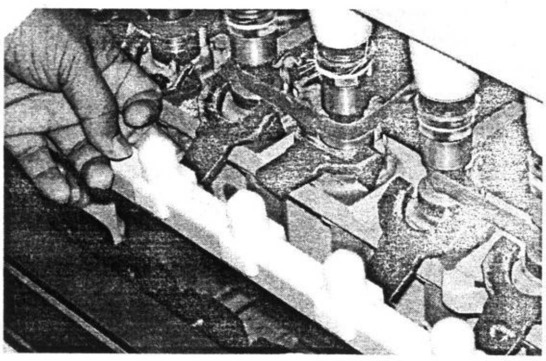
   The new open end or rotor spinning system eliminates some steps of the spinning preparatory operation and reduces many accidents.

6.6 Ring (Spinning) Frames :

Main process is twisting (rotating) and winding thread on bobbins.

Return-air system with humid air suppliers (diffusers) is used for better ventilation and humidification. Purpose of humidifiction is to prevent thread breaking. It provides large duct area through floor openings, air cleaning, rapid air changes, more humidification and more reduction in flying fluffs.

1. **Transmission parts :** (i) The main drive and the other driving belts and ropes should be guarded, (ii) Mounting of taps on jockey pulleys should be done after stopping the pulley by cutting of power, (iii) The headstock gears should be interlocked. Tieing ribbon on limitswitches and making interlocking ineffective is noticed many times. By frequent checking such unsafe practice must be discouraged, (iv) Drafting gear and drafting rollers, warm and warm wheel should be guarded.



2. **Damaged Bobbin Shields :** Sharp edges of the broken metal shields of bobbins cause many injuries on fingers while piecing or doffing operations. Following remedies should be provided, (i) Inspection and rejection of damaged shields, (ii) Use of plastic bobbins instead of wooden with metal shields, (iii) Suitable kneebrake or hand brake as

shown in the figure for each spindle to stop it. The .height of this brake should coincide with the knee of the worker. This is the design (ergonomic) aspect.

3. **Struck against various m/c parts :** (i) The sharp edge of a protruding metal sheet on the frame and broken edge of a ring frame may cause struck injury. Such damaged components should be replaced, (ii) Care should be taken while creeling, de-creeling, piecing, cleaning rollers, cleaning cotton fluff, stopping bobbins for piecing, fixing bobbins on spindles, doffing and adjusting arbor so as not to be struck against rollers, their supporting brackets or roller beams; work near lappet rail, filter-box, lappet middlerollers, top arm and cradle and middle arbor and cradle assembly, pocker rod, tube bracket and dashing against the frame of the machine while attending to different jobs. Proper supervision necessary.
4. **Fall of bobbins from creel top :** (i) Stacking of bobbins on creel top should not be haphazard. Only one row of bobbins should be stacked, (ii) Safe means of access i.e. suitable foot-boards and hand-holds should be provided for climbing up.
5. **Fall of rollers :** (i) Fall of clearer rollers and dead weight rollers occur in the course of operations such as releasing auto-lever, piecing, removing the rollers or holding them for cleaning. Care is necessary, (ii) Mechanism holding the rollers in position should be maintained in good condition.
6. **Auto-lever :** (i) Care should be taken while releasing or replacing the auto-lever, (ii) Condition of the saddle should not be defective.
7. **Ring travellers :** These can fly and injure persons unless there is an effective system of periodical replacement. Also the travellers should be of good quality and properly fitted.
8. **Dotting boxes :** (i) The hook on the doffing boxes for placing them on the rail should be proper. (ii) Splintered condition of the boxes and the protruding metal band may cause accident. Their periodical inspection and repair is necessary.
9. **Suction pipes :** Sharp or broken edge of a suction pipe may cause injury. It should be checked and required or replaced. Suction fan with duct is provided to collect broken ends.
10. **Others :** (i) Side plate of a frame may get loose and fall down. It should be periodically inspected, (ii) All motor fans should be closed by the covers.

6.7 Doubling Machines (frames) :

Two or more threads are joined, twisted and wound on bobbin.

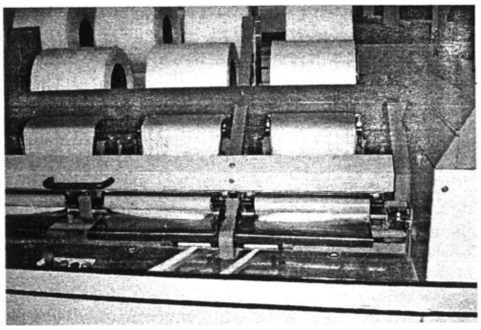
1. **Drives :** Main drive pulley belt and head stock gearing should have guards. Delivery roll gears should be guarded.
2. **Knee-brakes :** They should be provided to stop bobbin for piecing operation and maintained properly. They should be at proper knee height.
3. **Cans :** (i) The edges of cans for storing bobbins should not be broken or sharp, (ii) They should be inspected and repaired or replaced, (iii) Plastic cans are desirable.
4. **Ring Travellers :** (i) They should be of good quality and properly fitted, (ii) They should be periodically inspected and replaced.
5. **Machine Parts :** The creel tops to store bobbins should be within the arms reach. Foot rails should be provided.
6. **Unsafe actions :** Striking against knee-brakes, ring travellers, top roller, tap on a spindle, rough edge of jockey pulley etc., may cause accidents. Care should be exercised and supervised.

7 HAZARDS AND SAFETY MEASURES OF WEAVING PREPARATORY AND WEAVING PROCESSES

7.1 Winding Machines :

Purpose is to wind weft on bobbins.

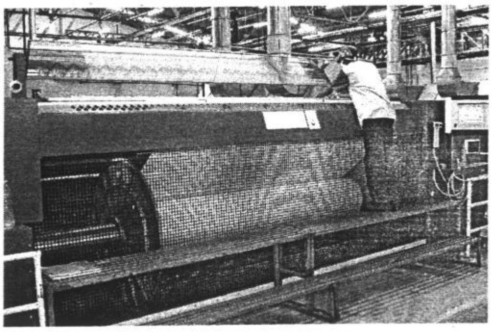
Types of machines used are : Barber-Coleman ITI/C, Auto-coner, pirn winder etc.



1. Guards should be provided on main drive, revolving drum, drum drive motor, timer drive, cam drive, traveller pulley and track nip and conveyor drive. Knotter-carriage assembly & spindle assembly should have cover.
2. The gap between the moving parts of conveyor and fixed parts should be checked all along its length and reduced to the minimum by suitable covers/guards.
3. Bobbins/sleeves used on the m/cs should be inspected for broken edges, burrs etc. as also for their proper fitment on driving spindles.
4. Haste in loading spindles with empty bobbins should be avoided. Also, dust and other extraneous materials on spindle and moving yarn should not be removed while they are in motion. Dust collecting blower and bag are useful.
5. Automatic winders like cone winder and spoolers prevent hands reaching near the rotating drum and are preferable.

7.2 Warping Machines :

Purpose is to wind warp on warp beam. Different types of warping m/cs are available.



1. The flanges of rotating beam should be properly guarded. Aluminium flange beam without metal flange ring is safer. Metal flange ring may open, fly out and hit.
2. The main drive, gear wheels, motor pulley, clutch pulley-belt and other parts should be properly guarded.
3. The nip between the driving roll and warp beam should be guarded. Trip cum distance guard should be provided for protection from rotating beam.
4. Beam side distance guard (rod) should be interlocked (contact switch) with drum which drives the beam-.

5. Multiple photo-electric device is more safe.
6. Hydraulic braking system should be provided to stop the beam within shortest possible time.
7. Stop motion indicator lamp is useful.
8. Wheels of moveable stands should have guards.
9. Drum drive motor pulley, beam drive chain, beam ends and section warping gears should be guarded.
10. **Unsafe actions :** Dashing against rotating beam, leading the thread from the creel to the drum (at this time the m/c should be stopped), removing ball bearing from the shaft of the warp roll, stepping on the slopping platforms of the m/c, removing empty pegs from bobbins on creels and loading and unloading the beams can cause injuries.

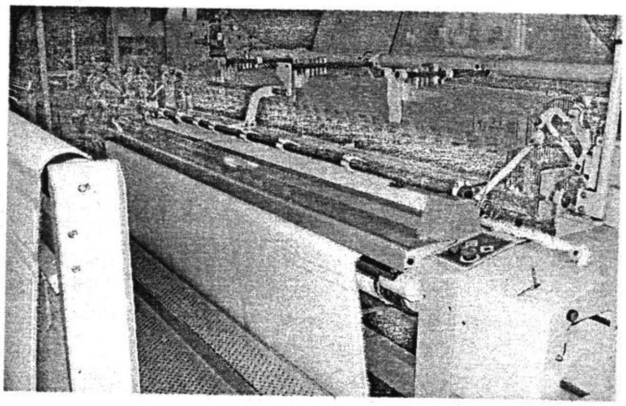
7.3 Sizing Machines :

Purpose is to apply starch on yarn or cloth.

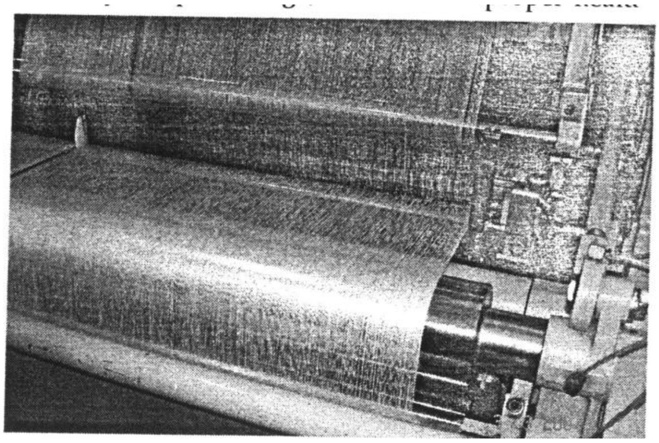
1. Nips : Nip guards should be provided on in running nips between the driving rolls and other revolving rolls at the front of the m/c. Guards on drag rolls and squeeze rolls are essential.
2. The main drive, beam drive chain, size box drive chain and speedometer chain should be guarded.
3. Suction hood necessary to arrest steam vapour.
4. **Gears :** The gears of the marking mechanism of the m/c should be guarded. Other m/c parts be guarded.
5. **Beam weights :** The counter weights of a beam should be properly placed so that they may not fall down while touching.
6. Loading and unloading of beams can cause accidents. Care should be exercised.
7. **Rule 61(8) GFR :** (i) These provisions should be followed for thin wall cylinders, (ii) Form No. 11- test report - should be available for each sizing cylinder, (iii) Pressure reducing valve, safety valve, pressure gauge, steam trap and drain-cock for condenset, steam stop valve etc., should be properly provided, set and maintained for ensuring safety, (iv) Maximum permissible working pressure shall be reduced 5% every year (v) Maximum life 20 years. (vi) New and second hand pressure vessel shall be tested at 1.5 times 'its Maximum Permissible Working Pressure.

7.4 Looms (power looms) :

Purpose is to weave cloth by using weft (pirn) bobbins and warp beam by a machine known as loom.



1. **Types of looms are :** Ordinary power looms, automated jacquard looms, drop-box, dobby, air-jet, water-jet, rapier etc. Loom sizes are 46", 52", 56", 60" and 64".
2. **Flying Shuttles :** (i) Shuttle flight may be caused by warp breakage, broken or improper heald



(heddle) wires, slackness in picking mechanism and other causes. Shuttle less looms (auto looms) is the best remedy for shuttle flights, but it is not economical. Therefore, the practical remedy is the shuttle guard. The shuttle guards be properly provided. It should extent sufficiently forward and the gap below it should not be too much. Because of possibility of change in this gap and despite the guard the shuttle car fly and hit Certainly they protect the upper body of a worker from hitting, (ii) To protect from injury due to shuttle flying from the adjacent loom, every loom must be equipped with barrier guard placed close to each end of the slay beam Such guards of strong wire netting or similar material are advisable, (iii) Reasons for shuttle flights should be properly recorded, investigated and removed.

3. **Shuttles :** (i) Shuttle receptacle should be provided near each end of the slay to place the shuttle properly, (ii) Removing empty pirn (bobbin in shuttle) 'and loading wound pirn into the shuttle may cause injury. Also care should be exercised while placing shuttle on the slay. (iii) Automation of process of filling up the empty shuttle can reduce these hazards where a pirn battery loads the shuttle as soon as the weft yarn on it is exhausted. This device of modern looms is advisable.

4. **Picking stick assembly :** (i) Vertical picking stick is less dangerous than horizontal one. Work near the proximity of the stick should be done carefully, (ii) Spacing between two looms should be at least 55 cm measured from the farthest projecting point of an adjacent loom or wall. The aisles (alleys) should atleast be one meter wide. It is so desirable for safe movement, (iii) Picking stick (arm) should be securely guarded along its fixed path of movement so that hitting by it can be avoided, (iv) The loom spindle on which the picker moves may crack or fly out and hit. Defective spindle should be found out and replaced, (v) Picking spring should be inserted in position carefully (vi) The picking wheel should be guarded, (vii) All parts of picking mechanism and heald frame should be sound for proper fitment, wear and tear.

5. **Beam Weighing :** (i) Compound lever should be adopted for beam weighing wherever possible. The shape of the weights should be such that they would not come off the lever and hit. Weights of shape '8' should be preferred to those of shape 'C'. Weights must be harnessed to the beam by strings or straps of adequate strength (ii) Spring loaded mechanism used for beam weighing should be inspected at least once in a week and defects, if any, rectified. Defects of spring, lever handle, threads used if any, should be found and removed.

6. **Cloth and Emery rolls :** (i) The support brackets of the cloth roll should be examined once a week for any defects to ensure that the cloth roll sits tight in the brackets, (ii) Care should be taken from hitting the cloth or emery rolls while walking near them (iii) Heavy cloth rolls should be handled mechanically or by more workers, (iv) Guards should be provided on emery roll and

guide roll, crank tappet gears, take-up gears, bottom cam drive gears, motor drive, shedding motion etc.

7. **Slay beam :** (i) The slay moving towards and away from the weaver may hit the hand and fingers may get trapped between the moving slay and the front rest head frame, temples etc. Hands should not be placed on the slay or at places near its path. (ii) Clearance between the slay bolts of two adjacent looms should be adequate, (iii) Setting of die weft fork holder and hammer should be proper, (iv) Removing fluff or wastes and attending to minor adjustment on the loom must be done only after stopping the loom.

8. **Duck bill and Hitter :** The duck bill and hitter should be guarded on every loom to prevent contact with sharp edges of these moving parts or being trapped between them. Such guards can be in the form of close pitched springs surrounding the duck bill and extending 3 to 5 cm beyond so that approach to the sharp edges from the sides is prevented.

9. **Others :** (i) Driving pulley-belts (main drive) of the loom must be securely guarded by a fixed guard. (ii) Ratchet and pawl or crank and tappet mechanism (including gears) should be guarded. The edges of the guards should not be sharp so that it may injure, (iii) The tuning of the loom should be checked once in every shift and adjusted wherever necessary (iv) Spare pirns and their boxes should be examined for their broken edges etc., and should be rectified, (v) The operators must be alert to join the broken ends. They should be joined only after stopping the loom. (vi) Pall of various improperly fitted loom parts on workers while cleaning, oiling etc., dashing against loom parts, getting caught between loom parts due to accidental starting, striking weft box while loading or unloading pirns, striking heald wire while drawing ends or doing adjustments nearby etc., may cause accidents. Care should be exercised and supervised in such operations, (vii) Suction device for pirn-battery return air system, diffusers, sprinklers, hydrants, fire extinguishers etc. should be in good working order.

10. **Noise :** Hearing loss is possible due to high noise in loom shed. Noise level should be below 90 dBA. Shuttle less loom gives less noise. Good lubrication and maintenance, proper tuning, quick replacement of damaged parts of picking mechanism and stroke resistors help to reduce noise. Workers should wear ear protection.

8. HAZARDS AND SAFETY MEASURES OF PROCESSING (FINISHING) AND FOLDING MACHINES

8.1 General Precautions :

1. **Types of machines in use are :** Shearing, singing, washing, bleaching, kiers, yarn and cloth dyeing, printing, polymerising, sanforising, stentering, padding, finishing, folding, bale (cloth) pressing machine etc.
2. The in-running nips between rollers and similar parts, unless the nips are inaccessible, should be securely guarded with nip guards (bars) along the whole length on the intake side (Rule 54, Sch II, GFR).
3. In dryers and similar machines where there is a risk of access from the sides to nips referred to in item (2) above and driving gears should-be guarded to prevent such access.
4. Other machine parts such as main and counter drive, belts, pulleys, shafts, gears and flappers should be guarded.
5. Removing crease from die cloth on rollers should never be done when the machine is in motion.

6. Oiling, greasing, adjustment or repairing near dangerous parts should not be done with the machine running.
7. Entanglement with the cloth in process is a serious hazard in some of die machines. While working here, care should be exercised and supervised.
8. To the extent possible, splash guards should be provided for containing the likely splashes of chemicals and hot liquids at those parts of machine where- splashes generally occur. These would also facilitate keeping the floor free from spillage.
9. Wherever risk of splashes from chemical or hot solutions exists, operators should be provided with PPE such as face shields or goggles, hand gloves, aprons and gum-boots.
10. Wherever persons have to reach and work at parts of machine situated at heights, suitable means of access in the form of catwalks and platforms should be provided. Wherever these are not provided due to infrequency of the operations or any other reason, alternative arrangements such as scaffolding or safe ladder should be provided and the operations carried out confirming to standard safe practices.
11. Dismantling and fitting of heavy parts of machine should be done with care. To the extent possible, mechanical handling devices should be used for the purpose.
12. Acids, alkalis, bleach liquors or whitening agents, dyestuffs and solvents are used for process or cleaning purpose. Their storage should be kept away in a separate room. They should be handled in small containers with lids. Their spillage or leakage should be avoided and cleaned immediately. Cleaning by solvent is risky. Source of ignition must be avoided while using solvent to clean printing machine, vessel, container etc. Then nearby electric fitting should be flameproof or switched off. Ordinary short circuit has caused many accidents.

Schedule 12 and .19 u/r 102, GFR should be followed while handling acids, alkalis and other chemicals. Rule 68D should be followed for using hot oil circulation in stenter etc. through thermic fluid heaters.

8.2 Bleaching Process :

Purpose is to whiten the cloth or yarn (threads). Normally chlorine, sodium hypochlorite or hydrogen peroxide are used as bleach liquors. Their concentration should be within safe limits. They should be stored in minimum quantities. Transfer from bulk storage to small containers should be safe. Flexible connections must be checked for safety. Emergency kit to handle chlorine leak should be kept ready. Proper respirator, eye goggles and gloves should be worn while working near chlorine gas or hydrogen peroxide fumes. Addition of chlorine in caustic solution to make sodium hypochlorite should be in closed and safe system. See Part 8.6.1 of Chapter-18 for chlorine safety.

Open bleaching tanks should have fencing to prevent fall inside.

Bleaching machine should have fume exhaust device. Bleaching range should have nip guard on rolls.

8.3 Processing Machines (Dyeing, Printing etc) :

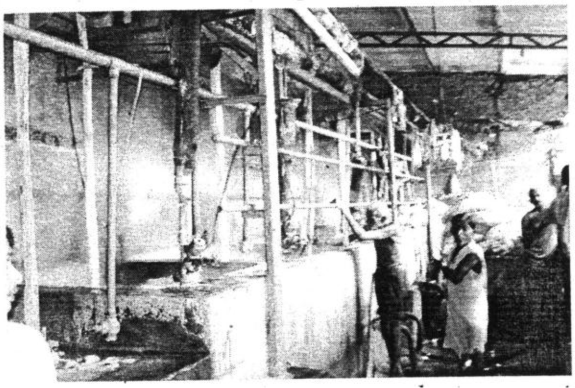
Purpose is to wash, dye (colour), print, dry, heat, press, stretch, carbonise, mercerise, sunforise and fold the cloth etc.

Water is used in large quantities in processing machines. Reverse Osmosis (RO) Plant should be used to remove hardness as well as total dissolved solids (TDS) if the water available is hard and saline (salty). Such soft and salt less water decreases rate of corrosion and increases life of the vessels/ machines.

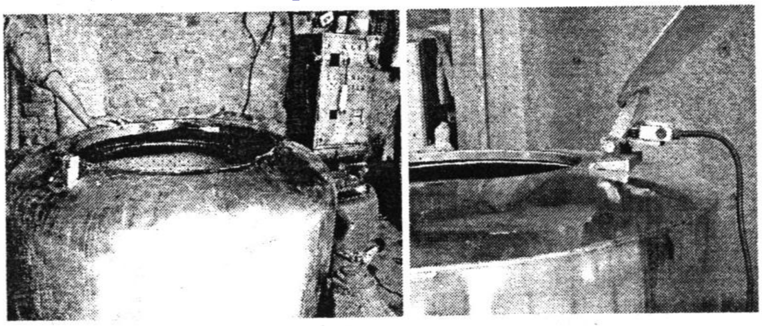
Safety measures for some processing machines are stated below.

1. **Washing machine :** Purpose is to wash the cloth in open tub (i.e. no pressure) (i) Nip Guards on rollers (ii) Catwalk and platforms to reach and work at the required places with sufficient handhold and foothold (iii) Guard on moving flappers, (iv) Distance guard, belt and chain guard (v) FRP and acid-proof lining if acid/alkali is used. (vi) Clean overflow "pipe with water tank (vii) Nip guard on draw nip (viii) Air regulator for pneumatic loading of rolls (ix) Guards on chain drives of nip rolls (x) Doors on soap tanks (xi) safely of steam lines and (xii) Guard on chain drive of a plaiter. (xiii) Nif guard on padding mangle.

2. **Washing Tanks :** Purpose is to wash the cloth (i) Railing near hot water tanks to prevent falling into it (ii) Drain pipes and valves to drain hot water from the tank. Simple hole, cotton plug (stopper) and bamboo use is an unsafe practice.



3. **Hydroextractor :** Purpose is to remove water from wet cloth, (i) Interlock basket cover (ii) Fixed guard on pulley-belts (iii) Brake to stop basket.



(a) (b)

Hydro extractor - (a) Hazard due to no basket cover (b) Basket cover with electrical enterlocking.

4. **Jigger machine :** Purpose is to colour the cloth in open tub (i.e. no pressure), (i) Nip guards on rollers and gears (ii) Splash guards should be provided on each of such machines to minimise chances of chemicals and colour solutions splashing on persons, (iii) Aprons and chemical goggles should be given to workers (iv) Periodic inspection and maintenance of the floors. They should be free from water and solution so as not to keep it slippery, (v) Pneumatic valve to control steani flow (vi) Cover on motor pulley belt drive and gearbox (vi) Roll motion controller.

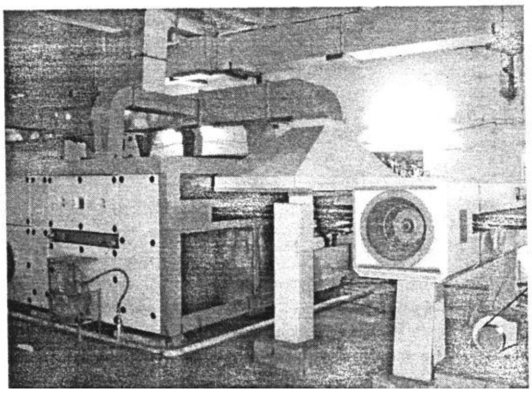
5. **Calendar machine :** Its function is to give fine finish (ironing) by passing the cloth through calendar rolls or bowls, (i) Auto temperature control to prevent over heating (ii) Nip guards on in-running nips (iii) Guards on main motor drive and reduction gears, (iv) Heavy rolls should be handled mechanically (v) Contact with hot rolls may cause burn injury. Care should be taken

while working at heights (vi) When steam pressure is above atmospheric pressure. Rule 61 GFR should be complied with. All safety devices should be properly maintained.

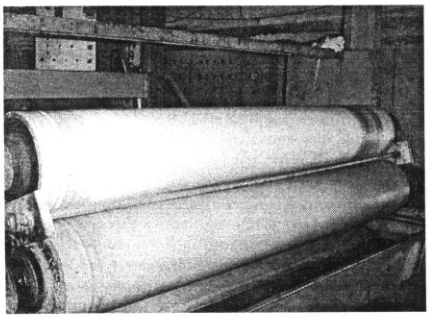
6. **Drying machines :** Purpose is to dry cloth, (i) Nip guards on rotating rolls and mangle rolls. Guards on chain, bevel gears, winch drive and stack drive, (ii) Platform, foothold and handhold to work at heights (iii) Hot cylinders of drying range may cause burn injury. Care and effective supervision (iv) For pressure control, follow Rule 61, GFR.

7. **Kiers and Agers :** Purpose is heating by steam pressure, (i) While tightening the eye bolts of kier, bars used should be of such construction that they hold the eye bolt securely and do not slip off. (ii) Catwalks and platforms to work on the top of the Kier (iii) Care form coming into contact with the hot parts of the kier (iv) Pressure reducing valve, safety valve, pressure gauge, stop valve etc. should be properly maintained for the safe working pressure inside. Safety valve and pressure gauge should be provided on jacket also (v) Hydraulic pressure test at every two years (vi) Chain pulley block or hoist to lift heavy parts.

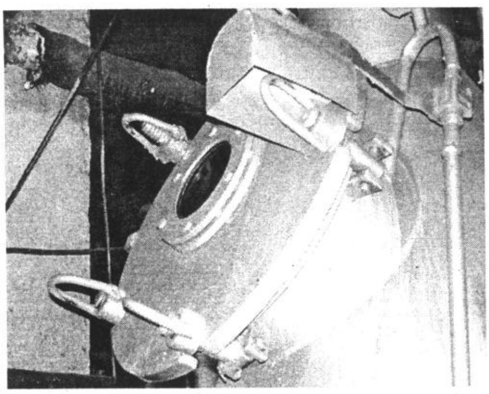
8. **Stenter machine :** Purpose is to dry cloth by passing it through heat chambers. Padding mangle, feeding zone, heating zone (chambers), batching and plaiting are main divisions (i) Nip guard between in-running rolls and rollers of the padding mangle, guard on uncurler nip, main drive and bevel gears (ii) Catwalks or platforms for working at heights, (iii) Temperature control devices (iv) Effective exhaust hood and chimney for removal of fumes from the machine, (v) Effective and sufficient exhaust fans in the workroom (vi) Scouring process i.e. oil removal from fabric before feeding it to the stenter machine to reduce the oil fumes, (vii) Textometer to detect moisture content, (viii) Covers on roll drive chain box, overfeed chain drive, batching and plaiter drive (ix) 3-way pneumatic oil flow control valve where oil heaters are used.



9. **Pladding machine :** (i) Nip guard on in-running rolls and padding mangle (ii) Guard on main drive, roll chain drive and gear drive (iii) Pressure regulator for pneumatic loading of rolls. drive, roll chain drive and gear drive, (iii) Pressure regulator for pneumatic loading of rolls.

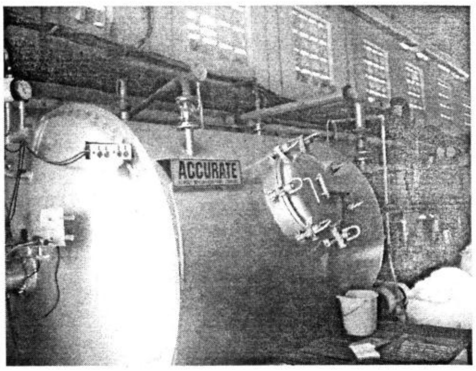


10. **Jet Dyeing machines -.**Purpose is to colour the cloth under steam pressure, (i) PRV or pressure regulator in pressure feed line (ii) Adequate safety valve and rupture disc - both of at least .1.5 inch (dia) size and in parallel on the top of the vapour cell (iii) High pressure alarm and automatic or manual de-pressure (venting) device to operate at that alarm (iv) Use of heatexchanger for indirect heating and cooling (v) Periodical hydraulic tests and NDT for corrosion effects



(vi) Non-corrosive metal, joints and body parts (vii) Flap guard near filter cover at the bottom and internal disc to restrict outflow (viii) Temperature gauge near the pressure gauge on the vessel (ix) Water, steam and air control valves (x) Manhole cover interlocked with depressure device (xi) Maximum pressure indicator and automatic pressure controller (xii) Trained operator (xiii) Effective supervision and auto programming.

11. **Drum washer :** It is a washing machine under steam pressure, (i) Fixed guards on belt and chain drive (ii) Pressure Reducing Valve, Safety Valve, rupture disc, proper nut bolts and fitting or welding, proper material of construction and Pressure Gauge on steam supply line (iii) Drum motion fixing device (locking) while loading and unloading. Internal drum should not rotate while loading or unloading it. It should be mechanically locked. Power should also be deenergised at that time.



12. **Expander machine :** (i) Nip guard on rollers and between the cloth in process and the rollers (ii) Parts of machine should be periodically examined to detect defective conditions such as protruding nails.

13. **Stitching and sewing machine :** (i) Gap between the needle and the machine table should be guarded to 'prevent access to this zone. (ii) Electric earthing should be proper and ELCB should be provided in power supply line.

14. **Printing machine :** Purpose is to print the cloth by machine. Various types of machines are in use. (i) Nip guards on the printing roller, cloth roller and on the lapping and a roller (ii) While removing a heavy roll from the machine, care should be taken' or the mechanical handling should be used. (iii) Care should be exercised while changing a design roller otherwise a hand may be caught between the design roller and control roller (iv) Care should be taken while turning a handle to apply pressure to the printing rollers otherwise a worker may slip and fall from height (v) The doctor blade of the machine should be removed carefully otherwise it may slip and its sharp edge may cause injury. (vi) Fixed guards on pulley-belt drive, sector, connecting (eccentric) rod, repeat-setting device and under table rollers (vi) Safety while cleaning blanket.

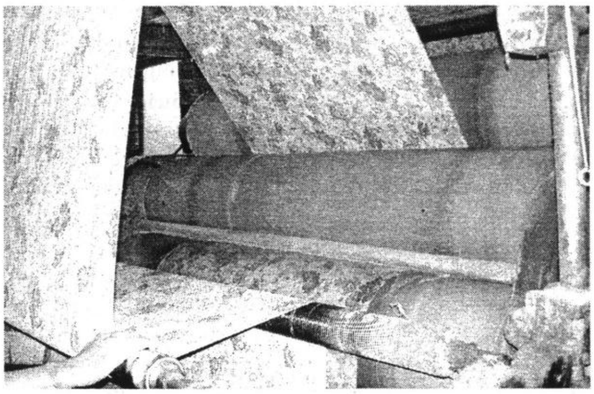
15. **Stretching machine :** Nip guard between running cloth and roller.

16. **Polymerising or curing machine :** See part 3.3 and 9 of this Chapter.

17. **Gas/Electrical Singeing machine :** See part 9 of this Chapter.

18. **Shearing and Cropping machine :** (i) Rotating cutters should be interlocked by a transparent cover, (ii) Guards on main drive, suction blower and dust chamber and (iii) Metal detector are necessary.

19. Sanforizing and Palmer machine : Its function is to give final finish (ironing) to the cloth.



(i) Nip guards and side guards on in-running rolls and trip wire near cylinder (height < 1.7 mt) to stop the motion (ii) Pneumatic controls and roll drives guards (iii) Steamline safety (iv) Plaiter drive guard.

20. Mercerising machine : Nip guard on mangle rolls, guards on main drive coupling, chain drive, bevel gears, mangle roll gears, chain return wheel, squeeze roll belt drive, squeeze rolls, impregnator nip between float roll and top roll, stabilizer-tension roll and top roll nip and splash guard on caustic tank are necessary.

21. Carbonising unit : Its function is carbonising i.e. acid burning of cotton fibre of the blended cloth. (i) Acid bath (70% H,SO,,) should have safe overflow device and splash, guards on both sides (ii) Nip guard on squeeze rolls (iii) FRP tray and acid-proof flooring, PVC valves for acid use and use of PPE and safety shower by workers.

22. Folding machine : (i) The crank-wheel and reciprocating arm should be guarded to prevent hit injury, (ii) Fixed guard on main drive.

23. Towel cutting machine : Cutting edge should be guarded at the feeding end of towel.

In addition to above textile machine guarding, general safety measures for metal working machinery, lifting machines, material handling, hand tools, hand trucks, chemicals, flooring, fire and health hazards, must also be provided and maintained. Welfare facilities of canteens, lunch/rest room, ambulance room, creche, welfare and safety officers should also be provided. See Part-3 for statutory provisions.

9 FIRE AND EXPLOSION HAZARDS AND CONTROLS

A booklet 'Fire Prevention in Textile Industry, Instructions for Supervisors' published by the Loss Prevention Association of India Ltd., Mumbai - I (Gujarati copy is also available), IS:3079 and 2190 are most useful to understand and control fire/ explosion hazards in textile industry.

Cotton dust is not fine enough to cause dustexplosion but it may certainly cause fire if any spark is available. Explosion hazard lies with polymerising or curing machine where flammable liquids are used and therefore explosion relief are required. Fire hazard is more in blow-room and spinning sections due to loose and flying cotton and in processing department due to solvents and, chemicals.

The main cause of fire in textile mills can be attributed to the failure of electrical equipment, sparks from foreign material carried along with cotton stock, friction, hot bearings due to inadequate oiling and attention, presence of excessive quantities of fly and dust in the department and the use of flammable liquids and processing of cloth at high temperatures.

Building Construction : Textile mill buildings are classified as 'fireproof; 'non-fire proof and 'inferior'. In order to minimise the risk of fire, all mill processes and storage buildings must be of fire proof construction of at least 6 hours grading. The behaviour of a structure when subject to fire stresses must be taken into account at the design stage.

Godowns for cotton and finished products shall be essentially single storey structures and located at least 30 mt away from the spinning department. In textile mills, the departments that requires separation by perfect party walls in order to reduce the fire loads are : (a) Baled cotton warehouses, cotton mixing and blowing rooms; willow and thread extractor rooms; waste opening rooms; carding rooms; speed and ring frames; mule spinning department; preparatory sections and loom sheds, cloth processing houses with fire walls around special hazard processes such as 'singeing' and 'cloth raising', (b) Boiler houses and firing places must be separated from all process and store buildings except the engine rooms and the like. (c) Electric generating stations and transformer houses must be cited at least 10 mt away.

Cotton and yarn drying chambers must be constructed of incombustible materials and .fitted with thermostat controls in order to cut off the source of heat supply at predetermined temperatures.

Warehouses and Stores : (a) Breakage of cotton bale hoops causes sparks and subsequent fires (b) Faulty electrical equipment, both for lighting and bale stackers may cause fire; (c) Lots of baled cotton must be stacked in an orderly manner away from godown walls to prevent spread of fire arid assist fire fighting and salvage operations, (d) Adequate drainage of godown floors is necessary in order to prevent excessive water damage of lower layers.

All sources of ignition like mechanical sparks due to friction, electrical spark, spark from welding or cutting, prismatic effect of sunrays from glass window on cotton bales, use of naked flames, heated lamp or metal parts, oil dripping and electrical loose wiring or electrically heated metal parts, should be avoided by prompt supervision. Fire hydrants should be kept nearby.

Cotton Mixing and Blow Rooms : (a) Generation of sparks from foreign matters, particularly pieces of metal carried along with cotton stock through metal rollers and spiked lattices of opening and blowing lines. Loose rivets and short ends of hoop iron are the main causes which could be eliminated by providing suitable magnetic separators which should be cleaned during each shift, (b) Machines with high speeds are more prone to fires. Machines with higher capacities are exposed to large quantities of loose cotton and hence fires in such machines are carried faster and at longer distances (c) All cotton opening and cleaning machines with spiked lattices and rollers must be sprinkled.

Carding Department : Cotton in the carding machines being still in the loose stage is susceptible to fire due to friction between metallic parts, particularly fillets, licker-ins and grinds.

Spinning Frames : (a) Frequent fires occur due to heated spindle bearings of those of the rollers driving them (b) Lint and fly cleaner units of spinning frames cause fire due to improper conductor or collector shoe contacts with the open bus bars running the entire length of the machines. The uneven contacts of the collector shoes cause sparking which ignite the fluff collected around the buses, (c) Generation of static electricity is generally encountered in the spinning of rayon yarn particularly in the card room and it is safer to ground all machines and to provide suitable humidification system to eliminate static charges.

Loom Shed : The picking mechanism usually gets jammed due to accumulation of fluff which causes fire spreading and droppings below the loom or at times to the warp beams.

Processing Department:

1. **Cloth and Yarn Singeing (burning by fuel fire):** Due to the presence of open flames and flammable gases, fires are frequent in singeing rooms but these could be avoided by the use of proper electrical equipment and electrical interlocked sequence in order to prevent the machine being started up before the exhaust and gas blower fans are brought into operation. All control gear in such case must be mounted externally with vapour-proof lighting fixtures.

   Solenoid valve on the fuel line is essential to stop fuel supply in the event of power or m/c failure. This will prevent stationary fabric undergoing singeing and from being ignited.

   LPG and air pipelines should be colour coded. NRV to prevent flash back, gas burner control, no smoking notice and ready fire extinguishers are required. LPG safety rules should be followed.

   Fuel (petrol) control valve on carburettor (petrol vaporiser), temperature control on air heater, suction hood, duct and dust chamber, flameproof electric fitting, guards on nip rolls and batch drive, brush rolls and roll drive, water cooling of the guide rolls near burner and safety ladder to fuel tank are also important.

2. **Electrically heated Yarn Singeing Machines :** An interlocking arrangement is necessary to ensure that the heating elements cannot be switched on while the yarn is stationary in the machine. Only water washed fabric should pass. Solvent may cause hazard.

3. **Polymerising or Curing Machines :** Its function is to dry (by heating) the printed cloth. Several explosions and fires have occurred in polymerising machines in textile mills due to the mixture of organic solvents in the printing pigments.

   Precautions to eliminate accidents are : (1) Predrying of printed fabric over drying ranges to remove most of the solvent outside the machine. (2) Lock the exhaust openings in top of curing machine at least 2/3 full opening. (3) Electric heaters must be provided with thermostat controls and synchronised with the exhaust fan and machine main drive so that in the event of accidental failure of exhaust fan motor, the entire machine stops along with the heating elements. (4) Provision of safety flaps on the tops of polymerising machines which would open out automatically in case of explosion. (5) Air circulation fan filter gauze must be regularly cleaned as poor circulation would cause localised pockets of solvent vapour. (6) Exhaust duct must be regularly cleaned every week and extended outside the work room. (7) Interlocking of exhaust fan with fabric motion so that the fans will start before fabric is fed into the chamber.

   See Part 3.3 for Rule 68C GFR.

   Steam curing is safer.

4. **Cloth Raising Department :** Here fires are frequent due to passage of foreign materials between filleted rollers and it is necessary that the cloth be inspected before passing through the machine. The machine must be regularly cleaned of fluff accumulation.

5. **Electrical Installation:** Electrical equipment must comply with Electricity Act and Rules (See Part 2 of Chapter-28), relevant Indian Standards and installed and maintained in safe condition. Lighting fixtures in places where considerable dust and fluff accumulate and godowns must be of dust-proof type, wired in screwed conduits and switchgear must be mounted externally. Stop motion devices on machines must be dust-proof, wired in conduit and checked regularly. Overhead electric lines in compounds should also be cleaned regularly.

6. **Fire Extinguishers:**

   Fire fighting arrangements consisting of portable appliances, water hydrants and automatic sprinklers must be designed and laid in accordance with relevant IS Specifications.

   The automatic sprinkler system discovers fire, sounds alarm and extinguishes the smallest fire. In sprinkled building, water damage will be less because the amount of water necessary for extinguishing is smaller, hence all mill buildings must be 'sprinkled'. Such installations are expensive but their worth is justified. High pressure automatic sprinklers of special design must be provided in generating stations, transformer houses and oil godowns. They should be used after power is switched off. A trained fire fighting squad shall be maintained round the clock within the mill premises.

7. **General Safety Precautions :**

   Mill compounds must be regularly cleaned and housekeeping both inside as well as in the yard should be of good order. Overhead structures in all departments must be regularly cleaned and floors swept during each shift. Electrical equipment shall be satisfactorily maintained and periodic check-up is necessary. Risk. of overheating can be reduced by providing efficient lubrication and day-to-day maintenance of all machines, bearings and moving parts. Adequate guarding for machines should be provided particularly on blowing and carding machines. Smoking should be prohibited within 6 mt of process and storage blocks and it is advisable to provide smoking booths.

10 HEALTH HAZARDS AND CONTROLS

Some important health hazards in a textile industry are as follows :

Accidents to fingers, hands and other body parts are due to a variety of textile machinery and their hundreds of moving parts. Constant machine guarding is the best solution. Noise and vibration are incidental hazards. **Byssionosis** is a lung disease due to prolonged exposure to high concentration of cotton dust. Extraction and suppression is the best remedy. Sch. 27, Rule 102, GFR requires this. See Part 3.2.

Increased humidity and temperature cause discomfort to workers. Limits of dry and wet bulb temperatures should be maintained. Well designed and maintained AC plants are more comfortable.

10.1 Health Hazards in Cotton Textile Industry :

1. **Cotton Dust and Byssionosis :** According one survey 20% (approx. 3 lakh) of the textile workers in mills were found victim of byssionosis. It was 14% in carding section and 10% in spinning and winding sections.

   Measurement of cotton dust concentration in 8 units in India showed it from 3.4 to 5.6 mg/m" in blow room and 0.1 to 2.2 mg/m^3 in card room. Another survey showed cotton dust level as under:

At Kanpur - 7.85 mg/m^3
At Delhi - 5.50 mg/m^3
At Ahmedabad - 4.00 mg/m^3
At Mumbai - 3.90 mg/m^3

The threshold limit suggested is 0.2 to 0.75 mg/m^3 2nd Schedule of the Factories Act prescribes 0.2 mg/m^3 lint free raw cotton dust. ILO prescribed cotton dust values are as under: TWA OSHA -

- 0.2 mg/m^3 in yarn manufacturing.
- 0.5 mg/m^3 in other operations.
- 0.75 mg/m^3 in slashing and weaving.

STEL ACGIH - 0.6 mg/m^3 .
IDLH - 0.5 mg/m^3

Vacuum stripping and suction exhaust arrangement attached to carding machines, lint and dust collectors and general exhaust ventilation are necessary to minimise the flying cotton dust. Proper dust mask or cotton cloth should be given to workers.

Byssionosis is an occupational disease caused to many mill workers by the cotton -dust. This name was given by Proust in 1877. It is a lung disease like TB or Asthma and reduces working capacity of a worker. After working for 5 to 10 years in cotton dust area, respiratory problem starts. Initial symptoms are cough or bronchitis, chest pain, breathlessness, emphysema and phlegm. Ultimately the lungs are damaged. The victim gets exhausted soon by a small work. He feels energy loss and becomes unfit to work. Its major hazard area is spinning department, though it can happen to winders and weavers and also to flax, hemp or jute workers. Under section 89 and the Third Schedule of the Factories Act, byssionosis is a notifiable occupational disease and the medical practitioner noticing this disease has to report to the Inspector of Factories, otherwise he is liable for penalty.

For its diagnosis (1) Occupational history of the worker and (2) Lung function test are required. The effected worker is examined on tKo-first day after his holiday and also at the"~nd of his shift after working. His loss of working capacity is measured. Workman Compensation is available under WC Act or ESI Act.

Factory Medical Officer should check such workers periodically. His workplace must be changed soon after the first detection. X-ray and gradation reports should be maintained. There is no medical remedy for this disease. Therefore its prevention is the only best solution. Local exhaust ventilation attached with machine, room exhaust ventilation, water sprinklers and use of cotton dust mask or respirator are the effective remedial measures.

Workers engaged in cleaning of cotton dust or in its high concentration must be provided with air line respirator and hood or efficient face mask. Instead of broom-stick cleaning, vacuum cleaning machine should be used to minimise the flying particles.

2. **Heat and Humidity:** Higher temperature due to closed operations and work rooms, humidity (to reduce thread breakage), heat generating processes such as sizing, kiers, drying range, stenter, hotdyeing, singeing, polymerising or curing, steam and oil heaters, hot air dryers, boilers etc., create higher temperature in spinning and processing departments which if exceeds 29.5°C (85°F) (threshold or effective temperature), or humidity is increased, causes discomfort and fall in productivity. Therefore the room temperature" must be, controlled @ 25.5 to 29.5°C (78 to 85°F)

by good natural and mechanical ventilation (See Chapter 10). Workers should be relieved at short interval from high temperature zone. Air conditioning is desirable. Hot metal parts should be insulated.

3. **Noise :** High noise in weaving and ring frame department causes mental stresses and may result in a hearing loss which is an occupational disease under the Factories. Act. Permissible limit of 90 dB for 8 hr. working should not be exceeded.

One survey in a mill'at Bombay indicated the noise levels in Spinning Dept. - 96.5 dB, Doubling machines - 97.6 dB, Winding machines - 98.5 dB, Auto loom shed - 99 dB and Non-auto loom shed - 102 dB. Use of sound absorbing material is effective but expensive. Use of ear muffs or ear plugs (glass wool) is the most practical remedy and the workers must be trained to wear them. In Nigeria, it was observed that due to use of ear protection individual efficiency was increased by 12% and overall production by 1%. The long term solution is the design of noiseless looms.

Legally Sch. 23, rule 102, GFR is applicable.

4. **Weaver's Cough :** This is caused by inhalation of sizing materials, 50% of which comes out during weaving. As the name suggests the workers of loom shed are prone to it. Good ventilation dilutes the effect.

5. **Cancer and Coronary diseases :** These diseases like bladder cancer, chrome eczema or chrome poisoning, dermatitis are caused due to the chemicals like lead chromate, potassium or sodium bichromate, toxic solvents, titanium dioxide, hydrogen sulphide, sulphur dioxide and trioxide. Local exhaust system near toxic fume generation, chemical respirators, gloves, aprons etc. are useful. Non or less hazardous substitutes should be utilised. Medical health check-ups and advice should be followed. Training and supervision will also help.

6. **Machinery hazards :** Foregoing parts 6 to 8 have classified and explained process-wise machine hazards in textile industry. Newer machinery has reduced many of these hazards. The most dangerous parts of textile machines are main motor and gear drives, head stock gearing of spinning frames, revolving beaters of blow-room machines, card cylinder, flying shuttles and loom gears, picking stick and in-running rolls of processing machinery. Specific hazards of jet dyeing and other pressure vessels have also caused many accidents. The fixed guards, interlocked guards, nip guards and other safety devices should not be tempered with or kept open while machinery is in motion:

7. **Material handling :** Heavy rolls and other machine parts and bulk containers are to be handled in textile industry. Excessive weights may cause health injuries, strain and pain. Mechanical aids should be used to lift, carry and handle such heavy loads.

8. **Poor lighting :** Many textile processes require high standards of illumination, such as drawing in threads through healds and reed, weaving and processing of coloured cloth, jacquard (design) weaving, fabric defect checking, folding and packing etc. Poor lighting on such processes causes eye strain. Poor lighting in passage ways, corners, stairs, platforms, confined spaces, tanks, pits and vessels, unguarded machinery and slippery surfaces may cause accidents. Therefore in addition to providing sufficient lighting (see Part 5 of Chapter-9), window glasses, lamps and tubes should be regularly cleaned and local lighting should be provided where required.

9. **Shuttle Kissing :** Suction shuttles of ordinary (non-auto) looms need thread (weft) sucking by mouth through shuttle eye (small hole) and pirn bobbin many times during a day. Dirt, dust or

broken fibre ends are drawn into the throat. The same shuttle may be used by different workers in different shifts. Therefore this is unhygenic and infectious method. Non-suction shuttle or pirn bobbin battery requiring no kissing by mouth is the only remedy.

10. **Overtime work :** Legal limit of 8 hours a shift is hardly followed in thousands of small and medium scale textile industries. 12 hours a shift has become a routine working. This certainly causes health hazards. This causes more harm to women and child workers. More working hours cause physical, mental and nervous strain and result in more accidents and sickness rates. Full co-operation of employers and employees can solve this problem.

11. **Welfare provisions :** Large scale factories have lunch room, rest room, canteen, ambulance room, creche, washing facilities, free medical examinations, transport facilities etc. But majority of small and medium scale factories do not have such facilities. This affects the health and general well being of the workers.

12. **Fire and Explosion hazards :** Cotton is easily combustible material. Solvents used in processing department can cause fire and explosion both. For details see part just following.

10.2 Health Hazards in other Textile Industry :

1. **Manmade fibres (mmf) :** Fire and explosion is the main risk from solvents and nitrocellulosic materials. All flammable materials should be stored in specially designed separate' building and its flow should be through closed system. All sources of ignition including static charge should be eliminated. Electric fitting should be flameproof.

Toxic effects due to H_2S, CS_2, C_6H_6, acetic acid etc. should be reduced by local exhaust ventilation. Workers should be given respirators.

Spillage of water and other solutions may cause slipping hazards. Protective clothing is necessary for wet processes. Machine guarding to machineries is similar to cotton industry.

Glass wool manufacturing induces infrared emissions from molten glass. Heat absorbing screen is required. Flying or breaking glass particles may cause skin penetration. Resins, hardeners and accelerators may cause skin irritation. Protective clothing, good hygienic practices and medical advice are necessary. Dust fumes need local exhaust ventilation.

Synthetic fibres are made from chemicals or petrochemicals. Nylon, polyester, polyolefins, polypropylene, polyurethane etc. are well known. Machine guarding is required as in case of other textile machines. The large quantities of solvent vapours given off during spinning and extrusion pose fire, explosion and poisoning hazard and need local exhaust with safe discharge and respiratory protection. Delivery of toxic and flammable substances through pumps and pipes reduces hazards of manual handling and direct exposure. TLV, LEL and other safe limits must be maintained. Sparks should be eliminated. Electric equipment should be flameproof. Effective earthing to machines and vessels shall prevent dangerous spark. Static charge eliminators to machines are necessary. Workers should wear footwear with rubber soles.

2. **Flax & Linen industry :** The fibres of flax plants are used to make linen cloth, towels, nets and ropes. The fibre is light, strong and absorbent Its strength increases on wetting.

Machine guarding on rollers, pulley-drive; and other moving parts is essential. Flax dust may cause Mill fever and Weaver's cough chronic bronchitis and byssionosis. An ILO report (1965) gives following figures for flax dust levels and byssionosis prevalance :

Process	Mean total dust concentration mg/m3	Byssionosis prevalence (% all grades)
Pre-preparers	6.7	44.0
Prepares	2.7	30.0
Wet-finishers	0.6	3.6
Other finishers	1.4	0.7

Dust measurement at 6 months interval by a trained industrial hygienist is useful. Fine dust is removed by passing air through canvas filter. Coarse dust is extracted by a cyclone extractor. Hackling machines and carding engines need hood enclosure and exhaust system at the sources of generation.

For noise reduction, sound absorption treatment to walls, ceiling and floors and isolating mounts to machines are necessary. Process segregation by separate rooms of heavy partition walls and ear muffs to workers reduce noise problem.

3. **Jute industry :** See Part 5.2
4. **Silk industry :** Silkworms were reared in homes where CO poisoning was noticed in Japan. In reeling raw silk, dermatitis was noticed. Handling raw silk may produce skin and respiratory allergy.

   Very good lighting is required in the weaving of coloured silk yarn. Temperature, ventilation and humidity control are important at all stages. Reeling bath temperature should be lowered to control skin effect Exhaust ventilation on bath and frequent replacement of water are necessary. Machine guarding is required as in case of textile industry. See also Part 33 of Chapter-23.

5. **Wool industry :** Like cotton textile machines/wool textile machinery also needs effective machine guarding and spacing. Anthrax is possible to wool sorters. Chemicals used may cause poisoning, eye burning, gassing etc. Selection of less harmful chemicals, local exhaust ventilation, good washing facility, PPE and strict personal hygiene are necessary. Dust, temperature and noise control are also necessary.

11 EFFLUENT TREATMENT AND WASTE DISPOSAL IN TEXTILE INDUSTRY

Textile effluents are generally coloured and contain soluble (organic and inorganic) and insoluble (suspended) impurities and possess high BOD and COD. Therefore their treatment and safe disposal are necessary and statutory.

Effects of textile effluents :

(1) On Water courses :

S. No.	Impurity	Content	Effect
1	Colour	Dyes	Colourification, Photosynthesis is affected.
2	Suspended impurities	Collodial & suspended particles	Turbidity of receiving water.
3	pH	Alkalis	Alkalinity disturbs aquatic life.

4	Oils & Grease	Mineral oils	Form blanket and prevent O_2 entry in water.
5	Dissolved minerals	Inorganic sodium salts	Increase salinity of water.
6	Toxic chemicals	Chromium, sulphide, chlorine and aniline dyes	Toxic effect to fish and microbial organisms.
7	Oxygen depletion	Starch, dextrin, sulphide, nitrite etc.	Demand O_2 from water and affects aquatic life.

(2) On Land:

The excess content of sodium and boron of textile wastes adversely affects crops. High sodium alkalinity combined with salinity impairs the growth of plants. Suspended solids and sodium prevent root penetration in land and soil texture is spoiled.

(3) On Air:

Continuous addition of CO_2 and other particles due to fuel (coal, LDO, gas) burning in boilers and stenters, and toxic fumes of chlorine, acids, H,O, and flammable vapours from volatile solvents pollute the air and surrounding environment.

Effluent generation flowchart is as under -

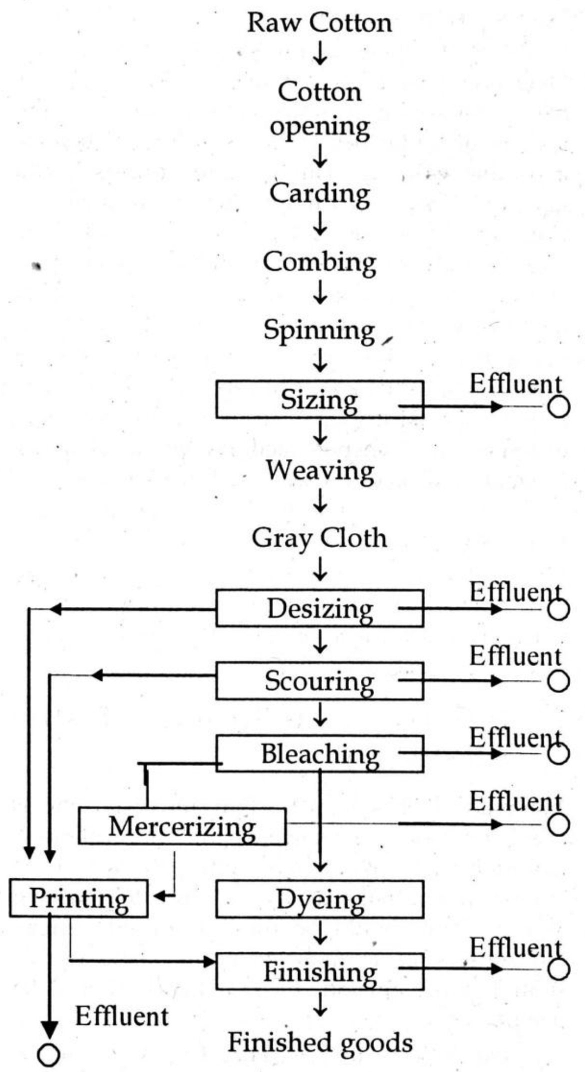


Fig 21.10 : Effluent Flowchart

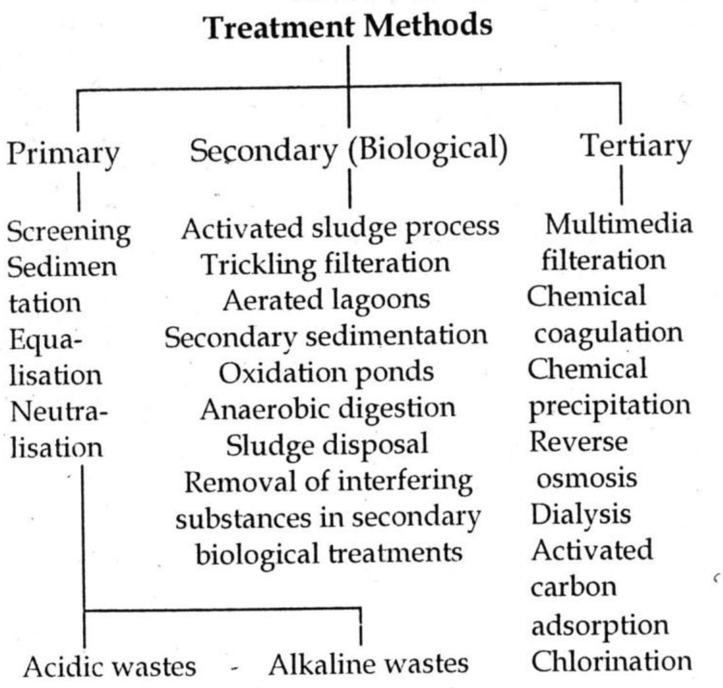
Reduction of Pollution Load :

To reduce costs and complexity of treatment, it is first necessary to reduce pollution load of the effluents. It also results in saving of costly materials. Good housekeeping, controlled and efficient use of dyes and chemicals and closer process controls are essential for this purpose. Some important methods are as under :

1. Waste segregation.
2. Recovery and reuse.
3. Substitution of low pollution load substances.
4. Judicious use of chemicals.
5. Process changes.
6. Economical water use.

Treatment Methods:

Three stage treatment methods of textile effluents is as tabulated below :



Other inetilodsure

1. Colour removal.
2. Recovery and reuse of waste water.
3. Conservation- and reuse of water.

For details of these methods, books on pollution control methods should be referred. Please see reference No.7 at the end of this chapter.

Diagram of effluent treatment plant in textile processing industry is given in Fig. 21.11

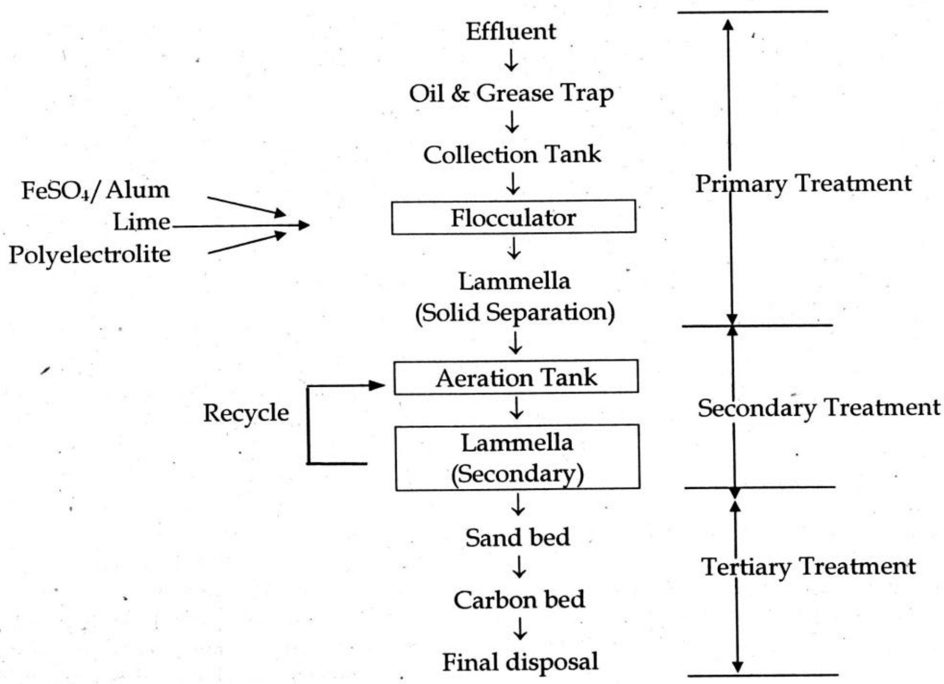


Fig 21.11 : Effluent Treatment diagram for textile processing industry

Tolerance Limits:

IS 2490 (Part I to 10) and Schedule I & VI u/ r 3 & 3A of the Environment (Protection) Rules, 1986 prescribe tolerance limits applicable to textile effluents.

Characteristics of raw (untreated) effluent and required parameters of process houses are shown ii the table.

Process House Effluent Characteristics

No.	Parameter	Before Treatment	Required after Treatment
1	pH	6.6-8.0	6.5-8.5
2	Color	1000-1500 unit	100 unit
3	Suspended Solids	600-900 ppm	100 ppm
4	Total Dissolved Solid	10000-14000 ppm	2100 ppm
5	Oil & Grease	20-25 ppm	10 ppm
6	BOD	500-600 ppm	30 ppm
7	COD	1600-2200 ppm	100 ppm
8	Ammonical Nitrogen	0-5 ppm	50 ppm

E X E R C I S E

1. Explain, State, Mention or Discuss :

1. Need of safety in textile industry.
2. Statutory provisions for safety of textile machinery.
3. Flow chart of a composite textile processes.
4. Flow chart of spinning and weaving OR Finishing processes.
5. Flow chart of long staple finishing processes.
6. Flow chart of synthetic fibre manufacture.
7. Flow chart of Filament yarn (Nylon - 6)
8. Flow chart of Oriented yarn (LOY, POY etc.)
9. Manufacturing process of spun (oriented) Yarn (POY, FOY etc.)
10. The merits and demerits of rotor spinning.
11. Hazards and safety measures of Blow room machinery.
12. Hazards and safety measures of Carding machines.
13. Hazards and safety measures of Sliver and Ribbon lap machines.
14. Hazards and safety measures of Combers and Draw frames.
15. Hazards and safety measures of Speed frames.
16. Hazards and safety measures of Ring frames.
17. Hazards and safety measures of Doubling machines (frame).
18. Hazards and safety measures of Winding machines.
19. Hazards and safety measures of Warping machines.
20. Hazards and safety measures of Sizing machines.
21. Hazards and safety measures of power looms.
22. Hazards and safety measures of Bleaching process.
23. Hazards and safety measures of Washing machines.
24. Hazards and safety measures of Jigger machines.

25. Hazards and safely measures of Calendar machines.
26. Hazards and safety measures of Jet dyeing machines.
27. Hazards and safety measures of Stenter machine.
28. Hazards and safety measures of Drum washer machine.
29. Hazards and safety measures of Printing machine.
30. Hazards and safety Carbonising machine.
31. Health hazards and controls in Cotton .textile mill.
32. Health hazards and controls in Silk and Wool industry.
33. Fire and Explosion hazards in Textile industry.
34. Effluent treatment flow chart of a textile mill. Explain by a diagram.
35. Types of effluent treatment methods in a tovUlp mill

2. Write short notes on :

1. Inference of accident case studies in a textile mill.
2. Types of fibres and their use.
3. Spinning preparatory OR Weaving preparatory process.
4. Spinning processes OR Finishing processes.
5. Jute Manufacture.
6. Rotor Spinning.
7. General Safety measures of textile processing (finishing) machines OR Safety devices on a Singeing machine.
8. Hazards and controls of flying shuttles.
9. Picking stick assembly.
10. Hazards and safety aspects of a Washing tank.
11. Kiers and Agers.
12. Byssionosis OR Weaver's Cough.
13. Heat and Humidity problems in a textile mill.
14. Fire hazards in cotton go-downs.
15. Methods to reduce pollution load in a textile mill.

3. Explain the Difference between

1. Cotton and Man- made Fibres
2. Thermic fluid heater and Drier.
3. Ginning and Pressing.
4. Ring frame and Doubling frame.
5. Pirn winding machine and a Warping machine.
6. Bleaching and Dyeing.
7. Spinning and Weaving.
8. Fibre and Fabric.
9. Short staple fibre and Long staple fibre.
10. Gilling and Carding.
11. Ring spinning and Rotor Spinning.
12. Singeing machine and Curing machine.
13. Stitching machine and Folding machine.
14. Fire hazards and Explosion hazards in a cotton textile mill.
15. Primary and Secondary effluent treatment methods.

4. Comment on the following explaining whether it is true or false ?

1. Women or children can be employed toward delivery - end side of a cotton opener.
2. Section 30 (F.A) is not .applicable to hydro extractor.

3. Rule 61 (GFR) is applicable to drum washers.
4. Copper sizing cylinder is a thin wall pressure vessel.
5. PET fibres pose no health hazards.
6. PET fibres pose environmental hazards.
7. Beaters are most dangerous parts in below room machinery.
8. Rotor spinning machine cannot spin combed yarn.
9. Bleaching and dyeing of jute is not possible.
10. Trip cum distance guard is required on a Warping machine.
11. Rule 61 (8) for thin wall pressure vessels is applicable to sizing cylinders.
12. Vertical picking stick is less dangerous than horizontal picking stick of a loom.
13. Hydro-extractor does not need interlocked top lid.
14. Jigger machine needs splash guards.
15. Calendar machine needs safety valve.
16. Stenter machine needs exhaust fans.
17. Jet dyeing machine needs de-pressure device.
18. Drum washer needs PRV and safety valve.
19. Sanforizing .needs steam line safety.
20. Towel cutting machine needs guard on delivery end of towel.
21. High noise area in a textile mill is its cloth department.
22. Jacquard (design) weaving requires better lighting condition.
23. Mmf manufacture has toxic hazards.
24. In silk industry dermatitis is not possible.
25. Glass wool processing has dust hazard but no infrared radiation hazard.
26. Flax dust cannot cause Byssionosis.
27. Employment of Industrial hygienist is justified in a textile mill.
28. Explosion is possible in a polymerising machine.
29. Cotton mixing room does not pose fire hazards.
30. Solenoid valve is essential on fuel supply line of a singeing machine.
31. Flameproof electric fitting is required in a fuel fired singeing machine room.
32. Electric heaters should be interlocked with exhaust fan drive and cloth drive of a curing machine.

5. Explain the following terms from safety point of view

1. Fibres from Animal origin.
2. Card OR Comber.
3. Kier.
4. In-running nip.
5. Head stock gearing.
6. Drying range.
7. Artificial humidification.
8. Byssionosis.
9. Cotton opener.
10. Polymerising machine.
11. Yarn singeing machine.
12. Sanforizing.
13. Texturising.
14. Bobbin shield.
15. Knee brake.
16. Duck bill and Hitter.
17. Weaver's cough Shuttle kissing.
18. Tolerance limits of effluent.
19. Padding mangle.

20. Scouring process
21. Hinged swing door.
22. Micro switch.
23. Lap rod.
24. Beam flange.
25. Drafting zone.
26. Etching of copper roller.
27. Dust chamber.
28. Flutted roller.
29. Licker in.

6. **Match the words in column 'A.' with appropriate words from column 'B' from safety point of view -**

A	B
Fibres from – Vegetable origin Natural polymer Petrochemical origin Polyvinyl derivatives	 Acrylic fibres Synthetic fibres Viscose rayon Cotton Wool Asbestos
Carding machine Roving frame Ring frame Pirn winding machine Warping machine Draw frame Loom Jigger machine	Dyeing of cloth Gray cloth Weft for shuttle Drawn warp Combed yarn Cone of yarn Sliver Twisted yarn Rove yarn Warper's beam
Cotton opener Carding machine Silver lap m/c Comber m./c Slubber frame Inter frame Ring frame Rotor spinning	Cylinder doors Beater Coiler and draw box Gears Nip guard Rotating flyers Bever whell guard Knot-free yarn Knee brakes Ring travelers
Warping machine Sizing machine Loom Bleaching machine	Nip guards Photo electric device Fume exhaust Shuttle guard Doffer wheel
Washing Tank Hydro extractor Calendar machine Jigger machine	Chemical goggles Heavy rolls Railing on hot water tank Brake

Drying Range Ager machine Stenter machine Jet dyeing machine Drum washer Stitching machine Shearing machine Carbonising unit Folding machine	Use of chain pulley block Chain drive guard Rupture disc Exhaust hood and chimney Crank-wheel guard Locking device Acid proof flooring Metal detector ELCB Repeat setting device
Cotton dust Noise Weaver's cough Humidity Bleaching process Shuttle kissing 12 hours shift Anthrax Yarn singeing machine Storage of cotton bales	To reduce thread breakage Sizing material H2O2 Byssionosis Explosion hazard Loom shed Pirn bobbin battery Fire hydrant Wool industry LPG Safety Illegal

7. Give probable causes and controls of the following -

1. Accidents in blow room OR Loom shed
2. Accidents in Sizing OR Carding m/c.
3. Accidents in Dyeing OR Bleaching m/c
4. Accidents in Printing m/c. .
5. Bursting of drying cylinder.
6. Broken shields of bobbins.
7. Processing chemicals.
8. Stentering machines.
9. Ring spinning OR Winding m/c.
10. Carbonising of polyester.

CHAPTER – 22

Safety in Construction Industry

THEME

1 SCOPE OF SAFETY IN CONSTRUCTION WORK

1.1 Basic Philosophy : 03235213618

Construction activity is not only an oldest industry but also the largest one in many parts of the world. It started with the basic human need 'shelter, home or dwelling house' and is ever expanding with the growing population and their growing needs of residential and commercial buildings, shops, offices, factories, roads, bridges, dams, railways, power transmission lines, communication lines, towers, columns, chimneys, silos, oil and gas installations, air fields, hoists, lifts, many types of underground, under-water and aboveground works and works of excavation, foundation, construction, alteration, renovation, repair, maintenance, demolition, dismantling, erection, fabrication etc.

After agriculture, construction seems to be the second largest economic activity. If mining and quarrying are considered as a part of or inclusive of construction industry, it becomes the largest of all industrial activities. Some figures of the most advanced country, USA, are as under :

Table : 22.1 Deaths & Death Rates, USA :

	1992	1993	1994	1995	1996
DEATHS					
Agriculture	779	842	814	723	710
Mining, Quarrying	175	169	177	156	150
Construction	889	895	1000	1043	1000
Manufacturing	707	698	734	638	610
Trans. & Pub. Util.	767	753	819	822	750
Trade	415	450	492	451	460
Services	601	631	676	655	610
Govt.	586	528	534	523	510
DEATH RATES (per 1 lakh workers)					
Agriculture	24	27	24	21	21
Mining, Quarrying	25	28	30	26	25
Construction	15	15	16	16	15
Manufacturing	4	4	4	4	3
Trans. & Pub. Util.	13	13	13	13	12
Trade	2	2	2	2	2
Services	2	2	2	2	1
Govt.	3	3	3	3	3

Source : Accident Facts, 1997, NSC, USA.

In our country reportability of construction accidents is not known. But following figures are reproduced below from Indian Labour Statistics, 1991-93.

NIC Code 50 & 51 represents construction and construction activities and all India fatal accidents in this industry are as under :

Year	Fatal Accidents
1986	114
1987	141
1988	100

These figures are not reported for many years and from many States and many works. Therefore this data is incomplete and misleading.

Table 22.1 makes it clear that the combined deaths and death rates of construction and mining industries are more than even agriculture. Decrease during last years indicates that safety activities can certainly decrease the accidents. This proves the scope and importance of safety in construction industry.

As per rough estimate about 2 lakh firms and more than 200 lakhs workers work in construction industry in India. Thus mostly it is labour oriented and unorganised. Workers are mobile, mostly illiterate and work on contract basis. They work under sun and rain, cold and wind and dust and sand. Their working conditions are mostly unsafe, hazardous and unhygienic. Their workload is heavy and demands heavy muscular work. Their work and workplaces are not of permanent nature and therefore not governed by any law like the Factories Act. The Building and other Construction Workers Act 1996 and the Rules 1998 have been passed and implemented in 2006. The overall working conditions of majority of construction workers are, therefore miserable.

Basic philosophy to improve their working conditions is the safety philosophy. It should be realised that construction is inherently hazardous industry, , contract based industry, demands heavy work load, contributes high frequency and severity of accidents, less protected by law, movable and needs continuous efforts to maintain safety at all levels. It may not be possible to completely eliminate the hazards, but it is certainly possible to minimise them by enforcing certain safety precautions. The working and service conditions of the workers need to be improved. Peculiarity of accidents is well known. Falling from height, struck by falling body including landslide, material and equipment, striking against object, falling on the flat or into pit, sump, gutter etc., occupational diseases of lung, skin, locomotors and nervous system, electrical and pneumatic tools, unguarded machinery, heavy vehicles and working without safety equipment are the major causes of accidents. Mechanization can eliminate some manual work hazards. Work permit system, prompt supervision and first-aid, use of personal protective equipment and proper tools, training and education and project safety committee are some of the remedial measures.

Safety philosophy for construction work should be based on the following points:

1. Safety policy statement and strict adherence to it.
2. Safety cannot be delegated. It is a line function.
3. Safety is everybody's responsibility.
4. It is an integral part of all project activities.
5. Good planning and advice, and discussion with contractor and subcontractors are essential at design or initial stage.
6. Safety ensures success with satisfaction.
7. Work permit system is desired for all hazardous works.
8. All construction accidents should be recorded, reported and investigated for the purpose of safety and costing.
9. Standards, Codes and Statutory provisions must be followed. Safety manuals should be prepared for contractors, workers and supervisors, and
10. Education, training and supervision for safe work methods and use of safe tools and equipment play an important role. See Part I of Chapter-? also.

12. Parameters of Safety in Construction:

Peculiarities and parameters .governing safety in construction industry are, now, discussed in the following paragraphs.

1.2.1 Studies, Statistics and Results :

Statistics and studies on construction accidents are not much available as factory accidents. This is mainly because of no exclusive authority, late and poor administration, non report ability and no complete compilation of such data.

In one study which lasted for 15 years, Levitt (1987) highlighted the hidden costs of construction accidents. He concluded that these accident costs mostly exceeded the gross-profit of most of the firms in construction industry. He also found that all managers who had good safety records do three things:

1. Motivate their subordinates to attend to safety.
2. Provide training for managers and workers at all levels, and
3. Insist that work is carefully planned.

Champoux et. Al. (1987) studied 357 accidents in construction industry and identified the higher risk areas of work and orgnaisation as targets for prevention. High risk tasks are crucial to ergonomist and all those working for safety in construction.

National Institute of Training for Industrial Engineering (NITIE), Bombay conducted a study (1989) and after interviewing site engineers, safety officers and labourers on site, it was concluded that the reasons for health and safety problems were -

1. The absence of safety rules and regulations.
2. The unorganised nature of work.
3. Almost total lack of any need for safety felt by engineers and contractors and
4. Absence of trade unions for welfare and health.

The main safety measures suggested were
1. Compulsory use of safety helmets.
2. Use of safety belts for working at heights greater than 1.5 m.
3. Provision of canvas around the scaffolding to prevent falling objects from striking people.
4. Good and tidy housekeeping.
5. Provision of proper tools and
6. Adequate training to new workers.

Occupational health diseases were studied by Englund, Triebig, Duivenbooden and Husmark (1987). Diseases of the skin, locomotor, circulatory, respiratory and nervous system were noticed amongst construction workers. A few occupations handling asbestos, showed respiratory cancer in plumbers and insulators.

Fatal occupational injuries in Construction, by type of event or' exposure, in USA, 1995 are reported as under (Accident Facts, 1997) :

Out of total 6210 fatal accidents in all occupations in 1995, 1043 i.e. 16.79% fatal accidents took place in construction and comparatively it is the highest in this industry. Its causewise breakup is as under:

Fall to lower level	324
Electric current .	163
Traffic accidents	117
Struck by object	104
Struck by vehicle, mobile equip.	079
Caught in or crushed in collapsing materials	052
Caught in or compressed by equipment or object	033
Others	171
Total	1043

One study of construction accidents in our country gives following figures.

Type of Accident	Temporary Total	Permanent Partial	Permanent Total

	Disablement %	Disablement %	Disablement %
Handling of Materials	24.3	20.9	5.6
Falls	18.1	16.2	15.9
Falling object	10.4	8.4	18.1
Machines	11.9	25.0	9.1
Vehicles	8.5	8.4	23.0
Hand Tools	8.1	7.8	1.1
Electricity	3.5	2.5	13.4
Others	15.2	10.8	13.8
Total	**100**	**100**	**100**

Following figures were 'published in Industrial Safety Chronicle, Oct-Dec, 1996, as ILO data for Construction Sector :

Country	Accident Rate per 1000 workers	Fatality Rate per 1000 workers
Austria	142	25
France	125	30
Germany	120	16
Mauritius	70	15
Mexico	70	24
Spain	138	38
Sweden	48	9
United States	70	25

To compare with this. Accident Rates for the year 1992 and 1993, given by Construction Wing of NPC (Nuclear Power Corporation, India) are reported as 10.05 and 12.06 respectively. This indicates that our construction accidents are 5 to 14 times less than those of foreign (developed) countries.

Similarly Fatality Rates for 1992 and 1993, given by the same NPC, India are 0.124 and 0.120 respectively and again these figures when compared with ILO figures, indicate that fatal construction accidents in our country are 75 to 320 times less-than those in western countries.

The reasons of this anomaly, as stated in the article are as under :

1. Gross under-reporting of accidents by Indian industry.
2. ILO figures include first aid injuries while ours are reportable (48 hours absence) accidents.
3. ILO figures are old when safety efforts in western countries were poor.

Now some figures of recent construction accidents in our country are given below.
37.5 °/ 32.5 ~ 12.5 °/ 07.5 °/ 10.0 °/ inn °/

Some 30000 workers were employed at one place in Gujarat constructing various plants during 1991 to 1997. The large civil construction and structural steelworks including fabrication and erection o buildings were carried out through competent contractors and sub-contractors. Safety Officers and safety supervisors were also employed exclusively for contract workers. Record of all accidents, reportable o not reportable, was maintained, studied and used in further prevention of accidents. Its summary is a under:

From March 1994 to July 1997, total fatalities were 39. Its cause-wise percentage break-up is as under :

1.	Struck by falling objects, structures, plant, mobile construction equipment etc.	37.5%
2.	Fall	32.5%
3.	Electrical	12.5%
4.	Traffic accidents	07.5%
5.	Others	10.0%
	Total	100%

Comparing above figures with the same causation figures of USA, UK, Germany, Sweden, Japan and Canada (from Safety &: Health Journal of USA - 1994), it is deduced that, all over the world, t1ie first two major causes of fatal accidents in construction activity are :

(1) Fall from height and
(2) Struck by falling objects.

Therefore safety work to eliminate these causes need first priority.

Statistics of nonfatal accidents of above mentioned construction during 1995 to 1997, gives following figures :

1. Types of Accidents - Fall from heights 15 to 22%, struck by falling objects 13 to 33%, struck by others 21 to 38%, Electric shock 2 to 7%.
2. Agency/ Activity - Material handling 27 to 41%, Work at height 14 to 21%, Hand/Power tools 10 to 12%, Fabrication & election 12 to 13%.
3. Body parts injured - Hand, Fingers & arms - 22 to 35%, Head & scalp - 16 to 18%, Foot &toe 12 to 15%, Leg & thigh 9 to 17%.

As a summary from various such records, general classification of hazards at construction can be drawn as under :

Hazards at Construction :

1. Fall of Persons - Fall from height, fall through opening, collapse of scaffold, structure failure, tripping.

   Fall from height may be due to non-use or failure of safety belt, lack of proper access, nonuse of proper ladder etc.

   Fall through opening may be due to unguarded opening or poor guarding.

   Collapse of scaffold may be due to its improper design, no toe board, no means of access. Minimum dimensions are : Board width 6", thickness I" and guard rail height 30 to 36".

   Tripping may be due to loose object/cables etc.
2. Fire : Due to welding, gas cutting, smoking, gas cylinders, scattered wooden material/ rubbish, paints/thinners, temporary shed etc.
3. Electrocution : Electric shock, burns, damaged cable, no earthing, no ELCB, no use of 3 pin plug/socket, work by non-qualified electrician etc. .
4. Material Handling : No training,- excessive weight lifting, improper or failure of lifting tackles, slings etc.
5. Transport Accidents : Untrained driver, not obeying traffic rules, reversing without signalling, over-speed, speed-breakers, poor brakes, poor lighting etc.

6. PPE : Not using helmet, safety shoes, hand gloves, safety belt, respirators etc.
7. Others : Noise, vibration, dust, gas, fumes, cave in, night work, overtime, intoxication etc.

This suggests the direction of accident prevention work in construction activity.

1.2.2 Site Planning and Layout :

In construction activities, scope of site selection is less though not zero. Mines are at fixed places and cannot be shifted. Builders or organisers generally purchase the site where land is available at low price and where .contractors and workers have to work. In a fixed factory premises, construction is to be carried out in a limited space. In dense population, construction of high rise (multi-storeyed) building needs working at height. Gutters and underground piping have fixed tracks available. Underwater work has fixed destinations and long pipelines are passed through the shortest possible distance for economic reasons. Therefore in a limited scope of site selection, planning and layout becomes most essential on .the available site.

Refer part 6 and 7 of Chapter 7 for planning, design and layout.

First, plan for the whole and then for the detail. Plan site layout, plot layout and equipment layout as per requirement. Alternate layouts should be prepared for selecting the best one. Process flow diagram and stages or sequence of work should be decided. Each work should be subdivided in steps accounting for safety precautions and responsibilities. Facilities for water, fire fighting, first-aid, tools and equipment availability, roads, vehicle movement, parking, smoking booths, sanitary blocks, creche, canteen, control room, safe entry, exit and escape route etc. should be properly planned. Topography, geology, weather, environment, separation distances, service corridors, overhead work (pipe bridges, tanks, slabs etc.), segregation etc. should also be considered. Special precautions should be encountered for working at heights or depths (See Chapter 16).

Planning, layout and designing of steel structure, tall towers, metal tanks, vessels, reactors, utilities, piping etc. need Hazop, hazard identification, risk and reliability assessment, strength and stability criteria, inventory reduction, process safety, fail-safe design, emergency shut-down procedure and emergency planning.

Appointment of safety and health personnel, trained supervisors and requirement of adequate first-aid and fire fighting facilities and personal protective equipment should be considered at the stage of planning and budgeting for safety at work.

1.2.3 Safe Access :

For the safety of workplaces and avoiding risk of injury to workers, safe means of access to and egress from all workplaces should be provided, maintained and indicated where necessary.

Section 32 of the Factories Act requires that all floors, steps, stairs, passages and gangways' shall be of sound construction and properly maintained and shall be kept free from obstructions and substances likely to cause persons to slip and where it is necessary to ensure safety, steps, stairs, passages and gangways shall be provided with substantial handrails. Safe means of access are required at all working places. To prevent fall, fencing or other devices are required.

Rule 66A of the Gujarat Factories Rules specifies access for fire fighting and requires unobstructed layout .of plants and building and doors and windows on external walls ->for easy access inside the building.

Means of access may be a ladder-portable or fixed, ramp, runway or stairway. They should conform to the code or standards prescribed.

1.2.4 Safety Work Permit & Checklist :

A format of such permit is given in Table 22.2.

Table 22.2 : Safety work permit (swp), at construction site Date :

Date : SWP No. : ___________

SWP Requested by / Issued to :			Project/ Section	Location of the work to be done	SWP issue Date & Time	SWP Expiry Date & Time
Name of the person	Designation	Company				

Description / Nature of the work	Equipment / tools to be used Tick ✓	Probable Hazards Tick ✓	
	☐ Cranes	☐ Fall of persons from height	☐ Suspended load
	☐ Chain pulley blocks	☐ Falling objects / overhead work	☐ Failure of sling/ tackles
	☐ Slings & other lifting tackles	☐ Fall below ground level	☐ Toxic dust/fumes
	☐ Electrical equipment	☐ Electrical shock	☐ Fire
	☐ Power hand tools	☐ Moving machinery	☐ Poor illumination
	☐ Others (write)	☐ Ionising Radiation	☐ Other causes (Write)
		☐ Eye injury (flying object/arc)	

Following safety measures/ precautions are necessary and have been taken / ensured. Tick ✓	Following safety measures / precautions to be taken / ensured during execution of the job. Tick ✓	Remarks / special instruction if any by issuing authority (pl. specify) viz., display of warning signs to warn against overhead hazards etc.
☐ Proper means of access (Ladders etc.)	☐ All workmen use safety helmet.	
☐ Proper scaffolding / work platform with hand rails.	☐ Workmen use safety belt & anchored properly.	
☐ Static (Rope) line	☐ Use of safety goggles and safety shoes by the workmen.	
☐ Safety net ☐ Safety belt	☐ Provision of shoring / machine	
☐ The crane is in good working condition.	☐ Guards on moving machines are in place.	
☐ The crane operator is	☐ Static lines are provided and	

competent & has licence.	used by the workmen at height.	
☐ Electrical equipment provided with proper earthing.	☐ Cordoning off deep excavation/ hazardous area with warning signs.	
☐ Power supply to hand tools thro' ELCB.	☐ Hand lamps (24V) to be used with safety guards.	
☐ Hazardous area barricaded / protected.	☐ Power supply to lighting through ELCB.	
☐ Condition /capacity of lifting tackles ensured.	☐ Specified work procedure adhered / Tool box talk given.	
☐ Specific work procedures is necessary / available.	☐ Workers possess the required skills.	
☐ Area below hazardous overhead activity cordoned off.	☐ Others (Write)	
Signature of the permittee:	Signature of the site engineer/ Permit issuing authority :	
Signature of the site engineer:	Name & designation	

A checklist for construction safety is given in Table 22.3.

Table 22.3 Construction Safety Checklist

Name and address of the Construction Company __________________ Working at __________________
Audited by __________________________ Audit date ______________

No.	Checkpoints	Comments
1	Helmets used by all	
2	Safety belts used by all during work, if height is more than 2 meters.	
3	Static lines are provided to facilitate hooking of safety belts.	
4	Safety nets are provided where scaffolds not feasible.	
5	Scaffolds are in good condition, ladders are used.	
6	Hand tools are of standard type and maintained properly.	
7	Power tools are in good condition and supply through ELCB.	
8	Grinding machines are with guards.	
9	Welding machine and cables are in good condition.	
10	Gas cylinder of cutting sets are protected from spark.	
11	Hose of cutting sets, pressure regulators and pressure gauges are in good working condition – leak free.	
12	Good insulation, earthing and ELCB are maintained in electrical installations.	
13	Cranes are in good working condition.	
14	Lifting tackles are in good working condition.	
15	Crane is operated by competent operator.	
16	Standard signaling and rigging practices are followed.	
17	Area where heavy erection is done is barricaded.	
18	Area where load is lifted or suspended by crane is	

	barricaded.	
19	Fire hazards are taken care of combustibles removed from site of hot work.	
20.	Fire extinguishers are provided.	
21.	Floor openings are protected / covered / guarded.	
22.	Procedure for critical job is available and followed.	
23.	Persons employed on job possess required skills.	
24.	Vessel entry permits are taken for confined space entry.	
25.	Safety permits are taken to work at height.	

Signature of Auditors ______________________

1.2.5 Good Housekeeping :

See Chapter-8 for details.

Good housekeeping programme should include

1. Speedy removal of scrap, waste, debris, loose and unused materials at regular intervals.
2. Proper storage of materials, tools and equipment. Removal of nails from lumber before stacking.
3. Cleaning of floors, passageways, stairs etc. to remove oil, water, dust etc. Sand, ash, sawdust and proper absorbers can be used.
4. Containers should be provided for collection and separation of waste. Flammable/ hazardous waste should be covered and safely disposed off.
5. After completion of any job, excessive materials, tools and equipment should be lifted and placed in their proper place.
6. Piles of materials should be stable and properly supported.
7. Throwing of material should be avoided. If it is to be thrown, warning signals should be given.
8. Proper painting and colour-coding should be followed.
9. At least at the beginning and end of a shift, supervisors should take round to check above points.

2 STATUTORY PROVISIONS

See Part 7 of Chapter-28 for the Building and other Construction Workers (Regulation of Employment and Conditions of Service) Act, 1996 and Central Rules, 1998 under this Act. These rules came into force from 19-11-1998. Out of 252 rules, 200 are pertaining to safety & health of construction workers and prescribe much detail. Henceforth it will be referred as 'BOC Workers Rules 1998' for brevity's sake.

The above rules prescribe for safety committees (for workers 500 or more). Safety Officer (for workers 500 or more), reporting of accidents, medical examination of building workers, occupational health centre, construction medical officer, ambulance room, ambulance van, stretchers, occupational health services, notice of poisoning or occupational diseases, first-aid boxes, emergency care services, provisions for working hours, rest interval, spread over, weekly holidays, notices and registers, latrine and urinal, canteen for workers>250 and payment of wages.

Its Chapter-VI, rules 34 to 54 prescribe for excessive noise, vibration, fire protection, on-site emergency plan (for workers>500), fencing of motors etc., excessive weight, health and safety policy, overhead protection, dust, gases and fumes, eye and head protection, electrical hazards, vehicular traffic, structural stability, stacking of materials, disposal of debris, use of safety helmets and shoes etc.

The other provisions are regarding registration, responsibilities and duties, lifting appliances and gear, runways and ramps, work on or adjacent to water, transport and earth moving equipment, concrete work, demolition, excavation and tunnelling works, steep roof, ladders, catch platform, safety belts and nets, structural frame and frame work, stacking and un-stacking, scaffold, cofferdams and caissons, explosives, piling and powers of Director General and Inspectors.

See Part 2 of Chapter-? for provisions under the Factories Act and Rules. Some provisions regarding construction of a factory, plant layout, lighting, ventilation, safety aspect and preparation of plans stated therein are useful for general construction work also.

3 INDIAN STANDARDS

The Indian Standards on Construction are most useful and must be followed. Some of them are mentioned below :

Safety in excavation 3764, scaffolds and ladders 3696 (Part I & 2), 4014 (Part I & 2), code of practice for design and construction of pile foundations 2911 (Part I to 4), blasting and drilling 4081, underground blasts 6922, demolition of buildings 4130, tunnelling work 4756, piling and deep foundations 5121, structural steel work 7205, concrete framed structures 8989, cement manufacture 12770, construction machinery 7293, handling and storage of building materials 7969, additional construction and alteration to existing buildings 13430, hazards prevention 13416 (Part I falling material hazards. Part 2 fall prevention), working in compressed air 4138, floor and wall openings, railing and toe boards 4912, wooden flush door shutters 2191 (Part I & 2), use of hot bituminous materials 5916, fibre rope slings 9944, dress divers 10291, river valley projects 10366 (Parts I to 10), sewerage system 11972, protective barriers in and around building 13415, reservoirs, guidelines for operation 7323, shallow foundation 1904, masonry walls 1905, loading standards 875, underground air raid shelter 5499, bucket elevators 7167, conveyor belting 6687, conveyor safety 7155, fire resistance test of structures 3809, fire safety of buildings (general), details of construction 1642, fire safety of industrial buildings; cotton textile mills 3079, fire safety of industrial buildings, storage and warehousing 3594, noise reduction in industrial building 3483.

Glossary of terms relating to corrosion of metals 3531, design practice for corrosion prevention of steel structures 9172, cathodic protection of steel structures 8062 (Part I to 4), fire precautions in welding and cutting 3016, approval tests for welding procedures 7307.

See Chapters 7 (Table 7.1 & 7.2), 9, 10, 12, 15, 16, 17, 18, 20, 21, 23, 24, 25 and 26 for the relevant Indian Standards pertaining to construction, building, working at heights and depths, material handling, tools, fire safety, other hazards, PPE and first-aid.

See Parts 6 & 10 of Chapter-23 for other IS. '

OSHA Safety and Health Standards for the Construction Industry (29 CFR Part 1926) may be referred for more interest.

4 CONSTRUCTION MACHINERY

Construction machinery can be classified into three categories as under

1 **Lifting Appliances and Gear :**
Pulleys, chain pulley blocks, winches, hoists, derricks, gin poles, cranes (fixed ad mobile), lifting ropes, slings etc.

2 **Transport, Earth-moving and Material Handling Equipment:**
Power shovels (excavators), bulldozers, scrapers, pavers, road rollers, pile drivers, mobile asphalt layers and finishers.

3 **Plant machinery. Equipment and Handtools**
Concrete mixers and vibrators, pneumatic compressors, pneumatic tools, cartridge operated tools, electric tools, hand tools, conveyors, crusher plants, power generators, engines and silos. ' Some salient safety features of these machines/ equipment are explained below :

4.1 Lifting Appliances and Gear :

For figures and pictures see Chapter 15.

Pulleys : Select the pulleys as per requirement. Steel and nylon rope should not be used together. Grooves should be uniform and smooth and the rope (wire or fibre) should run free. Sheaves, shafts, hooks and pins (with locking) should be checked before use and lubrication shall be provided where necessary. Sheaves should rotate freely on the shaft. The shaft should be free from any defect or crack. Worn out shafts should not be used. Anchorage should be firm and strong. Anti-twister should be used to prevent rubbing of the ropes with one another.

Chain Pulley Blocks : Refer Sec. 29 of the Factories Act. Select the lifting capacity depending on the maximum load to be lifted. Verify its test certificate. Check for slipping of load, jamming of links and free operation. The chain should not come out of pulleys. It is better to lubricate before every use. It should be tested periodically by a competent person (see Rule 60, and Form No. 10, GFR). The anchorage should be strong and rigid. It should be checked for cracks, wear and tear, elongation etc. Opened out hooks and tampered block/puller should not be used. No cannibalising should be done on chain pulley blocks.

See Chapter-Vm, Rule 55, 56, 74, Schedule-1 and Forms V to X of the BOC Workers Central Rules, 1998, for statutory details. See subsequent Part 6.5 and Part 7 of Chapter-28 for further details.

Winches : Safe working load with gear arrangement should be marked on the winch stand. A winch should be placed on a firm base, properly anchored and should not be overloaded. Brake, ratchet arrangement, gear and pinion, meshing, wire rope and its clamping, rope drum and tie rods should be checked before every use. Tie rod should be adjusted to prevent clutch arrangement to slip. Ratchet arrangement should be kept in position while hoisting a load.

See Rule 59 of the BOC Workers Central Rules, 1998, for statutory details.

Hoists : Refer Sec. 28 of the Factories Act. Design should be as per standard code. Outdoor hoist towers should be erected on firm foundation, securely braced, guyed and anchored. Ladder way should extend from bottom to top. Hoist shaft (way) should be enclosed with rigid panels or fencing at all landing platforms, access or where any person is liable to be struck by any moving part. The shaft enclosure, except at approaches, should be of 2 mt (minimum I mt) height above the floor or platform to prevent any person falling down the hoist way. Hoisting engine or motor should be capable of controlling the heaviest load. When the cage or platform reaches its highest point, it should be stopped automatically (no overrun).

Hoist platform or cage should be capable to carry the maximum load. It should have a safety gear to hold it if the rope breaks. At the ground floor coil springs should be provided to arrest any accidental fall. Cage or platform should have toe-boards or enclosures to prevent fall of material inside. Counterweights should run in guides. Interlock door should be provided where any worker has to enter the cage.

Notices of carrying capacity (weight/ persons) should be displayed.

Factory hoists/lifts should be thoroughly examined by a competent person at least once in 6 months with report in Form No. 9 (Rule 58, GFR). See Rule 65 & 78, Form VI of the BOC Workers Rules, 1998 for more details.

Derricks : They are of two types : Stiff-leg derricks and Guy derricks.

Stiff-leg derricks should be erected on a firm base to withstand the weight of the crane structure and the maximum load. Masts should be prevented from lifting out of their seating. The jib length should not be altered without consulting the manufacturer. Counterweights should be so arranged that they do not subject the backstays, sleepers or pivots to excessive strain. Electrically operated derricks should be properly earthed.

In case of wheels-mounted derricks the correct wheel distance should be maintained by a rigid member and struts should be provided to give support if a wheel brake fails or the derrick is derailed.

The mast of guy derricks should be supported by six equi-distance top guys and the guy spread angle from the mast should be less than 45° from the horizontal. The restraint of the guy ropes should be ensured by fitting stirrups or anchor plates in concrete foundations. Guy ropes should have a device to regulate tension. Pins and bearings should be lubricated frequently. When not in use, the derrick boom should be anchored to prevent it from swinging..

The derrick should be tested by a competent person and should not be overloaded. The mast, guyropes, wire ropes, swivel hook, rope clamps etc. should be checked before erecting the derrick. Welded or bolted joints/parts should be checked for crack, defect and tightness.

See also Rules 67 & 68 of the BOC Workers Rules, 1998.

Gin Poles : They should be straight, made of sound metal or straight timber without knots, of sufficient strength and adequately guyed and anchored. They should be adequately fastened at their feet to prevent displacement. Before their re-erection, the pole, ropes, guys, blocks etc. should be inspected and tested under load.

Cranes (Fixed & Mobile) : Refer Sec. 29 of the Factories Act and Rule 60, GFR.

The crane capacity should be ascertained and brakes checked before lifting a load. Mobile crane should be parked on hard soil and not near any pit or excavation.

Safe working load of any crane depends on (a) condition of the ground (b) boom length (c) inclination of boom to the vertical (d) radius of rotation while lifting the load (e) out rigger blocked or free and (f) ' operator's skill.

The safe working load should be displayed in the crane. It should be derated (lowered) due to defects in welding, bend in angle, bracing and conditions of clutch, brake etc.

Devices should be provided to prevent load being moved to a point where the corresponding safe working load of the crane would be exceeded.

Standard signalling code, understood by the operator and trained signalman, should be followed. See Fig. 15.1 of Chapter 15. The crane operator shall respond to signals only from the appointed signaller, but shall obey a stop signal from anybody.

Tag lines should be used while hoisting heavy and bulky load. The crane and its parts (brakes, boom, hook, wire ropes, pulleys etc.) should be checked regularly and maintained in good condition.

The load should not touch the boom and the boom should not touch any live electric line or structure. Quality of packing should be checked before lifting. Nobody should stand below the boom or load. The operator should be able to see the hook and the load, should keep his windshield clean for clear vision and deck clean of any oil, mud or dust.

When the hooks are lowered to the lowest point, at least two dead coils should remain on the rope drum. Makeshift methods to increase the capacity of a crane are unsafe.

During storm, the hook block should be anchored firmly and swing lock be released. At the end of work, the load should be removed from the hook and the hook should be raised to the maximum height.

The mobile crane should have horn, head lights, side lamps, rear and stop lights and flashing direction indicators. Jib crane should keep the job lowered while travelling without load.

While travelling up a slope, the load radius should be decreased and while travelling down, that radius should be increased. Constant watch on the radius is necessary while travelling on uneven surfaces.

Air pressure in the tyres should be equal, otherwise tilting is possible. .

While operating tower cranes, wind loads should be considered and trained operators should be employed to sit in cabs at height. Wind speed indicator should be provided in the driver's cab.

Where two or more cranes work side by side, direct communication system should be provided in the cab to alert the other driver about danger zone. Minimum distance between two approaching cranes should be maintained by limit switches.

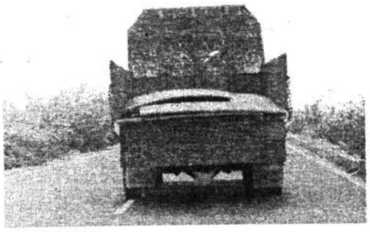
See Rule 57, 58, 63, 64, 74, 80 & 81 of the BOC Workers Rules, 1998 for other details.

Lifting Ropes, Slings etc. : Safe working capacity of the lifting ropes must be known beforehand. Ropes, slings, rings, shackles, tackles, chains, hooks, swivels etc. should be installed, maintained and inspected as per Sec. 29 of the Factories Act and Rule 60, GFR. Repaired ropes should not be used in hoists.

Where multiple independent ropes are used to lift a load, each rope should be capable of carrying tile load independently.

See also Rule 71 of the BOC Workers Rules, 1998.

4.2 Transport, Earth-moving and Material Handling Equipment:



All vehicles and earth-moving and material handling equipment should I have following general provisions.

They should be of good design, sound material and construction, adequate strength and maintained in good working order. Principles of safety and ergonomics should be considered in design and operation.

Operators/drivers should be well trained, medically examined, physically fit and above 18 years of age. They should be competent, reliable and follow the signalling code. Help of authorised signaller must be taken while driving backwards or the view is restricted. They should be protected against weather, dust, load being lifted and possible accidents.

All vehicles should be equipped with proper lights, horns, silencers, power and hand brakes and reversing alarm. Their motors, engines, brakes, gears, chassis, blades, tracks, wire ropes, sheaves, transmission parts and pneumatic, hydraulic systems should be checked daily before use.

The vehicle or machine should not be left unattended with the engine running. Deck plates and steps should be kept free from oil, grease, mud etc. The cab should be kept at least I m away from a face being excavated. Bucket excavators should not be used at the top or bottom of earth walls with a slope exceeding 60°. Gross laden weight, tare weight, maximum axle weight and ground pressure in case of caterpillar should be indicated.

When not in use, the boom should be in the direction of travel and scoop, shovel or bucket be raised and without load. Safe parking place should be provided where more vehicles have to work. Nobody should be allowed to rest or sleep under the vehicle.

Power Shovels (Excavators) : They should be equipped with emergency stop device and two independent locking devices for brake pedals. The bucket teeth should not come nearer the boom than 40 cm. Safe working load of the lifting gear should be displayed in the cabin and its indicator should be fitted. The boom should be prevented from swinging during transport. The boom should not be pulled tight against the emergency stop while supporting a load. The wire ropes should be of specified diameter and construction. The safe operating radius shall not be exceeded.

The shovels should be so operated as not to loose their stability. The driver should see that no person is under or near the raised bucket or grab. When not in use, the bucket shall be kept resting on the stable ground and not hanging. Truck to be loaded should be stationed at 60 cm. or more from the excavator even when it turns. Earthing and fire extinguisher should be provided where necessary.

Bulldozers : While moving uphill, the blade should be kept low. The blade should not be used as brake except in emergency. The blade suspension arrangement, wire rope or hydraulic system should be inspected weekly.

At the close of work, the bulldozer should be left on level ground and before leaving it, the operator should apply the brakes, lower the blade and ripper and put the shift lever in neutral.

Scrappers : The tractor and scrappers should be connected by a safety' line when in operation. Scrappers moving downhill should be left in gear. Scrapper bowls should be propped when blades are being replaced.

Pavers : Guards should be provided to prevent workers from walking under the skip.

Road Rollers : The land should be checked for bearing capacity and general safety before using a road roller. While moving downhill the engine should be in gear. When it is not in use, the brakes should be applied, the wheels should be blocked, the contact should be switched off and the engine should be in bottom gear if the roller is facing uphill and in reverse gear if it is facing downhill.

Pile-drivers : All pile-driving equipment should be of good design and construction and properly maintained. Ergonomic principles should be considered. Pile-driving should becarried out under the supervision of a competent person. Underground services should be located and rendered safe before starting piling. Pile drivers should be firmly supported on sound foundation. If necessary, they ' should be guyed also. If two pile-drivers have to work nearby, they should be separated by a distance at least equal to the longest leg.

If electrical conductors are in proximity, they should be made dead. When leads have to be inclined, they should be counterbalanced and tilting device should be secured against slipping. The hoses of steam and air hammers should be securely lashed to the hammer so as to prevent them from whipping if a connection breaks. Overturning of a pile-driver has to be prevented. Out coming of the rope from the top pulley or wheel and missing of hammer from the pipe should also be prevented.

Pile lines and pulley blocks should be inspected before the beginning of each shift. Only trained operators should be employed. Use of suitable signals, ear protectors and safety helmet is necessary. Piles should be prepared at a distance at least equal to twice the length of the longest pile from the pile-driver. When not in use, the hammer should be blocked at the bottom of the leads.

When pile-drivers are working over water, a suitable boat should be kept readily available at all times. Whistle, siren, signals, fire fighting equipment and sufficient sheaves should be provided, the weight of machinery should be evenly distributed and watertight compartments should be provided with siphons to remove water seepage.

Mobile Asphalt Layers and Finishers : The mixer elevator should be within a metal enclosure with a window for observation, lubrication and maintenance. Bitumen scoops should have covers. The sprayer should have fire resistant shield with an observation window. Non-foaming products are preferable. Reflective jackets should be provided to workers working on public roads.

The fire extinguishers are necessary near spreader and others in readiness. No naked flame should be used to see the level of asphalt in the tank. Thinners should not be heated on open flame. Inspection doors should not be opened if there is any pressure in the boiler.

If a burner flame is extinguished, the fuel supply should be cut off and the heating tube should be thoroughly blown out by the fan to prevent backfire.

See Chapter-X, Rules 88 to 95 of BOC Workers Rules, 1998, for statutory details of the above equipment.

4.3 Plant Machinery, Equipment and Hand Tools :

For figures and pictures see Chapter-17.

All such machinery, equipment and tools should be of good, ergonomic and safe design, maintained in good working order and operated .by trained operators with necessary personal protective equipment. Safety instructions from manufacturer and safe operating procedure should be followed.

Power driven equipment should be properly earthed, stop switch provided in close proximity, adequately guarded, speed regulated and when not in use, switched off (de-energised) and isolated before any major adjustment.

Concrete Mixtures : All gears, chains, rollers and open revolving blades should be guarded or fenced. Hopper should be protected by side railing to prevent workers from passing under the skip. Hopper hoisting wire rope, brake, skip hoist clutch and blocking (fixing when raised) device should be checked and adjusted regularly. Double earthing and insulation of electrical part is necessary. Before allowing a person to enter the drum for cleaning or repair, electrical connections (fuses) should be removed.

Concrete bucket towers and masts with pouring gutters or conveyor belts should be erected by competent persons and inspected daily. The winch operator should be able to see the filling, emptying and lowering of bucket, otherwise a banks-man should direct the operator. Guides for bucket should be correctly aligned to prevent the bucket from jamming in the tower.

Structure or scaffold carrying a pipe for pumped concrete should be strong enough (factor of safety 4 or more) to support a filled pipe and all workers on it. Such concrete carrying pipes should be securely anchored at the ends and at curves, provided at top with air release valves and securely attached to the pump nozzle.

Concrete Vibrators : Vibrating unit should be completely enclosed and belt be guarded. Electrical vibrator should be protected by overload relays and earthed. Cable length should be sufficient. Needle load should be firmly locked. Needle inner core should be lubricated.

See Chapter-XI, Rules 96 to 107 of the BOC Workers Rules, 1998 for Concrete Work.

Pneumatic Compressors: Testing by a competent person is necessary. Air receivers should be equipped with a .safety valve, pressure gauge, drain cock and openings for inspection and cleaning. It is safer to provide a PRV, a stop valve and an oil separator between the air receiver and the compressor.

Compressors should be equipped with an automatic device to control the safe discharge pressure,, a quick release valve and suitable arrangements to prevent or remove contamination in a confined space. Where explosive gas mixture may be formed in compressor, it should be protected against sparking.

Water flow should be ensured in water-cooling jackets. Inter and after coolers should be able to withstand the maximum pressure in the air discharge piping. Such piping should be provided with a fusible plug and insulation to protect workers against burns and fire risks.

Where stop valves are installed in air-discharge piping, they should be easily accessible for inspection and cleaning and one or more safety valves should be installed between the compressor and the stop valve.

Pneumatic Tools : Operating triggers on portable pneumatic tools should be so placed as to minimise the risk of accidental starting of the machine and so arranged as to close the air inlet valve automatically when the pressure of the operator's hand is removed. Air hoses and their connections should be equipped with safety clips or retainers to prevent dies and tools from being accidentally expelled from the barrel. Before any adjustment or repair, power should be disconnected and pressure in hose lines be released.

Cartridge-operated Tools : Preferably low velocity tool should be used. Such tools should have a cover (guard) which cannot be opened without rendering the tool inoperative, devices to prevent from accidental firing, to prevent firing if the muzzle is not pressed and to prevent firing if it is not perpendicular to the working surface.

The recoil should not be capable of injuring the user. The tool should be inspected for all safety devices and to see that the barrel is unobstructed.

Cartridge-operated tools should not be stored or operated in explosive atmosphere. When not in use, it should be kept in its special container for the purpose of safety.

Electric Tools : Portable electrical tools' should be operated at low voltage and with ELCB to avoid risk of shock. The tools should be properly earthed with metallic cases. All insulated or double insulated tools need not be earthed. Periodic inspection and maintenance should be carried out by a competent electrician. Proper fuse and insulated handle are necessary.

Hand Tools ; They should be tempered, dressed or repaired by a competent person. Cutting edges should be kept sharp. Heads of hammers and other shock tools should be dressed or ground as soon as they begin to mushroom or crack. When not in use or while carrying or transporting, they should be kept in suitable containers.

Insulated or non-conducting tools should be used near live electrical installations. Non-sparking tools should be used near flammable vapours.

See Part 3 of Chapter-17 for more details.

Conveyors : Conveyors should be smooth running. Nip between tight belt and pulley/roller and other transmission parts should be guarded. If they are not entirely enclosed, at cross over places, bridge with hand-railing should be provided. Emergency stop-devices (e.g. cord or cable) should be easily accessible. Stop buttons should be provided at drive and take-up ends. Where two or more conveyors operate together, control devices should be so arranged that no conveyor can feed on to a stopped conveyor. When a conveyor is discharging into a bunker or hopper, the feeding conveyor should be provided with an overload switch.

Screw conveyors should always be kept covered. The cover should not be opened without stopping the conveyor.

See Part 3.6 of Chapter-15 for more details.

Crusher Plants : They should be located away from construction area to keep away dust, sand, gravel, noise and vibrations. Extra isolation switch should be provided to prevent accidental starting during repair or maintenance. Electrical motors, switches and instrumentation should be dust and moisture proof. Access roads to the crusher hopper and screens should be cleaned by water spraying. Power cables should be laid underground or at safe elevation. All equipment, plant and machinery should be cleared daily of dust and sand.

Power Generators: They should be housed in a concrete room or insulated area to minimise noise effects. Silencers and exhaust pipes should be provided. Extra isolation switch should be provided to avoid accidental starting during maintenance.

Engines : Maximum safe speed should not be exceeded. Remote control device should be provided to stop or limit the speed. For internal combustion engines, exhaust ventilation should be provided and while fuelling, spark should be avoided and fire extinguisher should be kept ready. Secondary fuel tank should be provided outside the engine room.

Silos : Silos should be erected on sound foundation and capable of withstanding stresses without any deformation of walls, floors and other load-bearing parts.

Safe means of access (stairs, fixed ladders or hoists), quantity/level indicator, notices, blockage remover and fire extinguishers should be provided.

In silos where explosive mixtures are possible, all electrical equipment and hand lamps should be flameproof, non-sparking tools should be used and explosion vents should be provided in the walls at safer points.

Before allowing workers in a silo, work permit should be made, charge (filling) opening should be closed and safety belt with lifeline in the hands of another person outside, should be provided if they have to work on loose material.

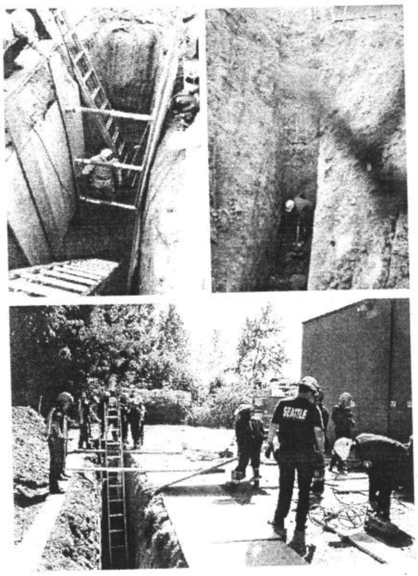
5 UNDERGROUND WORKS

Underground work includes excavations in surface soil or rock, drilling, blasting, trenching, shoring, strutting, tunneling, piling, shaft finking, haulage and underground pipelines. It requires due considerations of underground lighting, ventilation electricity, dust control, inrush of water, oil or gas and continuous safety of people at work. Some provision are explained below:

See Chapter-XIII, Rules 119 to 168 of the BOC Workers Rules, 1998, for excavation and tunneling works including warning signs and notices illumination, stability of structure, pilling, shoring and bracing, safe access, trenches, tunnelling operation shafts, pneumatic tools, inflammable oils, coupling an hoses, storing of oil and fuel underground, use of gases underground, water for fire fighting, flooding, steel curtains, exposure limits of chemicals, ventilation, a locks, man-locks, medical lock, emergency generated etc.

Similarly see Chapter-XXIU, Rules 214 to 222 (the same rules for piling.

5.1 Excavation:



Foundation or underground support is required for most of the constructions and method of reaching earth or rock stratum suitable for foundation is excavation. It may be with or without dewatering the site and out of many methods a suitable method of excavation should be selected.

General precautions for any excavation or underground work are : survey of hazards of fall of persons, soil, material etc., inrush of water, oil, gas etc., adequate lighting and ventilation to supply fresh air inside, controlling gas, vapour, dust etc. within safe limits, fire precaution, safe means of access, stability of the ground, position of public utility services such as electric or telephone cables, water, gas or sewers line etc., effect on adjoining building, structure, roadways, bridges etc. A competent person should make this survey and give permission to work.

If necessary, isolation of underground utility services should be effected by due permission or otherwise be protected. Chemical waste and contamination should be safely removed.

No load, vehicle or material should be moved or stacked near the edge of excavation unless shoring or piling is done to prevent the sides from collapsing. All support work such as props, wedges etc. should be regularly checked for deflection or distortion. All sides should be fenced by barrier at least up to 1m and a danger notice and red signal and light be provided.

Sides of all excavation must be sloped to a safe angle not steeper than the angle of repose of a particular soil. See Table 21 of Chapter 32 for such angle of repose.

Cutting shall be done from top to bottom. No undercutting of side shall be allowed. In narrow trenches a ladder should be extended from bottom to top and I m above the ground surface. Erosion of soil over excavated pits, trenches etc. should be prevented from running water by dewatering pumps etc. Road barrier at a distance should be provided if road is to be blocked. Helmets and gum-boots should be given to all workers working inside.

In large scale excavations for dams, huge buildings, highways, railways etc., accidents occur mostly due to the vehicles, dumpers, trucks etc. Therefore such vehicles must be checked for warning sirens, horns, lights, signals, reverse alarm etc. Rules of driving should be enforced. Sufficient lighting should be provided for night work.

5.2 Drilling, Loading and Blasting:

Drilling and loading are required before blasting.

Before starting drilling, any presence of unfired explosives should be carefully checked. No drilling should be allowed in the butts of old holes. Before drilling, loose or disintegrated rock should be removed by hand tools or pneumatic jack hammers to protect drillers against falls of material. Where this is not possible, a protective canopy or overhead screen should be provided.

Holes are drilled by pneumatic hand-hold drills to a specific pattern. Compressed air hoses should have self locking couplings. Drillers should wear helmet, hand gloves and gumboots.

After checking the drilling pattern and depth, the drilling crew is withdrawn from the site with all drilling equipment and accessories. The blasting foreman will check all the holes to be loaded by explosives and detonators for blasting. Transportation, storage, handling and use of explosives are governed by the Explosives Act and Rules. See Part 3.3 & 3.4 of Chapter-28. No smoking or open flame is allowed in explosive loading area. All the workers from this area are withdrawn to a safe place. Only suitable battery lamps should be used during loading shot holes.

No holes should be loaded except those which are to be fired in the next round of blasting. Holes loaded during one shift should be fired in the same shift. Diameter of the hole should be at least 3 mm more than the dia of the cartridge. To avoid misfires, the detonator should be completely inserted length-wise in the cartridge and fastened in such a manner that it cannot be pulled out accidentally. The cartridges are not forced into the holes. Cap crimpers of proper design should be used for crimping the blasting caps into fuse. A knife or teeth shall not be used for this purpose. Intensity of charge to be loaded must be well calculated and safe enough to prevent damage to nearby structures due to shock and vibration resulting form explosion.

Tamping of cartridge in the hole is done by a wooden (or non-sparking metallic) stick gently. If dynamite is to be removed from cartridge, loose dynamite should not be tamped. Primer -shall never be tamped. During tamping care should be exercised to avoid injury to fuse or cap wires. The holes are filled with clay and sand sticks at the top. Detonators' wires should not be damaged or pulled out.

Then the continuity of the entire circuit is checked by a blasting circuit tester and the resistance of the circuit is also measured. No other electric circuit should be allowed in that area or it should be de-energised. Radio, TV and Radar transmitters can detonate electric cap. Hence minimum safe distance should be maintained. The lead wires are connected to the exploder whose firing switches are kept 'open', locked and keys with the blasting foreman. The surplus explosives/detonators are returned to the magazines.

Then follows the warning procedure. 'Warning' and 'All clear' signals should be established and made known to all concern. Trained persons are posted at all approaches with red flags to stop all traffic and by passers.

The blasting foreman, then, sounds a warning siren to drive away all persons from the danger area and not to allow anybody to enter in the blasting area. After being satisfied with the readiness of blasting, the blasting foreman will fire the shots by closing the switch of the exploder. After dispersion of gases and dusts, the foreman will return to the area and check for any misfire.

Misfire can be minimised by using good quality explosives, testing each electric cap with a blasting galvanometer before loading or by testing the complete circuit before firing. The safest way to deal with misfire is to re shoot it by new primer. If there is no misfire, then he gives 'All Clear' signal and allows the removal of blasted materials. Loose rock should be scaled down.

Haulage i.e. pulling and shifting of material after blasting is carried out manually or mechanically. Vehicles (train or trucks) should have head-lights, tail-lights and loud horns. Hauling by winch should be done under the supervision of a competent person. Workers should not be transported along with the material.

Blasting record should be maintained. Date and time of blast, number of holes, type of explosives and detonator used, amount of charge per hole, firing pattern and sequence should be recorded.

5.3 Shoring and Underpinning:

Shoring and underpinning are required to stop settlement of a weak foundation, to strengthen the foundation to carry added loads, to provide support because of adjacent operations and to prevent deterioration of the foundation materials.

Shoring refers to removal of temporary supports after completion of job and underpinning refers to providing permanent supports which remain in place even after completion of job.

Shoring requires skilled workers and cordoning off the area due to hazardous nature of the job. It is to be carried out under constant supervision and control of qualified and experienced engineer. The jack, needles and temporary supports should be of adequate capacity and strength to raise the structure.

Types of shores available are raking, flying, needle beam and post. The shores and needles to be underpinned must be designed to withstand the anticipated load.

Underpinning is useful to stop settlement of the structure, or to give more support by new foundations to withstand added load of the structure. This work is to be done rapidly, in a limited space and with great care, to the existing structure. Adequate lateral bracing helps obviate the need of underpinning interior walls or columns.

If damage results during underpinning and repairs required, it is best to wait till all settlement and lateral movement are ceased.

Generally two methods are available for underpinning - the pit method and the steel cylinder or caisson method. The pit method is used where new foundation is not to be very deep. In the other method, the steel cylinders of caissons are placed under the existing footings and sunk to the rock. Skilled workers are required due to restricted availability of working space and headroom. The shoring of the column is removed at the end.

5.4 Tunnelling and Shaft Sinking:

Tunnels are required for road-ways and railways through mountain, hydro-power station underground, irrigation of water, drainage, mining of minerals, storage of hazardous Wastes and defence installations (underground shelter) etc.

Tunnelling may be in soft ground (clay, sand, gravel or soft earth) or in rock. Soft ground tunnelling is carried out by fore poling, needle-beam and timber, liner plates, shield and liner plates and plenum process or compressed air-lock. Rock tunnelling is carried out by drilling, blasting, mucking or by machines which may be full face boring machine or the header with rotary milling head on a telescopic boom.

Safety measures include well maintained equipment and tools, their testing by competent persons, speedy removal of debris, refuse and trash, safe and adequate walkway, proper drainage and water pumping if required, good lighting, use of helmet, gumboots and goggles by the workers, jumbo platform with guard rails and toe-guards to work near the entire face of the tunnel to be drilled, pneumatic drills with pusher legs, wet drilling for dust control, pneumatic coupling with self locking couplings, separate transport vehicles for explosives and detonators and their separate magazines, safe handling of explosives and detonators, avoidance of spark, no smoking in explosive area and all precautions mentioned in foregoing Part 5.2 for drilling, loading, blasting and haulage.

After blasting, rock falls can cause major accidents. Therefore inspection of walls and roofs, scaling of loose rock, bolting and supporting of weak spots, checking of weak seams and planes by a hand hammer and supporting of roof and sides are essential.

Mechanical loading of muck and haulage are required for speedy construction in tunnel. Muck (dirty thing) cars should be loaded evenly and not piled above the sides. Vehicles in tunnel should not run overloading and overspeeding. Rail-tracks should be safe and sound. Smokeless locomotives should be used. Dump cars should be with locking device to prevent accidental tipping.

When tunnelling is done through a shaft (vertical rod or stem), the tunnel musk is hoisted through die shaft and brought to surface for disposal. Hoisting machines should have automatic brakes to stop and hold the conveyance (cage or car) if the hoisting power fails. It should have a depth indicator. Rules for hoist/lift should be followed as mentioned in foregoing Part 4.1.

Mechanical ventilation is necessary in all tunnelling work to supply fresh air to the working crew and removal of dust, fumes and gases including methane, CO, etc. Rock dust containing silica and quartz may cause silicosis. Ventilation ducts should be airtight and should have reversible duct blowers to operate in both directions.

The tunnels are lined with plain or reinforced concrete or steel forms to support the surfaces and to prevent any rock fall. Scaffolding carrying pipeline of pumped concrete should be strong enough. The workers should wear face shield or safety goggles.

Safety precautions for shaft sinking are mostly same as stated above. The shaft which is not sunk through solid rock should be cased, lined or otherwise made safe. Workers should be provided with cradles from which they can work safely. The shaft top should be protected by fencing or guard-rails, toe-boards and gates. Means of escape and ladder from bottom to top should be provided in addition to any mechanical means of ingress and egress. Winches at shaft tops should provide easy replacement of bucket. All landings in shaft should have gates that close the opening to a height of at least 2 mt.

All shafts of over 30 mt in depth should have an adequate head frame strong enough to withstand the maximum load. It should be open steel work, fire resistant and protected against lightening.

Shafts should have a signalling system that warns the hoisting man when a conveyance passes beyond the safe limit of travel. The signal code should be posted in the hoisting machine room and at each landing.

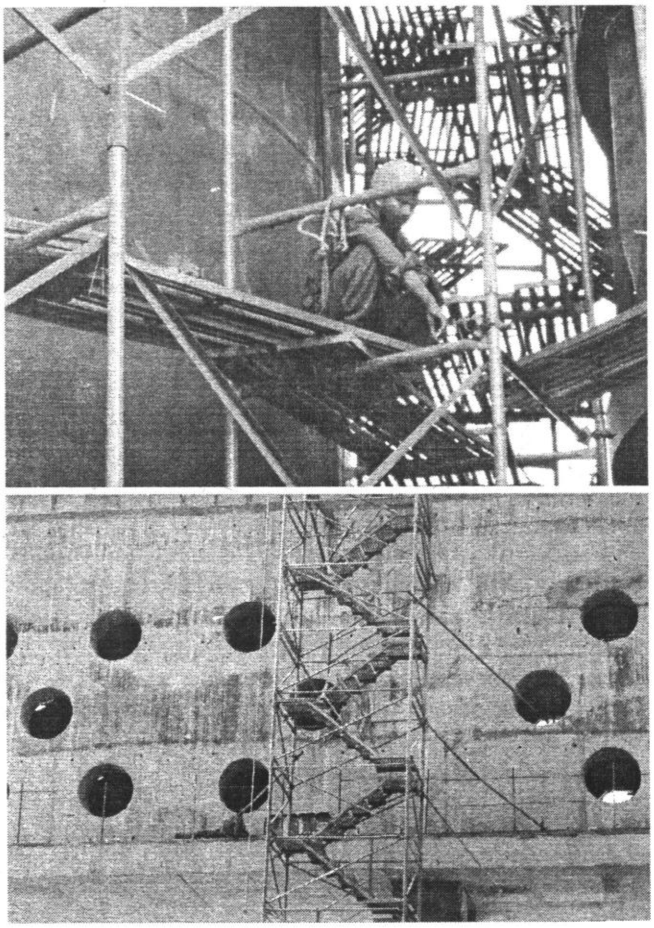
No combustible material or structure should be allowed within a shaft, tunnel mouth, engine house or fan house. Lubricating oils, grease and rope dressings should be kept in closed metal containers and away from shafts. Electrical installations in shafts and tunnels should comply with rules and regulations. Lightening arresters should be provided on the surface. Emergency lighting to function for a long time (to escape safely) should also be provided.

6 ABOVE GROUND WORKS

Most of the construction works in the form of concrete, steel, wood or mixed structure are found just on the ground. Basic requirements to work at height as the work proceeds, are scaffolding, ladders, staircases, centring, formwork, wall and floor openings, structural steel work and machinery and equipment for the movement of material and men.

6.1 Scaffolding, Ladders and Staircases:

For figures and pictures see Chapter-16.



See Chapter XV, Rules 172 to 174 for ladders and Chapter XIX, Rules 188 to 205 for scaffold, of the BOC Workers Rules, 1998. See Part 7 of Chapter-28 for their details.

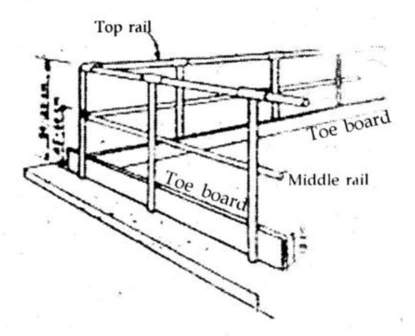
6.2 Structural Frames, Formwork and Concrete Work

All such works require trained workers and the supervision of qualified and experienced engineer. Temporary work (formwork, slip form, shuttering, false work, shoring etc.) should be safe enough to withstand loads on it and working platforms, ladders, bracing etc. can be attached to it. Safety of workers from temporary, unstable- or weak structure has to be foreseen.

See Chapter XVII, Rules 181 to 185 for structural frame and framework and Chapter XI, Rules 96 to 107 for concrete work of the BOC Workers Rules, 1998. See ' Part 7 of Chapter-28 for their details.

6.2.1 Erection and Dismantling of Steel and Prefabricated Structures

Safety of workers should be ensured by providing sound scaffolds, platforms, ladders, gangways, boatswain's chairs, safety belts, fall arrester nets and lifting appliances including power driven mobile working platforms. All such platforms must have safety railing (at least 1 mt high), hand rails and toe-boards. Free end of the safety belt must be tied with a fixed and strong support. Helmets, goggles, gloves, aprons and other equipment should be worn by the workers. Floors, stairs and platforms should be dry, clean and non-slippery. This can save many injuries.



Hooks for lifting and transporting prefabricated parts or material should be of self-closing type and withstand load and stresses. Precast concrete parts should be allowed to set and harden for its full strength. Stores and racks of steel and prefabricated parts should be on firm ground and so arranged as no part should fall or overturn. Lifting appliance should be suitable and tested at 20% more load. Tongs, clamps etc. should be capable of securing grip and marked with maximum permissible load. Lifted structure and wall units should be so placed that they do not fall by wind, jerk or other factors.

Adequate instructions should be given to the workers for safe erection. If due to high wind, rain, snow or reduced visibility, it becomes unsafe to work, the work should be interrupted. Parts to be erected at a greater height should be assembled on the ground. While lifting prefabricated parts, area underneath it should be barricaded. Steel trusses being erected, should be firmly shored, braced or guyed until they are permanently secured in position and no workers should be allowed to work under them at that time. A boom or any moving part of a crane (including the load lifted) should not touch such trusses. In absence of such precautions, six workers died in one accident 'when trusses fell down on workers working underneath. No load-bearing structural member should be weakened by cutting, drilling etc. Open-web steel joints should be directly placed in position and secured against dislodgement.

6.2.2 Cast-in-situ Concrete Structures :

The planning of construction of cast-in-situ, large span and multi-storey concrete structures should provide information on specifications of materials to be used, methods of safe placing and handling, reinforcement design and load-bearing calculations. During construction, a daily progress report should be maintained, stagewise erection procedure should be prescribed, defects watched continuously and loads should not be dumped or placed on setting concrete.

6.2.3 Wall and Floor Openings :

Walls should be on sound footing, perfectly vertical, properly joined and of sufficient thickness for strength and load-bearing. Brick joints should be properly aligned, cemented and pointed if required. Plastering and colour coating give extra protection. Support of the wall under construction should not be taken but a scaffold should be used. Doors, windows, ventilators and other openings in walls should be, provided as per requirement and drawing. As per Rule ISA, GFR, they should be at least 15% of the floor area. Bottom of a window should begin within 1 mt from the floor.

Floor construction uses a variety of material depending on choice. Earth filling with cement or cement concrete is necessary for strength. Wooden planks, steel grate (grill) or plates, tiles, stones, marble, cement concrete, asphalt etc. are some of the flooring materials.

Floor openings are required for erection of hoist or lift way, tank, vessel or reactor, piping etc. Till these floor-gaps are not occupied by their proper fittings, they pose danger of falling from height. Therefore Section 33 of the Factories Act requires that all such floor openings should be securely covered or fenced. If any gate is provided at any landing platform, it should be kept locked (not simply closed and openable) when any person has to work near it. In absence of such unlocked gate, a worker- fell from a 30 mt height and died on the spot.

Temporary floors should be securely covered with close planking or other covering until it is replaced by a permanent floor. Parts of protection should only be removed to the extent required for the progress of the work. In skeleton steel structures, permanent floor filling should be installed as the erection progresses.

6.2.4 Formwork and Slip forms:

Tubular steel frames used as staging to support concrete form-work should have a safety factor of at least 2 and be used as per manufacturer's recommendation. Struts and/or diagonal braces must be in proper position and secured for frames to develop full load carrying capacity. As erection progresses, all connecting devices should be in place and fastened for full stability of joints and nuts. As height increases above two tires, suitable planking should be used as a working platform. During concrete pouring operation, staging system should be constantly watched and corrected if necessary.

Concise procedures to cover all stages of work should be prepared and supervised by a competent person. Foundations should be checked for ground conditions. Drawing or sketch for shuttering should be explained to workers. Shoring should be provided for support and should not be removed until authorisation and the concrete has acquired sufficient strength. Shoring should be braced or tied together to prevent deformation or displacement. Mechanical, hydraulic, pneumatic or vacuum lifting devices should have automatic holding device in case of power failure.

Workers placing reinforcement rods and unloading concreted above the slipform platform should wear safety belts and lanyards to protect from falling. Slipform floor where reinforcement rods are being lifted should have temporary barricades. While lapping/ joining vertical reinforcement rods, the projections should be tied to prevent their falling off inadvertently.

6.3 Structural Steel Work and Erection:

A fabrication yard should be well away from a rail-track, road, overhead transmission, lines, boiler house and source of ignition. While unloading structural steel wagons or trucks by crane, wheels should be made stationary by fixing wedges and nobody should stand under a hanging load. While putting heavy structure, supports (props) should be given to prevent toppling. At both ends of a gantry crane, stoppers should be provided. Leather gloves, goggles etc. should be used as per requirement. Portable tools should have guards, proper fuse, earthing and ELCB in power connection. See Part 6.2.3 of Chapter11.

In erection work load should be ascertained for centre of gravity and its transfer at the slinging point. Lifting machines, ropes, slings, tackles etc. should be checked for its good working order and safety. Eye bolts should be provided at correct slinging points while lifting heavy machinery such as motors, turbines, generators etc. No sling should be overloaded. Signalling code should be known to all. Proper tag line should be used for guiding while lifting loads.

Stack of structural members should be such that light members should be at the top and in sequence of erection and not in a position to roll down or slide while handling. Clear passages, should be allowed. Hands should not be jammed against any object. Bolts, nuts, tools etc. should be kept in boxes and not loose on the structure. Vertical column should be tied by 4 guy ropes and only after bracing or fixing, the ropes may be removed one by one. Precautions in placing trusses are explained in foregoing Part 6.2.1. CGI sheet should be lifted manually by proper system. It should not fall. They should be kept tied on top and bolted or stitched ultimately.

6.4 Welding and Cutting Operations :

See Part 7.1 of Chapter 20, and Schedule 24, Rule 102 of the Gujarat Factories Rules.

6.5 Lifting Machinery and Equipment:

For figures and pictures see Chapter-15.

See Part 3.5 of Chapter 15, and also foregoing Part 4.1.

See Chapter VII, Rules 55 to 81 including Schedule 1 and Forms V to X, of the BOC Workers Rules, 1998, for statutory provisions of lifting appliances and gear. This chapter prescribes details of construction and maintenance of lifting appliances, their examination, automatic safe load indicators, winches, buckets, safe working load, operational safety, hoists, means of access, derricks, ropes, heat treatment, vacuum and magnetic lifting gear, attachment of loads, tower cranes and qualification of operator, signaller etc. See Part 7 of Chapter-28 for their details.

7 UNDERWATER WORKS

Work under or over water is required for deep foundation, well sinking, river dredging, underwater pipelines, tunnelling, concreting, cofferdam, floating structure and special operations pertaining to irrigation and marine purposes.

7.1 General Provisions:

Main safety measures necessary are (1) to prevent workers from falling into water (2) to rescue them in the event of drowning and (3) safe and sufficient transport and life saving equipment.

Life buoys, life jackets, manned boats, fencing, safety nets, safety harness and protection from reptiles and other animals are also necessary.

Bridges, footbridges, pontoons, walkways, gangways and workplaces should possess sufficient buoyancy, strength and stability, be wide enough to allow safe movement of workers, free from nails, bolts, knots and tripping hazards, boarded over, lighted sufficiently, be provided with life saving equipment, toe-boards, guard-rails, hand ropes etc., be kept clear of tackle, tools and other obstructions, be made nonslippery by spraying sand, ashes etc., be anchored to prevent run away, be provided with ladders with safety hoops.

Floating structures should have shelters, lifelines, gaffs, ring buoys. Rafts (logs), if used, should be strong enough to carry loads, securely moored and have safe means of access.

Iron decks should be studded with non-slip surface and deck openings should be fenced. Floating pipelines should have safe walkway. No person should enter a hydraulic dredge gear room without informing the leverman and without being accompanied by a second person. Hoist lines, drag lines, buckets, cutter heads .and bridles should be inspected daily. Workers should be embarked and disembarked only at safe and suitable landing places and counted regularly.

7.2 Boats:

Boat used to transport workers by water should comply with legal requirements if any. It should be manned by an adequate and experienced crew and be equipped with life-saving appliances.

The number of persons that can be transported safely should be marked as clearly visible and no more person than that must be allowed.

Tow-boats should have a device to quick release tow-rope. Power driven boats should carry suitable fire extinguishers. Row-boats should carry a spare set of oars. Rescue boats should be properly constructed and of sufficient length and beam to afford stability. For work in tidal waters or fast flowing rivers a powerdriven craft should be provided with a fixed selfstarting device on the motor. When not patrolling, their engines should be run several times a day to ensure full efficiency.

7.3 Rescue and Emergency Procedures:

Buoyancy-aid like life-jackets should be provided to rescue crew. Operatives should not work alone and they should be trained for emergency procedures.

Rule 36, BOC Workers Rules, 1998, requires emergency action plan to handle emergencies like drowning of workers, sinking of vessels, fire and explosion, collapse of lifting or transport equipment, building, shed, structure etc., gas leakage, spillage of dangerous goods, land slide, floods, storing etc. It should be approved by the Director General.

7.4 Well-Sinking:

Shaft-sinking operation for digging well or tunnel pose various hazards like wet and slippery footing, cramped working space, insufficient lighting, unknown weakness in rock or soil, handling of explosives and detonators, hoisting and haulage of muck and accidents due to machinery and mistakes in working methods. Dewatering pumps, shoring machine guarding and control devices, use of personal protective equipment, training and supervision are useful remedial measures. 7.5 Cofferdam:

Underwater excavation is carried out by (1) Pumping out the water if inflow is not excessive (2) Isolating the site by a cofferdam (temporary bund) (3) Sinking caisson (box) with or without compressed air or (4) Chemical consolidation.

The cofferdam is a temporary structure to exclude water from water-logged soil, river or the sea to enable the excavation and construction to be carried out in the dry. The cofferdam can be made out of earth, concrete, sheet piles or sheet cell.

The earthen cofferdam is possible in shallow water with low velocity of current. The earthen bank is constructed 1 mt of the top water level. Due to water seeping and leaking such dam can fail. Therefore constant watch is necessary.

Sheetpiled cofferdam can be constructed by using a floating structure with machinery and crew. All members of floating 'pile-driving crew should be trained to handle boats. The interlocking sheet piles and bracing in a cellular form are placed through water. Fuel tanks below deck of a floating pile-driving equipment should be vented to the outside air with flame arresters. Workers handling piles should wear leather gloves. A competent person should constantly supervise.

After erecting the cofferdam, inside water is pumped out. The excavation is done in dry soil up to a sound strata, the foundation is laid down and the structure is built. The cofferdam is dismantled thereafter.

7.6 Caissons:

A caisson is a box type structure to be used as a part of foundation. Unlike cofferdam, it is a permanent structure and forms an integral part of the bridge or building foundation.

The caissons are of three types (1) A box caisson which is closed at the bottom but open at top to the atmosphere (2) An open caisson which is open at both the ends and (3) A pneumatic caisson which has a working chamber with roof in which air pressure is maintained to prevent the entry of water and soil into excavation.

The box caisson is possible where no much excavation is required under water. The box is prepared of concrete or stone masonry 6n a dry dock, floated out to the location of sinking, sunk at the place of foundation bed and filled with mass of concrete or sand.

The open caisson is a hollow cylinder or rectangular hollow shaft made of timber, masonry or RCC. Its bottom edge is V-shaped (pointed) and known as cutting edge. On reaching foundation level, mass concrete is placed to plug the cell after which any water is pumped out and further concrete is placed to form the final seal. Such open caisson is possible on soft soil and not suitable on hard or irregular rock surface.

Where piles driving or open caisson is not possible, the pneumatic caisson is created by compressed air to drive water out of the working space for men and voids in material which is being excavated and thereby making the inside dry for easy working. More than 1 m" or 285 litres of fresh air per minute per person should be supplied in the chamber at a pressure below 2.5 bar. During compression initial pressure is kept about 0.25 bar until it is ascertained that no person is feeling discomfort, and thereafter it may be raised at a rate not exceeding about 0.5 bar/ min. Standby power should be available to the air compressors. To improve the working condition and to reduce the incidence of caisson sickness, the air should be warmed in cold weather and cooled in hot weather. In tropical climate, it should be dehumidified to keep the wet bulb temperature below 25 °C. In air and water tight chamber, openings for men and materials are provided at top in the vertical shafts with air-locks. The shafts (and openings) extend from the roof of the caisson to a level well above the water level outside. The man-lock should be of sufficient size and equipped with pressure gauges, communication system and man-lock attendant.

Every caisson, shaft, working chamber, medical lock and man lock should have a minimum internal height of 1.8 mt. The door between the working chamber and the man lock leading to a lower pressure should be kept open when any person is working inside and the lock is not in use. Air supplied to the caisson from a compressor should be clean and non-polluted. All air lines should be in duplicate and with non-return valves to prevent the air escape from the chamber if pressure in the lines fails. There should be a standby compressor for emergencies and two separate power supplies for each compressor. There should be two independent sources of electrical supply for lighting. Exhaust valves should be provided on chamber for clearing the air when necessary. Reliable means of communication such as bells, whistles, telephones etc. should be maintained at all times between the working chamber and surface installations. An adjustable safety valve should be fitted on the outside of the bulkhead to a separate pipe leading from the working chamber through the bulkhead to the outside air. Every caisson and shaft containing flammable material should have water lines, hose connections and fire extinguishers.

In all tunnels 5 mt or over in diameter or height, a well-guarded overhead gangway should be provided from the working surface to the nearest airlock with an overhead clearance of at least 1.8 mt.

Effects of air pressure on human body may be light (known as bends) or severe resulting in paralysis or death. Pain in ears, stomach and joints (like rheumatism), profuse cold perspiration, dizziness, giddiness, double vision, incoherence of speech, heat and feeling of resistance to move owing to density and pressure of air are reported. Rapid lowering of air pressure (decompression) causes severe effect as the nitrogen comes out from the body fluid (mostly blood). Therefore it must be ensured that the depressuring must be carried out slowly.

The workers should be physically fit (not fat, and with normal lungs, kidneys and good heart rate), above the age of 20 and medically re-examined at least every 2 months or earlier. A first-aid box should be kept in the working chamber.

To counteract the effect of cold, the air-lock should be warmed, the men coming out (emerging) should be given hot drink and they should dress warmly. The best cure for 'caisson disease' is recompression with slow decompression. This is achieved by putting the patient in a medical air-lock for this purpose. The trained lock keepers and medical lock attendants should be employed in the works. The medical lock should have two compartments so that it can be entered under pressure.

See Chapter XX, Rule 206 & 207 of the BOC Workers Rules, 1998, for cofferdams and caissons.

8 DEMOLITION

Demolition of very old, life-ended, weak or unsafe construction becomes necessary. Sometimes it is required for a new construction, alteration, addition or repairs on the same site. High risk is involved due to falling or flying material, working at height or on a structure being broken, use of heavy hand tools and heavy blows and vibration or sudden collapse. Not only the workers but the public passing by, have also to be protected. Proper planning, permit, procedure, sequence of work, training of workers and safety supervision by a competent person are some of the basic requirements.

See Chapter XII, Rules 108 to 118 of the BOC Workers Rules, 1998, for demolition. See Part 7 of Chapter-28 for their details.

8.1 Precautions Prior to Demolition :

A definite demolition procedure should be worked after studying the entire structure and carrying out a survey of its drawings, load bearing members, type of foundation, walls etc., chemical contents if any, previous use, structural problems, ground characteristics, condition of roof trusses, type of framing used in framed structure, equipment sensitive to noise, vibration, dust etc., radioactivity, utility or service lines, gas and power lines, joint with or effect on adjacent building, climatic conditions etc. A help of structural engineer is advisable.

A method of demolition should be formulated after above survey and recorded in a method statement after identifying the problems and their solutions.

All electric, gas, water and other service lines should be shut off or safely protected against damage. The plant or building should be isolated from all other plants or buildings.

For protection of the public, all the roads and open areas surrounding the work (i.e. danger or safety zone) should be fenced off (fence height at least 2 mt) and caution boards and danger signs should be displayed in the local language, Hindi and English at prominent places. Unauthorised entry into it shall be effectively controlled. If a swinging weight (ball) is to be used for demolition, width of the safety zone should be 1.5 times the height of the structure. If a clamshell bucket is to be used for demolition, safety zone of 8 mt from the line of travel of the bucket should be maintained.

8.2 Precautions During Demolition :

Only trained workers should be employed (new or unskilled may cause more accidents). They should wear helmet, safety belt, safety shoes, safety goggles and gloves.

A part which would destroy the stability of other parts should not be demolished. To prevent danger, parts of structure should be adequately shored; braced or otherwise supported. Foundation walls serving as retaining walls to support earth or adjoining structures should not be demolished until the adjoining structure has been underpinned or braced and the earth removed or supported by sheet piling or sheathing.

Where a deliberate controlled collapse technique is to be used, expert engineering advice should be obtained. It should be used only where enough surrounding space is available to withdraw men and equipment at a safe distance. Structure not carrying its design load may be pre-weakened before a deliberate collapse, but in such cases the pre-weakening should be carefully planned and dead load should be reduced systematically.

When equipment such as power shovels and bulldozers are used for demolition, type of building, its dimensions and the power of the equipment should be considered.

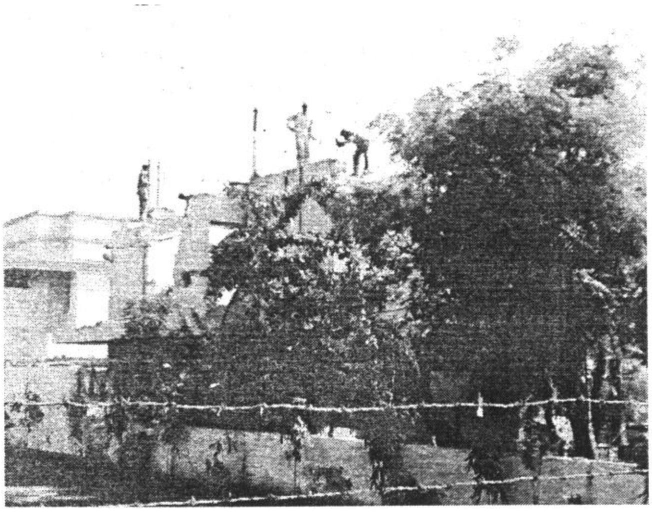
Where explosives are used to demolish key members, the blast protection and safe distances should be agreed in advance. The work should be carried out by experienced personnel in a controlled manner.

Sometimes catch platforms (at least 1.5 mt wide) are provided along the outside of the outer walls to catch falling materials. The outer edge of such platform should be higher than the inner edge (i.e. inclined to wall side) and the platform should be lowered as the demolition work gets lowered. Sequence of Demolition: Glass panels of doors and windows should be removed first. Then loose objects and projecting parts including balconies should be removed. Work should start at the top of the structure and proceed downwards. When work is going on at upper level, workers should not be deployed at lower level. Broken material should not be thrown but lowered safely. It should not be allowed to be accumulated to disturb stability. Dusting should be minimised by watering. Stairs with hand railing should be kept in place as long as practicable to provide access and egress.

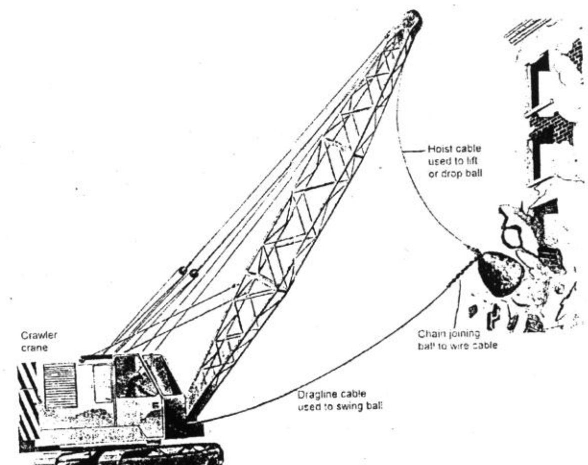
Scaffolds used for demolition, should be independent of the structure being demolished. Travelling mechanical ladders can be used.

AC sheet roofing requires careful consideration of points of support before planning its demolition. A firm ladder resting on such point should be given to workers to climb to the roof. Then they should use a cat ladder or a crawling board supported on ridge to stand and remove the sheet. In no case, they should be allowed to walk or stand directly on the AC sheet. Underneath nearby fall arrester net should also be used.

Walls should be demolished storey by storey and starting from the top. Unsupported walls should be prevented from falling by shoring and, ties.



Starting of demolition from the top level



Demolition by Balling

Floors should be demolished by using planking or walkways to stand or move when it becomes weak to withstand the load. Openings through which material is dropped should be fenced or barricaded.

Tall chimneys should not be demolished by blasting or overturning unless the sufficient open area is available for its safe fall. Workers should not stand on chimney wall. Thrown down material should be removed during breaks in the work or under controlled conditions.

Structural steelworks should be demolished by cutting its parts in such a way that it should not collapse, twist or spring suddenly. It should be demolished tier by tier. Cut parts should not be thrown from a height. They should be lowered safely.

Industrial structure such as a nuclear power plant, hazardous chemical or petrochemical plant or a plant containing a plenty of asbestos material (e.g. insulation, AC sheets) should be demolished only after consulting their respective experts or specialist engineer and taking all precautionary measures against their specific hazards. General rules are as stated earlier.

9 MOVEMENT OF MATERIALS AND MEN

Construction materials being heavy, long or varying in size, pose hazards in handling, loading, unloading and transportation. Railway wagons, motor trucks, tractors, trailers etc. are used depending on the weight, size and distance to be travelled. Training of handling of such materials and use of lifting appliances for them is a basic requirement. Sec Chapter15 and 16 for material handling and working at heights and depths. See Part 6,7,8 and 9 of Chapter28 also.

Some general precautions are as under :

1. For selecting transportation by railway wagons, the route should be surveyed. The material should not foul with any fixed structure object or another wagon while negotiating bend or turn. The material should not project outside and height should not reach electromagnetic field of overhead traction line. Railway rules should be followed. Identification, marking and proper packing are necessary.
2. Motor trucks must have valid RTO permits and efficient brakes, lights, horns, side and reverse signals, jacks, tools etc. They should be in good working condition. Only trained and licensed driver should drive and not the helper or cleaner. While driving an Ethylene oxide tanker by a cleaner, it was dashed against a structure resulting into breaking of the main valve and the whole factory shed and the tanker were burnt into ashes.
3. Drivers should strictly follow the speed limit on highway and inside any factory premises. They should observe utmost care while turning, overtaking, crossing railway level crossing and applying brakes. They should have 'tremcard' while carrying hazardous chemicals.
4. The transport vehicle should not be overloaded. No material should project above or beyond the side panels. Backward projection should not be more than a meter. Bending bars (rods) should not touch the road. Liquid should not be leaking. Lime, cement, gravel or dusty material should not throw continuous dust. They should be covered. Red signals (flag or light) should be displayed on the projected end.
5. Material should be properly loaded considering weight, dimension, centre of gravity of the load, carrier capacity, safety distance and working clearance. Load should be properly packed and lashed. In rainy season, waterproof cover should be provided.
6. Men should not sit on the load or side panels or on the driver's cabin. They should not walk on a moving vehicle.

Necessary fire fighting arrangement should be kept ready. Engine exhausts shall not open near any flammable material. Vehicles carrying highly flammable liquids or gases must have spark arrester on their exhaust pipe. Explosives, detonators and combustible material shall be separately stored with safety precautions. It should not be piled over 2.5 mt height. See Chapter 13 for fire & explosion safety. For electrical safety see Chapter II. See Chapter 28, Part 6.1 and 6.2 for Motor Vehicles Act and Rules.

10 HEALTH AND WELFARE OF CONSTRUCTION WORKERS

For figures and pictures see Chapter-24.

Occupational hazards and diseases relating to construction work are mainly dust hazards (Silicosis due to silica dust, Siderosis due to iron dust, Anthracosis due to coal dust and Cement Pneumoconiosis due to cement dust), noise and vibration, heat and humidity, electricity, hazardous chemicals, work at heights and depths (in a confined space), material handling, lifting machinery, transport vehicles, radiation hazards, biological hazards etc. First-aid boxes and occupational health services at workplace or nearby are most desirable.

10.1 Dust Hazards :

While handling building materials, workers can be exposed to four types of dusts which by inhalation can cause following lung diseases (Pneumoconiosis) :

Silicosis : Silica (SiO,) dust (respirable size 0.5 to 3 micron) causes fibrotic changes, modulation in both lungs, shortness of breath, decreased chest expansion, reduced capacity for work and in advanced case impairment of total lung capacity. The effect is irreversible and no effective treatment is available. It is a notifiable and compensable disease under the law.

The effect of exposure, varies with the concentration of dust, time period, working conditions, body resistance, control measures etc.

Chest X-ray shows a snow storm appearance in lung fields. But it should be confirmed by a history of prolonged exposure of silica dust and symptoms of dry cough, dysponea, chest tightness and difficulty in breathing. Regular medical examination of workers and engineering controls to minimise exposure are necessary.

Siderosis is caused by inhalation of iron dust (Iron oxide). Electric arc welding, dry grinding of iron, buffing, polishing and shot-blasting produce iron dust. It seldom causes serious symptom unless there is coexistent silicosis.

Anthracosis (Coal workers' pneumoconiosis) is caused by inhalation of coal dust. Foundry workers, coal handlers, couple collie, boilermen (sealers), furnacemen, railway firemen, graphite workers etc. are exposed to coal dusts. The first phase (requires about 12 years of work) causes little ventilatory impairment, but the second phase causes progressive massive fibrosis (PMF) resulting in severe respiratory disability and tending to death.

Early diagnosis and change in occupation offers the best hope. Other treatment like chemotherapy should be as per doctor's advice.

Cement (Benign) Pneumoconiosis, silicosis with associated pulmonary tuberculosis, bronchitis and emphysema are possible with cement or cement and free silica dust (e.g. acid resistant cement).

In addition to these respiratory disorders, other health hazards are as under :

Skin	Cement eczema due to alkalinity or presence of chromium Furncles, Pyoderma, Cellulitis, Asbestosis
Vision	Conjunctivitis
Nervous system	Muscular pain, Back pain, Neuralgia, Spondylosis, Arthritis and Rheumatism
Digestive system	Peptic ulcers
Ear	Hearing loss due to high noise
Others	Radiant heat, High temperature near furnace, CO gas and Asbestosis due to

	asbestos cement products

Prophylaxis (Control measures) are engineering control and medical monitoring.

Engineering control includes methods of elimination or minimisation of dust exposure. Local exhaust (suction hood), cyclone dust collector, unit dust collector, electrostatic precipitators, substitution of wet grinding for dry grinding and hydro-blasting for sand blasting and built-in devices with grinding and polishing machines etc. are generally used. They should be maintained in good working conditions. Workers should wear dust masks/respirators and eye protection also.

Medical monitoring includes appraisal of dust generating places or processes, area monitoring and analysis, medical examinations including X-ray and sputum test, lung function test and clinical tests.

See Chapter-24 also.

10.2 Noise and Vibration :

For figures, pictures and detail see Chapter-12.

Crushers, grinders, compressors and heavy lifting machinery in construction industry cause high noise. Continuously working near such high noise causes hearing loss, deafness, annoyance/change in heart rate, blood pressure, sweat rate, work performance etc. and also psychological and psychomotor effects. High frequencies are more serious than low frequencies. Noise level should be kept below 90 decibels by using quieter machinery and processes, enclosures and silencers. If this is not possible, workers should be given ear plugs or muffs of good quality.

10.3 Heat and Humidity :

For figures, pictures and detail see Chapter-10 and 24.

Steel mills, forge shops, furnaces, boilers, hot asphalt, tar, steam, hot water, damp clay, under-water work etc. expose heat or humidity.

In dry hot atmosphere, thermal balance can be maintained by evaporation of sweat but in moist hot atmosphere as in cotton mills, process of perspiration (sweat evaporation) slows down due to humidity and workers feel great discomfort and their productivity gets down due to heat stress. Main three types of heat stresses are heat stroke, heat exhaustion and heat cramp.

Insulation of hot processes and parts, lagging of hot pipes, shielding against radiant heat, local exhaust ventilation, improvement in general (natural or mechanical) ventilation, spot cooling of hot object, isolation or segregation of hot processes, replacement of workers near furnaces or giving frequent recesses and adequate supply of drinking water are some of the remedial measures.

10.4 Other Hazards :

Use of solvents, thinners, paints, varnishes etc. cause fire hazards. See Chapter-13 for fire safety. Use of chemicals, pigments, radioactive substances and biological agents pose peculiar types of hazards. Their effects and control are explained in Chapter-24. Work permit and special precautions are required when workers have to work at height or in a confined space. See Chapter 16 for details. For electrical hazards and controls see Chapter-11.

10.5 First-aid and Health Services :

For figures, pictures and detail see Chapter-26.

At all work sites, first-aid boxes containing prescribed medicines, antidotes and equipment are most essential. Trained first-aiders should also be employed. They should be proficient in the use of resuscitation and other life-saving techniques and in rescue procedures. Necessary equipment including stretchers should be readily available.

All workers should be subject to health surveillance. Work area monitoring should be carried out. Health services should be available at workplace or nearby. See Chapter-24 for further details.

See Chapter XXIV, Rules 223 to 232 of the BOC Workers Rules, 1998, for medical facilities. It requires medical examination, construction medical officer, OHC, ambulance room, ambulance van, stretchers, FAB, emergency treatment, notice of occupational diseases etc.

10.6 Welfare :

At or near work site, adequate supply of drinking water, sanitary and washing facilities or showers, change or cloak room, lunchroom or canteen, rest room or shelter, facilities for food and drink and suitable living accommodation should be available to workers. The size and number of such facilities may vary according to the number of workers. Where necessary separate facilities should be provided for male and female workers.

See Chapter XXVID, Rules 242 to 247 of the BOC Workers Rules, 1998, for statutory provisions regarding above welfare facilities.

10.7 Accident Reports and Records :

For statistical tables see Chapter-5 and 19.

Where prescribed, as in case of factory premises, all accidents to construction workers should be reported to the authorities where absenteeism due to accident lasts for more than 48 hours. All fatal accidents should also be reported to police and the family of the deceased. Where format is prescribed (e.g. Form 21, GFR), it must be reported in that form only.

Record of non-reportable accidents including near-misses should be maintained for internal use.

All accidents should be thoroughly investigated by a team of concerned officers including Safety Officer and their conclusions should be used as remedial measures to prevent future accidents.

Non-factory construction sites should report their accidents to the authorities prescribed.

A good record of all such accidents and their costs should be maintained for a long time. It may be useful to draft a law or to make internal rules and regulations. See Part 9 of Chapter-5 and Part 3 of Chapter-19.

Safety Committee should be constituted and a Safety Officer should be appointed in every establishment wherein 500 or more construction workers are employed as required by Section 38 of the Building and Other Construction Workers Act, 1996.

See Rule 210, Form XIV for accident report and Rule 230, Form XIII for notice of poisoning or disease, of the BOC Workers Rules, 1998.

10.8 Ergonomics :

For figures and pictures see Part 3 of Chapter-24.
Different postures while doing construction operations, seat and control arrangement in lifting and shifting material, equipment and vehicles, use of hand tools etc. require ergonomic considerations.

In a study conducted by NITIE (National Institute of Training for Industrial Engineering, Bombay), in 1989, on construction workers, 10 different tasks were evaluated for their severity. The tasks of excavation/digging, plastering, climbing with 15 Kg weight, bending reinforcement bars and concreting were found to be severe. The energy expenditure for these activities ranged between 8 to 10 Kcal/min and the heart rate between 130 to 150 bpm. Others like casting, painting, mixing cement and aggregates with water and masonary work were placed in the category of light and moderate work. The energy expenditure in that case ranged between 2.5 to 8 Kcal/ min and heart rate between 90 to 135 bpm.

In plastering, a stooping posture was found to be harmful. It would be better to adopt a squatting posture for plastering the wall area below the hip level.

The workers reported acute pain in elbows of the arm holding the working pan. A simple use of a stool or stand to put the pan can reduce the pain. The use of a longer handle for the patella can be resorted to reduce stooping.

E X E R C I S E

1. State, Explain, Mention or Discuss -
   1. The reasons for health and safety problems and safety measured based on NITIE study (1989).
   2. The main provisions under the Building and other Construction Workers Act 1996 or Rules (1998) there under.
   3. What are the precautions necessary to run- (1) Crusher plants (2) Power generators (3) Engines (4) Transport equipment.
   4. Safety precautions required for –
      (a) Excavation work (b) Drilling, Loading & Blasting (c) Mobile asphalt layers (d) Crushers plants
   5. The safety measures necessary while carrying out tunneling and shaft sinking OR Safety measures for wall and floor openings.
   6. Sequence of demolition OR Precautions during demolition.
   7. At length the health and welfare of construction workers.
   8. The difference in hazards and control measures while doing under ground, above ground or under water works.
2. Write Short Notes on –
   1. Basic philosophy
   2. Dust hazards.
   3. Cofferdam.

4. Shoring & Under pinning.
5. Derricks.
6. Precautions prior to demolition
7. Winches or Hoists.
8. Excavators or Road rollers
9. Concrete mixtures
10. Pneumatic compressors
11. Duties of a Construction Safety Officer or a Construction Medical Officer.
12. Role of a Construction Welfare Officer.
13. Ergonomic aspects in construction work.
14. Siderosis or Anthracosis.
15. Caissons or Cast-in-situ concrete structures
16. Site planning and layout OR Precautions for movement of materials and men.

3. "Fall from height and struck by falling objects, are the two major causes of fatal accidents in construction activity" Justify this statement with statistics or actual case studies.
4. Design a safety work permit at construction site OR A construction safety check-list.
5. Classify the construction machinery and explain in detail any two of them.
6. You are deputed as a construction supervisor for structural steel work and erection. Narrate what precautions you will observe.

CHAPTER – 23

Safety in Construction Industry

THEME

1. INDUSTRIES NEEDING ATTENTION

Three questions are important from safety point of view:

1. Which industries are more in number?
2. Which industries employ more men-power?
3. Which industries have more accidents?

According to the number of working factories (as per Table 5.16 in Chapter-5) the chronological order is as follows:

1. Chemical and Chemical Products.
2. Non-metallic Mineral Products.
3. Machinery and Parts.
4. Wool, Silk and MMF.
5. Food Products.
6. Metal Products and Parts.
7. Basic Metal and Alloy Industry.
8. Cotton Textiles.
9. Rubber, Plastic and Petroleum.
10. Wood and Wood Products.
11. Paper and Paper Products.
12. Electrical Machinery and Parts.
13. Other Manufacturing.

14. Transport equipment parts.
15. Textile Products.
16. Repair services.
17. Beverages, Tobacco.
18. Repair of Capital Goods.
19. Education, Science & Research Services.

According to the number of workers employed, (as per Table 5.16 in Chapter-5) the chronological order is as under :

1. Chemicals and Chemical Products.
2. Cotton textiles.
3. Wool, Silk and MMF.
4. Food Products.
5. Non-metallic Mineral Products.
6. Machinery and Parts.
7. Rubber, Plastic and Petroleum.
8. Basic Metal and Alloy industry.
9. Metal Products and Parts.
10. Electrical Machinery and Parts.
11. Paper and Paper Products.
12. Transport equipment & parts.
13. Other Manufacturing.
14. Repair services.
15. Textile Products.
16. Electricity, generation, transmission & distribution.
17. Wood and Wood Products.
18. Beverages, Tobacco.
19. Education, Science & Research Services.
20. Repair of Capital Goods.
21. Water Works & Supply.

According to the number of accidents, (Table 5.22 in Chapter-5) the order is :

1. Cotton textiles.
2. Machinery and Parts.
3. Chemicals and Chemical Products.
4. Wool, Silk and MMF.
5. Basic Metal and Alloy industry.
6. Non-metallic Mineral Products.
7. Rubber, Plastic and Petroleum.
8. Repair of Capital Goods.
9. Metal Products & Parts.
10. Repair Services.
11. Food Products.
12. Other Manufacturing Industries.
13. Paper and Paper Products.
14. Transport Equipment &: Parts.
15. Jute & other Vegetable Fibre Textile.
16. Wood and Wood Products.
17. Beverages, Tobacco.
18. Textile Products.

An all India order (as per Table 5.9 in Chapter5, for the year 1990) according to the number of injuries (frequency rate) is as follows :

1. Jute & Vegetable Fibre Textiles.
2. Cotton Textiles.
3. Non-conventional Energy Generation.
4. Other Manufacturing Industries.
5. Rubber, Plastic & Petroleum.
6. Gas & Steam Generation & Distribution.
7. Transport Equipment.
8. Basic Metal Industries.
9. Non-metallic Mineral Products.
10. Wool, Silk & MMF.
11. Electricity, generation, transmission & distribution.
12. Food Products.
13. Paper and Paper Products.
14. Repair of Capital Goods.
15. Chemicals & Chemical Products.
16. Wood and Wood Products.
17. Textile Products.
18. Metal Products & Parts.
19. Beverages, Tobacco.
20. Machinery.
21. Leather & Leather Products.
22. Water Works & Supply.

According to the number of accidents in Gujarat and India, textile industry has the highest number of accidents and injuries. But this trend is changeble.

In Gujarat, numberwise and workerswise chemical industry is at the top.

Out of above industries, we have studied so far up to the last chapter, the cotton textiles, chemicals, synthetic fibres, machinery, metal products, basic metals and alloy industries and electrical machinery industries. Therefore the statutory provisions and the safety aspects with inspection experience of the remaining main industries are given below in brief.

2 ASBESTOS MANUFACTURE AND HANDLING

Asbestos-chrysotile, crocidolite or amosite in natural fibrous silicate forms - is a white, blue or grey brown substance (available from 1880). It is a cheaper man-made mineral fibre used for many products. Its main uses are in asbestos-cement products as roofing sheets, pipes and wall boards.

Asbestos dust causes lung damage. Fibrosis of the lung by asbestos was first described with PM report by Montague Murray in 1899. The name asbestosis was given by Cooke in 1927.

Control of airborne contamination becomes difficult and costly. Therefore effective enclosures to source of generation and local exhaust ventilation on machine, wetting of fibres before mixing, spinning and weaving, vacuum cleaning instead of brushes and changing of clothing at the end of work are the best controls. Dust masks are also essential.

Asbestos dust is a confirmed human carcinogen and its STEL/CEILJNG values published by ACGIH are as under :

Crocidolite	-	0.2 fibre/cc
Amosite	-	0.5 fibre/cc
Chrysolite and other forms	-	2.0 fibre/cc

The 2^{nd} Sch. of the Factories Act gives this value as 2 fibres/ml (length 5 nm and breadth 3)Lim as respirable dust).

Asbestosis is an occupational disease specified in the 3rd Schedule of the Factories Act. See Part 4 of Chapter-24 for further details.

Statutory Provisions:

Summary of Schedule 17, rule 102, GFR i.e. Gujarat Factories Rules, Sch.17 u/r 114, MFR i.e. Maharashtra Factories Rules and Sch.20 u/r 95 of the TNFR i.e. Tamil Nadu Factories Rules is as under :

Application :

This schedule is applicable to the process of asbestos in any form of making insulation slab or mattresses, textile, cardboard, paper, cement goods consisting asbestos or spraying asbestos or cleaning asbestos dust. Definitions:

Asbestos is a fibrous silicate mineral and any admixture of silica known by different names. Its dust means airborne particles. Respirable asbestos fibres means those having diameter less than 3 µm and a length to diameter ratio greater than 3:1. Other terms are also defined.

Tools and Equipment:

They should not create asbestos dust above the permissible limit or they should be equipped with efficient exhaust draught.

Prohibition :

Processes of tools releasing asbestos dust beyond the permissible limit, use of crocidolite, spraying of asbestos and installation of friable asbestos insulation materials are prohibited.

Employment of young persons and smoking are also prohibited.

Substitution :

Asbestos shall be used only when its risk can be prevented or controlled, otherwise it shall be replaced by other less harmful or harmless material or technology.

Restriction :

Number of persons exposed to asbestos and their exposure time shall be kept minimum. Their work area shall be 'demarcated by warning signs restricting unauthorised access.

Exhaust draught:

An efficient exhaust draught shall be provided and maintained to control dust from the process and machines prescribed in para-4 (1) of the Schedule. Dust coming from the exhaust apparatus shall be collected by filter bags or suitable receptacles and shall not be drawn free into the air of any work room.

Testing of Ventilation System :

A responsible person shall inspect the system every week. A competent person shall test it every year. Defects found shall be rectified forthwith. Test report shall be in form No. 26-A.

Segregation :

Dust creating work places shall be segregated from other work places to avoid exposure to other workers.

Breathing Apparatus & Protective Clothing :

An approved type of breathing apparatus and protective clothing shall be given to workers, for working in chamber or cleaning dust or filling , beating or other operation where it is not possible to keep the dust within permissible limit. Separate accommodation shall be provided to put on or take off such apparatus and clothing and to store when not in use.

All protective clothing shall be deducted under an efficient exhaust draught or by vacuum cleaning and shall be washed at suitable intervals. The cleaning schedule and procedure shall be established to ensure the efficiency of protection.

They shall be cleaned and disinfected at suitable intervals and inspected every month by a responsible person.

A record of cleaning and maintenance shall be maintained. Full instruction shall be given to the user before employing in such work. No apparatus worn by a person shall be worn by another person unless it has been thoroughly cleaned, disinfected and full instruction given to that person.

Separate accommodation other than that for breathing apparatus, shall be provided to store other personal protective equipment or personal clothing.

Washing and Bathing Facilities :

Washing places shall be provided at the rate of I for 15 persons. Stand pipe separation shall be more than a metre. Constant water, clean towels, soap, and nail brushes shall be provided. Washing (bathing time of 30 minutes within working hours) shall be provided at the end of the shift.

Mess Room :

A suitable mess room with tables, benches (with back rest) and means to warm food shall be placed under the charge of a responsible person and be kept clean.

Cautionary Notice :

Cautionary notices regarding (i) Health hazards from asbestos dust (ii) Need to use appropriate equipment and (iii) Entry of authorised persons with protective equipment or no entry shall be displayed.

Labelling:

The container of asbestos or its products shall be labelled with warning of dust hazard and its safety measures. MSDS shall be supplied to consumers.

Information regarding health hazards of home carrying contaminated clothing shall be given to the families of the workers.

Air Monitoring :

Monitoring of asbestos fibre in air shall be carried out once in every shift. Time weighted average concentration shall be calculated or measured by Membrane Filter Technique (MFT). Records shall be preserved for thirty years.

Medical Tests and Records :

1. A doctor shall be employed with the approval of the CIF*. Medical facilities shall be provided to him.
2. The CS** will examine a new worker within 15 days of his first employment. This will include pulmonary function tests, tests to detect asbestos fibres in sputum and chest X-ravs. No worker shall be employed without: Fitness Certificate in Form No. 27 A by the CS.
3. Periodical tests every year by the CS.
4. Health Register in Form No. 20 to be signed by the CS. Reasons of unfitness shall be recorded in it. Re-employment in the same process is possible with a Fitness Certificate from the CS.
5. Post Medical Examination shall also be carried out. No cost to the workers. Results shall not be used to discriminate against the worker. Workers will be informed about the test results. If health is impaired due to long time exposure, the worker shall be compensated to maintain his income.
6. Records of Medical Examinations shall be preserved for 30 years. On closure of the factory, the records shall be deposited to the Office of the GIF.

* CIF = Chief Inspector of Factories
** CS == Certifying Surgeon

Other Provisions :

1. Loose asbestos, while not in use, shall be kept in closed receptacles.
2. A sack containing asbestos shall not be cleaned by hand beating but by a safe machine.
3. Disposal of waste should not pose health hazard to workers or the public in the vicinity.
4. All floors, work benches, machinery and plant shall be kept clean and free from asbestos dust. Vacuum cleaning equipment shall be used, otherwise respirators will be given to the cleaners. The cleaning apparatus shall also be cleaned for asbestos waste and dust.

IS : Safety and health requirements relating to exposure to asbestos 11451, Asbestos dust control 11770, cleaning premises 11767, airborne concentration 11450, chrysotile 9690, 11276, 11267, Manufacturing premises - exhaust ventilation system 12080, packaging, transport & storage 12079, personal protection of workers 12078, products safe use 11769, terminology 11707, workplace pictorial warning 12081, products 5913, control recommendation 12082, corrugated sheets 459, 13008, asbestos fibre 2712, 11275, 9745, yarn 13362.

3 AUTOMOBILE INDUSTRY

This is a part of an engineering industry and carries out various processes like casting, forging, machining, electroplating, painting, assembly, testing etc. The safety measures include :

1. Noise and vibration control.
2. Dust, fumes and gas emission control by
3. High temperature control near furnaces by insulating material or heat reflective surfaces to heat source.
4. Heat protective clothing, eye and face protection.
5. Mechanical lifting.
6. Guarding of drilling, reaming, grinding, milling machines, power presses, conveyor belt etc.
7. Machine tools with splash guards.
8. Barrier creams and oil-resistant aprons. .
9. Welding and soldering precautions.
10. Electroplating baths with special lip ventilation and anti foaming surface tension agents.
11. Solvent and spray controls with special booths in painting shop Paint dipping and electrostatic or electrophoretic painting requiring worker outside are more safe.
12. Dryers with exhaust ventilation.
13. Controls for chemicals which are toxic, flammable and explosive.
14. Electrical safety.
15. Precautions against silicosis, solvent poisoning, lead poisoning, skin diseases. X-rays for nondestructive testing etc.

See Table 15 of Chapter-32 for TLVs of Silica and other chemicles.

IS : Safety Code for industrial trucks 6305 (Part I & 2), life jackets 6685, protective helmets 4151, stability testing of forklift trucks 4357, 5752, 5753, conveyor safety 7155 (Part I to 7), glossary of terms 7862, smoke emission for diesel vehicles 8118, CO emission limits 9057, braking system 11852 (Part I to 7), driver safety 11939, life saving equipment 10548, speed limiters 10144, automobile accessories 8925, 8098, control cables 5836, electric equipment 9175, light-reversing 9961, stop, tail & turn signal lights 10256, wiring cable terminations 8395, Automotive vehicles - accelerator control, safety requirements 14283, air brake system 11852, 12831, 12821, electronic flashers 13135, pneumatic tyres 10914, rear view mirrors 14210, registration plate 14224, side doors safety requirements 12009, terms & definitions 13111, windows for buses, safety requirement 13944.

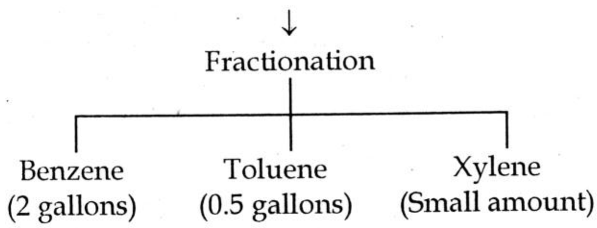
4 BENZENE MANUFACTURE, HANDLING AND USE

Manufacture :

Benzene is a solvent frequently used in many organic processes. It is also used as a fuel, additive of motor fuel, chemical reagent and a raw material for large number of chemical synthesis.

Old process of obtaining benzene is from coal. Its line diagram is as under :

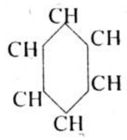
Coal (1 ton) → Coke (1500 lb) + Light oil (3 gallons] + Coal tar (8 gallons) + Ammonium sulphate (20 1b) + Illuminating gas (11200 cuft)



Benzene and related compounds (toluene, xylene) are also obtained commercially by subjecting open-chain alkanes obtained from petroleum to cyclization followed by dehydrogenation. This conversation is brought about at high temperatures and pressures in the presence of suitable catalysts :

n-Hexane → catalyst → Benzene
n-Heptane → catalyst → Toluene

Benzene can also be produced by cyclization and aromatisation of paraffin hydrocarbons. Benzene is the simplest member of the aromatic group of compounds. It is represented by a closed ring of six carbon atoms as –



i.e. C_6H_6.

Hazards and Control:

Benzene is lighter than water (sp'. gr. 0.88) and heavier than air (vd 2.8). Its other properties are BP 80.1 °C, FP -II °C, explosive range 1.3-7.1 %. It is less soluble in water, but highly soluble in organic solvents and oils.

Looking to its very hazardous nature, the ILO passed its Benzene Convention 1971 (No. 136) and Recommendation 1971 (No. 144).

It is highly flammable, explosive and toxic, all at a time. It exerts acute as well as chronic poisoning. Its TLV is 10 ppm (30 mg/m^3), STEL 25 ppm (75 mg/m^3) and IDLH 2000 ppm. ACGIH booklet 2007 shows TLV (TWA) as 0.5 ppm and STEL as 2.5 ppm.

Fatal cases of blood disease - leukaemia - have been reported. It destructs bone marrow. Benzene handling must be in a closed system. Its exposure must be measured in work areas and the affected person (by medical examination) must be immediately removed from exposure. Less hazardous substitutes like toluene, xylene, cyclohexane and other suitable solvents e.g. alcohol, ketones, esters etc. should be used. Good ventilation including exhaust ventilation, plant enclosures, flameproof fittings, leak detector with alarm, environmental and biological monitoring (estimation of urinary phenols), breath sampling, dyke surrounding storage tanks, curbs round the process vessels, elimination of sparks, flames and excessive heat and effective fire fighting arrangement are necessary.

Statutory Provisions:

Schedule-20 u/r 102, GFR, and also as Schedule20 u/r 114 of the Maharashtra Factories Rules, 1963, (MFR) and as Schedule-27 u/r 95 of the Tamil Nadu Factories Rules, 1950 (TNFR) gives safety provisions regarding manufacture and use of Benzene or substances containing benzene.

This Schedule is applicable to manufacture, use, storage, packing or handling of Benzene or substances containing benzene (means wherein benzene content exceeds 1% by volume).

Manner of using Benzene or its substitute (less harmful) includes enclosed system or equally safe system.

Protection against inhalation prescribes enclosed system or efficient exhaust draft to remove benzene vapours from the workroom so that its concentration in air does not exceed 25 ppm or 80 mg/ 3 Its measurement and report of concentration exceeding above limit to the Inspector are compulsory. The workers exposed to such higher exposure shall be given necessary respirators.

To avoid skin contact suitable gloves, aprons, boots and vapour tight chemical goggles (not affected by benzene) should be given to workers.

Other provisions include prohibition of employment of women and young persons, labelling of name, danger symbol, toxicity and flammability, no misuse of benzene for hand cleaning etc., no food, drink, smoking or chewing in the workroom, instruction regarding risks, cautionary notice (as per Appendix-B), washing facilities, cloak room and mess room, medical examination, pre-employment and six monthly medical examination including blood test and other biological tests and temporary shifting of the exposed worker.

Appendix-A specifies the processes where benzene substitute is not possible i.e. its production, chemical synthesis and motor spirit (use of fuel).

Appendix-B is a cautionary notice specifying the hazards, preventive measures, protective equipment and first aid measures in case of acute poisoning. It is reproduced below :

APPENDIX B

(A) The hazards :

1. Benzene and substances containing benzene are harmful.
2. Prolonged or repeated breathing of benzene vapours may result in acute or chronic poisoning.
3. Benzene can also be absorbed through skin which may cause skin and other diseases.

(B) The preventive measures to be taken :

1. Avoid breathing of benzene vapours.
2. Avoid prolonged or repeated contact of benzene with the skin.
3. Remove benzene soaked or wet clothing promptly.
4. If any time you are exposed to high concentration of benzene vapours and exhibit the sign and symptoms such as dizziness, difficulty in breathing, excessive excitation and losing of consciousness, immediately inform your - Factory Manager.
5. Keep all the containers of benzene closed.
6. Handle, use and process benzene and substances containing benzene carefully in order to prevent their spillage on floor.
7. Maintain good house-keeping.

(C) The protective equipment to be used :

1. Use respiratory protective equipment in places where benzene vapours are present in high concentration.
2. In emergency use self-generating oxygen mask or oxygen or air cylinder masks.
3. Wear hand gloves, aprons, goggles and gum-boots to avoid contact of benzene with your skin and body parts.

(D) The first aid measures to be taken in case of acute benzene poisoning:

1. Remove the clothing immediately if it is wetted with benzene.
2. If liquid benzene enters eyes, flush thoroughly for at least 15 minutes, with clean running water and immediately secure medical attention.
3. In case of unusual exposure to benzene vapour call a physician immediately. Until he arrives, do the following :

If the exposed person is conscious -

1. Move him to fresh air in open.
2. Lay down without a pillow and keep him quiet and warm.

If the exposed person is unconscious -

1. Lay him down preferably on the left side with the head low.
2. Remove any false teeth, chewing gum, tobacco or other foreign objects which may be in his mouth.
3. Provide him artificial respiration in case difficulty is being experienced in breathing.
4. In case of shallow breathing or cyanosis (bluish skin, lips, ear, finger, nail, beds), he should be provided with medical oxygen or oxygen carbon dioxide mixture. If needed he should be given artificial respiration.

IS : Benzene 534, safety code 4644, reagent grade 1840, insoluble matter determination 1214.

5 BEVERAGE INDUSTRY

Use of soft drinks (non-alcoholic carbonated and non carbonated or still drinks) is increasing day by day. Industrial safety measures include :

1. Guarding of high speed bottling and canning machines.
2. Net or wire mesh screening under over head conveyors.
3. Nip guards on conveyor belts, drums and pulleys and frequent stop buttons for conveyors.
4. Ammonia respirators and water type fire extinguishers or sprinklers.
5. Bottling machines with strong shields to contain bursting bottles or siphons.
6. PPE to workers for protection against broken glass.
7. Containers for broken glass equipped with a hinged clover or long chute to prevent "fly back".
8. Mechanical handling.
9. Dry floors by proper draining and cleaning. Workers with safety shoes with tread type soles. Tennis shoes and sandals not permitted. Waterproof aprons.
10. Fixed platforms (instead of portable ladders), catwalks and stair ways with open grating to mixing tanks and elevated locations.
11. PPE and water showers for caustic splashes.
12. Waterproof and properly earthed electric fittings.
13. Noise control by reducing the number of impacts, speed of bottle travel, acoustic barriers, enclosures and ear protection.

14. First-aid including waterproof plasters and dressings.

See also schedule I, Rule 102, GFR and also Sch.l u/r 114, MFR and Sch.l u/r 95 TNFR.

IS : Beverages (Aerated water)- protein based 7482, protein food 9038, carbonated 2346, nonalcoholic 13019, sensory evaluation 8140, 8639.

6 BRICK AND TILE INDUSTRY

Bricks and tiles are essential building materials. Their clay work should include :

1. Chute feeds as protection against falls.
2. Guarding of presses, dies, tools, pug-mill gears and drives, rollers, edge runner pans.
3. Oiling, greasing and repairs only when the machinery is at rest.
4. Good lighting, flooring and electric fittings.
5. Dust producing equipment viz., crushers, vibrators, conveyor belts with' local exhaust ventilation.
6. Moistening of raw materials and premises to suppress flying dust.
7. If sand is applied, it should be made wet by mechanical means and local exhaust ventilation with compressed air.
8. Glazes should be non-lead type. Lead is hazardous.
9. Correct draft conditions in kilns to prevent carbon monoxide.
10. PPE and clock room.
11. Mechanical handling.

Refractories (Substances with high melting point and good physical resistance) are of four types: alumina-silicate, silica (or acid), basic and miscellaneous. Hazard control is as stated above. Here chances of silicosis are more. Permissible concentration of fibrogenic dust should not be exceeded. Manual breaking should be avoided. Mechanical crusher/ grinder with exhaust draft and dust collectors or water or steam spray are essential. Floors should be cleaned by vacuum cleaning.

See Sch. 5 for grinding or glazing of metals and Sch. 18 for stone or other material containing free silica, under Rule 102, GFR.

IS : Brickwork - measurement 1200, code of practice 2212, Brick-acid resistant 4860, alumina 8953, 14313, building heavy duty 2180, work with compressed air 4138, piling and deep foundations 5121, handling of building materials 7969, Falling hazards 13416 (Part I & 2), scaffolds and ladders 3696 (Part I & 2), Tiles cement concrete 10646, brick flooring laying 5766, insulating 2042, kiln, design and construction 4805, paving 3583, sand lime 4139, silica mortar 1292, brick panel 14143.

7 CANNING AND FOOD INDUSTRY

There are six methods of food preservation heating, radiation sterilisation, antibiotic sterilisation, chemical action, dehydration and refrigeration (frozen food industry). Industrial safety measures include :

1. Training for safe lifting, stacking and maintenance of good housekeeping. Mechanical handling avoid manual hazards.
2. Machines designed for less spillage.
3. Floors clean, dry and drained.
4. Protection against burns due to hot liquors,
5. Guarding of filling and closing machines, conveyor belts and drums, pulleys and gears.

6. Safety valves and pressure controls where steam is used.
7. Vaccination against infectious diseases, good personal hygiene, sanitary and washing facilities.
8. For noise control sound absorbent mounting, magnetic elevators, nylon coated cables and speed matching in can conveyor systems, use of plastic containers and ear protection.
9. Ventilation systems with special attention to condensation problems.
10. At ionising radiation, full protection, hazard monitoring, health screening and medical examinations are necessary.
11. Control of lead levels due to side seam soldering. Avoidance of lead content.

IS : Canning fruit and vegetable hygienic code 6542, Food analysis handbook SP-18, bacterial detection 5887, 7688, sampling and tests 1699, freezers, safety 10542, processing units 2491, 8077, cereals, warning 1656, 1657, safe use of packing 7277, 7288, 7961, food colours 5346, test for dye content 6120, food mixers, electric 4250, food container, metal 6093, hawker, hygienic conditions 10973, plastic for packaging 10171, food poisoning bacteria 7688, food samples analysis 5404, food yeast 3839, food service establishments 6074, 7021, 8220.

See Part 18 also.

8 CS_2 and H_2S PLANT

Carbon di or bisulphide, CS_2 is found in coal tar and crude petroleum. It is produced by heating charcoal with vaporised sulphur or by reacting sulphur with petroleum hydrocarbons. Reaction is $C + S_2 = CS_2$ Pure product is obtained by distillation of crude CS_2 and it is kept submerged in water.

It is a colourless, odourless gas with following .properties:

Sp. gr.	1.26	ER	1.3-50%
VD	2.6	IT	100 ^{0}C
BP	46.3 ^{0}C	TLV,NIOSH	1 ppm
FP	-30 ^{0}C	TLV (skin)	10 ppm
			30 mg / m^3

IDLH 500 ppm (under the Factories Act & ACGIH)

Acute and chronic poisoning occurs in viscose rayon industry. CS, poisoning is a notifiable disease in the 3rd Schedule of the Factories Act. It has toxic and fire hazard. It is a neurotoxin. Therefore effect on CNS is the main symptom. It affects liver and kidneys also. Chronic poisoning begins with headaches, fatigue, weakness and sleep disorder.

Safety measures require total enclosed system, general and local ventilation, exposure measurement, iodine-azide test of urine (biological measurement), pre and periodic medical examinations.

Statutory Provisions:

Summary of Sch. 14 u/r 102, GFR, Sch.l4 u/r 114 MFR and Sch. 30 u/r 95 TNFR for CS_2 and H_2S is as under :

Amongst other definitions, 'efficient exhaust draught' is defined as localised ventilation effected by mechanical means for the removal of gas or vapour, so as to prevent it, as far as practicable from escaping into air of any occupied room. No draught shall be deemed to be efficient if it fails to remove smoke generated at the point where such gas or vapour originates.

Other provisions include

1 Prohibition of employment of women & young persons.
2 Efficient exhaust draught on CS_2 churn to keep CS_2 exposure below 20 ppm, and also on H_2S fumes. SBA necessary if ventilation is ineffective or stops suddenly, otherwise the worker shall leave the room as soon as possible or within 15 minutes of such occurrence. Fresh air inlets shall also be provided.
3 Air analysis to measure CS_2 and H_2S every 8 hours and its record. Exposure of CS_2 or H_2S above 20 ppm, its duration and reason shall be reported to the CIF. Manager's duty to reduce the excess exposure.
4 Electric fittings in CS_2 fume process room shall be flameproof.
5 Washing facilities - 1 tap per 5 workers, standpipe within 1.2 mt spacing and sufficient supply of soap and clean towels. 6 PPE as specified in the Table. Its use compulsory. Suitable storage room or lockers necessary.
7 Mess room of at least 1 mt^2 per worker, in charge of a responsible person and furnished with tables, chairs, wash-basin and means to warm food.
8 Prohibition of smoking and source of ignition. Notice necessary.
9 Medical examination of workers employed in a fume process, by the CS (Certifying Surgeon) every year. Record in Health Register.
10 Medical practitioner (MBBS with PG Diploma in Industrial Health or 5 years experience) and his duties.
11 Breathing apparatus & life belts.
12 Cautionary placard and instructions.

Looking' to the prescribed TLV 10 ppm for both CS_2 and H_2S, under the Second Schedule of the Factories Act, that limit of 20 ppm stated in the State Rules should be changed to 10 ppm on safer side and to bring uniformity in the provisions of the Act and Rules.

Summary of Schedule 22, rule 102, GFR, Sch.19 u/r 114, MFR and Sch.26 u/r 95, TNFR is as under

(1) Application:

This schedule is applicable to CS,„ manufacturing plant containing electric furnace, condenser, refiner and storage.

(2) Construction and operation :

Building should have optimum ventilation. Workers at risk of fire/explosion should be minimum. Furnace should be sound with supports grounded 60 cms in concrete. Operating instructions to be strictly followed.

(3) Electrodes:

Seamless tubes with cooling water system giving alarm of interruption of water in the electrodes and stopping power supply for furnace operation. Electrodes should be kept covered with charcoal bed. Charcoal separator required between the furnace and sulphur separator to prevent charcoal entry into condensers and piping.

(4) Rupture Disc and Safety Seal :

Two rupture discs on each furnace to blow off at. twice the maximum operating pressure. Water sealing arrangement between charcoal separator and sulphur separator.

(5) Pyrometers and Manometers :

Pyrometers on furnace with dials in control room to know temperature of the furnace and manometers to know pressure (1) before and after the sulphur separator and (ii) in primary and secondary condensers.

(6) Check valves:

They are required on CS carrying piping to prevent back flow of gas in to the furnace in the event of its shut down.

(7) Bulk Sulphur Storage :'

Sulphur dust being explosive, its clouds generation should be minimised and its contact with spark, flame etc. should be prevented. Use non-sparking tools. Smoking, matches and sources of ignition not allowed.

(8) Other provisions:

1. Inspection and maintenance by a competent person and in a prescribed manner.
2. Hourly record and log book for gas and water temperature, pressure, primary and secondary voltages and current and energy consumed.
3. Fire/explosion proof electric apparatus, wiring and fittings.
4. Adequate means of escape.
5. Fire warning by electric and non-electric alarm.
6. Adequate number of fire extinguishers.
7. Trained workers and supervisors.
8. Washing facilities with one tap per five workers, pipe spacing more than 120 cms and soap, towel etc.
9. Suitable PPE to workers.
10. Cloakrooms to put work clothing and personal clothing. In-charge person should be appointed.
11. Unauthorised, persons shall not be admitted in the plant.

IS : Code of safety for Carbon disulphide 5685, technical 717.

9 CARCINOGENIC DYE-INTER MEDIATES

Dye or dyestuff are soluble colours and the textile fibre or other materials are immersed in their solution for dyeing process. Pigments are insoluble and are applied externally on surfaces by dispersion methods.

Finished dyes are not much hazardous but in making them many intermediates are manufactured from hazardous chemicals like aniline, benzene, naphthalene, anthracene, acids and alkalis etc. and a wide range of dye-intermediates are manufactured (e.g. quinones, aromatic amines etc.) and these intermediates are hazardous and some of them are carcinogenic also.

Auramine and magenta have caused bladder cancer to the workers. Azo dyes derived from benzidine or other chemicals, benzyl violet 4B, 4 amino or nitro diphenyland beta-naphthylamine have carcinogenic potential.

Dermatitis is possible due to skin contact. Respiratory disorders have also been reported.

Statutory Provisions:

Summary of Schedule II, Rule 102, GFR, Sch.22 u/r 114, MFR and Sch.22 u/r 95, TNFR is given below.

Applicability:

This schedule applies to factories where following substances are formed, manufactured, handled or used –

Prohibited substances	Controlled substances
Beta – naphthylamine and its salts	Alpha naphthylamine or Alpha – naphthylamine containing less than 1% of beta-naphthylamine.
Benazidine and its salts	Ortho-toludine and its salts.
4 amino diphenyl and its salts	Dianisidine and its salts
4 nitro diphenyl and its salts	Dichloro Benzidien and its salts
Any substance containing above compounds	Auramine and Magenta

No person shall be employed in process of 'prohibited substances' mentioned above except as exempted by the CIF in writing. This becomes possible if the process is carried out in a totally enclosed, safe and hermetically sealed system as prescribed in para23 of the schedule. The CIF may impose conditions, if any.

Precautions for processes of 'Controlled substances':

1. Prevention of inhalation, ingestion or absorption of such substances.
2. Process in a totally enclosed system or under local exhaust ventilation.
3. Containers shall be tightly closed and properly labelled.

Other precautions:

1. PPE : Long trousers and shirts or overalls with full sleeves and head coverings, rubber gum boots, rubber hand gloves, rubber aprons and respirator if required.

2. Prohibition: No women or young person shall be employed in such process. No person below the age of 40 shall be employed in such process.

3. Floor: Smooth, impervious, no use of tar or asphalt, suitable slope, gutters and daily washing.

4. Empty containers: shall be thoroughly cleaned and inactivated before disposal.

5. No manual handling: Scoop with a handle shall be used. It shall be thoroughly cleaned daily. 6. Instruction & Notice: All workers shall be instructed on properties of toxic chemicals and their safe use including emergency procedure. Prescribed cautionary placards shall be displayed at prominent places.

7. Washing/ Bathing facilities:
   1. Wash places (basin) with clean towel, soap and nail brush to each worker, nearer to work place.
   2. Bathrooms with facility of hot and cold water.
   3. One stand pipe on each floor.
   4. Daily facility to wash uniforms.

8. Food, Drinks etc. - Food, drinks, pan-supari, tobacco and smoking in. workroom are prohibited.

9. Clock room: Lockers with separate compartments for street clothes and work clothes. Separate place from locker room and mess room to store PPE given to the workers:

10. Mess room - With tables, benches and means to warm food.

11. Washing time - 30 minutes for bathing before the end of each shift and 10 minutes for washing before each meal.

12. Medical Examination and Record
   1. Employment of a doctor with approval of the GIF.
   2. Provision of all medical facilities to him.
   3. Examination by the CS within 15 days of first employment. It includes haematological test, paranitrophenol in urine test, pulmonary function test and CNS test. Employment after such fitness certificate (by the CS) only.
   4. 6 monthly re-examination by the CS.
   5. Fitness certificate in Form No. 33 and record in Health Register in Form No. 20. Ready to be shown to the Inspector.
   6. Unfit worker shall be given alternate placement. He can be re-employed in the same process if declared fit by the CS.

IS : Carcinogenic substances, handling safety 14165, Dye application classes 4472, intermediates sampling & tests 5299, pigment for paints 59, dyesbasic strength 12387, dye-hair, liquid 8481, disperse dyes 11635, vat dyes 4394, 5970.

10 CEMENT INDUSTRY

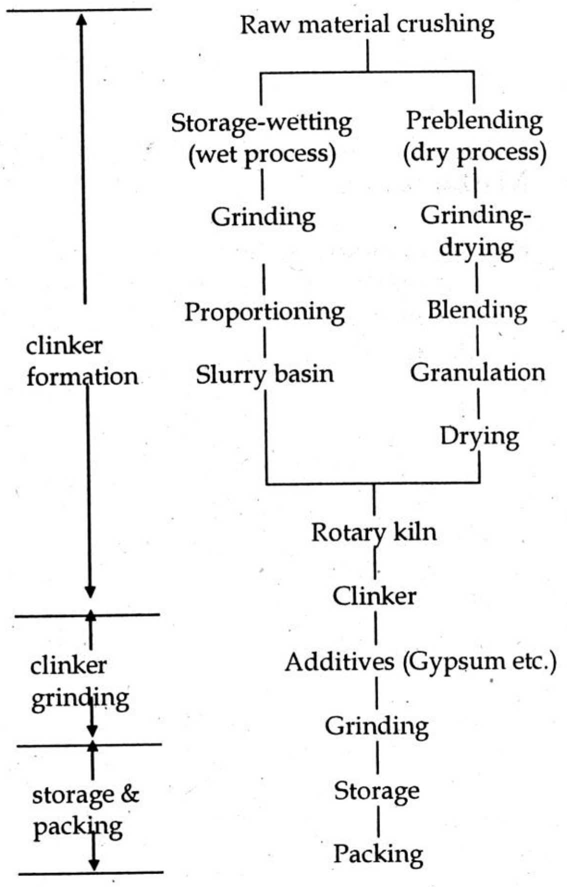
Manufacture :

Cement is mainly made from limestone, clay and small amounts of other metallic oxides, which, when mixed with a small amount of water, sets to a hard stone-like substance in a few hours. It is a main building material working as a hydraulic bonding agent.

Types of cement are portland, pozzolana, calcium aluminate and special or corrosion-resistant cement. Grades are more than fifty.

Cement is a mixture of four essential raw materials i.e. 'calcium, silicon, aluminium andiron. Calcium is obtained from limestone or cement rock or hydraulic calcium silicate i.e. clinker or chalk. Silicon, aluminium and iron can be obtained together from clay or shale or slate or separately from sand, bauxite on and iron ore respectively. Gypsum, fly ash and bias furnace slag are also added in certain proportions Composition of these materials should be proper otherwise the property or quality may change.

Manufacturing process is wet process (old one) dry process (new) or the combined process. The raw materials are finely ground, mixed and heated (burned) in a rotary kiln to form cement clinker During calcining, clinker compounds are also obtained. Various reactions such as evaporation of water, evolution of CO and reaction between lime and clay take place during burning. Liquid formation begins at 1250 °C and fusion occurs near the end of the process. Closed circuit grinding is preferred to open circuit grinding. Process flow chart of the combined process is shown below.



I Storage-wetting (wet process)

Hazards and Controls :

In quarries where limestone, clay, gypsum etc. are extracted, hazards of dusts during drilling and crushing, fall of rock and earth, blasting and bad weather conditions are obvious.

In cement processing area dust levels were found from 41 to 384 mg/m", the highest being at sieving, cement packing and clinker grinding. Modern plants using wet process have 15-20 mg/nr" level. Free silica content in dust is also possible. Electrostatic filters are useful to reduce the air pollution.

High temperature near furnace doors, high noise (upto 120 dB) near ball mills, CO near limestone kiln and dusting at most of the places including conveyor and manual handling cause health hazards. Pathological disorders are found in respiratory, digestive and nervous system, and also in skin, hearing, vision and rheumatic disorders.

Cement Pneumoconiosis may appear after prolonged exposure. Silicosis may not occur in cement plant (because of. absence of free silica) but may occur in refractory processes due to dust containing free silica.

TLV (ACGIH) for Calcium oxide is 2 mg/ m^3 and Aluminium oxide 10 mg/ " USSR-MAC values are as under-:

Cement dust without free silica	6 mg/ m^3
Cement dust with free silica <10%	5 mg/ m^3
Asbestos cement dust with asbestos >10%	5 mg/m^3

2[nd] Schedule of the Factories Act prescribes 10 mg/nr" total dust containing less than 1% quartz as permissible TWA concentration/8 hours TLV for Portland cement.

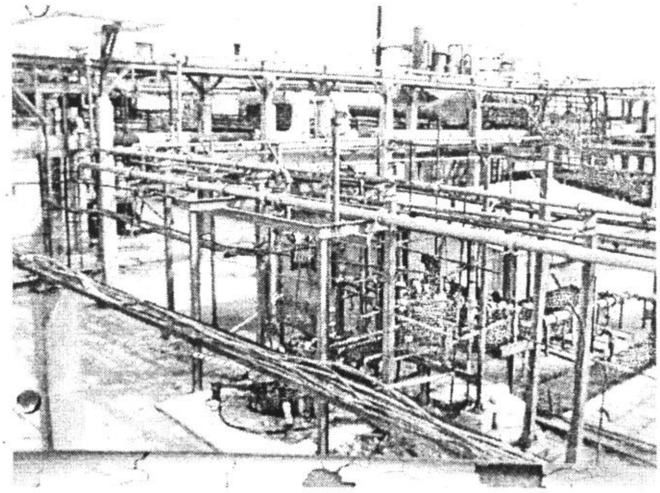
Similarly, the same Schedule prescribes 2 mg/ m^3 respirable dust fraction containing less than 5% quartz as TLV for coal dust.

Cabins of excavators in quarries should be fully closed and the drivers should be supplied fresh air through respirators. Modern surface mining machines do many operations safely. They dig the surface, collect extracted material in ,a trailer, resurface the dug land and utilise wet process and dust suppression system. Dust suppression measures near drilling, crushing and blasting, keeping away (at a distance) from CO possibility at blasting points (fumes), enclosures to dusty processes and to conveyor belts including their drives and transfer points, electrostatic and bag filters at clinker kiln stacks, sieving and packing processes, cold air flow (showers) at hot places, thermal screening, shower baths and barrier creams for skin protection and desensitisation treatment in case of eczema are all important safety measures.

IS : Cement, hydraulic - glossary 4845, sampling 3535, physical tests 4031, flow table 5512, chemical analysis 4032, colorimetric analysis 12423, bag, jute cloth 12001, jute bag for packing 2580, polypropylene 11653, high alumina for structural use 6452, masonary 3466, mastic 3709, test for permeability 3085, oil-well 8229, paint 5410, pipeasbestos 9633, 9627, plants-emission limits for particulate matter 10693, control of air pollution 12002, plaster finishes 1661, Portland - blast furnace Slag 455, high strength 8112, hydrophobic 8043, low heat 269, 12600, pozzolana 1489, rapid hardening 8041, sulphate resisting 12330, white 8042, rotary kilns 8125, refractories for kilns 10607, standard sand for testing 650, Testing apparatus -10078, 5516, 5514, 5536, 7509, 7510, 9350, 5724, 5513, waterproofing compounds 2645, Coal for manufacture 12770, cement concrete 12727, tiles for canal lining .10646, asbestos cement-2098, 1626, 3140, 7639, 11450, bone cement 8681.

11 CHEMICAL WORKS

See Chapter-18 for safety in chemical industry.



Statutory Provisions:

Summary of Sch. 12 and 19 u/r 102, GFR is given below.

Sch.l2, Rule 102, GFR, Sch.l2,Rule 114, MFR & Sch.21, Rule 95, TNFR :

Sch.l2 is applicable to manipulation of sulphuric, nitric, hydrochloric and hydrofluoric acids or liquid ammonia and hydroxide of sodium or potassium or mixture thereof.

Safety measures include acid and fireproof flooring, suitable PPE, safety showers, cautionary notice, containers, crates and rubber-wheeled truck/ trolley to carry the containers safely, suitable tilling or lifting device for emptying jars and carboys, scoop to handle alkalis, use of wooden implements to clean acid tanks for prevention of arsine or H, production, storage of turpentine, carbides, metallic powders and combustible materials not with acids and suitable fire extinguishers. 15 minutes washing is suggested in case of acid or alkali burns.

Sch.l9, Rule 102, GFR and Sch.l6, Rule 95, TNFR:

Part-I Applicability and Definitions:

It is applied to all manufactures and incidental processes carried on in industries listed in the First Schedule of the Factories Act.

The terms defined here include toxic substances, emergency, dangerous chemical reaction, manipulation and confined space.

For other definitions see Chapter-2 and Part 2.1 of Chapter-16.

Part-II General Requirements:

Main points are highlighted as under:

1. **House keeping :**
Spillage to be cleaned. Floors, ways etc. free of obstruction. Easy means of access. Improper use prohibited. No food, drink etc. in the work area. Cautionary notices and instructions regarding fire, explosion, health hazard,' unsafe practices, symbols and colours used on labels. Undertaking

from the workers within one month that they have read the notices and instructions, understood them and would abide by them.

2. **Preparation of new process :**
All hazards of materials and reactions to be studied before staring any process or experimental work. Details of hazards and measures from design stage to disposal stage shall be sent to the CIF before 15 days of commencement.

3. **Authorised entry :**
Only authorised persons shall be allowed to work at dangerous chemical reactions or storage.

4. **Test of Instruments and Safety devices :**
Test before use. Monthly tests by a competent person. To be operated daily to ensure effective working at all times.

5. **Electrical installations :**
Of appropriate type and conforming to IS.

6. **Handling and Storage :**
Containers of adequate strength, labelling, colour - coding, identification of hazard and safe handling method. Use of damaged containers under supervision. Storage or charging should be safe to avoid risk of fire, explosion and toxic concentrations above limits prescribed in the Second Schedule of the Act. Suitable venting to maintain safe levels in vessels and containers. Type and capacity of flooring and compatibility of substances shall be considered. Storage of highly unstable, reactive or explosive material to be limited to the use of 2 months. For excess, permission of the CIF is necessary. The CIF can direct to lower the limit of 2 months if more safety is required. Standby arrangements for emergency transfer should be equal to the biggest container. Non metallic vessels should be strong and independently supported.

7. **Isolation:**
Quick isolation facility with indication required.

8. **Personal Protective Equipment:**
They should conform to IS, should be in clean, sterile and hygienic condition before issue. Information to workers for their use. For any doubts regarding appropriateness, the decision of the GIF shall be final.

9. **Alarms :**
Audible and visible alarms in control room as well as at strategic locations for process correction to control the parameters. They should be checked daily and tested every month. The CIF has power to direct.

10. **Control of Escape of Materials :**
Enclosure, by-pass, exhaust, vacuum etc. required to control the escape and spread of hazardous chemicals. In case of failure of such system, immediate steps necessary to stop further escape and bring down to safe level. The escaped materials shall be diluted with water, air or suitable agent or treatment.

11. **Devices for Dangerous Reactions :**
Automatic and/or remote control arrangements. In case of their failure automatic flooding, blanketing or effective arrangements should come into operation.

12. Testing and Repair of Plant & Equipment :

Test by a competent person before first use. Then periodic test at 2 years interval, or after repair. Detailed precautions are prescribed in para-15 of the Schedule in respect of pressure or reaction vessels.

13. Staging:

Structure erected for maintenance, repair or for entering into confined space should be safe and with access with hand rails. Toe board to work at a height of 1 mt or more.

14. Seating arrangements:

Should be safe to prevent risk of exposure to toxic, flammable & explosive substances.

15. Entry or work in Confined space :

Identify hazards and safeguards. Follow work permit system. Before testing wash, clean, neutralise or purge the space and provide forced ventilation. Test for safe entering. Education,; training and use of PPE for rescue, resurrection and first aid. Work under supervision. A log book of such work should be maintained and shown to the Inspector on demand.

16. Maintenance work etc.:

All such work including cleaning of empty containers of hazardous chemicals, shall be done under safety work permit system and by the trained workers under supervision. Place of such work shall be cordoned off for safety of others.

17. Permit to work system :

It should be under supervision of knowledgeable and responsible person. Clean the work place by washing, purging etc. Then isolate it from other parts throughout the period of work. Develop predetermined work procedure for safety. Physical fitness of the person is necessary. He should be informed about the correct work procedure. Rescue, resurrection and first aid arrangements should be in ready condition for use in emergency. Approved PPE shall be used. Restore the original condition after completion of the work.

18. Safety of Sampling Personnel :

This should be ensured by safe procedure and use of approved PPE.

19. Ventilation :

Adequate ventilation at all times in process area to avoid any harmful concentration.

20. Emergency Procedure :

Should be developed as prescribed in para-23 of the Schedule and must be rehearsed every three months. They include identification of all possible emergencies (which should be reviewed every year), arrangements for outside help for rescue, fire fighting and medical facilities, warning arrangements (its effectiveness should be checked every month), alternate power supply, safe close down procedure, evacuation of persons and its training to workers, information to doctors and precautions against danger due to effluent. Deficiencies to be corrected. Ten percent workers should be trained in the use of first aid fire fighting equipment. The chemical identity (with antidote) should be furnished to the doctor for emergency or first aid treatment to exposed person. For On-site and Off-site Emergency Plan see Part 7 of Chapter-19.

21. Dangers due to Effluents :

Gas evolution due to mixing of different effluents should be prevented. Effluents causing poisonous gases should be trapped and rendered safe by independent drainage.

Part - III : Fire & Explosion Risks :

1. General:

Fire hazards area classification should be as per IS. Spark generating machines, equipment, fittings etc. not permitted in fire prone area. Hot pipes either outside the plant or be protected. Soles of footwear, wheels of trucks or conveyors and tools shall be of nonsparking type. Smoking prohibited. Notices to that effect. Pipelines carrying flammable/ explosive substances shall be protected, examined once a week and record kept of defects and repairs.

2. Static electricity:

Plant, machinery, pipelines, belt drives, receptacles of flammable liquids etc. shall be earthed and humidity be regulated. Mobile tankers to be earthed before filling and discharge. Lightening arrester shall be maintained where necessary.

3. Process heating :

Contact of flammable vapour and open flame should be prevented. Heating should be safe and automatically regulated below danger point.

4. Leakage control:

Bund/dyke surrounding storage vessels of flammable liquids. Fire fighting appliances near such vessels. Waste material contaminated with flammable substances be disposed off safely under supervision.

5. Safety valves and Pressure gauges :

Be fitted on stills and vessels containing gas pressure above atmosphere and maintained well.

6. Fire fighting system :

Where workers exceed 500, trained fire fighting squad of more than 8 persons available at any time and consisting of watch and ward personnel, fire pumpman, departmental supervisors and trained operators for fire and emergency services is required, the squad personnel be provided with protective clothing and equipment. Muster roll of duties be maintained. Telephones should be inter-linked with pump room, main gates and storage area.

Part-IV : Toxic Risks :

1. Leakage & Drainage :

Construction to prevent, segregate or localise escape of toxic release. Bund, dykes and catchpits below pipe joints to collect leakage. Drainage leading to collection and neutralisation or treatment tanks for safe discharge.

2. Vessel covers :

Be provided to avoid physical contact. Fence height 90 cm. or more.

3. Exhaust arrangement;

Required on gas evolving processes and be interlocked with process control where possible. In case of its failure, the process should automatically stop.

4. Work benches :

Of smooth impervious surface and be washed daily after work.

5. Waste disposal:

Non absorbable receptacle with tight fitting cover to collect waste or rejected material soiled with toxic substance. It shall be destroyed by burning or other safe way under supervision. Empty containers be cleaned before disposal.

Part-V : Special Provisions :

Here precautions have been prescribed for following specific processes- .

1. Nitro or Amino processes.
2. Chrome processes.
3. Use of Glass vessels.
4. Chlorate manufacture.
5. Use of plastic vessels and equipment.

Dust or fume control and antidote methylene blue injection are suggested for Nitro or Amino processes.

Exhaust draught, washing facilities, weekly inspection of hands and feet and skin ointments are required for chrome processes.

Wire mesh covering and spillage removal are necessary for all processes in glass vessels.
Chlorate manufacture requires use of hard, smooth, non-combustible surface or vessels, water showers and daily cleaned PPE.

Plant and equipment made from reinforced plastics should be standard (IS), strong against loads, pressure tested by a competent person and not allowing over filling or over loading.

Part-VI: Welfare Amenities:

1. **Washing:**
   One tap for every 15 workers with liquid soap and nail brushes. They should be separate for males and females.

2. **Special bathing:**
   Are required for workers engaged in processes of nitro or amino compounds, chrome, tar, cyanide, cyanate or cyanogen compounds, bleaching powder, chlorine, nickel and its compounds or their derivatives. The CIF has power to direct other industry also. 1 bathroom for 25 workers. Bath necessary at the end of shift.

3. **Mess Room:**
   Required for factories employing 50 workers or more with good ventilation, furniture, drinking water and washing facilities.

4. **Cloak room:**
   Two lockers for each worker, one for work clothing and another for personal clothing.

Part VII : Duties of workers :

Workers shall not make any safety device, guarding or fencing inoperative or defective. They shall report malfunction or defect of machinery, equipment etc. immediately, use PPE, co-operate in emergency duties, undergo medical examination and not do any unauthorised work to cause risk t themselves or others.

Part VIII : Restrictions on young persons

The CIF may by an order in writing, restrict c prohibit employment of women and young person below the age of 18, considering their health and safety aspect. Then such workers should be provide' with alternate work not detrimental to their health c safety.

Refer following schedules also for specified chemical processes :

Schedule No. u/r			Process
102 GFR	114 MFR	95 TNFR	
2	2	2	Electroplating
3	3	3	Electric accumulators
4	4	4	Glass manfacture
5	5	5	Grinding & Glazing of metals
6	6	6	Lead & lead compounds

8	8	8	Air/steam blasting
10	10	17	Chromic acid or chromates
12	12	21	Acids or Alkalis
14, 22	14, 19	26, 30	Carbon disulphide
15	15	29	Pesticides
16	16	18	Compression of O_2 & H_2 by electrolysis of water
18	-	19	Stone & free silica
21	21	23	Oils, fats and solvent extraction plants
24	-	-	Gas welding & cutting
-	18	25	Manganese & its compounds
-	-	10	Cellulose spraying
-	-	11	Graphic powdering
-	-	13	Cashew-nut processing
-	-	14	Coir & Fibre factories
-	-	24	Fireworks & Match factories
-	-	30	Rayon by viscose process

IS : See Chapter-18 exclusively for safety in chemical industry and its Part-5 for IS listed therein.

12 CLOTHING INDUSTRY

Garment making is an old and universal industry. Hazards are hand injuries, cuts, burns, crushing, fire and chemicals. Preventive measures include :

1. Fire safety (see Chapter-13) and safe means of escape.
2. Good housekeeping (see Chapter-8).
3. First aid (see Chapter-26).
4. Guarding of circular knives of portable cutting machines, power presses, needle and drives of sewing machines, under-bench shafting. Various types of needle guards and press guards (two hand control not fully safe) are available.
5. Good earthing and ELCB of portable electrical power tools including irons.
6. Dust suppression and fume control of formaldehyde resin and toxic solvents.
7. Ample air space, good ventilation and temperature and high standards of illumination.
8. Well designed seats for normal posture and reducing fatigue of scapular, dorsal and lumber muscles. Adjustable seats and backs are necessary where more than one shifts operate. Ergonomic designs are safe.
9. Noise control in zip fastener chain production plant.
10. Pre and post employment medical examinations, lunch/rest rooms, washing and sanitary facilities and
11. No exploitation of any kind where girls, women and illiterate workers are employed.

IS : Washing machine 6930, lockers – metal 3314, wooden 5923, clothing - conductive for live working at 800 KV 13771, leather protective 6153, safety industrial 8990, stains removal 11210, clothessize designation 10015, body measurement sizing systems 10397, collar-white, handloom 2715.

13 DAIRY PRODUCTS INDUSTRY

Milk, cheese, curd, butter, ghee and milk powders are widely used. Their industrial manufacture should include :

1. Machine guarding of separators, centrifuges (with interlocking), rotary churns with bar fencing interlocked with churn drive unit, icecrushers, cheese graters, bottling or filling machines, nip between conveyor drums and pulleys etc.
2. Safety of boilers, steam receivers and pressure vessels.
3. Toxic hazard control of refrigerant used. Respiratory and other PPE are necessary.
4. Non-slip floor, non-slip footwear, cleanliness, good housekeeping, fixed stairs and platforms with hand railings and guarding of open vats and vessels.
5. Chemical hazard control for acids and alkalis, use of PPE, first aid and medical care.
6. Double insulation and earthing of electrical machines and tools.
7. Explosion relief vents and temperature control in milk spray drying chambers to avoid fire and explosion.
8. Veterinary medical supervision, personal hygiene, good washing facilities to prevent animal infectious causing brucellosis and bovine TB.

See Part 10.9 (Micro-organism Rules) of Chapter28 for some statutory provisions.

IS : Dairy- floor finishes 7956, equipment, cleaning and sterilising 5253, industry '- rubbers 6450, tests 1479, effluents guide 8682, laboratories, layout 2981, thermometers, floating 1672, farms, cattle sheds 6027.

14 ELECTRONICS INDUSTRY

The use of electronic items is day by day increasing in industry, at homes and at many places. Their manufacturing should include:

1. Exhaust ventilation for fumes of lead, zinc, rosin etc. and also for molten-solder tanks.
2. Eye protection for organic peroxide hardeners and respirators for quartz flour, epoxies with phenol compound and airborne concentrations.
3. Prevention of flammable or explosive mixtures of solvents and source of ignition.
4. Exhaust ventilation for printing process.
5. Acid resistant and non-slip flooring, exhaust ventilation, eye bath and PPE in etching processes. Use closed containers for etching liquids.
6. Good industrial hygiene.

IS : Electronic apparatus, safety requirements 616, climatic and durability tests 589, .gas lighters 9000, equipment - environmental tests 2106, reliability testing 8161, 7354, safety in use , maintenance, manufacture 11743, measuring apparatus, safety requirements 9858, weighing systems 9281, 11547, buzzers 12825, flash apparatus safety 12274, flashers 13135.

Electronic ear protectors 9167, assessment of noise exposure 7194, radiation protection for X-ray tube, radio transmitting equipment, safety requirement 10437,6970, 6567, safety code for radiographic practice 2598, safety of data processing equipment 10422, Hand/foot contamination monitors 11869, Fire hazard testing 11000, protection against ionising radiation 11868.

15 ELECTROPLATING INDUSTRY

This electrochemical process of surface treatment uses chemicals and direct current source for electroplating of many components to protect against corrosion, to improve surface properties and decorative effects. Washing and galvanising are also carried out.

The electrolyte solutions may be acidic, alkaline o: alkaline/cyanidic. The safety measures include:-

1. Control against irritant and toxic chemicals acids, alkalis, dust, gases, fumes and vapouri of organic solvents.

2. Control against electric current with good earthing.

3. Ventilation system to carry exhaust air at a low level and supply of fresh air from upper level

4. Local exhaust ventilation near mechanical cleaning, polishing and grinding. Ergonomic designs are necessary. Aluminium dust must be collected in wet trap to avoid explosion.

5. Iron and aluminium should be ground in separate units.
6. Goggles, gloves, respirators and other PPE necessary.

7. Sucking off heavier solvent vapours from below (where they are condensed) near degreasing baths which should be installed with 1 mt safety zone between the worker and the edge of the bath. Bench ventilation is also necessary for the after treatment of degreased parts. Benzene should not be used.

8. Protection against acids and alkalis in pickling process. Nitrous fumes and HF fumes must not be allowed in workroom. Their proper exhaust is necessary. Water showers and eye-washers for treatment of burns and acid-proof PPE necessary. The acid should be poured into water while stirring continuously, not the other way.

9. Cyanide poisoning may be fatal by breathing or skin contact. The process must be in closed condition. The first-aid measures must be ready. Removal of contaminated clothing, washing with water and fresh air or oxygen treatment will be helpful. Lunch should not be allowed in work room. Optimum hygienic conditions necessary.

10. Chromium plating can cause burns, ulceration, nasal perforation and eczematisation. Powerful exhaust ventilation with maximum closing surface hood and acid-proof PPE are necessary. Exhaust ventilation at the rim of the bath is most effective. Air extraction per cm^2 bath surface should be @ 1800-2700 m^3/h. Non skid floors or plastic duck-boarding, electrical safety (see Chapter-11) and environmental and biological monitoring are necessary.

Statutory Provisions:

Schedules 2, 10, & 12, u/r 102, GFR are relevant. Summary of Schedule-2 is as under :

Applicability:

This substituted schedule is applicable to electrolytic process which means electrolytic plating or oxidation of metal articles by the use of an electrolyte containing acids, bases or salts of metals such a chromium, nickel, cadmium, zinc, copper, silver, gold etc.

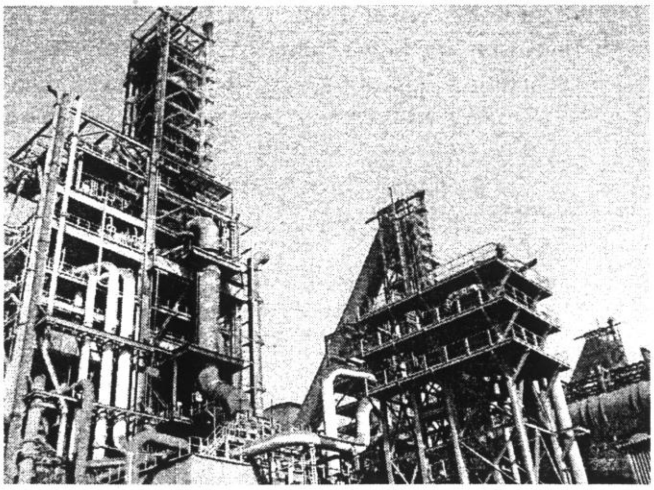
Safety Measures prescribed:
1. An efficient local exhaust draught near vapour origin, preventing the vapour to enter into anyroom or work place.
2. Child, adolescent or Women are prohibited to work at a bath.

3. Impervious floor. It should be washed daily.
4. Waterproof aprons, bibs, rubber gloves, rubber boots, chemical goggles and accommodation to store and dry such PPE of the workers.
5. An undercover wash place or wash basin, one tap for five workers working at a time, with spacing of 12 cms. per worker, waste pipe and constant supply of water.
6. Clean towels and soap etc.
7. Emergency shower with eye fountain.
8. Storage tank of 1500 litres clean water for above purpose.
9. Cautionary notice as prescribed.
10 Medical examination of workers by an employed doctor approved by the CIF. Pre employment and fortnightly examinations and their records are prescribed. Barrier cream, ointment, waterproof plaster, emergency cyanide kit etc. should be provided.
11. Medical examination by the certifying surgeon includes pre-employment and periodical six monthly or yearly examination as prescribed. For use of chromium, nickel and cadmium, urine test is suggested. Fitness certificate in Form No. 27. Health record in form No. 20. Unfit person shall be given alternate placement. Re-employment in the same process if the CS declares him fit.

IS : Electroolated coating- - silver 5925. 6267, 1959, 9530, aluminium 9844, brass 11773, chromium 1068, 1986, gold 4252, 3266, lead 1992, nickel and chromium 4942, nickel 12393, 1809, zinc and cadmium 9839, zinc 1880, 2290, 3027, 12519, Corrosion resistance test 9844, 5528, Local thickness testing 3203, Glossary 3554, Equipment 2679, Industry, treatment of effluents 7453, Recommended practice 3655, filter and powder 10472, mechanical polishing of metals 3656, copper salts 487, succinic acid for electroless plating 9909.

16. FERTILISER INDUSTRY

Fertilisers are natural (manure) or artificial. Artificial fertilisers are produced in chemical plants and they may be organic or inorganic, nitrogenous, phosphatic, potash and trace element fertilisers. In the warehousing stage, phosphate. potassium-salt and other dusts are released. In chemical processing plant, air pollution by toxic gases (Fluorine compounds, H_2SO_4, NO, HCI, CO and NH_3, gases) and dust, high air temperature and noise are noticed. Closed and efficient ventilation is necessary. In finishing processes, weighing, bagging and storing, gaseous emissions and fluorine compounds are released. Phosphates and other raw materials contain 10% or more free silica which may cause pneumoconiosis. The dust of soluble fertilisers causes irritation. The safety measures include:



1. Mechanisation and automation of production processes, provision of remote control, careful assembly and safe operation of equipment and heat insulation.
2. Process segregation and walls and floor covering to absorb fluorine compounds.
3. General ventilation, exhaust ventilation of enclosed plant, cleaning of exhaust air and waste water.
4. Education and personal hygiene.
5. Use of PPF and safety showers.
6. Safety and sanitary supervision.
7. Pre and post medical examination including radiographs of the locomotor system and lungs.

IS : Fertiliser - Glossary 1304, sampling and tests 6092, bagged, handling and storage 5985, mixtures 7863, 9024, effluents - tolerances 2590, treatment and disposal 9841, application equipment glossary 9855, Metering mechanism plate type 12599, feed roller type 12613, Urea ammonium phosphate based 8359, nitrophosphate based 7131, seed drills 6316, 6813, Phosphatic fertiliser industry. Limits of emissions 8635. -

17 FIRE WORKS AND MATCH FACTORIES

There are two types of matches, strike- anywhere matches and safety matches which strike only on friction slips. Wood for its splint and phosphorus for its ignitable head pose fire and explosion hazard. There are dust and fume hazard also. Employment of more number of children in poor working conditions and exploitation increase more hazards. The safety measures include:

1. To prevent fire and explosion risk, manual handing should be replaced by mechanical handing, sources of ignition and friction should be eliminated, fire-resisting PPE should be provided.
2. Good house keeping , gangways and exits.
3. Guarding of guillotine, splitting knives, rollers, printing press and other machinery.
4. Prohibition of white phosphorus. Use closed containers.
5. Good general ventilation and local exhaust ventilation near weighing, mixing splint polishing drum and where chromium or lead compounds are used.
6. Strict cleanliness, sanitary and washing facilities for all workers and cloakroom, mess room or canteen to be separated from process room.
7. Good sitting arrangement should be provided.
8. Only adult workers should be employed.

IS : Fireworks - aeroplanes 12975, rockets 12980, match box - paper 3303, safety 2653, 10373, 10374, 9600, log 1140, Match industry, animal glue 13254.

In December 1999, the Central Government declared prohibited production, sale and use of such fire works which cause noise>123 dB within 4 mt from the point of their firing.

18 FOOD INDUSTRY

Food industries include treatment, preparation, conversion, preservation and packaging of foodstuffs. Women employment varies from 20% to 55%. The industry depends upon seasonal raw materials of vegetable or animal origin.. The processes are handling and storage of raw materials, extraction, crushing, separation, centrifuging, filtering, processing, fermentation, cooking, dehydration, distillation and preservation by high or low temperature processes. High-temperature processes include cooking, sterilisation (steaming in autoclave), pasteurisation, smoking and .dehydration. Low temperature processes include cold storage, freezing and deep freezing.

The safety measures include :

1. Nonslip and dry floor.
2. Good housekeeping.
3. Covered pits and floor openings.
4. Good ladders, safety belts, lifelines and safe means of access.
5. Good lighting and ventilation.
6. Safe use of knives and cutters.
7. Treatment of burns and scalds from steam and hot substances. Insulation of hot surfaces.

8. Prevention of explosion of boilers and autoclaves.
9. Electrical safety.
10. Control of airborne concentrations, dusts and explosive mixtures of gas or oil fired ovens.
11. Prevention of health hazards due to caustic, refrigerants, infections and parasitic diseases spread by animals and dermatitis and allergies by organic products. See Part 10.9 of Chapter-28.
12. PPE for protection in cold storage.
13. Personal and industrial hygiene.
14. Good sanitary and washing facilities and Guarding of typical machinery used.

IS : Food poisoning bacteria 5887, 7688, cereals warning 1656, Foodgrain and pesticides residues sampling 11380, Parathion residues 5952, malathion residues 5863, monocrotophos residues 11374, Safe use of -PVC 7288, polyethylene 7277, styrene polymers 7961, Food colours 5346, tests for dye content 6120, dimethoate residue 11021, Sampling and tests 1699, sensory evaluation glossary 5126, effect of packaging 8639, food yeast 3839.

See Part-7 also.

19 GLASS INDUSTRY

Types of glasses are soda-lime-silica glasses, lead potash silica glasses and borosilicate glasses. Regenerative or recuperative furnaces work upto 1500°C. After melting, other processes are annealing (controlled cooling) manual and mechanical blowing, pressing, rolling, float glass process, grinding and polishing, surface modification, pre-stressing for toughened glass and bonding for laminated glass.

Hazards are due to glass breaking and flying, silica, lead alkaline dusts, fuel and exhaust gases, heat radiant energy, glass blowing, heat cataract and noise.

Safety measures include :

1. Mechanisation and automation.
2. PPE against cut injuries, dust, fumes, gases, heat and noise.
3. Good housekeeping and regular monitoring.
4. Exhaust ventilation (for room and furnace).
5. Automatic weighing, mixing and transfer by enclosed methods.
6. Protection against HF fume by polyethylene containers and siphon transfer, PPE, washing facility and magnesium oxide paste.
7. Protection against high heat by screening, water cooled undersuit beneath reflective asbestos clothing.
8. Medical supervision for lead and other poisoning.
9. First aid and X-ray photograph arrangement to detect glass penetration and
10. Good washing facilities.

Statutory Provisions:

Summary of Scheduler, Rule 102, GFR is given below:

Efficient exhaust draught, lead compound and suspension are defined. Exhaust draft is required for mixing of raw materials to form a 'batch', dry grinding, glazing and polishing of glass article, processes giving HF or NH,, vapours, pots or furnace mould processes and all processes involving dry lead compound. In such processes employment of women and young persons is prohibited.

Floors mid workbenches should be smooth and impervious to water, cleaned daily and well maintained where lead compound or silica dust are manipulated.

Other safety measures include safe handling of HF (cylinder made of lead), no food, drinks etc. in workrooms, PPE, washing facilities and medical examination - pre employment and then at every month, with record in Form No. 20.

IS : Glass - Glossary 1382, packing 6945, safety 2553, toughened 6180, sheet transparent 2835, tableware 1961, tubing for laboratory 7374, thermometers solid stem 2480, protector for tubular gauge 5428, condenser 6052, containers - thermal shock test 11930, vertical load test 11539, electrode for direct reading pH meters 6804, glass fibre chemical resistant test 10661.

20 HAZARDOUS CHEMICALS AND PROCESSES

See Chapter-18 for safety in chemical industry and Part-10.8 of Chapter-28 for statutory provisions on hazardous processes.

Statutory Provisions:

Hazardous process is defined in section 2 (cb) of the Factories Act, a list of 29 hazardous process industries is given in the 1st Schedule and detailed provisions are given m Chapter-4A (sections 41A to H) of the Art

See foregoing part II of this chapter for general safety provisions for 'Chemical Works' also applicable to hazardous chemicals and processes.

The Central Government u/s 6, 8 and 25 of the Environment (Protection) Act made the Manufacture, Storage and Import of Hazardous Chemicals Rules 1989 (See Part 10.8 of Chapter-28). Then similar Rule 68J was added to the Gujarat Factories Rules 1963 w.e.f. 15-2-95. It was substituted by Notification dated 30-6-2004.

Now sub-rules of rule 68-J, GFR are as under :

Definitions (Subrule-I)

Subrule-I defines hazardous chemical, industrial activity, isolated storage, major accident, pipeline and Schedule.

Disclosure of Information (Subrule-2)

1. This provision is applicable to an industrial activity of hazards chemical mentioned in Part1 'or II of Schedule-1.

2. MSDS specified in Schedule -5 should be prepared for hazardous chemical. It should be shown to workers on request.

3. Labels on containers of hazardous chemical should identify content, name and address of the manufacturer or importer and physical and toxicological data.

Duties of Inspector (Subrule-3)

The inspector shall inspect at least once in a year the industrial activity or isolated storage, send annual status report and check major accident, site, safety report, safety audit report, onsite and offsite emergency plans.

General Responsibility of Occupiers (Subrule-4)

1. It is applicable to an industrial activity of hazardous chemical mentioned in part I or II of Schedule-1 and also to isolated storage containing threshold quantity (or more) mentioned in column-3 of Schedule-2.
2. Identification of major accident hazards and steps to prevent or control them are necessary. Persons working on site should be given ' training and equipment including antidotes necessary.

Notification of Major Accident : (Subrule-5)

1. Inspector and the CIF should be informed within 48 hours of such accident in Schedule-6.
2. The CIF shall inform the DGFASLI and the Ministry of Labour through proper channel.

Application of Subrules 7 to 13 : (Subrule-6)

Subrule No.	Apply to threshold quantity in
(a) 7,8, 12 and 13	Sch- 3, Column – 3 (excluding, isolated storage)
(b) 8 to 10	Sch.-3, Column – 4(excluding, isolated storage)
(c) 5 and 6	Sch- 2, Column -3 (to isolated storage)
(d) 8 to 12	Sch -2, column – 4 (to isolated storage)

Notification of site (Subrule-7)

The CIF should be informed in Schedule -7 at least 3 months before commencing such activity. If quantity of chemical mentioned in column 3 of schedule-2 & 3 exceeds the threshold quantity, it should also be informed subsequently.

Report of the Updated information (Subrule-8)

Information sent as above shall be updated and subsequent updated report shall be sent to the CIF.

Safety Report and safety Audit Report (Subrule-9)

No industrial activity, to which this sub-rule applies, will be undertaken unless a Safety Report is sent in Schedule-8, three months before commencing that activity. Safety Audit report should be sent subsequently. Frequency of safety audit report-internally every year and externally two years.

Updating of Safety Report (Subrule-10)

Every 3 years updated safety report shall be sent.

CIF can ask further information (Subrule-11)

CIF can ask further information regarding safety report or safety audit report.

On site Emergency Plan (Subrule-12)

An occupier carrying an industrial activity to which this sub-rule applies shall prepare and submit to the Inspector and the CIF an On site Emergency Plan in Sch-8A and rehearsal at every 6 months. For its details see Part 6.2 of Chapter-19.

Information to the persons likely to be affected (Subrule 13)

The occupier shall inform persons likely to be affected the nature of major accident hazard and 'DOS' and 'Donts' about it.

Disclosure of Information (Subrule-14)

This is regarding information to other person and his obligation.

IS : See Part 5 of Chapter 18 on Chemical Industry. Hazardous Chemicals - glossary 4155, classification 4607.

21 FLAMMABLE LIQUIDS AND GASES

See Part 8.3.1 and 8.3.2 of Chapter-18 and Schedules 7, 13, 14, 16, 19, 20, 21, 22 and 24 u/r 102 of the Gujarat Factories Rules for statutory provisions pertaining to flammable liquids and gases.

As defined under MSIHC Rules highly flammable liquids and gases are classified as –

1. Flammable gases (LEL upto 13% or explosive range 12%).
2. Extremely flammable liquids (FP<23 °C, BP<35 °Q.
3. Very highly flammable liquids (FP<23 °C, BP>35 "Q.
4. Highly flammable liquids (FP between 23 °C to 60"C)and
5. Flammable liquids (FP between 60 °C to 90 °C).

Difference between heat generated by the ignition source and heat generated by the burning material is called the flammability index. This index of combustible material ranges from 0.5 to 2.1 and that of highly flammable exceeds 2.1.

From flammability point of view, substances having melting (or dew) point above 50 °C are considered as liquids and those having saturated vapour, pressure of 0.3 Pa or more at 50 °C are gases.

Properties of flammable substances are flash point, fire point, auto-ignition temperature, flammable or explosive limits (range), maximum explosion pressure, maximum safe gap, minimum ignition energy, minimum extinguishing concentration, rate of combustion, rate of total combustion, rate of heating and type of reaction.

For the detailed definitions of above properties and evaluation of flammability of solids, liquids and gases, reference No. 1 at the end of this chapter may be studied.

Hazards and Controls :

Highly flammable liquids need low energy ignition source. Flammable gases are like boiling vapours (owing to their boiling point $\leq$ 20 °C)

Therefore both these substances will ignite immediately on contact of a spark or static charge. Hence precautions mentioned in Section-37 of the Factories Act must be strictly followed. These provisions prescribe -

1. Effective enclosure of plant, machinery or process.
2. Removal or prevention of accumulation of flammable dust, gas, fume or vapour.
3. Exclusion or effective enclosure of all possible sources of ignition (this includes static electricity).
4. Explosion relief devices (vents, baffles, chokes etc.) to restrict the spread and effects of explosion.
5. Safety precautions before opening any part or machinery, such as stopping (isolation or blinding) of inflow of flammable substance, reduction of pressure inside etc.
6. Prohibition of welding, cutting, brazing etc. on vessel, tank etc. containing flammable substance without necessary precautions.

Statutory Provisions

Schedule 13 u/r 102, GFR, Sch.23 u/r 114, MFR and Sch.31 u/r 95, TNFR prescribe statutory requirements. Their abstract is as under (G=Gujarat, M=Maharastra & TN=Tamilnadu):

Sch.l3, Rule 102, GFR :

This is regarding manufacture of bangles and other articles from cinematograph film and toxic and inflammable solvents.

Here 'toxic inflammable solvents' mean solvents like acetone, tetrachloroethane, alcohol, denatured spirit, phenol, amylacetate, butyl acetate, diacetone and such other substances which in the opinion of the CIF are toxic and inflammable.

Statutory provisions include -

1. Prohibition to employment of woman and young persons in the storage or process of above chemicals.
2. Medical examination - first within 7 days of the employment and then every month. Record in Form No. 20.
3. Protective clothing including apron and head-coverings.
4. Efficient ventilation in workroom.
5. No smoking and no source of ignition.
6. Flameproof electrical installation and fittings.
7. Smooth and impervious floor and to be washed daily with water.
8. 10 minutes washing time before each meal and before the end of the day's, work.
9. Washing, bathing, cloak-room and mess-room facilities.
10 Fire-fighting appliances, means of escape in case of fire and doors/windows to open outwards readily.
11 Cautionary notices regarding dangers to workers. Contents to be explained to illiterate person carefully.

Sch.23 u/r 114 MFR and Sch.SI u/r 95 TNFR :

This is regarding highly flammable liquids and flammable compressed gases.

Here 'highly flammable liquid' means that specified u/s 14 & 15 of the Petroleum Act, 1934 and which gives off flammable vapours below 32 °C.

'Flammable compressed gas' mean» that defined u/ s 2 of the Static and Mobile Pressure Vessels Rules, 1981.

Statutory provisions include –

1. Safe storage in a fixed tank or closed vessel or a room of fire resistant construction.
2. Enclosed system of pipes, pumps etc. so as to avoid leak or spillage.
3. Leakage shall be contained, drained off or diluted to prevent flammable air mixture.
4. Exclusion of source of ignition by flameproof electric apparatus, prevention of static charge, no footwear with steel or iron, belts without iron fasteners and prevention of ignition sources such as open flames, sparks, hot surface, heat generating reaction and radiant heat.
5. Prohibition of smoking.
6. Fixed and portable fire fighting systems, materials and procedures as prescribed by IS.

IS : Flammable gases and vapours classification 9570, Flammable liquids detection, storage, construction safety 10386, Flammability test for aerosol products 8469, cables 10810, flame spread of products 12777, flame resistant suit 7612, flame photometer 8651, flame safety lamps, gas testing 7577, Flameproof - AC motors for mines 3682, electric lighting fittings 2206, enclosures of electrical apparatus 2148, transformers 11333, Compressed - oxygen 309, hydrogen 1090, argon 5760, carbon dioxide 307, nitrogen 1747, solvent - for paints 82, insulating varnishes 10026, petroleum hydrocarbon 1745.

See also Part 5 of Chapter-18.

22 LEATHER INDUSTRY

Leather is the skin of animals when tanned and prepared for human or industrial use. Leather processing includes cutting and incision, chasing, moulding, embossing, hammering, mosaic formation, trimming, bonding, stitching and dyeing. Industrial safety measures include :

1. Benzene and any aromatic solvents containing benzene should be replaced with substances in the aliphatic series.
2. Toxic concentrations should be controlled by efficient exhaust ventilation.
3. As the solvents may produce fire and explosion, flameproof electric fitting and elimination of sources of ignition are necessary.
4. Dyeing operations should be fully mechanised or enclosed to avoid human contact.
5. Personal protective equipment.
6. Medical check-ups.
7. Guarding of machinery and safe use of knives and hammers etc.

Statutory Provisions:

Summary of Schedule-10, Rule 102,, GFR, Sch.9 u/r 114, MFR and Sch.9 u/r 95, TNFR on liming and tanning of raw hides and skins and incidental processes is given below :

Cautionary notices regarding Anthrax, Chrome ulceration and the occupational diseases listed in the 3rd Schedule of the Act, are compulsory.

Rubber gloves and boots, aprons and leg covering to workers working with chrome solutions or lime work and other PPE to those handling hides or skins are necessary.

Washing facilities of one place for 10 workers, one wash basin-for 10 workers, mess room and cloak room are required. Foods and drink in work rooms are prohibited. Hands of workers coming in contact with chrome solutions shall be checked twice a week and suitable ointment and waterproof plaster shall be kept in a box readily available.

IS : Leather - glossary 1640, clothing protective 6153, garments 12718, chromed buff calf skin 8121, apron 3446, chemical testing, chrome- belt lace 575, high altitude gloves 5866, footwear sampling 2051, gas meter diaphragms 9155, leg guard 3946, oil seals and washers 3020, gauntlets - for steel workers 2574, mittens for steel Workers 2575, welders 2573, harness 580, belting for power transmission 2240, round for small machines 2241, V-open ended, cogged 10022, endless flat for lenix drive system 12854, hydraulic 581, loom-pickers 8546, picking band 1225, shuttle cock caps 4102, laces, footwear 7721, Safety-belt & strap, lineman's 3521, boots for miners 1989, boots for metal industry 3737, shoes for women miners 11225, footwear with moulding sole 11226, 5677, industry effluent 5183, lining 3840, polish wax emulsion 6045, sampling 5868, sandal for men 6493, sole 579, boards for insoles 5867, shoes non-slip 11543, leather cloth vinyl coated fabric 1259, leather roid for electrical purposes 4819, leathers 3840, chemical testing of leather 582, physical testing of leather 5914, utility glove 11230, slickers for leather industry 5712.

23 PAPER INDUSTRY

Paper is a thin felted matrix of interlacing cellulosic fibres made from wood pulp or rags, straw and grass or waste paper.

In making paper, first raw material from wood pulp, west paper or grass is cut in to pieces. Then it is soaked in water to make pulp. Necessary additives and bleaching agents like $C1_2$ or H_2O_2 are passed through the pulp to make it white. It is passed through many tanks and pulper machine. Then homogenous pulp is passed through paper mill where it is run on the felt through wet and dry (hot) processes. A paper film is formed as a result of this process in the paper machine. Then continuous paper is wound or reel and a papci roll is formed. The roll is removed from the re-winder machine and sent to the cutting department. There if is cut in to the required sizes and packed in bundles.

The safety measures should include :

1. Nip guards on various rolls and felt nips of drying and re-winders etc. Interlock guards for the whole in running nip with additional side guards, efficient doctor blades, air feeds, belt feed and well designed hand tools are necessary.
2. Manual straightening of paper should be replaced by mechanical straightening.
3. Sufficient stopping and breaking pushbuttons i.e. switches.
4. Operation with moving machinery at slow speed.
5. Automatic lubrication instead of manual while machinery is in motion.
6. Interlocked door on hopper of the baling press.
7. Pulpers should have strong fencing (railing) to prevent fall into the deep vessel and interlock door near feed point.
8. Interlocked or photo cell guards on guillotine cutters and slitting machine.
9. Keirs, digesters, dryers and boilers should be fully closed under pressure and Rule 61, GFR should be strictly followed. Safety valve, pressure reducing valve or regulator, pressure gauge etc. should be well functioning.
10. Digester drives should be properly locked so that they may not rotate while charging or discharging. Their start-switches should be with keys and properly identified.
11. Steam pipes should be lagged to prevent burns.

12. Bridges and walk ways over and along side the machine should be protected with double railing, toe-boards and non slip surfaces to prevent falls into the machines.
13. Effective fencing at all points where there are chances of falling on moving-machinery or into pits.
14. Adequate stock and use of lifting machinery.
15. Good drainage of wet flooring and cleaning thereof.
16. Guards on straw cutter drives and beaters. Hopper feeder for straw or grass cutter essential.
17. Railing around feed opening over digesters.
18. Guards on grass-beaters and cutters.
19. Guards on all drives, gears, couplings, pulley belts etc. of all machineries.
20. Locking of electric switches where accidental starting may cause accidents.
21. Fencing or guarding on pulper chests, agitator tanks and pump-motor sets.
22. Test all lifting machinery u/r 60 GFR and maintain form No. 8 and 10.
23. Exhaust blowers of steam dryers should run efficiently.
24. Guard of fly-knife (rotary cutter) should be interlocked. It should not open when cutter is moving.
25. Exhaust ventilation near steam exposures or hot environment.
26. Sufficient lighting in congested areas.
27. Enclosures, barriers and absorptive or reactive silencers to reduce high noise levels.
28. Suction and closed ducting to convey flying dust.
29. To prevent chemical hazards of soda, sulphate and sulphite, use hooded ventilation to vent off steam, HF, SO_2, mercaptans, etc. Use mechanical agitation and spraying.
30. Prevent chlorine and ammonia hazards in bleach plant. See Part 8.6.1, 8.6.2 and 17.3 of Chapter-18 for chlorine & ammonia safety. Bleaching should be carried out in a closed system at a negative pressure.
31. Treatment for caustic burns.
32. Many chemicals used are toxic, flammable and explosive for which effective ventilation, careful handling and fire control are necessary.
33. Good washing facilities, cloakrooms and lunchrooms are necessary.
34. Speedy removal of waste paper, pulp, spillage, dusts and good housekeeping are essential.

IS : Glossary of terms relating to paper and packaging 4261, 4661, 7186, relating to paper sacks 9028, terminology 7186, methods of test for pulp 6213 (Part I to 21), methods of sampling and test for paper and allied products 1060 (Part I to 3), methods of test for corrugated fibre board 7063 (Part I to 4), methods of test for smoothness/roughness of paper 9894, Axial (end to end) compression strength of composite cans, tubes and cores, method of test 13975, method of end blow-off pressure test for composite cans 13976, corrugated fibre board boxes for packing and transportation 13228, for exporting glass jars and bottles 9313, for packaging of apples 11844, for packing soaps 10176, fibre board drums 7601, general purpose packing/wrapping paper 6615, grease proof paper 6622, ice-cream cups and lids 10177, kraft paper 1397, packing paper, waterproof bitumen laminated 1398, aluminium foil laminates for packaging 8970, waxed paper 3962, 3963, 7162, 9988, alkali resistant paper 3673, base paper - for carbon paper 3413, for tracing paper 11687, for waxed paper 2991, blotting paper 1396, cover paper 6956, hand made drawing paper 3064, map printing paper 12765, newsprint paper 11688, paper for permanent records 1774, paper sizes 1064, sizes of envelopes 3338, tracing paper 8431, tissue paper 8460, printing paper 1848, cellulosic paper for electrical purposes 9335 (Part I to 3), 2189, paper clip 5650, Cuttings 4356, germination 6671, insulated leadsheathed cables 3961, insulation, tear resistance 10810, photographic 6139, 6650, 10329, sizing, gelatine for 11227, stationery for schools 5195, top gummed 4185, teleprinter page roll 9031, tray 3791, wastage and spoilage guide for printing industry 12000, writing and printing 1848, for computer 12766, for data processing 10557, paper and board impregnated 5134, paper rolls, sizes, 13075, paper green dehydrated 9486.

24 PESTICIDE INDUSTRY

Pesticide is a chemical used to destroy an organism detrimental to human interest. It includes insecticides, fungicides, herbicides, rodenticides, bactericides, miticides, nematocides, moUuscicides. They are generally halogenated (Cyclodienes, Bischlorophenyls, Cycloparaffins, Organo-chlorines and Chlorinated terpenes) or Organophosphorus (Parathion, malathion, TEPP, OMPA, DDVP, abate, ciodrin etc.) type. They are classified as extremely hazardous, highly hazardous, moderately hazardous, slightly hazardous etc. For these classifications and their details including Lethal Dose values see Reference No. 1 given at the end of this Chapter. Strict safety rules are necessary during their processing, handling, packaging etc. Exhaust ventilation and use of PPE are essential.

Statutory Provisions:

Schedule 15, Rule 102, GFR, Sch.l5, Rule 114, MFR and Sch.29,Rule 95, TNFR give statutory provisions for manufacture and handling of dangerous pesticides listed in Appendix-1 to that Schedule. Appendix-11 gives cautionary placard.

The measures include prohibition of employment of women and young persons, air space of 500 m^3 or more per person, efficient exhaust draft on charging, discharging, blending and powder or liquid preparation, sound and sloping floor with gutters and drainage, daily washing, workbenches of stainless steel, waste container with lid and waste disposal by burning, safe disposal of empty containers, no manual or direct handling, protective clothing and their daily washing, medical facilities including doctor and antidotes and medical examination - pre employment, quarterly examination and record in Form 20, GFR additional rest interval of 10 minutes before each meal and before the end of the day's work, washing and bathing facilities with at least 50% bathrooms and 1 place for 5 workers with clean towels, soap and nail brushes, prohibition of food and drink in workrooms, cloak room for clothing and PPE, mess room with incharge person and prior permission o? the CIF to start manipulation of a new pesticide i.e. not listed in Appendix 1.

Sch.l5, u/r 102, GFR defines "pesticides" as agents used for the purpose of destroying or arresting the growth or increase of harmful organism and defines "dangerous pesticides" as those listed in Appendix-1 as under:

Appendix-1, List of Dangerous Pesticides
(Under GFR & MFR both)

Prathion	Mercury compounds
Diazinon	Methyl bromide
Hexaethyl tetraphosphate	Cyanides
Tetrathyl pyrophosphate	Chlordane
Tetraethyl ditripyrophosphate	Endrin
Demeton (systex)	Aldrin
Schradan (OMPR)	Dieldrin
Para-Oxon (E. 600)	Texaphene
Methyl Parathion	Dinitro-o-cresol
Dimefox	Arsenical compounds
Sulphotepp	Cryloite
EPN	Pentachlorophenol
Nicotine or its compounds	Carbojuran

This list gives commonly better to refer the exhaustive Insecticides Act. used pesticides. It is list u/s 3(e) of the

Sch.l5, u/r 114, MFR, defines "dangerous pesticides" as those defined in Sec. 3(e) of the Insecticides Act 1968 or any other substance declared as such by the CIF in writing. List of Insecticides u/ s 3(e) of the Act is very long with addition from time to time.

Sch.29, u/r 95, TNFR does not give Appendix1 i.e. a list of dangerous pesticides but defines dangerous pesticides' as any product proposed or used for controlling, destroying or repelling any pest or for preventing growth or mitigating effects of such growth including any of its formulations which is considered toxic under and is covered by the Insecticides Act, 1968 and the rules made there under any other products as may be notified from time to time by the State Government.

"Manipulation" includes mixing, blending, formulating, filling, emptying, packing or otherwise handling.

Appendix-11, Cautionary Placard is similar in all above three State Rules and is reproduced below:

Cautionary Placard

1. Pesticides are generally poisonous substances.
2. Therefore in rooms where these are handled(a) do not chew, eat, drink Or smoke; keep food or drink away from pesticides. (b) use the protective wear supplied e.g. gloves, aprons, clothes, boots, etc.
3. Before meals or when any part of the body has come in contact with the pesticides, wash with soap and water.
4. Before leaving the factory, take a bath and change your clothing.
5. Do not use any container that has contained a pesticide as a pot for food or drink.
6. Do not handle any pesticide with bare hands; use a handled scoop.
7. Avoid spilling of any pesticide on body, floor or table.
8. Maintain scrupulous cleanliness of body and clothing and of your surroundings.
9. In case of sickness like nausea, vomiting or giddiness, inform the manager who will make necessary arrangements for treatment.

Effects and Controls :

Pesticides and agrochemicals enter into the body through inhalation, ingestion or skin absorption. They are classified as toxic, harmful, corrosive, irritant, flammable, explosive or oxidising. Toxicity is mostly denoted by LD,, or LC,, values. All agrochemicals should be labelled, transported safely and correctly stored in a room (locked and cool). Containers should be opened only after wearing correct respirator (positive air pressure), neoprene or plastic hand gloves, aprons, boots etc. Protective clothing are always essential while handling pesticides. Inhalation of vapour should be avoided. Contact with skin, eyes and clothing should also be avoided. Contaminated clothing should be immediately changed, the entire body .should be thoroughly washed with soap and water. After working with pesticides, shower bath should be taken and clothing should be changed. Contaminated equipment should be cleaned with soap or soda ash.

Local exhaust ventilation on filling line must be effective.

Types of effects may be acute (immediate) or chronic (prolonged or slow delayed). Some common symptoms are - dizziness, headache, shaking and weakness. More toxic effects may cause convulsions, irrational behaviour or unconsciousness.

First-aid treatment includes - removal of affected person to a safe, clean and airy place, washing of the part affected and to put the person in recovery position (slipping on shoulder). On swallowing, vomiting should be induced if person is in consciousness. Medical charcoal and plenty of water may also be 'given.

Effect of organophosphorous pesticides is to reduce cholinesterase level in body and it can be noticed by pin-point in pupils (eyes).

Blood cholinesterase activity test should be carried out every 15 days. If the level is found less than 62.5%, the worker must be transferred to another place where no exposure is possible. After medical treatment and. safe report he can be put back to his plant. But meantime the engineering controls should be provided or revised to eliminate the exposure. Leakage and spillage must be removed. Defect in PPE should be checked and removed.

An Office Circular dated 27-7-1995 of Factory Inspection Office, Bharuch, sent to pesticide factories, seems to be more important and suggests following safety measures :

1. For filling bottles or small containers of liquid, granules or powder, automatic filling machines with closed chamber and attached local exhaust ventilation must be used. Weighing, plugging and sealing operations and conveyor movement should also be automatic and under suction chamber so that a worker has not to touch any thing and no spillage, vapour or dust shall touch his body.
2. To fill barrel or big container a chamber with exhaust hood and ventilation should be used.
3. To contain or collect leaking liquid small bund and pit shall be provided.

   Spilled pesticide should be neutralised or washed with dry clean cloth and stored in a dust-bin with spring-lid. Then it should be safely disposed or burnt out.
4. Workers engaged to shift, move, clean or pack the filled (plugged) container or to clean any spillage, shall be given goggles, long sleeved shirt and pent, good quality rubber hand gloves, waterproof suit or apron, gumboot and air-line respirator. Safety showers and bathrooms shall be provided.
5. Illiterate, untrained and temporary contract workers are exposed to more risk. Therefore such training should be given to them so that they can read or understand the necessary precautions.
6. Pedestal or positive air fan removes the vapour or dust from one worker to another. Therefore it is inadvisable. Exhaust or negative air suction and air-line respirators are the effective remedies. Exhaled air should be passed through carbon bed filter or effective absorber and final vent discharge should be within safe limit.
7. Regular air monitoring at work place, ppm record and leakage checking are necessary.
8. A record of full name, address, signature, date of joining and photograph of all the workers at the time of first employment are useful to detect cases of delayed effects or after-service effects.
9. If pre-employment and subsequent medical examination shows blood cholinesterase level less than 62.5%, that worker should not be employed in pesticide work. If RBC level is also low, the worker should be kept away for 3 months from such process. Sufficient stock of PAN, Atropine etc. (antidotes) should be kept in the factory first-aid centre.
10. The workers must be aware that in case of symptoms (dizziness, headache, vibration, vomit etc.), which doctor they have to approach. They will follow the medical advice.
11. In each shift, qualified and trained supervisor shall strictly supervise the working conditions, work habits, methods, use of PPE, washing, cleaning and no smoking, eating or drinking in work area.

Specified medical treatment is as under :

1. In case of skin contact of-organo-phosphorous, it should be immediately treated with solution of 5-10% ammonia or 2-5% chloramine.
2. Give injection Atropine sulphate according to age, 2 to 4 mg intravenous or intramuscular. Continue this injection every 5 to 10 minutes till pupils size and heart beats become normal.
3. Give injection PAM (2-Pyridine Aldoxime Methochloride) in glucose slowly. Toxogonin is a condensation product of Pyridine aldoxime and dichlorodimethyl ether.
4. Maintain fluid and electrolyte balance.
5. Give antibiotic medicine to prevent secondary infection.
6. Give Frusemide if lungs are swallowed or water filled.
7. If breathing stops, artificial respiration must be tried till doctor comes. The patient should be kept in a cool and quiet place. Give oxygen if difficulty is in breathing. If breathing trouble is more, the victim should be shifted to hospital and put on ventilator.

Personal hygiene - to wash hands and mouth before and after lunch and bathing and changing clothes at the end of the work - is highly essential.

See Part 4.1 & 4.2 of Chapter-28 for Insecticides Act & Rules.

IS : Handling cases of pesticide poisoning 4015 (Part I & 2), malathion- safety code 10872, technical 1832, phorate G 9359, methyl parathion 10630, benonyl 13786, dodine 13784, diflubenzuron 14185, 14186, pesticide common names 885, determination of metalaxyl residues 14161, methods of test 6940, Residues determination in agriculture, food commodities, soil and water - 13830, 13831, aldicarb 10629, aldrin, dieldrin, aptafol 13245, in food 5863, organochlorine in tobacco products 11820, sampling 11380, solid and liquid packing requirements 8190 (Part I to 4), solid packaging 6604, zinc phosphide 9278, aluminium phosphide 9279, kitazin 13788 to 13790.

Packing containers - HDPE bags 8069, polyethylene 9754, aluminium bottles 9503, aluminium containers (5 litres and above) 9445, tinplate cans 9992.

25 PETROCHEMICAL INDUSTRY

This is relatively a recent industry. The plants are modern, mostly automatic and totally enclosed. It uses gaseous, liquid or solid hydrocarbons. Toxic and flammable exposures and high pressure- high temperature reactions pose health, fire and explosion hazards. Proper FFE and PPE should be used. Pre and periodical medical examinations are necessary. Other aspects similar to chemical industry (see Chapter 18).

Statutory Provisions:

Summary of Schedule 7, Rule 102, GFR, Sch.7, Rule 114 MFR and Sch.7, Rule 95 TNFR is as under:

It is applicable to generation of gas from dangerous -petroleum class A (FP<23 ºC). Safety measures include prohibition of employment of women and young persons, two flame traps to prevent flash back from burner to the plant, one trap being nearest to the plant, leakproof valves and pipes, separate well ventilated building for gas generation, proper fire extinguishers for petrol fires, permission of the CIF to manufacture petrol gas, prevention of spills and leaks, warning notice for no smoking and not carrying any matches, naked light etc., no entry to unauthorised person to petrol vessel, flameproof electric fittings, doors opening outside or sliding and repairing of petrol vessel only after steam cleaning and rendering safe for repair.

For Sch.l3 GFR, Sch.23 MFR and Sch.SI TNFR see foregoing Part 21 on flammable liquids.

26 PETROLEUM REFINERY AND LPG BOTTLING PLANTS

A simple refinery carries out atmospheric and vacuum distillation and produce naphtha and limited products. Other refineries have more processing units such as cracking, alkylation, reforming, isomerisation, hydro treating and lubricant processing. A refinery operation includes 7 areas

1. Separation of crude oil.
2. Conversion of hydrocarbon molecules.
3. Treating crude oil fractions.
4. Blending hydrocarbon products.
5. Auxiliary operating facilities.
6. Refinery offsite facilities and
7. Emission and effluent control. .

Detailed safety norms are prescribed by Oil Industry Safety Directorate and known as OISD norms or standards. They are available in such oil industries.

Some OISD standards are listed below.

OISD Standards :

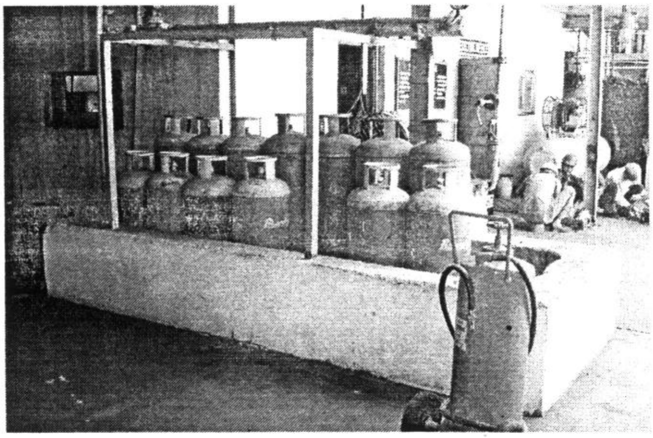
Sr. No.	OISD Code No.	Name
1	105	Work permit system
2	106	Process design and operating philosophies on pressure relief & disposal system.
3	110	Recommend practices on static electricity
4	112	Safe handling of air-hydrocarbon mixtures and pyrophoric substances
5	113	Classification of area for electrical installations at the hydrocarbon processing and handling facilities.
6	117	Fire protection facilities for petroleum depots and terminals
7	118	Layouts for oil and gas installations
8	119	Inspection of pumps
9	120	Inspection of compressors
10	121	Inspection of turbines & diesel engines
11	123	Inspection of rotating equipment components
12	124	Predictive maintenance practices

13	125	Inspection and maintenance of mechanical seals
14	126	Specific maintenance practices for rotating equipment
15	127	History recording of rotating equipment
16	128	Inspection of unfired pressure vessels
17	130	Inspection of pipes, valves and fittings
18	131	Inspection of boilers
19	132	Inspection of pressure relieving devices
20	134	Inspection of heat exchangers
21	135	Inspection of loading & unloading hoses for petroleum products
22	137	Inspection of electrical equipment
23	140	Inspection of jetty pipelines
24	142	Inspection of fire fighting equipment and systems
25	144	LPG bottling plant operations Vol-I Design philosophies
26	144	LPG bottling plant operations Vol-II Operating practices
27	144	LPG bottling plant operations Vol – III Inspection & maintenance practices
28	144	LPG bottling plant operations Vol – IV Safety & fire protection
29	145	Guidelines on internal safety audits
30	146	Preservation of idle electrical equipment
31	147	Inspection and safe practices during electrical installation
32	148	Inspection and safe practices during overhauling electrical equipment
33	149	Design aspects for safety in electrical system
34	152	Safety instrumentation for process system in hydrocarbon industry
35	153	Maintenance and inspection of safety instrumentation in hydrocarbon industry
36	154	Safety aspects in functional training
37	155	Personnel protective equipment (part I)
38	155	Personnel protective equipment (part II)
39	156	Fire protection facilities for petroleum depots and terminals.
40	157	Recommended practices for transportation of bulk petroleum products
41	160	Protection to fittings mounted on existing LPG tank trucks
42	161	Rescue and relief operations involving tank truck accident carrying LPG
43	162	Safety in installation and maintenance of LPG cylinders manifold
44	166	Guidelines for occupational health monitoring in oil and gas industry
45	169	Small LPG bottling plants – Design and fire protection facilities.

Safety Measures in Petroleum Refinery _

1. H_2S generation should be used to get pure sulphur.
2. Hydrocarbon vapours should be controlled by floating roof tanks, double mechanical seal and leak detectors.
3. Safety distance should be maintained as per OISD, CCE and TAC norms. Petroleum Act and Rules should be implemented:
4. Computerized system to prevent overflow, over filling and leakages.
5. Automatic detection and alarm systems for flammable and toxic gases throughout the plant.
6. Deluge water spray system on tanks, pumps, critical vessels, air coolers etc.
7. Aviation lights on all tall structures.
8. Explosion proof control rooms.
9. Use of HAZOP studies from design to operation stage.
10. Zero effluent discharge and minimization of SOx, NOx, CO, H_2S, NH_2 and un-burnt carbon discharges.
11. Efficient dust control measures for dusts of coal, coke, sulphur and other materials.
12. Efficient communication and fire fighting systems throughout the plant.
13. On-sight and off-sight Emergency plans, SOPs, work permits, safety audits, risk assessment and control measures, safety policy, safety committee, medical examinations of workers, safety training and use of necessary PPE are all essential.
14. Double staircases/safety ladders should be provided on all tall structures where any worker has to go for any work.
15. High noise areas should be marked. Noise reduction program should continue. Ear protectors should be used.
16. All safety devices should be regularly checked and record maintained. The factories Act and Rules should be strictly followed.
17. Isolation valve below the safety valve should be remotely operated (ROV) for high hazard chemical like LPG, Propylene, Benzene etc.
18. On rail/road tanker filling gantries, vapour exposure should not come to workers. Their discharge should be safe. Recovery system should be provided. Interlocking of earthing clamps with loading arm is safer.
19. Travel distance on platform should not exceed 22.5 mt without exit as per GFR.
20. Doctors should take factory rounds to see actual work places and exposures to workers.
21. Services of Industrial Hygienist should be utilized.
22. In laboratory, contaminated air should not be re-circulated. Fume hood sash height should be such that face velocity 0.5 m/s is available.

Safety Measures in LPG Plant :



An infrastructure of one good LPG Bottling plant is described below.

LPG plant is having fully automated fire fighting facility in the form of sprinkler system and hydrant network which is spread all over the plant. For fire fighting purpose, water is stored in separate tanks which last for 4 hrs of fire fighting. For catering water to the sprinkler and hydrant system, fire engines are provided alongwith jockey pumps which automatically maintains a water pressure of 8 kg/sqcm in the hydrant and sprinkler lines. All the Horton spheres. Pump House and Sheds are provided with the sprinkler system which automatically operates if the temperature in these areas rise to 79 °C during an emergency. The operation of sprinkler system will start the fire engines automatically and will pump water in the sprinkler lines. All the facilities are covered with a well maintained hydrant and monitor network which is again fully automatic. Besides this, fire extinguishers of DCP and CO, type are provided near all the facilities as per OISD norms which are checked monthly.

For fire fighting purpose fire organisation chart is prepared which comprises of employees of the plant itself. The fire organisation is basically divided into three teams viz. (1) Fire Fighting team (2) Assisting team (3) Rescue team. All the employees working in the plant have been allocated a job to be carried out during an emergency. For accessing the performance of the teams, Fire Drill is carried out every month and Disaster Drill is conducted once in a year.

Plant is also equipped with fire fighting accessories like fire entry suit, fire proximity suit, water gel blankets, different kinds of nozzles, low temperature clothing, breathing apparatus etc.

General safety measures include :

1. Continuous monitoring of hydrogen sulphide gas, carbon monoxide, ethyl merceptan and other toxic gases.
2. Safe shutdown procedure and start-up procedure should be followed with sequential steps.
3. Good maintenance by blinding or blanking off, electrical lockouts, gas tests and hot work permits.
4. Protective clothing and equipment.
5. Ventilation and air pollution control.
6. Gas monitoring programmes.
7. Leak and fault detection.
8. Control of catalysts hazards.
9. Medical check-ups and industrial hygiene.
10. Fire protection.

IS : Glossary 4639, ventilation in petrochemical plants and refineries 12332, refining industry, effluent treatment 10044, air pollution in petroleum refineries 10179, limits of gaseous emission 8636, LPG 4576, LPG storage installations 6044 (Part I & 2), jointing compounds 3465.

See IS in foregoing Part 25, Part 5 of Chapter18 and Part 3.1, 3.2 and 3.5 of Chapter 28.

27 PHARMACEUTICAL INDUSTRY

Because of strict requirements of Drugs and Cosmetics Act and Rules, generally pharmaceutical factories are neat and clean and the plants are properly laid out. Some safety measures include :

1. Safety from chemicals, chemical processes and vessels as described in Chapter-18.
2. Guarding of all machinery, their drives and dangerous parts.
3. Hood and exhaust ventilation for solvent baths and similar processes.
4. Temperature controls for ovens and dryers.

5. Extremely sensitive methods of sampling and analysis.
6. Medical check-ups.
7. Good manufacturing practice i.e. GMP (See Part 2.11 of Chapter-19).

Mostly ovens and driers are used in pharmaceutical or bulk drug industries. Statutory provisions for them are as under.

Rule 68G, GFR, for Ovens and Driers provides as under :

This rule is applicable to ovens and driers operating at a temperature higher than ambient temperature and in which flammable/explosive air mixture may be evolved in an enclosed structure. It is not applicable to those of capacity below 325 litres and used in laboratories or kitchens.

1. Separate Circuit:
   Separate electrical power supply with isolation switch should be provided.

2. Design, Construction, Test & Examination :
   (1) Proper design on sound engineering practice, good construction, sound material, adequate strength and free from patent defect.
   (2) Testing by a competent person.
   (3) Retesting after repair or alteration and certified by a competent person.

3. Safety Ventilation:
   (1) Centrifugal fan/s for dilution of air mixture and speedy exhaust.
   (2) Safe dilution level is less than 25% of its LEL. 50% of LEL can be allowed if continuous monitor with alarm at 50% LEL is provided which shuts down heating system at 60% of LEL.
   (3) If above ventilation system is not efficiently working or dilution level is not as mentioned, oven or drier shall not be operated.
   (4) Exhaust of ventilation shall be away from the workroom. It should not re-enter through windows/doors.
   (5) Fresh air should be evenly circulated in oven/drier without any. air pocket.
   (6) Throttling damper must allow minimum ventilation rate in its maximum throttling position.

4. Explosion Panels :
   (1) All ovens/driers of more than 0.5 nr" internal space shall have explosion panels (hinged or fragile doors) to release the pressure of accidental explosion.
   (2) Size of such panel - 2200 cm2 per Im" volume of the oven/drier.
   (3) Should open at roof or walls where no person works.

5. Interlocking arrangements:
   (1) Ventilating fans must start first before the feed conveyor starts.
   (2) Failure of ventilating fans will automatically stop the feed conveyor, fuel supply, ignition and the heat source.
   (3) Failure of the conveyor will close the fuel valve, ignition and the heat source.

6. Purging by pre-ventilation:
   Automatic pre-ventilation system will change 3 times the fresh air volume before starting the heating and conveyor feeding.

7. Temperature Control:
Automatic temperature control to ensure its safe limit. Multi stage temperatures will be maintained within the designed limits.

8. Prevention of Dripping:
Dripping of combustible material on heaters or flame shall be prevented.

9. Test, Examination, Ignition & Maintenance :
   (1) Trained responsible person will thoroughly examine all parts at frequent intervals.
   (2) Register shall be maintained for above work.

10. Trained Operators:
Only an adult (above 18 years) and trained operator will be allowed to work on oven/driers.

IS : Pharmaceutical products, packaging, code of practice 14233, plastic containers 7803, rubber closures 3692, safe use in contact with - PVC 7288, 10148, 10151, polyethylene 7277, 10141, 10146, styrene polymers 7961,10142,10149.

28 PLASTICS INDUSTRY

This is a fast growing industry. It has three sectors: (1) polymers and moulding compounds (raw material) manufacturers, (2) processors and (3) machinery manufacturers.

Polymer (resin) Plants should include :
1. Plant design and layout for fire and explosion control, safe venting, storage etc.
2. Control of exothermic reactions and training of operators.
3. Emergency Plan to control fire, explosion and gassing.
4. Prevention of falls (see Chapter-16).
5. Use of PPE.
6. Splash guards.
7. Exhaust ventilation.

Plastic Processing Industry converts bulk polymers into finished articles and includes :

1. Guarding of press platens of compression, transfer, injection and blow moulding machines. Effective or double interlocking is essential.
2. Trip device at rollers and calendars with nip guards.
3. Programmed electronic controls which are more safe.
4. Good housekeeping, cleaning and machinery layout.
5. Static eliminators or earthings to machines where plastic film or sheet travels.
6. Hopper feeders to extruders and granulators. Guards on drives of extruders and insulation of hot surfaces.
7. Fine plastic powder may cause explosive mixture, therefore it should be controlled in an enclosed system with relief panels venting at low pressure (@ 0.05 bar) to a safe place.
8. Fire safety from flammable liquids.
9. Separate storage for peroxides to manufacture glass reinforced plastic (GRP).
10. Exhaust ventilation near toxic and acid fumes, isocyanates, formaldehyde resins, styrene vapour and chloririated hydrocarbons.
11. Safe disposal and burning of plastic waste particularly PTFE and urethanes.

12. Noisy granulators and ultrasonic welding machines should be separated from working area. Coating the machine with sound deadening material and fitting baffles at the feed opening reduce noise. Wear hearing protection.

IS : Industry, glossary 2828, fire safety code 11457, Plastic - for food packaging 10172, container for Vanaspati 10840, 11352, pouches for milk 11805, for edible oils 12724, 12883, 12887, brattice sheeting, unsupported, fire resistant 11884, button 1461, 1465, .chair 13173, clays for ceramic industry 4589, container for fuel 7394, emulsion paint 4511, films for electrical purposes 11298, laminates 5746, measuring cylinder, graduated 10073, mechanical properties test 8543, moulded briefcases 9848, packaging material 10106, packaging terminology 7019, pipes farm drainage 9271, reflectors, lighting fittings 3287, spectacle frame 3693, suitability for food packaging 10171, Surgery - scissors 4275, 4281, needle holder 4245, respiratory 4587, dissecting 4282, forceps 9184, Tests 8543, use in instrument industry 7078, welding, glossary 5687, transparent sheet 9035, 9036, water bottles 8688, wood 423, adhesive tapes 7809, 13262, valves, float diaphragm type 13049, cartridge for shot guns 12497, strain ratio V for sheet metals 11999, PVC lining for chemical process vessels 4682, method of testing 13360, hoses and tubing, bending tests 112656, plasticiser 9591, 3672, 6627, 9572.

29 POLYMER PLANTS

In organic chemistry certain giant molecules such as starch, rubber, plastic .or resin, synthetic fibres, cellulose, proteins are called polymers and plants manufacturing them are polymer plants. Thus rubber manufacturing plant, synthetic yarn (nylon, terylene etc.) unit, plastic, resin or silicon making factory or a starch manufacturing factory can be called a polymer plant.

The polymer (bigger) molecules are built up of smaller units joined together and form a repeating structure. The repeating structure or the recurring unit in a given molecule is called the monomer, and the entire molecule composed of several such repeating units is called a polymer. Thus we can say that rubber is a polymer of isoprene, starch of a-glucose and cellulose of (3-glucose.

Polymerisation process is of three types (1) Addition polymerisation i.e. the combination of monomers either of the same kind or different kind by a process of addition involving no loss of fragments, for example, ethylene - polythene. (2) Copolymerisation involves two different types of monomers, for example, vinyl chloride with vinyl acetate. (3) Condensation polymerisation means the combination of monomers by a process involving loss of a simple fragment or a molecule of water. The terminal units of the polymer chain may be different from the units inside. For example, polyester from a dialcohol and diacid. The alkyd resins are such polymers obtained from phthalic acid and glycol or glycerol. Linear polymers are thermoplastic and cross-linked polymers are thermosetting.

Proteins, starch and cellulosic fibres, plastics and resins are used to make thousands of industrial products. The variety and names of polymers are many, only a few are mentioned below :

Hazards and Controls :

Mostly the polymerisation processes are carried out in totally enclosed system and therefore the hazards are reduced to much extent. Machinery is also mostly enclosed. The hazards are possible from exposure to raw materials, leakage and spillage, dusts and fumes, hot surfaces and radiant heat, noise and vibration and heat and humidity.

Chemicals like formaldehyde andcaprolactam cause burning in eyes, nose and throat. High temperature and pressure of thermic fluid (e.g. Dowtherm) in oil heating system may cause burn and sometimes fire. Extrusion machines have hot surfaces which need insulation to prevent burn injury and hopper feeder to prevent hand contact with screw conveyor inside. Cutting machines for plastic, rubber and other hard substances need safety guard on cutting blade and machine drives. Charging of toxic materials (powder or liquid) need enclosed system with local and room exhaust fans and necessary respirators.

Polyamides used to manufacture epoxy resin are skin irritant. Acrylonitrile used in polyacrylonitrile (PAC or acrylic) fibre is toxic, skin irritant and carcinogenic. This effect was noticed in polymerisation workers. Another chemical dimethyl formamide (DMF) causes digestive effects, abdominal pain, skin effect and pancreatitis to workers exposed to it. (e.g. spinning bath and solvent tanks).

Styrene monomer, acetone (used in cleaning) and organic peroxide catalysts used in making polyester resins may cause fire and explosion. Styrene vapour may cause narcosis (effects on head, nose and throat).

To control such vapour, dilution ventilation and spray booth are necessary. TLV is more critical than the LEL of styrene. (Styrene monomer-phenylethylene or vinylbenzol – C_8H_8 TLV 50 ppm or 215 mg/ m^3 STEL 100 ppm or 425 mg/m^3, LEL 1.1%, UEL 6.1%, FP-33 °C, VD 3.6, poison via oral, ivn). The inhalation dose of styrene can be measured by analysis of exhaled air (gas chromatography).

Solvent storage should be kept away, covered metal containers should be used to collect solvent wastes, electric fitting should be flameproof and smoking must be prohibited. Direct contact of peroxide catalysts should be avoided. Neoprene or plastic gloves are not affected by solvents.

Itching from fibrous glass particles can be minimised by good housekeeping, ventilation, use of long sleeves, barrier creams and frequent washing with soap and water.

Ethylene, propylene and other olefin members to make polyolefins (polymer) are weak anaesthetics at a concentration above 60%. Freezing burns due to liquid propylene and hyperplasia due to prolonged exposure to diolefins have been reported. Aluminium alkyls are flammable in air and explosive in water, their fumes may cause lung damage and in solution it causes burns. Adequate body PPE should be given to workers.

Ethylene, propylene and butylene are gases at room temperature, highly flammable or explosive when mixed with air or oxygen and large fires of olefins are difficult to extinguish. In case of fire, their supply should be stopped, fire should be allowed to burn out and adjacent structures be cooled by water. Small fires may be controlled with CO_2 or DCP extinguishers.

Polystyrene is made by polymerisation of styrene and other monomers. They are flammable. Polymerisation process is highly exothermic and uncontrolled reaction may reach explosive stage. Cooling and pressure relief devices on vessels are essential. Foamed polystyrene is also flammable. Most of the chemicals are toxic. Therefore leakage should be prevented by quick maintenance and enclosed system. Female workers exposed to polystyrene production showed disturbed menstrual cycles, sexual activity, disturbed pregnancy and child birth. Biological indicators are blood styrene level and styrene metabolites in urine. Polystyrene dust may cause weight loss and erythrocyte, leucocyte or hepatic changes.

Polystyrene process should be fully enclosed, automated or remote-controlled. Manual handling should be replaced by mechanical one, leakage should be stopped, local exhaust ventilation on air contamination, respiratory and other PPE to the workers and their medical examinations are necessary.

In making various types of synthetic rubbers, solvents like hexane, styrene, butadiene, chloroprene, acrylonitrile, toluene diisocyanate (TDI) and other isocyanates in making elastomers, ethylene dichloride (EDC), methyl chloride, ethylene, propylene etc. are used. Safety measures are required depending on properties of these dangerous chemicals, their splashes and leakage, pressure release, machine parts, entry into vessels, cuts and burns, fall from height and on the floor.

Health hazards are possible in handling raw rubber containing extender oil and carbon black. During fire CO hazard is also possible.

Workers should be made aware of all these hazards and properly trained. Gas detectors with alarms, welding permit, vessel entry permit, exposure measurement, good ventilation, rubber gloves, eye protection, hearing protection and washing facilities are also required.

Thus depending on a type of polymer plant, a variety of control measures are applicable.

IS : Styrene polymers, safe use in contact with foods etc., 7961, 10142,10149, styrene vinyl benzene 4105, styrenated phenol 7351, styrene butadiene rubber (SBR) - latex 11356, latices, tests 4511 (Part I to 6), tests 4518 (Part I & 2), Polystyrene - for insulation 4671, wall tiles 3463, fixing 4112, sheets 5210, Polybutadiene rubber (PBR), test methods 10016, Polyester resin bath tubs 6411, tank, chemical resistant 10661, Polyolefin - plastic container 7408, fibre analysis 9896, Polypropylene and its copolymers, safe use with food stuffs, drinking water etc., 10909, 10910, thermoplastics 10951, Polyurethane foam - domestic mattresses 7933, insulation, code of practice 13205. PVC - resin 4669, sheeting, flexible 2076, boots, oil & fat resistant 13038.

30 POTTERY INDUSTRY

This is one of the oldest human crafts and many techniques have been changed during centuries. The basic processes of modern industry are preparation of body ingredients, forming and shaping, biscuit firing, glazing, glost firing and decoration. The product is classified as tableware, sanitary tiles and industrial ceramics. The safety measures include :

1. Interlocked guards, mechanical feeding and takeoff at machines.
2. Good house-keeping.
3. Mechanical handling.
4. Control of gas hazards at kilns and dryers.
5. Dust (free silica) control by substitution by dustless process or reducing free silica, isolation from the work room with exhaust ventilation and by using dust mask.
6. Processes of calcining, crushing and mill feeding in a closed system under negative internal pressure to extract dust.
7. Other processes including glazing under hood and exhaust ventilation.
8. Vacuum cleaning and washing of floors and tables.
9. Efficient dust filtration plant not allowing re entry of the filtered air.
10. Dust monitoring and control.
11. Medical examination including X-ray test.
12. Avoidance of lead or restricting to 5% soluble lead in glaze process with exhaust ventilation. Lead in glaze is toxic.
13. Use abrasive rubbers and grinding heads instead of chemicals for cleaning unwanted decoration.
14. Temperature control near kilns and glaze dryers.

Statutory Provisions :

Provisions of Schedule 25 Rule 102, GFR and Sch.lS, Rule 95, TNFR are summarised as under :

1. Applicability:

This schedule applies to all factories engaged in manufacture of pottery except where following articles are made –

(1) Unglazed or salt glazed bricks and tiles.
(2) Architectural terra-cotta made from plastic clay and either unglazed or glazed with a leadless glaze only.

2. Definitions:

The words pottery, leadless glaze, low solubility glaze, fettling, efficient exhaust draught, potter's shop etc. are defined.

3. Efficient Exhaust Draught :

Many processes have been mentioned which cannot be carried out without efficient exhaust draught. These include manipulation of dry and unfritted lead compound, fettling operations, shifting of clay dust, pressing of tiles from clay dust, loading and unloading of saggars, brushing, crushing, dry grinding, cleaning, lifting of materials, weighing, mould making etc. unless the machine is so enclosed or material so damp that no dust can be given off.

4. Other Measures Prescribed

(1) Processes giving dust or using dry lead compound should be separated. Women or young persons cannot be employed in such processes.
(2) Use of leadless glaze or low solubility glaze is permitted and that of high lead content is prohibited.
(3) Potter's wheel (Jolly and Jigger) should have screen to prevent clay scrapings being thrown off.
(4) Damp saw dust or other moist method should be used to prevent flying dust during cleaning of floors.
(5) PPE like overalls, head-coverings, aprons and dust respirator should be given as per need.
(6) One water tap or stand pipe for every five workers with their spacing 1.2 mt or more and towels, soap and nail brushes should be provided. Washing time shall be allowed before each meal and at the end of the shift.
(7) Mess room of size 0.93 m' per person and will facilities of washing, drinking water, warming food and furniture. The room should be clean. well ventilated and in charge of a responsible person;.
(8) Food, drink, pan supari, tobacco etc. should not be consumed in the work room.
(9) Cloak room to put personal clothing and separate arrangements to put PPE.
(10) Medical examination by the certifying surgeon within 7 days from the first employment and thereafter at every 3 months of workers engaged with dry and unfritted lead compound and at one year of workers engaged in dusty processes. Fitness certificate in form No. 27-A shall be granted by the Certified Surgeon. Record in health register. Unfit person can be re-employed after fitness certificate by the certified surgeon.

IS : Clay - ball for ceramic industry 4589, bricks 6165, 5454, 3495, burnt 7556, Hollow bricks for walls and partitions 3952, filler blocks for floor and roof 6061, pipe products glossary 2248, Tiles 3951, 3367, roofing tiles, half round flat 13317, china clay 2840.

Ceramic tiles - 13711, 13712, 13753 to 13756, Tests 7571, 13630, Tower packing 7087, water filter 7402, components for thermocouples and thermometers 8495, Limits of toxic materials 9806,12038.

Ceramic grinding media and lining 7775, Earthenware & dinnerware 2857, 3149, bone china crockeryware 6958, Glossary for - ceramicware 2781, enamelware 2717, stoneware 2839, stoneware, crockeryware 11745, stoneware coatings 2838, colour test for vitreous enamel coatings 8709, methods of test for vitreous enamels and frits 8687 (Part I & 2), 3972 (Part I, Part 2, Sec. I to II), plaster of Paris for ceramic industry 2333, plastic clays for ceramic industry 4589, porcelain crockeryware 3505, powdered talc for ceramic industry 10429, pyrophyllite for ceramic industry 11477, quartz for ceramic industry 11464.

31 RUBBER INDUSTRY

The rubber may be natural from rubber tree or synthetic classified as homopolymers and copolymers. Safety measures include :

1. Interlock guard on the knife of bale cutting machine.
2. Trip guard or sensitive safety bar on horizontal double roll mills for mastication and compound mixing process.
3. Interlocked guard to prevent access to the trapping area near feed hopper of internal mixing machine.
4. Distance guard and feed hopper to an extruder machine. Its fumes should be removed away by exhaust ventilation. Hot surface insulation.
5. Manger type distance guard at the feed nip of calendar machine and fixed guard or electrically interlocked guards on other nips.
6. Interlocked lid of agitator.
7. Solvent vapour removal on spreading machine. Exhaust ventilation, flameproof electric equipment, use of non ferrous tools and antistatic footwear and earthing of machinery are necessary.
8. Guarding of punching, stamping, cutting and slitting machines.
9. Follow Rule 61, GFR for vulcanisers (curing pans or autoclaves). Its lid should be interlocked. Safety valve, pressure gauge, PRV etc. should work efficiently.
10. Interlocked guard on a moulding press. Photo cell guard on a large press. Trip bar at a safe distance.
11. Good ventilation and cool wall colours in moulding plant to reduce heat effect.
12. Exhaust ventilation on buffing.
13. Power press guarding.
14. Guarding of Latex rubber machinery and use of PPE.
15. Exhaust ventilation for nitrous fumes.

Synthetic rubber manufacturing should include :

1. Fire prevention for flammable materials. Well trained fire fighters. Gas detectors with alarms.
2. Handling precaution of pyrophoric catalysts.
3. Handling of volatile monomers and solvents in closed system. Good general ventilation.
4. Self-breathing apparatus to handle large leaks and spills of toxic material.
5. Steam purging of vessel to remove chemical vapours.
6. Personal protective equipment.
7. Washing facilities.
8. Noise control.

Statutory Provisions:

For an abstract of Schedule 4, Rule 54, GFR see Part 4.4 of Chapter-14.

IS : Rubber - industry glossary 7503, acrylonitrile butadiene 8683, aprons for hospital 6407, belting - transmission 1370, conveyor 1891, 14206, Boot 13695, 13995, 5557, knee boots 3738, bottle' for hot water 1867, Compounds - sampling and tests 7086, vulcanised 5192, Hose, wire reinforced 7651, Flooring materials 809, floors code for laying 1197, Footwear - sampling 6368, use at low temperature 14290, antistatic 13575, 13996, Rubber for dairy industry 6450, gasket 11149, for pressure cooker 7466, Gloves for electrical purposes 4770, post mortem 4149, surgical 4148, hawai chappal 10702, seals 13249.

Methods of test for natural rubber 3660 (Part I to 54).

Rubber - ice bags 3867, insulated cable, current rating 3961, jointing 638, latex 5430, 11001, foam products 1741, lining for chemical equipment 4682, mat for electrical purposes 5424, gaskets foe joints with CI pipes 12820.

Rubber packaging - 5190, styrene - butadiene 11356, symbols 6611, tests 3708, 9316.

Natural- raw 4588, 5599, tests 3660, formula for evaluation 7499, latex based 9827.

Rubber - reclaimed 7490, tests 6306, rollers for offset printing 11610, sheetings, hospital 4135, synthetic, test methods 11720, tests for feeding bottles 3565, tul)es, cycle 2415, Ttfcing for - LPG 10908, general purpose 637, medical use 5680.

Rubber vulcanised - chemical analysis and tests 3400, storage 6713.

Rubber based adhesives for - tubes and tyres 2560 to 2562, PVC tiles 12830.

Rubberised - coil cushioning 11060, coir sheets 8391, fumigation sheets and covers 4810.

See also IS in foregoing Part 29.

32 SHIP BUILDING, REPAIRING AND BREAKING

Ship building and breaking at shipyard or dock, engage many workers and attract provisions of the Factories Act and Rules, though the Dock Workers (Safety, Health and Welfare) Act 1986 (and Rules) is a specific legislation on the subject. See Part 8 of Chapter-28 for Dock Safety Laws.

In addition to the bad weather conditions and climatic effects, the working conditions are also very risky as it involve handling of large sized heavy steel plates, pipes and other articles, fabrication, machining, erection, welding, cutting and work in confined spaces as well as at heights. Welding and cutting in oil tanks have caused many fatal accidents. Raising and lowering of heavy parts and materials and mechanical lifting cause hazards. Falls from different levels, striking against objects, stepping on objects, struck by falling bodies, injuries by hand and power tools, lifting gear, fire, explosion and gassing, burns by hot surfaces, effects of noise and vibration, fumes and eye burning from organic pigments, resin and solvents, loose or temporary wiring, inadequate lighting, dusts from asbestos insulation and shot blasting are also possible. Most of the workers are employed through contractors where training and supervision are poor.

Occupational diseases specific to this industry are : arc eye due to welding, deafness due to high noise, white finger due to vibrating tools, lung irritation, narcosis from exposure to solvent fumes, asbestosis, mesothelioma, carcinoma, asthma, siderosis a banign lung condition due to inhalation of iron oxide dust or flue from welding or burning, dermatitis or skin rashes and cataracts due to ionising radiation and lasers.

Statutory Provisions:

Rule 68H, GFR gives statutory provisions. Its summary is given below :

1. **Applicability:**
   This rule is applicable to "operations" of construction, reconstruction, breaking, repairing, refitting, painting and finishing of ship or vessel.

2. **Definitions:**
   The terms certificate of entry, hot work, naked light certificate, oil, oil tank, tanker, shipyard, stage and staging have been defined. Oil means any liquid having FP below 132 °C and also includes lubricating oils, liquid methane, butane and propane.
   Certificate of entry and naked light certificate are issued by a competent analyst after testing the atmosphere in oil tank to allow a person to work.

3 **Ladders:**
   Ship's accommodation ladders or sound gangways (width more than 55 cm. with each side railing of 90 cm.) of adequate strength and securely fixed should be provided. Rope ladders and boatswain's chairs, ropes, gears etc. should be of sound material and securely attached.

4. **Throwing Down Materials and Loose Articles: .**
   Materials or articles shall not be thrown from a height but shall be properly lowered. When this is not possible, warning notice shall be displayed or work shall be done under direct supervision of an authorised person. Materials left, lying anywhere and likely to fall should be safely collected.

5. **Entry into Confined Space :**
   A space likely to contain dangerous fumes shall not be certified for human entry unless it is properly purged, ingress of dangerous fumes is prevented, sludge or other deposit liable to give off dangerous fumes has been ventilated and tested for adequate air (oxygen) for respiration. If oxygen is insufficient, breathing apparatus and safety belt shall be utilised.

6. **Welding, Cutting and Heating :**
   1. Pipes containing oxygen or flammable gas/vapour shall be safe and properly maintained. They should be securely attached by means of suitable clips.
   2. Pressure reducing valves shall be provided.
   3. Back pressure valve and flame arrester shall be provided in the acetylene supply pipe.
   4. Valves should not open accidentally. They should be securely closed when not in use.
   5. Gas pipes, not in use, shall be kept at the top, safe and ventilated places and may be dis-connected from source if possible.

7. Naked light and Hot work on Oil carrying Vessels:

Normally no naked light, fire or lamp (not being safety lamp) or hot work shall be permitted unless a naked light certificate is obtained and is in force or such work may not produce sufficient heat to ignite flammable material.

8. Cleaning of Oil-tanks:

Before a test for flammable vapour is carried out with a view to issue a naked light certificate, the tank shall be cleaned and ventilated. First volatile oil shall be vaporised, then residual sludge/deposit shall be removed and thoroughly ventilated by mechanical or effective means to remove all oil vapour.

9. Personal Protective Equipment:

Hand protection, goggles, helmets, face shields, screens, safety belts etc. shall be provided to workers as per requirement.

10. Others:

1. No young person shall be employed to clean, break , cut or spray asbestos.
2. An experienced supervisor shall be employed in a shipyard for exclusive observance of these rules.

IS : Safety and health requirements in electric and gas welding and cutting operations 818, ship geometry glossary 8214, ship building, noise level on board 13161, desk machinery 8650, 12719,

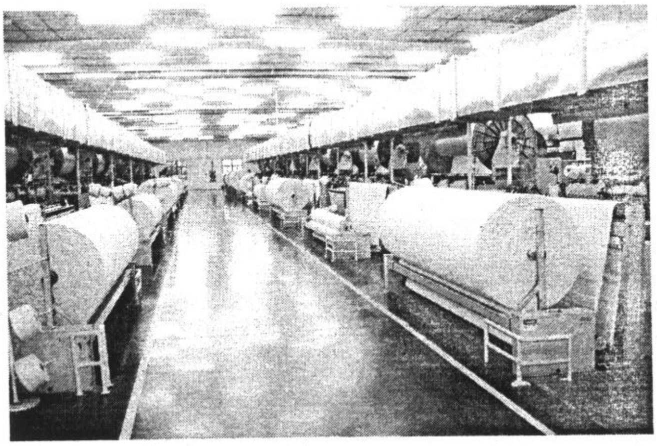
Ships - international shore connections 12266, hull, steel plate 5488, structural steel 3039, tools and outfits guidelines 11160, vibration guidelines 13121.

33 SILK INDUSTRY

Silk is a lustrous, tough, elastic fibre produced by the larvae of silk worms and includes the thread of cloth made from it Similar synthetic fibre is known as artificial silk. In industrial use the hazards are similar to those in' the textile industry (see Chapter-21). Shuttle and other guards for looms and good lighting for spinning and weaving are necessary.



IS : Silk - cloth 1687, coating 3356, 3359, evenness 2944, fabric 3357, 3358, 3561, handloom 1583, 1686, khadi - national flag of India 300, Raw test - cleanness 2945, neatness 2946, cohesion 2948, size or count 2942, 2943, grading 2938, serigraphtest 2947, conditioned mass 2940, winding test 2941.

Silk - ribbon tap 10056, sarees 2207, sewing thread for parachutes 3254, webbing 7776, screen printing inks 12530, raw - grading methods 461.

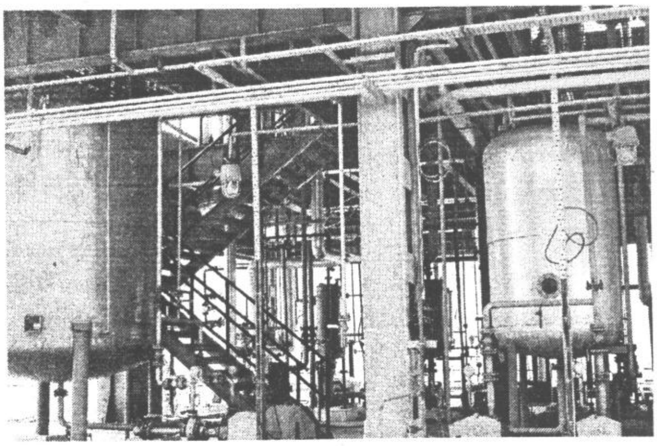
34 SOAP INDUSTRY

Soap is prepared from triglycerides (animal or vegetable oils and fats) by alkaline hydrolysis (saponification). It is a water soluble salt of carboxylic acid and is extensively used for cleaning, washing and textile processing. Safety measures include :

1. Guarding of stamping tools and other machinery. Interlocks and limit switches should be regularly checked.
2. Follow Rule 61, GFR for steam pressure vessels, blow off valve should be used carefully.
3. Prevention of falls by non-slip floor, regular cleaning and good housekeeping.
4. Safe handling of materials and stacking.
5. Rubber gloves, aprons, boots and goggles or face shields to prevent burns from sodium hydroxide, sodium silicate, cresylic acid, inorganic builders (alkali phosphates, silicates, carbonates etc.) and organic builders (starch, cellulose ethers and esters).
6. Lagging of hot pipes and colour coding.
7. Good washing facilities, barrier creams and medical check-ups for dermatitis due to oils or rosin.
8. Temperature near boiling pan should be reduced by vessel lagging, exhaust ventilation and proper roof height. Fencing of vessel and safe platforms are necessary.

IS : Soap - toilet 284, transparent 839, soap stock 12031. -

35 SOLVENT EXTRACTION PLANT



Industrial solvents are generally organic liquids like benzene, hexane, xylene, CS,, petrol etc. They dissolve many substances which may or may not be dissolved in water a fundamental solvent.

Solvents are classified in 9 groups :

1	Hydrocarbons (aliphatic & aromatic)	6	Glycol derivatives
2	Halogenated hydrocarbons	7	Esters
3	Aldehyde and Ketals	8	Ketones
4	Alochol	9	Miscellaneous
5	Ethers		

Uses of solvents are many, such as surface coatings, paints & thinners, synthetic fibres, to make the material soft (plastic) for moulding, extrusion or shaping, to extract oil, fats and medicinal material from seeds, nuts and bones, degreasing, dry-cleaning and for dissolving chemical reagents. It is used directly as raw material in organic synthesis also.

Fire, explosion and toxicity are its main hazards. Less harmful solvent should be selected as far as possible. Local exhaust ventilation to keep the material below its LEL, dyke walls to tanks, flame arrester and cooling system, flameproof electric fitting and equipment, air as well as biological monitoring, alarms and trips, respirators and other PPE, and work permit to work in confined spaces are necessary safety measures.

Statutory Provisions:

Summary of Schedule 21, Rule 102, GFR, Sch.21, Rule 114, MFR and Sch.23, Rule 95, TNFR is given below:

1. Definitions:

Solvent ex traction plan t means a plant where process of extracting oils and fats from vegetable and animal sources by use of solvents is carried on. Solvent is a flammable liquid such as Pentane, Hexane, Heptane used for the recovery of vegetable oils.

Competent person is specially defined for this Schedule. He should be (i) B.E. (Mech.) or B.Tech. with special knowledge of oil and fat with 5 years experience or (ii) a member of Institution of Engineers (India) with 10 years experience or (iii) of qualification accepted by the State Government.

2. Location and Layout:

The plant should be 30 metres away from the nearest locality, 1.5 mt. fencing at a distance of 15 mt. from the plant. Boiler house etc. at a distance of 30 mt. from the plant. If godowns and preparatory processes are within 30 mts. from the plant, barrier wall of non-combustible material and 1.5 mt. height should be at a distance of 15 mt. from the plant. Prohibition to carry match box and open flame inside. Smoking prohibited within 15 mt. from the Plant.

3. Electrical Installations:

They should be of flameproof construction. Metal containers of solvent and non energized electrical equipment to be properly bonded and earthed.

4. Precautions against friction:

Tools, ladders, chains, lifting tackle and footwear to be of non sparking type. Static charge eliminator on belt drive. Clothing of nylon or other fibre capable of causing static charge are not allowed.

5. Fire fighting:

Adequate number of portable extinguishers and automatic water sprinklers or open-head deluge system over the plant are required.

6. Ventilation:

Plant building should have mechanical ventilation providing at least 6 air changes per hour.

7. Venting:

Solvent tanks should have emergency vent to relieve excess pressure in case of fire. Such vents should open at least 6 mts. above the ground so that vapour should not re-enter the plant.

8. Others:

1. Automatic device to cut off steam and to supply cooling water from overhead tank by gravity in case of power failure.
2. Magnetic separators on oil cake feeder to remove iron pieces.
3. Flash evaporator to remove solvent from process waste water located 8 mts away" from the fence but within fenced area.
4. Solvents should not be stored in the plant building. Space of 15 mts within the plant shall be kept free from combustible material. Spillage shall be cleaned immediately. Daily removal of oily rags and wastes etc.
5. Trained operators certified by the competent person.
6. Women and young persons prohibited.
7. Vapour monitoring by a combustible gas detector. Sampling locations to be approved by the CIF. Register is required for record.
8. Examination by the competent person every year. Repairs under the direct supervision of the competent person.
9. Purging (with inert gas or steam) required before opening for cleaning or repairs or introducing solvent after repairs.

IS : Solvent - for paints, sampling and test 82, insulating varnishes 10026, petroleum hydrocarbon 1745.

Solvent extracted - coconut oilcake 3591, cottonseed oilcake 3592, ricebran 3593.

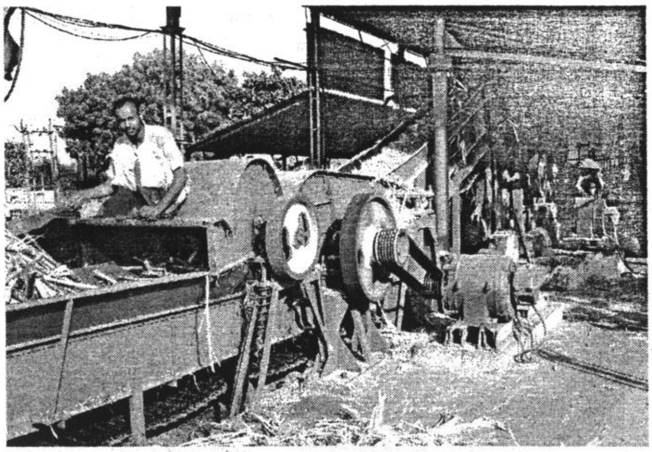
Test for corrosivity of solvent 13643.

See also Part 5 of Chapter-18 and foregoing Part 20 and 21 of this Chapter.

36 SUGAR INDUSTRY

The growth of sugar factories is very wide and mostly in co-operative sector. Except some small Khandsari units, generally the sugar mills are large factories running with heavy machinery and big-sized vessels, employing more than 1000 workers and occupying a bigger area for the mill plant, sugar cane transport vehicles, sugar godowns, bagasse (crushed fibrous waste) stocks and long conveyor belts, molasses tanks, solvent extraction plant if provided, residential facilities for mill workers and offices for other related activities.

The nature of sugar mill machinery pose mostly the mechanical hazards like crush injuries, falls or slipping from heights, falling into pit or hot sugar juice, hurt by falling bodies or sugar bags, fumes and gases (SO , HCI, CO, CO,), steam at many places, sugar cane dust (may cause bagassosis), noise and vibration due to centrifuge machines and vibrating screens, packing machines and large size crushing gears.



In the process, sugar canes are put on feed (rolling) carrier, pushed ahead by steel beaters and crushed in two to three sets of heavy rollers. The initial juice contains bagass fibres, clay, grit, albumen, pectin etc. Bagass fibres cause lung disease known as Bagassosis. The juice is then heated and chemical agents are added to remove impurities and to get saccharose. After clarification (through heating) the juice is concentrated in vacuum evaporators till it precipitates in the form of greyish crystals. The concentrated juice (molasses) contains 45% water. By centrifuging the water is separated and brownish granulated sugar (brown sugar) is filtered. White sugar is made by refining (Sulpher) process. The filtered syrup is evaporated in quadruple effect evaporators, vacuum pans and crystallisers till it crystallises. Centrifugation is again applied to get white crystalline sugar. Vibrating screens are used to separate sugar crystals in different sizes (grades). It is then weighed, begged and sent to the sugar godowns.

The safety measures include -

I Cane Milling Plant :

1. Cane handling platform with gantry and gantry columns (not more than 10 m. apart) attendance platform, approach staircase, sling bar and grab attachment, mechanical/ electrical controls from crane operator's cabin.
2. Fixed sound guards on motor and gear drives of feeder tables, steel structure to withstand heavy shocks, inclined tail end to feed into the main carrier.
3. Cane carrier (1800 mm wide), 3 strands chain (150 mm pitch) and sprockets with heavy guards, hood 'to cover cane knives with inspection door and head-shaft and gears with guards.
4. The cane carrier motors be interlocked with the cane leveller and cutter motors so that the cane carrier stops when either of these motors trips.
5. Cane feeding chute from cane carrier to the crusher at an angle of 50° from the horizontal. The chute length should be more than 3.5 m.
6. Guards on gear and motor drives of cane kicker - a rotating shaft (dia > 125 mm) mounted with more than 20 blades or arms.
7. Totally enclosed reinforced steel hood with suitable swing flaps and bolted top covers on cane leveller with more than 42 knives and cane cutter with more than 52 knives. The knives should be

of specially shock resisting steel with carbide tips or stellited cutting edges. Guard on flywheel of the shaft.

8. Crushing mills may be of following types :
   Based on sugar cane crushing capacity per day-
   For 2500 tonnes-12 rollers-4 steam turbines
   For 3500 tonnes-18 rollers-6 steam turbines
   Fixed guards on mill gearing, flexible couplings and mill rollers (max. speed 18 mt/min).
9. The juice gutter under the mills shall be made of brass or copper lined MS plates or aluminium plates of sufficient strength.
10. Cylindrical whirler type pumps of 75 m3/h at 10 m head, non corrosive, non choking type, and with bronze impellers.
11. Vertical guard or fencing on bagass elevator and conveyor and also surrounding floor or feed opening and horizontal guards or grills on moving slats and bagass scrappers.

    A gangway of open flooring with hand railing alongside the whole length of the conveyor with access ladders at different platforms including boiler control platform.
12. Testing and maintenance of all cranes and lifting machinery as per Rule 60 of the GFR.

II Clarification Plant:

1. Juice heaters with necessary valves, venting and condensate extraction device with collection tanks and safety for steam use. Solid drawn brass tubes for heaters with 42 mm ID, 45 mm OD and total length of tubes not exceeding 4.5 mt
2. Continuous juice sulphitation unit, with lime milk proportioning arrangement, guards on lime slacker motors, couplings and gear drives and stirres drives. SO_2 absorption tower with safe vent, effective stirrer, sulphur furnace with cooling water jacket for vertical gas pipes and scrubbers made of cast iron.
3. Clarifier with flash tank, juice overflow box, scrapper drive, mud overflow box, liquidating pump etc.
4. Vacuum rotary mud filter with bagacillo sifter, recirculation pump, juice trough, filtrate pumps and receivers, mud conveyor belt, juice separator, air blower, cyclone separator for vacuum filters, cake washing hot water pumps and guards for pump couplings and motor drives.

III Evaporation and Boiling Plant :

1. A quadruple effect evaporator with four bodies (vertical tanks) with two syrup extraction pumps (one standby), safety valve in the vapour space to open at 0.2 kg/ m2, pressure and vacuum (compound) gauges, thermometers, condensate extraction pumps, grit catchers, vapour space height more than twice the calandria height, calandria (bottom heating zone) height not exceeding 2 mt, domes and fittings of suitable save-all design, the calandria tubes should be solid drawn with 42 mm ID, 45 mm OD, tubes spacing more than 10 mm. and vapour condenser at the end.
2. Syrup and molasses tanks (13 to 15 tanks), bund or dyke, heating coil to molasses tanks, wash out connection to each tank, wash out gutter with suitable valves, working platform with handrails and approach stairs along the storage tanks. One molasses dilution tank with stirrer, water and steam connection is also necessary.
3. Vacuum pans, condensers and injection water pumps requirement is as under :

For plant of	Vacuum pans	Condensers	Water pumps
2500 T	5	6	6
3500 T	7	8	8

Vacuum pans are calandria of low head rapid boiling type with steam tubes (brass), compound gauges, thermometers, various pipelines and fittings, connections with crystallisers and multi-jet condensers, heavy molasses and hot water connection through nonreturn valves, guards on stirrer drives and gears, the injection water pumps - centrifugal and directly coupled, are all necessary.

IV Cooling, Curing and Grading Plant :

Heavy U-type air cooled and water cooled crystallisers are required with stirring arrangement, guards on stirrer and gear drives and centrifugal machines (15 for 2500 T plant and 20 for 3500 T plant). Superheated wash water or steam connection, timer controlled automatic brakes, solenoid and pneuma,tic valves, ploughing speed not exceeding 60 rpm, connection with magma mixtures, guards on magma mixture drives, guards on pug mill drives, reduction gears and air-compressor drives, steam connections with NRV for magma and molasses lines, sugar melter, grass hoppers and conveyors, hot and cold air blowing, sugar elevators and graders (vibrators) with dust catching arrangement, sugar weighing machines, bag stitching machines, molasses weighing scale and final molasses storage tank (3 to 4) each of 4000 m" capacity as per IS specification.

Other plants viz. Boiler and steam generating plant. Power generating plant and Miscellaneous e.g. reducing valves, pipelines, supporting structure, service tanks, water pumps etc. also need due consideration.

Dust, fume and gas extractors, noise and vibration dampers and medical examination of workers are also required.

IS : Sugar laboratories 1679, 5527, godown construction 4772, vacuum pan grading 498, filter cloth 1178, inter-carrier chains 9069, sprockets 12198, effluent treatment 4903, crusher 1973, 6983, 6997, juice hygienic code for sale 8124, stripper 7789.

Sugar confectionery- hard boiled 1008, sampling and analysis 6287, cube 1168.

37 TOBACCO INDUSTRY

Tobacco is manufactured into biddies, cigars, pipe, chewing tobacco or snuff. Some factories are large and fully mechanised but many are small factories employing mostly female workers. Safety measures include

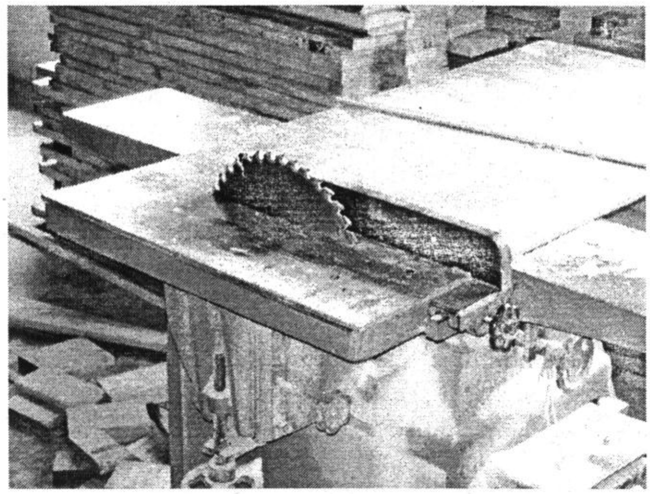
1. Guarding of all machinery moving parts, drives, shafting, gearing and cutting knives.
2. Nip guards to conveyors and rollers.
3. Prevention of explosion due to tobacco dust.
4. Local exhaust ventilation to dust sources (respirable tobacco dust is 0.3 to 3.6 mg/m").
5. Good housekeeping and vacuum cleaning.
6. Good sanitary and washing facilities, personal, hygiene, protective clothing, dust masks and medical supervision.

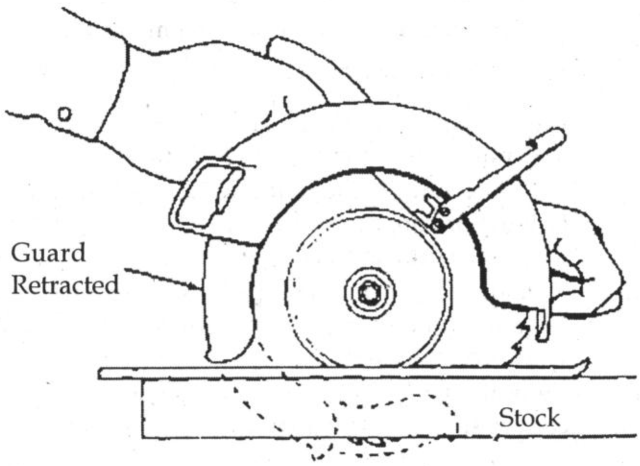
IS : Tobacco - glossary 10335, analytical test 7753, chewing (zarda) flake 2344, minced 3041, moisture determination 9379, packaging code 10106, packing seaworthy 4698, paste hookah 14332, sampling 8600, Virginia seedcake 10670.

Tobacco seeds - 3380, grading 8443, oil 5614, test 5643.

38 WOODWORKING INDUSTRY

Woodworking industry includes wood cutting in sawmills, wood preservation and treatment and making of panels (veneer plywood, chipboard, hardboard), furniture and other products by using woodworking machines and tools which are mostly dangerous and need strict guarding. The safety measures include :





1. Circular saw guarded with adjustable riving knife, guard hood with vertical and horizontal adjustment, under-table cutter guard and drive guard, readily replaceable blade aperture insert to prevent the entry of waste, intermediate guide or rip guide to prevent jamming, push stick with handle and stop/start switches within reach.
2. Guarding of chain saws and hand saws (vertical or horizontal) including blade wheel (drive and return wheel) guarding, blade guarding, adjustment and maintenance, sawdust exhaust ventilation and collector, effective brakes within reach and guarding of drives and other dangerous parts.
3. Guarding of surface planner, other planning machines and vertical spindle moulders and routers with effective and adjustable tool guards with exhaust ventilation with close hood to collect saw dust and shavings.
4. Tools well sharpened and balanced and vibration damping base to minimise noise.
5. Electrical equipment properly earthed and start/ stop switches within reach.
6. Exhaust hood or booth for belt, disc or orbital sander to collect saw dust.
7. Exhaust ventilation and spray painting booth while surface finishing with solvents and toxic chemicals.

8. Prevention of fire hazard by close dust collectors as stated above, regular cleaning and maintenance of machines, prohibiting smoking, good house keeping and using fire fighting equipment.
9. PPE like leather aprons, goggles and gloves.
10. Medical check-ups for dust effects.

For an abstract of Schedule 3, Rule 54, GFR see Part 4.4 of Chapter-14..

IS : Woodworking machines - safety conditions 8964 (Part I to 24), terminology 11011, working dimensions 7287, working level heights 7229, mortising machine 7266, 7286, moulding machine 7254, planning machine 7289, 7296, routing machine 8107, surface planning machine 7267, thickness planning machine with rotary cutter 7249, table handsaw machine 7227, slot mortising machine 7266.

Woodwork - fire safety 6329, aluminium paint 3585, Wooden packaging - terminology 6703, timber 6662, packing cases 1503, 6729, 8358, 4834, 3728, 8725, 8726, 7698.

Wood preservatives - 4873, 218, 4833.

Industries may be endless, as they are ever increasing with the human needs. A few are stated above with more than 500 safety measures which give sufficient knowledge to find out safety measures for other industries also. Chapters' 14,18,20,21 and 22 cover major part of machine guarding and safety aspects of all mostly used processes and provide a data bank for effective safety inspection of any industry.

E X E R C I S E

1. What are the health hazards of pesticides and methods of their control?
2. What are the main health hazards in cement industry? Briefly discuss the safety measures of safe guarding the health of workers in this industry.
3. State the main hazards which are generally encountered in the storage and handling of solvents in a petrochemical plant. Give their important preventive and control measures.
4. Explain the statutory provisions on manufacture of:
   (1) Asbestos. (2) Benzene. (3) CSz (4) Glass. (5) Flammable liquids and Gases. (6) Rubber. (7) Pottery. (8) Wood working. (9) Solvent Extraction plant.
5. Explain in details the health and safety measures on Chemical Works OR Hazardous Chemicals and Processes.
6. Write short notes explaining safety measures :
   (1) Types of industries needing attention. (2) Cement industry. (3) Electroplating industry. (4) Fertiliser industry. (5) Leather industry. (6) Paper industry. (7) Plastics industry. (8) Polymer plants. (9) Ship breaking industry. (10) Sugar industry. (II) Carcinogenic Dyeintermediates (12) Tobacco industry.
7. Enumerate safety measures required in -
   (1) Food industry. (2) Match factories. (3) Electronics industry. (4) Automobile industry. (5) Beverage industry. (6) Brick or Tile industry. (7) Clothing industry. (8) Dairy industry. (9) Petroleum refinery. (10) Ovens & Driers. (11) Soap industry (12) Silk industry.

     - *3.4.3 Safety while using Power tools*
     - *3.4.4 Tools boxes, Kits & tool maintenance*
   - *3.5 Work Station Design :*

I INDUSTRIAL HYGIENE :

1.1 Meaning of Industrial Hygiene(IH):

Industrial (Environmental) hygiene is defined by the American Industrial Hygiene Association (AIHA) as that science and art devoted to the anticipation, recognition, evaluation and control of those environmental factors of stresses, arising in or from the workplace, which may cause sickness, impaired health and well-being or significant discomfort and inefficiency among workers or among the citizens of the community.

Thus Industrial Hygiene deals with (1) anticipation ie. identification (2) recognation ie. acceptance (3) evaluation ie. measurement and assessment and (4) control of workplace hazards or environmental stresses (heat, cold, humidity etc) imparing health of the workers or public.

Anticipation includes prior knowledge of possible hazards and their effects on health. It includs all methods of identification of hazards.

Recognation means acceptance of ill-effects of the identified hazards and accepting that environmental stresses endanger life and health accelerate ageing process or causes discomfort, (qualitative assessment) Evaluation means measuring or calculating the degree of hazard (quantitative) by instruments, air sampling and analysis, comparison with standards and taking judgement whether measured or calculated hazard is more than or less than the permissible standard, (quantitative assessment)

Control includes engineering and administrative controls, safe disposal of wastes, medical examination, use of PPE, education, training and supervision.

The scientific approach adopted in applying Industrial Hygiene includes, identifying the extent of toxicity (harmful effects) of chemical, physical and biological agents; identifying the extent of employee exposure through inhalation, skin absorption or ingestion; recommending and implementing process controls that reduce exposure to harmful substances and following safe work practices including use of personal protective equipment to guard against the exposures.

The Health effects are unlikely to occur unless exposure occurs. The science of qualitative and quantitative exposure assessment is applied in determining the extent of exposure. These data, then are used in determining the need for implementing prevention and control measures.

1.2 Difference between Industrial Hygiene & Occupational Health:

Industrial hygiene deals with Control Techniques to reduce or eliminate ill-effects of environmental hazards like chemical, physical, biological and ergonomic hazards on human health. The control techniques are mostly Engineering Control Measures which try to measure, quantify, monitor, control and eliminate (i) Chemical hazards like dust, gas, fumes, acids, solvents etc. and (ii) Physical hazards like temperature, pressure, noise vibration, radiation etc. (iii) Biological hazards like bacteria, virus, fungus, insects, moulds, parasite, algae, protodones, mematotes, mycoplama, cells lines and other micro-organisms or genetically engineered organisms or cells that can cause a disease and aspects of drinking water, cleanliness, waste and sewage disposal, food contamination etc., and (iv) Ergonomic hazards like pain, illness or accidents due to wrong design, awkward position, improper lifting, man-machine (or job) non-alignment etc. Application of engineering and biomechanical principles can eliminate such hazards.

Thus branch of industrial hygiene needs primarily engineering and biomechanical knowledge and expertise. Therefore, it is called "Hygiene Engineering" also.

Occupational health studies the mode, effects and consequence of environmental hazards or stress - chemical, physical, biological and ergonomic - on human health. The techniques are mostly medical .and study (i) Ill-effects or diseases on health, bodily disorder or maladjustment (ii) Medical remedies to remove occupational illness or disease and improve health (iii) Preventive measures to avoid disease and to maintain good health and (iv) Improvement of nutrition and general physical and mental health of the workers.

Industrial hygiene attempts to eliminate or minimise the exposure of environmental or work hazards on human or public health by engineering controls and good housekeeping and keeps the workplace environment clean, pollution free and hygienic while occupational health deals with the effects of exposure that penetrates human health, gives medicines to improve it and by pre-employment and periodical medical examinations, it strives to anticipate (early detection of) occupational disease and tries for continuous health care of the workers.

Occupational Health, also known as Occupational Medicine, aimes at identifying occupational diseases in the early stage. Industrial Hygiene is aimed at identifying and rectifying causes leading to occupational diseases. By the time an occupational disease is identified, it may be too late. Therefore prevention and control of factors leading to occupational illnesses and disease is the best option. Ultimately it increases the life span.

Even if no occupational disease has occurred, the hazards at workplaces reduce the life of exposed people from a few days to few years. Therefore industrial hygiene practice is always useful and most desired to assess and make the workplace safe and to stop decreasing the precious life span.

Distinction with public health:- Occupational health deals with man in relation to his work and working environment inside the workplace, both physically and mentally, whereas public health deals with man inrelation to his environment in society, outside the workplace and where hazards such as air and water pollution, noise, nutrition and infections may affect his health.

1.3 Work co-ordination between Industrial Hygienist, Safety Officer and Factory Medical Officer for the purpose of safety.

The work of Industrial Hygienist, Safety Officer or professional and Occupational Health Specialist or Factory Medical Officer is reciprocal and useful to each other.

Industrial Hygienist can measure and report the hazard level (noise in dBA, gas vapour in ppm, or percentage, light in lux, oxygen level, air velocity, heat stress etc.). He can carry out personal monitoring and report individual exposures. He can assess the need of biological monitoring and report to the Director.

Safety Officer can study this report and suggest appropriate engineering and other controls.

If industrial hygiene -practices are implemented first, there will be less work for the occupational health specialist or doctor and less ill-effects on workers, public and environment.

The work of industrial hygienist is useful to health physician (doctor) in drawing some conclusion and conversely the diagnostic doubt of the physician can be scientifically replied by the hygienist.

Health specialist or Doctor can examine the worker for effect of exposure, can carry out biological monitoring if necessary and suggest necessary medical measures.

Thus work of all the three officers should be coordinated for the purpose of safety.

1.4 Occupational Health Hazards :

1.4.1 Introduction & Classification of Occupational Health Hazards.

In the past, mostly the workers' health was considered in relation to their work and working conditions in industrial places like factories, mines, workshops etc., hence the terms industrial safety and health and industrial hygiene were developed and used. But gradually the concept of health and safety at work was developed and workers' health at any work-place or occupation, not limited to industry, was considered in USA (Occupational Safety and Health Act, 1970) and UK (Health & Safety at Work Act, 1974) and now, therefore, the modern concept is to use the term Occupational Health and Safety covering industrial and non-industrial Occupation health hazards, their effects, controls and preventive measures.

The range of occupational health was also originally limited to occupational diseases or injuries concerned with the work, working condition or the working environment. But with the research in bacteriology at the end of 19th century it was accepted that a disease may arise due to combination of many factors and the definition of occupational health was widened in 1950 at the joint ILO/WHO Committee meeting, to consider promotion, maintenance and protection of health from all factors adverse to health.

Normally workers' health is influenced by non-occupational and occupational factors which can be sub classified as under :

Workers' Health or Work Environment (adversely affected by)

- **Nonoccupational Hazards**
  air, water, food, clothing, housing, personal habits, climate
- **Occupational Hazards**
  - **Environmental**
    - **Chemical**
      - **Inflammable**
        Solvent, Hydrocarbons, Phosphorous, CS_2, Flammable substance
      - **Explosive**
        Dust Solvent, Vapour, Powder, Solid, Substance
      - **Toxic**
        Dust, Fumes, Gas, Vapours, Mist, Poisons, Carcinogens
      - **Corrosive**
        Acid, Alkali, Irritant
      - **Radioactive**
        Atomic energy
    - **Physical**
      Noise, Vibration, Heat, Cold, Pressure, Ventilation airchanges, air velocity, Humidity, Light & Colour, Excessive weight, Overtime work, Physical workload, Radiation
      - **Ionising**
        Alpha, Beta, Gamma, X-rays, Neutrons
      - **Nonionising**
        UV, IR, Microwaves, Laser beams
    - **Instrumental**
      No proper instrument, No control instrument, Faulty instrument, No interlock, No alarm, No trip, No autocontrol, No process correction
    - **Mechanical**
      Unguarded machinery, No fencing, No safety device, No control device, Unsafe machine, equipment, instrument etc.
    - **Electrical**
      No earthing, Short circuit, Faulty design, Current leakage, Open wire, No fuse or cut off device, Static electricity, Nonflameproof fitting or equipment
    - **Biological**
      Bacteria, Virus, Fungi, Parasitic, Plant pest, Micro-organism, Infection, Diseases
    - **Ergonomic**
      Wrong design or layout of machinery, Poor housekeeping, No man-job alignment, Improper design, height or position of controls, Wrong tools, Awkward position
    - **Unclassified**
      Not known but causing health effect
  - **Non-environmental**
    - **Physiological**
      Tender age, Old age, Sex, Illhealth, Sickness, No physical fitness, Nervous strain, Fatigue
    - **Psychological**
      - **Employee's side**
        Wrong attitudes or aptitudes, No motivation or demotivation, Job habit, Smoking, Alcoholism, Emotional upsets, Unskilled, Poor discipline, Absenteeism, Accident proneness, No job security, No job satisfaction, Leadership etc.
      - **Employer's side**
        No education, information or training system for workers

Details and controls of above hazards are explained in respective chapters.

The occupational health is studied by various specialised branches considering different health hazards as under –

Faculty or Approach	Factors or Hazards
Occupational Physiology	Heavy work, heat stress, fatigue etc.
Occupational Psychology	Mental factors like job satisfaction, motivation, attitude, interest etc.
Ergonomics	To make the work suitable to man considering his anatomy, physiology and psychology.
Occupational Pathology or Medicine	Diseases due to exposure to skin, nose and mouth and due to physical factors like noise, vibration, radiation, heat, light etc.
Occupational Hygiene (Engineering)	Measurement and assessment of physical and chemical factors like noise, vibration, light, ventilation, temperature, gas, dust, fume etc., and suggesting engineering and medical controls.
Occupational Safety	Accident prevention considering mechanical, chemical, physical and human factors.
Occupational Psychiatry	Mental deviation or nervous disease due to physical or mental work environment or human relations at work.
Occupational Sociology	Attitudes or behavirous at work, working conditions, management etc.

1.4.2 Adverse Health Effects and Controls:

A short synopsis of above hazards, their adverse effects and control measures are given below.

(1) Heat & Cold

Heat causes burns, exhaustion, stroke, cramps, fatigue, decreased efficiency, pain, discomfort, heal collapse, systemic disorders, skin disorders, psychoneurotic disorders and tendency to cause accident. Acclimatisation to high temperature requires reduction in heart rate and internal body temperature at the expense of increased sweating. Radiant heat (e.g. ovens, furnaces), stagnant heat (e.g. textile mills), and high temperature (e.g. mines, glass furnaces) .create stress and impair health.

The amendment (1995) in Gujarat Factories Rules has prescribed certain limits - Room temperature < 30 °C (80 °F), Air movement > 30 mt/ min. Ventilation openings > 15% of the floor area and in summer when temperature exceeds 35 °C and humidity 50%, air cooling is required. For humidity control dry and wet bulb temperatures are also prescribed u/r ISA.

One UK Standard suggests the following criteria

Environmental Factor	Standard
Air temperature	21 °C
Mean radiant temperature	$\geq$ 21°C
Relative humidity	30-70%
Air movement	30-60 mt / min

Temperature gradient (foot to head)	$\leq 2.5\,^{o}C$

The cold causes chilblains, shivering, frostbite, trench foot, vasoconstriction, hypothermia and erythrocyanosis.

The control measures include (1) sufficient intake of water and salt (2) cotton and protective clothing (3) break in exposure time and more rest intervals (4) engineering controls (5) medical control and (6) acclimatisation of the workers.

For details see Part 8 of Chapter-10.

(2) Air Pressure :

Abnormal air pressure can cause decompression sickness known as 'Bends' (dull throbbing pain in joints or deep in muscles and bones) and 'chokes' (subtemal distress and difficulty in deep inspiration with coughing).

(3) Light & Colour :

Improper and insufficient illumination causes eye strain, eye fatigue, headache, lachrymation, congestion around cornea and miner's nystagmus (chronic effect). Glare or excessive brightness causes visual discomfort and fatigue, tiredness and irritability. There should be sufficient and suitable lighting natural or artificial in all work areas. For details see Chapter 9.

(4) Noise & Vibration :

Noise - too low or too high cause ear strain or pain. Auditory effects are temporary or permanent hearing loss. Non-auditory effects cause nervousness, fatigue, difficulty in conversation, decreased efficiency, annoyance and psychological and systemic effects. The degree of injury depends on intensity and frequency of noise, exposure time (duration) and individual susceptibility.

Vibration of 10 to 500 Hz frequency range as normally found with pneumatic drills, hammers and grinders affects the hands and arms. After exposure of months or years, fingers become sensitive to spasm known as white fingers. Vibrations also produce injuries to joints, elbows and shoulders.

For details see Chapter-12.

Sick or Tight Building Syndrome is a health effect on workers, mostly IT personnel due to heat or cold stress, poor ventilation, poor lighting, or monotonous work in fixed type of environment for a longer period. Sickness is resulted in health effects like indigestion, psychosis (mental fatigue), visual problem, mental feeling of impotency, headache, backache, uneasiness, obesity, acidity etc. Remedial measures include-change in working environment, new and attractive atmosphere, good lighting and ventilation, good house keeping, rotation of persons, recreation facility and staggered working hours instead of continuous eight or more working hours.

(5) Ionising & Non-ionising Radiation :

Electromagnetic radiation consists of varying electric and magnetic fields, operating at right angles to each other. It has both particulate and wavelike aspects. Following table shows the wavelength and frequency for various electromagnetic radiation. Longwaves have low energy, short-waves have high. The higher energy wavelengths (short-waves) are more penetrating i.e. more damaging. X-rays, Gamma rays and cosmic rays have short wavelengths, 10" cm and less, and high frequency, 10'6 c/s and above and cause ionising radiation.

Others i.e. electric waves, radio waves, micro waves, visible light, IR, UV and lasers have longer wavelength and less frequency and cause non-ionising radiation. Lasers are involved in visible light, IR and UV regions of the spectrum given below :

The Electromagnetic Spectrum		
Energy Form	**Frequency c/s**	**Wavelength, cms**
Non-ionising radiation :		
Electric waves	10^{2} to 10^{4}	10^{12} to 10^{6}
Radio waves	10^{4} to 10^{11}	10^{6} to 10^{-1}
Infrared (IR)	10^{11} to 10^{14}	10^{-1} to 10^{-4}
Visible light	10^{15}	7×10^{-5} to 4×10^{-5}
Ultraviolet (UV)	10^{15} to 10^{16}	10^{-5} to 10^{-6}
Ionising radiation :		
X-rays	10^{16} to 10^{18}	10^{-6} to 10^{-9}
Gamma rays	10^{18} to 10^{21}	10^{-10}
Cosmic rays	10^{21} on	10^{-11} on

Types and Limits of Radiation :

(A) Ionising Radiation:

Ionising radiation means electromagnetic or corpuscular radiation capable of producing ions directly or indirectly in its passage through matter. It is not visible by normal eyes. X-rays, Alpha, Beta, Gamma, fast neutrons, thermal neutrons and radionuclides are ionising radiation. Radioactive substance (chemical) must be firmly sealed within metal container to prevent dispersion to active material into surrounding. Radiation hazard means the danger to health arising from exposure to ionising radiation which may be external or internal.

Animal and human studies have shown that exposure to ionizing radiation can cause carcinogenic, teratogenic or mutagenic effects, as well as other sequelae. The NCRP has formulated exposure limits. Some such limits are given below :

Exposure limits given in rems per year are as under:

Whole body exposure Long term accumulation	5 (Age in year – 18) x 5
Testicles, Ovaries and Red bone marrow	5
Skin, Thyroid, Bone	15 to 30
Hands, Feet and Ankles	75
Forearms	30
All other organs	15
Pregnant woman, total during pregnancy,	1 0.5 in gestation period
Population 1 Individual 2 Average	 0.5 wholebody 5 gonads

International Commission on Radiological Protection (ICRP) has prescribed a dose-equivalent limit of 0.5 SV (50 rem) to prevent non-stochastic effects.

Radiation dosimetry in health physics tries to know whether individual radiation exposures are within permissible dose. Various fixed and portable monitors (detectors and survey instruments) are used for radiation exposure measurement. Some fixed monitors are as under:

Type of Detector For type of Radiation.

	Type of Detector	For type of Radiation.
1	Proportional or scintillation counter surface barrier diode	Alpha
2	Geiger-Mueller tube or proportional counter	Beta
3	Ionisation chamber, scintillation counter	X and Gamma
4	Proportional counter, ionsation chamber.	Fast neutrons
5	Proportional counter.	Thermal neutrons

Fixed monitors are either area monitoring instruments or contamination monitoring instruments. Area monitors are used for measurement of air, ganima radiation, neutron radiation and radioactive effluents. The contamination monitoring instruments include hand and shoe monitors, portal monitors, clothing monitors and monitors for contaminated wounds. The dosimeters are to be calibrated for proper use.

Protection Techniques include :

1. Control of exposure time and distance.
2. Shielding.
3. Wearing a film badge to check dose limit.
4. Pre and post employment medical test.
5. Prevention of radiation disease such as skin cancer, ulceration, dermatitis, cataract, damage to bones and blood etc.
6. Use of remote controlled containers.
7. Continuous monitoring and maintaining safe limits by engineering controls and PPE.
8. The sealed container should be leakproof.

Health Physics is a branch of science dealing with improvement of protection against exposure to ionising radiation (IR). The main principles of health physics were defined in 1977 by the ICRP. Three general principles of radiation protection are - (1) justification (2) optimisation and (3) limitation of worker's exposure to radiation.

Medical radiation (x-rays) and nuclear radiation to generate electric power are justified but nuclear weapons for war are not justified.

Optimisation means to keep the exposure as low as achievable

Limitation means to limit the exposure entering a human body by protecting individual or society by devices and observing prescribed safe dose limits.

A record for more than 30 years must be maintained even after completion of job on ionising radiation, of (1) doses absorbed by individual and (2) exposure measurement.

In our present day industry, radiation generating machines and radioactive materials for testing of materials, process control and research have found wide-spread use. X-ray machines are widely used in industry, medicine, commerce and research. Industrial X-ray devices include radiographic and fluoroscopic units used for the determination of defects in materials in packaged food etc. All such uses are potential sources of exposure. The most widely used naturally occurring radio-nuclide is Ra. 226 which is used in medicine and industry. In its use in the medical field, many individuals, besides the patient are potentially exposed to radiation. In industry, the principle uses of radium are for radiography in luminous compound and in making static eliminators. Textile and paper trades, printing, photographic processing and telephone and telegraph companies are the typical industries where the static eliminator may be found. The use of artificially produced radio-nuclides (radio-isotopes) in medical, biological, agricultural fields, and scientific research has been increased. Possible exposure from such radio nuclides is involved with their preparation, handling, application and transportation. Exposures, internal or external, might also arise through contamination of the environment by wastes originating from 'the use of these materials.

Applications of ionising radiation in industry are many. It is used mostly in biological and chemical research, chemical pilot plants and production. It is used for curing, grafting, testing & evaluation, free radicals, cross .linking, polymerisation, disinfection, sterilisation, pasteurisation etc. Productwise it is used in semi-conductors, rubber, adhesives, spices, paints and coatings, membranes, fuels, lubricants, plastic piping, enzymes, cosmetics, pharmaceuticals, medical supplies, foods, flooring, furniture, textile, medical uses, agricultural uses etc.

Biological Effects and Controls : Occasional small dose (e.g. X-ray photograph) does not affect much but small doses for a longer time or more frequent dose or higher dose may cause biological damage to a human body. Radiation energy passes through a body. The energy absorbed in a body is called dose. The time between the exposure and the first symptom of radiation damage is called latent period. The larger the dose or the residence time, the shorter the latent period.

Human body always generates new cells replacing dead or damaged cells. But when ionising radiation causes more damage than the body's repair capacity, biological damage takes place. Injury to individual .is called somatic effect and that being passed into future generations is called genetic effect. The. biological effect is the destruction of reproduction capacity of a cell or carcinogenic effect (cancer) which is difficult to cure.

Biological effect of radiation can be reduced by -

1. Shielding the body portion (especially blood forming tissues and intestine).
2. Shielding by a portion between the source and the human body by a high density material such as lead or concrete wall. Thickness should be increased depending on intensity of radiation.
3. Less dense (less hazardous) radiation (electromagnetic instead of charged particles).
4. Low dose rate or fractionation of the dose and decreasing the dose level.
5. Diminishing O_2 concentration in the tissues.
6. Reducing the exposure time.
7. Increasing the distance from source.
8. Using sealed source of radiation.

9. Monitoring the environmental exposures by various instruments such as film badge, thermoluminescence dosimeters (TLD), pocket dosimeter, Geiger-MuUer tubes (having automatic audible .alarm), ionismg chambers, neutron and proton monitors and keeping them below the permissible threshold limits. Calibration techniques for instruments is most important.
10. Decontamination facilities.
11. Safe disposal of radioactive wastes.

Medical Surveillance : Exposure to radiation workers may not give any clinical signs. Therefore, according to ICRP, the medical surveillance of radiation workers should aim at-

1. To assess the health of the workers.
2. To preserve good general health standards by monitoring the work conditions, exposure levels and the health of the workers and
3. To provide baseline information in case of accidental exposure or occupational disease.

Functions of such medical service include--

1. Scheduling of medicell and radiotoxicological examinations. Pre-employment and during and after (post) employment examinations are necessary.
2. Evaluating the fitness of individual workers for specific tasks.
3. Medical examinations and first-aid after radiation accidents, irradiation or contamination accidents.
4. Keeping of adequate medical records for quite a long time (30 years).
5. Contributing to safety and health training and
6. Helping to solve safety problems in the plant.

Large nuclear installations should have full time and fully equipped medical and health physics services and facilities - including decontamination facilities and ablutions very near the workplace. Small units should obtain part-time facilities.

Personal decontamination facilities include a separate ambulance port, monitoring devices, sink, showers, a disrobing room, clean clothing and pharmaceutical supplies.

Plant medical service should remain in touch with local and other hospitals where irradicated or contaminated persons can be treated.

Radiological Accidents and Controls : When radioactive irradiation or/and contamination is likely to exceed the maximum permissible levels, such overexposure is termed as radiation accidents.

Accidental external irradiation depends on nature of radiation, its distribution in space (exposed area), its penetration in body (dose level) and its duration. In the exposed area irradiation may be of whole-body or partial type. Dose level may be massive, substantial or slight. The biological effect may be irreversible tissue damage, severe but reversible changes or purely temporary disorders. Kind of radiation may be photon irradiation (x or y- rays), particle irradiation by electrons, neutrons and protons or mixed photon and particle irradiation.

Accidental radioactive contamination depends on the nature of the radionuclide (its physical, chemical and radioactive characteristics), local distribution in the body (path of entry through skin, wounds or inhalation), duration (initial and secondary impact following bodily intake) and level of contamination (massive, substantial or slight).

Control Measures necessary are -

1. In case of external irradiation, measurement of exposure in the body and the space, should soon be carried out to decide a course of action.
   Urgent treatment is not essential.
2. In case of radioactive contamination, urgent treatment is essential. Therapy should first be followed instead of measurement of radioactivity and clinical and biological examinations, though they should be followed subsequently to assess the level of contamination.
3. If the whole-body irradiation is more than 100 rem, the person should immediately be transferred to a specialised hospital.
4. Cases of massive whole-body irradiation are difficult to survive, but, they are mostly rare.
5. No immediate treatment is required for slight or partial irradiation. Persons should be observed for some weeks for subsequent development if any.
6. **Therapeutic measures** are as under:
   1. Cleaning and washing of skin and wounds.
   2. Decontamination by surgical excision, but before that a strong chelating agent must be applied locally as soon as possible.
   3. In case of inhalation, emergency medical treatment becomes necessary if the internal contamination exceeds the maximum 3monthly intake or exceeds (500 x Maximum permissible atmospheric contamination per hour). The person should be transferred to a specialised hospital. In serious accidents, the stomach must be washed out and the contaminant at the intestine should be rendered insoluble.
   4. Biological examinations and samplings are necessary. Blood samples must be @ 20 cm^3 by volume and raw i.e. without any additive. The first urine sample and next 24-hr samples are necessary. Samples of the first three stools and one 72-hr after the accident are also necessary.
   5. To check respiratory contamination, the person's handkerchief or nasal samplings by blowing nose into a paper tissue are useful.
   6. Decontamination of substances, objects and persons.

A card containing information of possible contaminants, the time of sampling and any treatment given before the sampling, must be sent alongwith the samples to the radiotoxicological laboratory as quickly as possible.

Decontamination : The ionising radiation cannot be neutralised or interrupted. Therefore rapid decontamination is one of the best safety measures to protect man against possible or actual hazards of direct or indirect radiation. The purpose of decontamination is to reduce its level below the safe level. Following methods of decontamination are used:

1. Mechanical decontamination i.e. removal of radioactive layer by scrubbing, shot blasting, washing by water etc.
2. Physical decontamination i.e. evaporation, dilution, filtration, ultrasonic techniques, or allowing the half-life time if it is in hours or upto 3 days.
3. Chemical decontamination i.e. treating with acid, alkali, chelating compounds, ion-exchange resins etc.
4. Biological decontamination of sewage.
5. Decontamination of water, surface and clothing by selecting appropriate material, e.g. 10% solution of citric acid followed by 0.5% solution of nitric acid to clean stainless steel surface, mineral acids to clean glass and porcelain vessels, replacement of concrete blocks etc. 6. Decontamination of persons by scrubbing the skin with warm water and soap and followed by use of surfactants and absorbents. I to 3% solution of hydrochloric and citric acid are also useful. Use

of organic solvent is inadvisable. Cleaning for more than 10 min. is also not advisable, as further cleaning cannot remove contaminant and may damage the epithelium.

Removal of radionuclides from the human body is much more difficult and needs experienced medical treatment. The choice of a method and reagent depends on the type and character of the contaminant, path of penetration and time elapsed after contamination. Surgery is the best method to decontaminate wound. Complexing reagents (viz. DTPA) are generally effective to decontaminate blood, internal organs and tissues. To decontaminate upper respiratory system, expectorants and vasoconstrictive preparations are prescribed.

See part 15.5.2 of Chapter 18 for radiographic non-destructive testing and Part 5 of Chapter-28 for radiation health effects and statutory controls.

(B) Non-Ionising Radiation :

The main difference between ionising and nonionising radiation is that the former is more hazardous because of its higher frequency range and shorter wavelength comparing with the later which has lower frequency range and longer wavelength. More safety measures - Decontamination, medical and others- are required to prevent and control the ionising radiation and its damage.

Non-ionising Radiation refers to those regions of the electromagnetic spectrum where the energies of the emitted photons are insufficient, under ordinary circumstances, to produce ionisation in the atoms of absorbing molecules. Its lower wave length limit is 100 nm (arbitrary). It includes ultraviolet, visible light, infrared radiation, microwaves, radiowaves, lasers, power frequencies and radar waves.

The Spectrum Phenomenon : The sun's energy is transmitted by electromagnetic waves. If a narrow beam of sunlight is passed through a prism and then projected upon a surface, colourful 'spectrum' is visible from red at one end through orange, yellow, green, blue, and indigo to violet at the other end. If a thermometer is moved slowly from violet to red portion, it shows a rise in temperature. Beyond red (in dark space) it shows a still higher temperature. This dark portion (beyond the red) is called infrared (IR), and the dark portion at the other end (beyond the violet) is called the ultraviolet (UV).

There is no sharp dividing line between IR, visible and UV regions. They differ from each other in frequency, wavelength or energy level. See the table of spectrum in foregoing para. The common factor among them is that all electromagnetic waves travel with the same speed and are originated from moving electric charges.

Physical & Biological Units: The entire electromagnetic spectrum is roughly divided and studied in two parts:

1. The upper region of shorter wavelength is of more concern to physicists and physical scientists who describe radiation in terms of wavelength.

2. The lower region of longer wavelength is of more concern to communication scientists and engineers who describe radiation in terms of frequency.

Both these units are given in the following table

Physical Units of NI Radiation		
Unit	**Symbol**	**Equivalent**
Wavelength		

angstrom	A	10^{-8} cm
centimetre	Cm	1 cm
micrometer	µm	10^{-4} cm
nanometer	Nm	10^{-7} cm
Frequency		
hertz	Hz	1 c/s
kilocycle	Kc	1000 c/s
megacycle	Mc	10^{6} c/s
Gigacycle	Gc	10^{9} c/s

Biological effects of the UV, visible, IR, radio frequency and the extremely low frequency of power transmission, have been studied. Visible light and heat waves can be easily perceived and dark goggles can reduce their intensity to a comfortable level. The UV, IR, microwave and lower frequency radiations cannot be perceived by eyes, but have biological penetration as shown in the following table -

Thermal effects are produced in the skin due to exposure in IR and FM-TV-radio region. Photochemical effects can be produced in the UV and visible regions.

Now, main divisions of non-ionising radiation are explained below in brief.

(1) Infrared (IR) Radiation :

The IR region extends from 750 nm to 0.3 cm wavelength of microwaves.

Exposure to infrared radiation is very common in glass industry and near cupolas and furnaces. Since long-wave infrared radiation is readily absorbed by the surface tissues of the body, it cannot inflict deep injuries in the 'human body. Over exposure produces some discomfort which generally gives adequate warning. However, the eyes may suffer injuries or general discomfort to other parts of the body, there is some evidence that this may result in cataract.

The protective measures against this radiation include the placement of reflective screens of polished aluminium shield near the source. Those screens will direct the .rays away from the personnel into unoccupied space or return them to the heat source. They have been found very effective in many industrial situations. Eyes of the exposed personnel should always be protected, by suitable glasses, from direct radiation arising from areas that given off intense heat, even though the temperature is not necessarily high. Infrared radiation be measured by the black-bulb thermometer and radiometers.

Main industrial IR exposures are from hot furnaces, molten metal or glass and from arc processes. Use of enclosures, shielding, eye protection and safe distance are main safety measures.

(2) Ultraviolet (UV) Radiation :

The UV region is subdivided as Near - 400 to 300 nm. Far - 300 to 200 nm and vacuum -200 to 4 nm.

The effects of ultraviolet radiation are similar to sunburn. Since there is a considerable time gap between exposure and development of injury, deep burns, may be endured without immediate discomfort. This radiation is readily absorbed in human tissue. As a result , superficial injuries are produced chiefly to the skin and eyes. Higher exposure can cause skin or eye damage. The skin effect is called dermatological and the eye effect is called ocular.

Some industrial processes, such as welding, produce considerable amount of ultraviolet radiation. In areas where ultraviolet radiation is quite intense, potentially hazardous chemical contaminants, such as ozone and oxides of nitrogen, are also produced due to action of this radiation on air. In the zone where arc-welding is carried out, very high concentrations of ozone and oxides of nitrogen have been found.

All personnel engaged in welding should invariably wear goggles and face shields. Besides these, the use of gloves, leggings, overalls and boots is an essential necessity for the personnel engaged in welding. Further more, opaque shielding should be used around welding areas to protect other persons. Local exhaust ventilation may also be used as an effective means for the removal of chemical contaminants produced during the arc welding.

Ultraviolet meters can be used for the measurement of .this radiation. It has been suggested that 0.5 microwatt per square centimetre be the permissible limit of ultraviolet radiation for a 7 hours continuous exposure.

The most common exposure to UV radiation is from direct sunlight. Solar irradiation exhibits intense UV radiation but due to the atmosphere (ozone) shielding of the earth (God's gift), we are not exposed to the lethal doses. Long time exposure to hottest sunlight (afternoon) may cause skin cancer. This must be avoided.

Some commercial application of UV radiation are fluorescent lamps, mercury vapour lamps, germicidal lamps, electric arc welding, chemical processing, etched circuit board production and UV lasers.

Wavelengths below 320 nm cause skin reddening and skin-burn (erythemal effect). Solar or UV radiation from artificial sources may cause skin pigmentation (tanning).

Wavelengths between 320 and 230 nm can cause carcinogenic effects.

Main safety measures are shielding of UVR source, use of eye goggles, protective clothing and absorbing or reflecting skin creams.

(3) Visible Light (Energy) :

This portion lies in the range of 400 to 750 nm. The danger of ratinal injury lies between 425 to 450 nm due to peak brightness. Eye response to excessive brightness i.e. partial or full lid closure and shading of the eyes, is a protective human mechanism.

Main sources of visible light are sun, laser beams, arc welding, highly incandescent or hot bodies and artificial light sources such as pulsating light, high-intensity lamps, spotlights, projector bulbs, neon tubes, fluorescent tubes, flash tubes and plasma torch sources.

The visible light is of three types : incident, reflected and transmitted light. Incident light is that light which strikes the work surface. Reflected light is that light which bounces off surfaces and reflected onto work surfaces by walls and ceiling. It is measured to determine glare and shadows. Transmitted light penetrates a transparent or translucent material.

Vision is a photochemical and physiological phenomenon. Exposure to glare can cause fatigue of eyes, iritis and blepharism. But these effects cannot cause pathological changes.

Poor illumination can cause industrial accidents. Direct glare, reflected glare from the work and dark shadows lead to visual fatigue. Better lighting provides safe working environment, better vision and reduces losses in visual performance.

Factors of good lighting are its quantity and quality. The Quantity is the amount of illumination that produces brightness on the task and surroundings. The Quality refers to distribution of brightness in environment and includes the colour of light, its diffusion, direction, degree of glare etc.

See Chapter-9 on Lighting & Colour.

(4) Radio and Microwaves :

Within the broad spectrum of radio frequencies, the microwave .region is between 10 to 3 x 105 MHz (megahertz). This form of radiation is propagated from antennas associated with TV transmitters, FM transmitters and radar transmitters.

Uses of microwave radiation are heating sources like microwave ovens, dryers for food products and plywood, pasteurisation, ceramics, telecommunications like radio and TV and medical applications (diathermy devices). Microwave ovens for heating or cooking food are clean, flexible and instantly controllable. The heating rate is very high and use of any fuel or pollution due to it should be avoided.

Radio or high frequency electrical heaters are used in metalworking plants for hardening cutting tools, gear-teeth and bearing surfaces and for annealing, soldering and brazing. Use in food industry is for sterilising vessels and killing bacteria in foods.

In woodworking plants, high frequency heating is used for bonding plywood, laminating and general gluing. Other uses include moulding plastics, curing and vulcanising rubber, thermosealing and setting twist in textile materials.

Induction heaters are used for annealing, forging, brazing or soldering conductive materials. Induction furnaces are used in foundries to melt metal. Dielectric heaters are used for non-conducting, dielectric materials like rubber, plastics, leather and wood.

The primary effect of microwave energy is thermal. The higher frequency cause lower hazard and vice versa. Frequencies less than 3000 MHz can cause serious damage. At 70 MHz, maximum SAR (specific absorption ratio) in human takes place. Exposure of high intensity and more time can cause localised damage by skin burning, tissue burns, cataracts, adverse effect On reproduction and even death.

The basic safety measures include restricting energy (power density in microwatts/ m2 and frequency) below the safe level, reducing time of exposure, shielding and enclosing microwave source, reorienting antenna Or emitting device, use of PPE and controlling at source.

(5) Power Frequencies:

The main hazards from high voltage lines and equipment (low frequency) are shocks and current. Extremely low frequency (ELF) radiation produces electric field and magnetic field. An external electric field induces electric current in the body.

Protection from ELF is possible by shielding of electric field by any conducting surface. Persons working in high field strength regions (e.g. high voltage lines) should wear electrically conductive clothing. Avoiding entry in such region is also advisable.

ELF magnetic field cannot be shielded. Therefore the only remedy is to keep the magnetic field below safe levels or to restrict entry of personnel into the magnetic fields.

See Chapter-11 on Electrical Safety.

(6) Radar:

Radar means "radio detection and ranging". It is a radio detecting instrument that operates in the radio frequency range from 100 to 105 MHz, echoing in a wavelength range from some meters to millimetres. It consists of a transmitter and receiver, usually operating through a common antenna. Power output varies from a few watts to megawatts.

Hazards & Controls : Main hazards associated with radar are as under :

1. Electrical hazards from high voltage equipment.
2. Fire hazards from flammable gases, vapours, explosives and other materials.
3. Toxic hazards of gas fills in certain waveguides.
4. Thermal effects of electromagnetic radiation.
5. Radioactivity from certain switching tubes.
6. X-rays from high voltage tubes.
7. Material handling hazards in moving portable and fixed equipment.

Control measures include -

1. Standing near or in front of the antenna should be avoided.
2. Radar workers should not look directly into a radar beam from a high energy unit. High energy is more than 0.01 W/cm2
3. Interior of microwave tubes should be seen through a remote device such as a periscope or telescope.
4. Microwave absorber should be provided to contain beam discharge.
5. Persons should take care to have minimum exposure by keeping a safe distance from the beam.
6. Photoflash bulbs should be properly packed to avoid ignition hazard.
7. Pre, current and after employment medical examinations of the radar workers including blood-count and complete eye examination including slit-lamp examination are necessary.

(7) Lasers and Masers :

Laser means "light amplification by stimulated emission of radiation". The original concept was invented by Dr. Charles Townes in 1955. In 1958, he and Dr. Arthur Schawlou presented a paper on how to make an optical maser. Maser means "microwave amplification by stimulated emission of radiation". An optical maser is a laser, therefore, the word laser is mostly used.

Normal light radiates in all directions. Light waves of varying lengths reinforce or cancel each other. Such light is called incoherent. When light waves are made to vibrate in a single plane, made to travel in only one direction and of the wavelength and focused towards a point, a laser beam is obtained. It is called coherent light.

Lasers involve IR, visible and UV regions, concentrate great energy in a point area and can be projected over long distances.

Uses of laser beam are increasing. Typical areas of laser applications are military, microsurgery, medicine, dentistry, material processing, stack emission analysis to detect air pollution, blood analysis, laser drilling & welding, communications, construction, embryology, geodesy, holography, business offices etc.

Hazards and Controls : It is necessary to understand type of laser, its power density, the method of usage and its operational aspects to consider laser hazards and controls. It is not the power (viz. 0.2 watt) but the point source of great brightness which poses hazard. There are two types of hazards - One from the laser itself and the other from equipment.

The solid-state lasers produce high power outputs and can cause skin burns and eye damage if safety rules are not followed. Other hazards are thermal effect, electric shock, ozone effect, high gas pressures in the flash lamp when it is fired (explosion hazard), cryogenic cool burns due to liquid nitrogen and helium, oxygen deficiency if N or He leaks into atmosphere and hazards from viewing, operation and reflections.

The control measures include -

1. Minimisation of ocular exposure to the direct laser beam and specular, mirror type, reflections.
2. Education and training of personnel.
3. Shields to prevent accidental exposures.
4. Specially designed eyewear (a major control).
5. Periodical eye examination.
6. A warning sign to be attached to laser equipment.
7. Laser unit in a separate room.
8. Diffuse or retroreflective card targets should be used for short ranges.
9. Laser beam should not be aimed at flat glass, mirror surfaces or flammable material.
10. Appointment of Laser Safety Officer.

Health hazards depend on the type of material, manufacturing process or work, e.g. poisoning in pesticide industry, chemical exposure in chemical industry, fall and hit accidents in construction industry, finger cutting in power-press industry and dusting in mine industry. Modern trend is to consider biological hazards also. The Rules for the Manufacture, Use, Import, Export and Storage of Hazardous Microorganisms, Genetically Engineered Organisms or Cells are useful in this regard. See Chapter-28 for these rules. All these need a specialised occupational health services at workplace. Depending on classified hazards like fire, explosion, toxic and corrosive effects, fully equipped fire fighting team, medical team and trained personnel with special protective equipment are also essential.

Even if an occupational disease has not occurred, the hazardous exposure at workplace can reduce the life span slowly and unknowingly.

1.4.3 Dangerous Properties of Chemicals and their Health Effects :

See Part-7 of Chapter-18 for Material (Property) Hazards, Material Safety Data Sheet (MSDS) and its interpretation. The properties mentioned in MSDS are dangerous properties needing attention for safety. Sch. 9 of MSIHC Rules, 1989, and Sch. 5 u/r 68J(2) of GFR 1963, statutorily require this information. The occupier of a factory has to keep this information ready to show to the workers on request.

Table-4 of Chapter-32 lists such dangerous properties of some chemicals.

Table-9 & 10 of Chapter-32 give health effects of some particulate matters and pollutants. For safe permissible limits of such chemicals to avoid health effects see Tables 10 to 15 of the same Chapter.

For some common chemicals and their health effects and occupational diseases, see Part-4 of this Chapter.

Classification of Air borne Contaminants:

When chemicals are disseminated in air and contaminate it, they are called air-borne contaminants. They are classified according to their physical state as under:

(A) Gases and Vapours :

(1) Gases : Normally formless fluid which occupy the space of enclosure and which can be changed to the liquid or solid state only by the combined effect of increased pressure and temperature. Gases diffuse. The particle size varies from 0.0005 to 0.01 micron.

Examples are chlorine, ammonia, sulphur dioxide, hydrogen sulphide, hydrogen cyanide, carbon monoxide etc. Main pollutants are oxides of carbon, sulphur and nitrogen.

(2) Vapours : The gaseous form of substance which are normally in the solid or liquid state and which can be changed to these states by either increasing the pressure or decreasing the temperature alone. Vapours diffuse. The particle size varies from 0.005 to 0.01 micron.

Examples are vapours of lead oxide, benzene, xylene, trichloroethylene and other solvents.

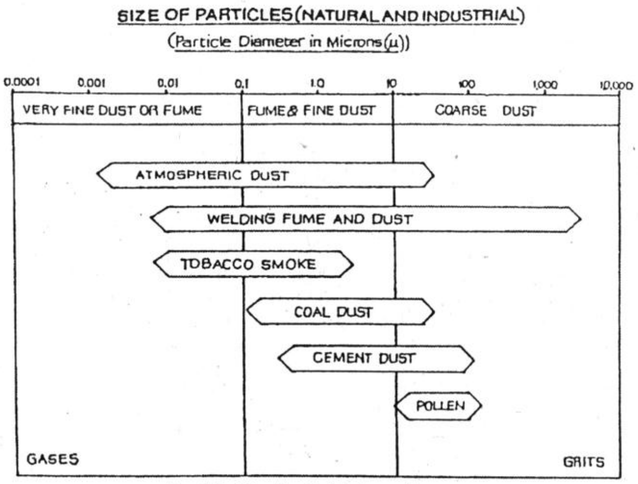
Gases and vapours are also classified as under-

1. Organic solvent vapours e.g. alcohol, acetone, CS_2, CCI_4, benzene, xylene.
2. Pulmonary irritant gases e.g. $C1_2$ NO_2, phosgene.
3. Upper respiratory irritant gases e.g. NH_3, SO_2, formaldehyde, acetic acid.
4. Chemical asphyxiant gases e.g. CO, HCN.
5. Simple asphyxiant gases e.g. N_2, CO_2, methane, its homologues and acetylene.
6. Other inorganic and organic gases e.g. H_2S, arsine and pesticides vapours.

(B) Particulate Matters:

These are solid tiny particles produced by blasting, crushing, drilling, grinding, mixing etc. and suspended in the air. Examples are as under:

(1) **Dusts :** Solid particles generated by handling, crushing, grinding, rapid impact, detonation and decrepitation of organic or inorganic materials such as rocks, ore, metal, coal, wood, grain etc. Dusts do not tend to flocculate except under electrostatic forces. They do not diffuse in air but settle under the influence of gravity. The particle size varies from O.I to 1000 microns. Fly ash from chimneys varies from. 3 to 80 microns.



Particle Size for Solid Aerosols

See Part 4.2.1 for more details.

(2) **Fumes :** Solid particles generated by condensation from the gaseous state, generally after volatilisation from molten metals etc. and often accompanied by a chemical reaction such as oxidation. Fumes flocculate and sometimes coalesce. The particle size varies from 0.001 to 100 microns. Examples : lead, zinc, or nitrous fumes.

(3) **Mists :** Suspended liquid droplets generated by condensation from the gaseous to the liquid state or by breaking up a liquid into a dispersed state, such as by splashing, foaming and atomising. The particle size varies from 50 to 100 microns. Example : sulphuric acid mist.

(4) **Smokes :** Small gas-borne particles resulting from incomplete combustion and consisting predominantly of carbon gaseous material are grouped in this category. The particle size varies from O.I to I micron.

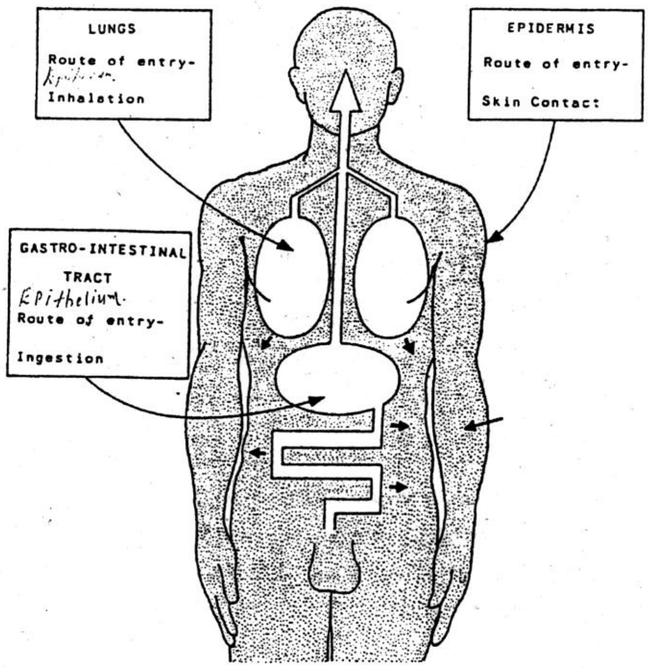
(5) **Smog and Fog :** The air contaminants may be present in the forms of smog and fog which are not usually encountered in an industrial environment. The particle size varies from I to 50 micron.

(6) **Aerosols :** It is a colloidal system m which the dispersion medium is a gas and the dispersed phase is solid or liquid. The term aerosol is applicable till the solids or liquids remain suspended in the gaseous media. The particle size varies from 0.01 to 100 micron. Dust, smoke or mist are examples.

Aerosols affect weather, damage materials and impair health. Atmospheric aerosols like hydrocarbons, lead, arsenic, sulphuric acid etc. may injure human health because of their toxic nature.

1.5 Routes of Entry & Toxic Effects:

1.5.1 Routes of Entry (Avenues) to Human System:



Following are the four main routes of entry of toxic material into human body :

(1) Absorption through skin (Dermal tract) : Skin absorption attains its greatest importance in connection with the organic solvents. The significant quantities of these compounds may enter the body through the skin either as a result of direct accidental contamination or indirectly when the material has been spilled on the clothing. Using industrial solvents for removing grease and dirt from the hands and arms is a source of dermatitis. Some solvents penetrate the intact skin, get into the blood stream and produce ill effects on the blood and throughout the body, e.g. nitrobenzene, aniline, phenol, nicotine, etc.

While manufacturing, handling and spraying pesticides, liquid splashes may enter through skin and cause toxic effects. Vapours of pesticide can enter through nose and solid or liquid pesticide if taken through mouth (unlolowingly, accidentally or suicidal) it can pass through digestive route also. Safety measures are suggested in Part 24 of Chapter-23.

Volatile material like phenol, aniline, nitrobenzene, cresol, tetraethyl lead and many organophosphorous or organo-chlorine pesticides pose greater hazard through skin than through inhalation. Absorption through lessings of the pidemis is more rapid than through the intact skin. Cut skin may absorb quickly. Therefore safety gloves, aprons, face shield, goggles and overalls are always desirable.

(2) Absorption through Gastrointesfinal Tract (GIT) (Ingestion or Digestive Tract) : Use of contaminated and dirty vessels used for eating and drinking is the most common route of ingestion. Accidental swallowing of chemicals is also possible. The detoxification affects the liver exerts when the ingested quantity is small. However, massive dose can lead to fatalities in absence of medical attention.

Contaminated food, drinks, beverages should not be eaten without washing hands and mouth properly. Habit of washing hands and mouth before and after eating, is most desirable. Where it is statutorily required, separate mess-rooms (eating places) are provided (Schedules u/r 102 of the GFR) for this purpose only. Food, drinks, pan-supari, tobacco, lime etc. and smoking are prohibited in workroom.

(3) Absorption through Lungs (Inhalation or Respiratory Tract) : The inhalation of contaminated air is the most important means by which occupational poisons enter into the body. Harmful substances may be suspended in the air in the form of dust, fume, mist or vapour and may be mixed with the respired air in the case of true gases. From 8 - hour working in a day, man may breathe about 10 cubic meters of air. Any poisonous material present in the respired air offers a serious threat.

Among those inhaled foreign matter, some particulate matter is trapped by the mucus which lines the air passages and is subsequently brought out with nasal mucus or phlegm. Other particulate matters are taken up by scavenger cells following which they may enter the blood stream or be deposited in various tissues or organs. True gases will pass directly from the lungs into the blood.

Inhalation is an easy route of entry of the airborne contaminants. Respirable dusts (see Table 15, Chap. 32), gas, vapour, mist dissipated in the air enter the respiratory system through breathing and may reach upto lungs and may transfer from lungs to some sensitive deeper sites also. Lungs damage may cause diseases. See Part 4.2.1 of this Chapter.

Rate of breathing for an average man is as

Activity	**Inhalation (lit/m)**
Resting in bed	6
Sitting	7
Standing	8
Walking (3 km/h)	14
Walking fast (6 km/h)	28
Slow run	43
Maximum exertion	65-100

Thus rate of breathing increases with exertion. Good housekeeping, ventilation, local exhaust ventilation and use of appropriate respirators while handling toxic substances are primary need.

(4) Injection : This fourth route of entry is the direct injection of the material into the bloodstream or the peritoneal cavity of the abdomen or the pleural cavity surrounding the lung. By a needle it can be inserted into the skin, muscle or other part of the body. Mostly this route is used to inject material into laboratory animals. The intravenous injection short-circuits protective mechanisms in the body, which resist the material from entering into blood.

Pre-employment and periodical medical examinations of workers exposed to toxic hazards, are necessary to detect health effects due to such entry of chemicals in human body and to draw inference for engineering and medical safety measures.

1.5.2 Toxicity and Relevant Terms :

Chemicals or airborne contaminants when enter into body through nose, mouth or skin as explained above, make different types of effects depending on their concentration, time of contact of exposure, body resistance etc. To understand this it is useful to understand following definitions first :

Toxic means poisonous or hazardous to health. Toxin or Toxicant or Intoxicant means toxic substance or poison causing harmful effect. It includes carcinogen, mutagen or carc/neo/teratogen. Most of the chemicals are poisons. The right dose differentiates a poison and a remedy.

Toxicity is the ability of a chemical to produce injury once it reaches a susceptible site in or on the body. Toxicometry is the measurement of toxicity i.e. a .system of principles and methods for determination of toxicity and hazards of chemical compounds. The study of nature, properties and effects of chemicals on living systems is termed as Pharmacology. The branch of pharmacology relating to poisons is Toxicology. It is the science of poisons, their effects, antidotes and detection. It is a science that defines limits of safety of chemicals. It is also defined as an interdisciplinary science concerned with the nature and mechanisms of toxic effects due' to chemicals in the working and/or living environment. It can also be defined as the study of action of poisons on the living organism. Industrial toxicology is concerned with the human organism and lies within the broad field of medicine. Toxicology from an occupational health point of view can be used to predict ill effects on workers from exposure to industrial materials. It is then used to design protection levels for workers.

Three main elements of toxicology are (1) Physical or chemical agent capable of producing response (2) Biological system with which the agent may react to produce response and (3) The response must be injurious to the biological system.

Acute toxicity

Adverse effects resulting from a single dose, or exposure to a substance for less than 24 hours.

Asphyxiant

A substance that interferes with the transport of an adequate supply of oxygen to the body by either displacing oxygen from the air or combining with hemoglobin, thereby reducing the blood's ability to transport oxygen.

Carcinogen

A substance that causes cancer.

Ceiling limit

The maximum permissible concentration of a material in the working environment that should never be exceeded for any duration.

Chemical hygiene plan

A written program that outlines procedures, equipment, and work practices that protect employees from the health hazards present in the workplace.

Chronic toxicity

Adverse effects resulting from repeated doses of, or exposures to, a substance by any route for more than three months.

Central Nervous System (CNS)

The central nervous system is the part of the nervous system that consists of the brain and spinal cord.

Combustible liquid

A liquid with a flashpoint at a temperature lower than the boiling point; according to the National Fire Protection Association and the U.S. Department of Transportation, it is a liquid with a flash point of 100 °F (37.8 "C) or higher.

Compatible materials

Substances that do not react together to cause a fire, explosion, violent reaction or lead to the evolution of flammable gases or otherwise lead to injury to people or danger to property.

Compressed gas

A substance in a container with an absolute pressure greater than 276 kilopascals (kPa) or 40 pounds per square inch (psi) at 21 °C, or an absolute pressure greater than 717 kPa (40 psi) at 54 °C.

Corrosive

A substance capable of causing visible destruction of, and/or irreversible changes to living tissue by chemical action at the site of contact (i.e., strong acids, strong bases, dehydrating agents, and oxidizing agents).

Explosive

A substance that causes a sudden, almost instantaneous release of pressure, gas, and heat when subjected to sudden shock, pressure, or high temperature.

Exposure limits

The concentration of a substance in the workplace to which most workers can be exposed during a normal daily and weekly work schedule without adverse effects.

Flammable

As defined in the FHSA regulations, a substance having a flashpoint above 20 OF (-6.7 OC) and below 100 OF (37.8 OC). An extremely flammable substance is any substance with a flashpoint at or below 20 OF (6.7 OC).

Hepatotoxin

A chemical that can cause liver damage.

Ignitable

A substance capable of bursting into flames; an ignitable substance poses a fire hazard.

Incompatible materials

Substances that can react to cause a fire, explosion, violent reaction or lead to the evolution of flammable gases or otherwise lead to injury to people or danger to property.

Irritant

A substance that causes a reversible inflammatory effect on living tissue by chemical action at the site of contact.

Lacrimation

Excessive production of tears when the eye is exposed to an irritant.

Mutagen

A substance capable of changing genetic material in a cell.

Neurotoxin

A substance that induces an adverse effect the structure and/or function of the central and/ peripheral nervous system.

Radioactive material

A material whose nuclei spontaneously give off nuclear radiation.

Reactivity

The capacity of a substance to combine chemically with other substances.

Reproductive toxicity

Adverse effects on sexual function and fertility in adult males and females, as well as developmental toxicity in the offspring.

Systemic

Affecting many or all body systems or organs; not localized in one spot or area.

Teratogen

A substance which may cause non-heritable genetic mutations or malformations in the developing embryo or fetus when a pregnant female is exposed to the substance.

Toxic substance

In general, as defined in the FHSA regulations, any substance (other than a radioactive substance) that has the capacity to produce personal injury or illness to man through ingestion, inhalation, or absorption through any surface of the body.

1.5.3 Types and Degrees (Rating) of Toxic Effects :

The toxic effect depends on various factor such as -

1. The quality (toxicity & concentration) an(quantity (dose) of the chemicals.

2. The rate and extent to which the chemical i absorbed into the blood-stream, i.e. the exposure time and quantity absorbed.
3. The rate and extent to which the chemical i biologically transformed in the body.
4. The rate and extent to which the chemical or it breakdown products are extracted from the body

Factors of Effective Dosage are :

1. Quantity or concentration of the material.
2. Duration of Exposure.
3. State of dispersion.(dust, fume, gas etc.)
4. Affinity for human tissue.
5. Sensitivity in human tissue or organ.

Types of health effects are local e.g. acid burn to skin or transported through the body to a target organ. The effects are also classified as acute (short duration), subacute (intermediate duration), chronic (long duration), nuisance (dust effect), irritant (causing inflammation),, allergen, corrosive (destroying living tissue) and toxic.

For definitions see previous Part 1.5.2.

Substance is called poison (acute) when it is liable to cause death or serious injury to health if swallowed or inhaled or contacted by skin.

Infectious substance is that toxin which is Viable Micro organism or their toxins which are known or suspected to disease in animals or humans.

Delayed or Chronic Toxic substance is that (2) which, if inhaled or ingested or penetrate skin, may cause delayed or chronic effects, including carcinogenicity.

Ecotoxic substance is that which if released presents or may present immediate or delayed adverse impacts to the environment by means of bioaccumulation and/ or toxic effects upon biotic system.

Hazards or Toxicity Ratings or Degree of toxicity are given as u (unknown), none (no toxicity), low (slight toxicity), mod (moderate toxicity) or high (Severe toxicity).

These terms indicating whether a material has high, moderate, or slight toxicity hazard or none at all, are obviously somewhat crude, but these still serve as rough guides to the risk involved in exposure to various chemicals until further information can be obtained. See next Part 1.5.4(8).

Range Finding Test : This approach to determining and expressing the degree of toxicity of chemicals used in industry has been developed primarily by H.F. Smith, JR and his collaborators. Its greatest usefulness is in testing new compounds for which no toxicological information exists. The basis of the tests is a comparison of the potency of an unknown compound with that of a more familiar material. This is possible since there are a number of chemicals for which fairly extensive toxicological data are already available. By this technique, a certain amount of valuable information can be obtained within a space of about three weeks.

Types of Exposure : This may be brief or prolonged. Individual susceptibility to exposure depends on age, sex, pregnancy, smoking, alcohol intake and general state of health.

1.5.4 Permissible and Threshold Limits of Exposure and Dosage :

Various limits, values or dosages are assigned to indicate permissible or lethal limit etc. as under :

(1) Permissible Exposure Limits (PELs)

- Set by OSHA, 29 CFR 1910.1000, and 1910.1001 through 1910.1450.
- Specifies the maximum amount or concentration of a chemical to which a worker may be exposed.
- Generally defined in three different ways

1. **Ceiling Limit (C):** the concentration that must not be exceeded at any part of the workday
2. **Short-Term Exposure Limit (STEL):** the maximum concentration to which workers may be exposed for a short period of time (15 minutes)
3. **Time-Weighted Average (TWA):** the average concentration to which workers may be exposed- for a normal, 8-hour workday

Other U.S. Exposure Limits

(2) Threshold Limit Values (TLVs)

- Prepared by ACGIH volunteer scientists
- Denotes the level of exposure that nearly all workers can experience without an unreasonable risk of disease or injury
- An advisory limit; not enforceable by law
- Generally can be defined as ceiling limits, shortterm exposure limits, and/or time-weighted averages
- Usually equivalent to PELs

(3) Excursion Limit - ACGIH

- This limit is applicable to those substances which have no TLV-STELs.
- Excursions in worker exposure levels may exceed 3 times the TLV-TWA for no more than a total of 30 minutes during a workday, and under no circumstances should they exceed 5 times the TLV-TWA, provided that the TLVTWA is not exceeded.

(4) Recommended Exposure Limits (RELs)

- Recommended by NIOSH
- Indicates the concentration of a substance to which a worker can be exposed for up to a 10hour workday during a 40-hour work week without adverse effects, however, sometimes based on technical feasibility
- Based on animal and human studies
- Generally expressed as a ceiling limit, short-term exposure limit, or a time-weighted average
- Often more conservative than PELs and TLVs

(5) Workplace Environmental Exposure Limits (WEELs)

- Developed by AIHA volunteers
- Advisory limits; not enforceable by law
- Typically developed for chemicals that are not widely used or for which little toxicity information is available

(6) Company-Developed Limits

- Developed by company scientists
- Advisory limits; not enforceable by law
- Usually based on only short-term studies of animals
- Generally intended for internal company use and sometimes for the customers

TLV may differ in different countries as shown below :

Substance	TLV in India	TLV in Sweeden
Aniline	2 ppm	1 ppm
Benzene	10 ppm	5 ppm
Oil mist	5 mg/m^3	3 mg/m^3
Trichloroethylene	50 ppm	20 ppm
Vinyl chloride	5 ppm	1 ppm

See Table 15 of Chapter-32 for TLVs and STELs under the Factories Act.

(6) Immediately Dangerous to Life or Health (IDLH):

Concentration immediately dangerous to life or health from which a worker could escape without any escape-impairing symptom or any irreversible health effect (NIOSH/OSHA). It is a concentration at which a person can escape without the use of a respirator within 30 minutes. This is used in selecting type of respirator etc.

(7) Tentative Biological Exposure Limits and Health Based Limits:

In fact the human organism itself may be regarded as a kind of sampling service. A worker's body represents his own individual collector, register and monitor of his personal exposure. To arrive at an accurate evaluation of toxic exposure effect, many additional physiological data are nevertheless required, such as rate of inhalation and quantity df inhaled air, percentage absorption by the skin and (occasionally) by the intestinal tract, retention rate of metabolism and excretion etc. Therefore the biological exposure (biological monitoring) has been gaining increasing attention recently. The tentative biological exposure limits for the most important toxic substances present in industry have been developed.

The most modern approach is to consider the integral exposure resulting from all modes of entry (inhalation, ingestion, skin absorption) including exposure in the living environment. Adopting this approach WHO (World Health Organisation) study group recently published 'health based limits' for occupational exposure to some common heavy metals.

(8) Lethal Dose or Lethal Concentration (LD orLC) :

In experimental toxicology, it is common practice to determine the quantity of poison per unit of body weight of an experimental animal which will have a fatal effect (A scale commonly used is milligrams of poison per kilogram of body weight.)

The commonly used expressions are :

LD_0 Highest concentration that would be tolerated in animals with no (zero) death.

MLD Minimum lethal dose, which cause even one

or LD_{L0}	fatality in a group of test animals.
LD_{50}	Lethal dose for 50 percent, the dose that kills one half of a group of test animals (usually ten or more).
LD_{100}	Lethal dose for 10(kills all of a OTOUD

This dose may also be expressed as lethal concentration(LC) for air borne toxic substances. See Reference No. 21 and 27 (at the end of this Chapter) for such values of different chemicals.

LC_{10},, 500 parts of substance per million parts of air (ppm) indicates 500 ppm concentration that kill 50% of the test animals in a stated length of time. With LC values time-span should be stated because the same concentration produces different effect, when given for different duration, e.g. more time more deaths. For example inl-hmm LCL_0 for chlorine is 430 ppm/ 30M. This means if 430 ppm chlorine is inhaled by a group of men for 30 minutes, at least one will die. ihlrat LC_{50} 293 ppm/IH means 293 ppm chlorine for one hour can kill 50% of rats sample.

Other terms are:

TCL_0 = lowest published toxic concentration.

TD or TDL = toxic dose level.

TDL_0 = lowest published toxic dose.

In Sch. I of MSIHC Rules, capacity to produce major accident hazards, toxicity is classified as under:

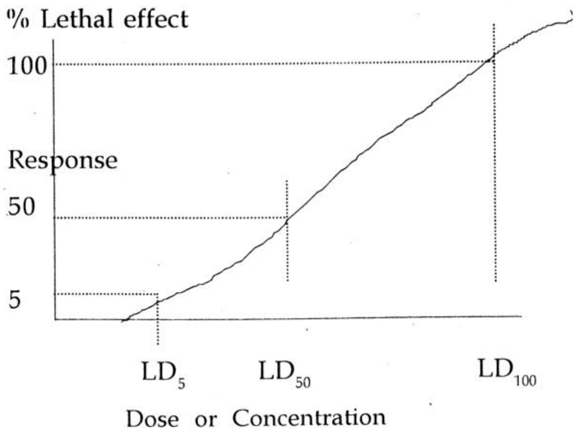
Toxicity	Oral LD_{50} mg/kg	Dermal LD_{50} mg/kg	Inhalation LC_{50} Mg/I
Extremely toxic	< 5	< 40	< 0.5
Highly toxic	5-50	40-200	0.5-2.0
Toxic	> 50-200	> 200-1000	> 2-10

For example, some LD/LC values are shown below:

Name of the chemical	TDL oral-rat LD_{50}	Ihl-rat LC_{50}	Ihl-cat LCL_0	Skn-hmn TCL_0
Calcium cyanide	39 mg/kg	-	-	-
Chlorine	-	293 ppm/1H	138 ppm/1H	-
Ammonia	-	-	-	1000 mg/kg
Diethyl ether	2200 mg/kg	-	-	-

1.5.5 Dose Response Relationship and Biochemical Action of Toxic Substances :

Dose-response relationship is useful to evaluate toxic effect. Normally test animals are subjected to lower to higher doses and their death-rate (percentage) is observed. It can be plotted in a figure



The doses given are expressed in mg per kg of body weight or per lllm2 of skin surface area or per II13 of the respired air of the test animal. The duration (time length) is also noted.

The dose-response relationship can also be expressed as the product of concentration and time (duration) of exposure : C x T = Constant

The CT value can be used mathematically to derive rough approximation of other combinations of concentration of a chemical and time that would produce similar effects. It can be useful in predicting safe limits for airborne contaminants in environment. Safe limits are set so that the combination of concentrations and time duration are below the lowest harmful level.

Interaction between Toxicant and the Body :

The interactions between toxicants and living organism comprise two aspects (1) Toxico-dynamic phase i.e. effect of toxicant on organism and (2) Toxicokinetic phase i.e. effect of organism on toxicant. This latter phase includes two processes, (i) Distribution process and (ii) Metabolic alterations of toxicants i.e. bio-transformation.

Distribution process includes absorption, transport, cumulation and excretion of toxicants and it depends on two factors (i) the physio-chemical properties of the substance concerned and (ii) the structure of the cell as a basic unit of the organism, especially structure and properties of membranes around and inside the cell.

The respiratory tract acts as gas-exchange device having surface up to 100 m2 in deep inspiration and a network of @ 2000 km of capillaries. The tract has upper and lower part. Soluble gases dissolve in the water of mucous membranes of the upper tract. Less soluble gases and vapours react with epithelium producing local damage (e.g. NO,). The absorption rate depends on solubility in blood, ventilation, blood flow and metabolic rate. Soluble compounds are •absorbed and less soluble are excreted from lungs to expired air. Soluble particulates dissolve at the site of deposition and insoluble are removed.

Absorption through GIT i.e. ingestion of toxicants is influenced by physio-chemical properties of the substance, quantity of food, motility, residence time, properties of the epithelium, surface, pH, absorption, bloodflow, hydrotropy and the presence of other substances. In liver the toxicants are metabolised and mostly degraded and detoxicated. Those present in the blood can be excreted into bile and intestines. A part of these excreted intoxicants can be reabsorbed in the GIT.

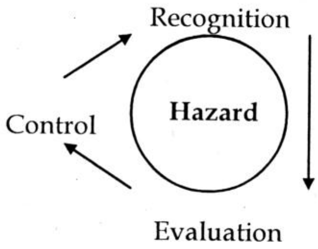
The skin consists of three layers - epidermis, true skin (dermis) and subcutaneous tissue (hypodermis). From the toxicological point of view, the epidermis plays an important role. Absorption through skin can take place (i) through lipid membrane in the epidermis (ii) around hair-roots and (iii) free entry if the barrier is damaged by mechanical trauma, chemical injury or by skin disease.

After absorption the toxic substance will reach the blood, lymph or some other body fluid. Blood is the important transport vehicle. After transport, the toxicants are distributed by uniform distribution in body fluids and deposition in reticulo-endothelial system of organs, in adipose tissues, in bones and in hair and nails.

Lastly excretion process takes place. The same mechanism that is involved in uptake is involved in the elimination of a toxic substance from the cell and body. Elimination depends on the properties of the toxic substance, its concentration and its binding in various compartments.

1.5.6 Recognition and Evaluation of Health Hazards :

Recognition means identification of nature, type and degree of hazard and evaluation means sampling and measurement of the identified hazard by direct reading instrument or laboratory tests and comparing the results with the norms or acceptable levels. Then follow the control measures to reduce the concentration (amount) below the norms for the purpose of safety and satisfaction.



Recognition (identification and exceptance) and evaluation (measurement and assessment) of the health hazards is the main work of an Industrial Hygienist. Then in designing and applying the engineering control, he and the Safety Officer have to contribute. The occupational health physician has to study and detect health effects on workers and to suggest medical measures.

Industrial hygiene approach or application includes -

1. Identification of health hazards and extent of their effects on body.
2. Identification of environment exposures to workers through different routes of entry into the body.
3. Recommendation and implementation of process controls to reduce exposures and following safe work practices including use of PPE.

Recognition requires knowledge of raw materials, storage conditions, process parameters, byproducts and products, waste generation and disposal, types of industrial operations, process flow sheet, check-list, MSDS etc. Then field survey should be carried out to identify potential hazards, worst cases and other health hazards. Then by sensory perception and control measures in use, the hazards should be accepted and measured in priority of their severity.

In evaluating or appraising toxic health effects following factors are important -

1. Nature of substance of exposure i.e. quality of exposure.
2. Quantity or concentration of the material.
3. Duration or length of exposure.
4. State of dispersion (e.g. dust, gas, fume etc.)

5. Intensity or severity of exposure.
6. Personal susceptibility or resistance.
7. Affinity for human tissue.
8. Solubility in human or organs.
9. Sensitivity in human tissue or organs.

There may be wide variations in any of these factors. Environmental survey or study should be carried out to record toxicity of the substance and workers exposure periods. After collecting such sufficient examples, workers weighted exposure to hazard (dust, gas, fume, vapour etc.) can be calculated.

For recognition the Material Safety Data Sheet (MSDS) is most useful to understand the physical, chemical, fire, explosion and health hazard properties of the material, what, how and when can go wrong and some primary first-aid, medical and spill-control measures also. For details see Part 7.2 of Chap. 18.

Hazards to be recognised should be classified. They include physical, chemical, instrumental, mechanical, electrical, biological, ergonomic, physiological and psychological hazards. Further information on recognition is given in Parts 1.4.1 and 1.4.2 of this Chapter. Some visible hazards like poor illumination, ventilation, temperature, noise etc. can be easily recognised by walk-through survey.

Evaluation techniques include measurement of noise, light, temperature, ventilation, heat stress, collection and analysis of air sample, and comparing with safe or legal limits.

For evaluation either air-samples are collected and tested in laboratory or by using direct-reading meters the results are obtained. Recorders can be connected to direct-reading meters to obtain a continuous recording of the meter reading. It can be plotted with time. Peak concentrations are important when the vapour is irritant, highly odorous or if subjective complaint is obtained.

The ultimate aim of the evaluation is to take judgement of the required control measures, after comparing measured values with the acceptable values.

Purpose of evaluation is to know the type of matter, its concentration, energy and length of time during which it reacts with body tissues. Dose-response relationship should be known to evaluate the degree of injury. Hazards of noise, vibration, light, radiation, heat etc. need to be measured to keep within permissible or safe limits.

In addition to MSDS, ACGIH values, statutory information (safe limits and control measures), and INTERNET information can also be available nowadays on health hazards, effects reported or known and a variety of preventive and control measures.

Exposure Assessment

"Having a toxic chemical at a workplace does not necessarily mean that it will cause an occupational disease". The exposure and toxicity together contributes in causing occupational diseases. Exposure assessment is aimed at defining extent of exposure to an occupational toxicant that may, or may not, lead to health hazard.

Qualitative exposure assessment

In qualitative exposure assessment, exposure potential is determined by identifying all exposure sources, determining exposure duration, evaluating effectiveness of the controls provided and ultimately integrating these data to arrive at a conclusion on the extent of exposure. The factors evaluated in exposure assessment are, toxicity of the chemical, properties and volume of the chemical used, duration of the exposure, individual tolerance of potentially exposed person, age and gender of the employee, the effectiveness of the exposure control measures provided, the use and effectiveness of personal protective equipment, general work practices such as rest periods, eating or smoking in the workroom, the presence of visible dust or fumes in the atmosphere.

Pfizer Inc., New York has developed an exposure assessment software titled "WORKBOOK" which integrates the above parameters and provides conclusion on severity of the risk.

Quantitative exposure assessment

In quantitative exposure assessment an employee exposure to a toxicant is quantified and compared with exposure limits to determine the severity of the exposure. Various types of monitoring are applied in conducting quantitative exposure assessment such as (1) Direct and Indirect biological monitoring and (2) Air, noise etc. Area or Personal monitoring.

1.6 Air Sampling :

Basic need of air quality sampling and work environment monitoring and analysis is to find the level of pollution and to work out strategy to reduce it. Need of sampling and monitoring is statutorily suggested by Form no. 37, Rule 12B of the Gujarat Factories Rules. The format calls for identification of airborne contaminants, sampling instruments and methods, number of samples and comparison of measured value with the TWA concentration in 2nd schedule of the Factories Act to assess the working environment and also the number of workers exposed to that. Correct record of such workplace monitoring is essential for good health and good housekeeping.

Need of sampling and monitoring is also inferred from the types, sources and hazards of air pollutants mentioned below. Monitoring is more than air sampling or medical examination of a worker. It includes a series of actions to assess the protection necessary.

1.6.1 Purpose & Types of Air Sampling:

Purpose of sampling are (1) To determine type and concentration of exposure due to health hazards to workers (2) To determine the types and effectiveness of the control measures provided, any change if necessary in them and new control measures to be provided (3) To investigate complaints and (4) For research purposes.

Types of Air Sampling : They are (1) Personal sampling (2) Area sampling (3) Grab sampling and (4) Integrated sampling.

In personal sampling the sampling device is worn by the worker near his breathing zone to evaluate personal or individual exposure to him.

In area sampling the air samples are taken at fixed places in a workroom or confined spaces to evaluate general concentrations of flammable, explosive or toxic material in air for the purpose of isolation or restriction to work or to design the control measures. It includes continuous monitors for leak detection, ventilation failure, equipment malfunction etc.

Short period (instantaneous) sampling is called grab sampling and long-period sampling is called integrated sampling. Grab sampling is used to measure concentration at a particular time (at least two samples within 5 minutes) e.g. peak value of NH_3 or Cl_2 at a particular time. The sample is collected in evacuated flask or plastic bag, sealed and sent to a laboratory where trace analysis is carried out by gas chromatography, IR spectrophotometry etc. Direct reading instruments can also be used for grab sampling. Temperature and pressure should be recorded during sampling. It should not be used for reactive gases.

Integrated air sampling is carried out by direct reading instruments (e.g. gas detector tubes or digital meters) to measure STEL value for 15 minutes and TLV for 8 hr TWA limits. An air-sampling train consisting of air-inlet orifice, collection media (solid or liquid sorbent, filters and passive monitors), air-flow meter, flow-rate control valve and suction pump, is used by qualified and trained personnel. Direct-reading gas and vapour monitors include (1) Colorimetric devices - stain tubes and hand or battery operated pump (2) Colorimetric paper tape samplers (3) Electrical instruments (4) 0 monitors (4) CO monitors and (5) IR analysers.

Types of sampling is also classified as

(1) **Passive or diffusive' air sampling** which involves collection of airborne gases/ vapours through a diffusion barrier onto absorbing medium without the use of air sampling pump and

(2) **Active air sampling** which involves collection of airborne contaminants by means of a forced movement of air by a sampling pump and through appropriate collection medium i.e. filter.

Selection of equipment for air-sampling is important and depends on many factors such as purpose of sampling, type of sampling, type of equipment available, nature of toxicant, environmental conditions, required accuracy and sensitivity, reliability, property of air-contaminant, presence of other chemicals which may mix or interfere, duration of sampling, cost etc.

Sampling Calculations : Calculations for gas and vapour concentrations depend on gas laws that (1) At constant temperature, volume decreases as pressure increases and viceversa i.e. $P_1V_1 = P_2V_2$ (2) At constant pressure, volume is directly 'proportional to the temperature and (3) At constant volume, pressure is directly proportional to the temperature.

Standard temperature and pressure (STP) condition is 0 ^oC and 760 mm of Hg atmospheric pressure, and at this condition 1 gm-mol of an ideal gas occupies 22.4 litres volume. If the temperature is increased to 25 °C (with pressure constant), I gm-mol occupies 24.45 litres.

Concentration is normally expressed in ppm or mg/m^3. Their relationship is given by

Concentration=mass/volume

$$Ppm = \frac{24.45 \times mg/m^3}{\text{molecular wt.}} \quad \text{or } mg/m^3. = \frac{\text{molecular wt} \times ppm}{24.45}$$

Volume Vm (ml) of material (solvent) to be used to generate concentration C (ml) : the following equation is used –

$$Vm = \frac{C \times MW \times 298 \times P \times Vc}{d \times 24.45 \times T \times 760 \times 10^6}$$

where MW = molecular weight of the substance (gm/mol), P = pressure mmmHg, Vc = chamber volume in litres, d = density (gm/ml), T = absolute temperature of apparatus $^oK = ^oC + 273$.

Samples are collected in the areas of (1) Breathing zone of the worker (2) General atmosphere of the room (3) Operation itself.

The factors determining the duration of sampling or the volume of the air to be sampled are (1) Sensitivity of the analytical procedure (2) TLV, STEL etc. (3) The expected air concentrations.

The number of samples to be collected depends on (1) The purpose of sampling (2) The concentration of the contaminant.

A minimum of 3 to 5 samples are necessary.

1.6.2 Air Sampling Methods:

Two basic methods employed to collect the gaseous contaminants are :

1. Use of a gas collector, such as an evacuated flask. The collector is resealed immediately to prevent loss before to the sample is analysed and
2. Passing a known volume of gas or air through an absorbing medium to remove the desired contaminants from the sampled atmosphere. The absorbing medium is chosen according to its efficiency for a particular contaminants.

Field methods require (1) Survey of work environment to collect basic data (2) Sampling principles or strategies to decide location of measurement (nose level of the worker, at source of emission and in general atmosphere of the workroom) (3) Types of samples (4) Minimum and optimum volume of sample (5) Duration and time of sampling and (6) Number of samples.

Then air sample is collected and the contaminant is removed for analysis. Gas detection tables, papers and liquids are used and finally the results are interpreted.

1.6.3 Sampling Strategies :

Factors to be considered while deciding sampling strategy are as under :

1. Collection techniques : The sampling device is attached to the worker who wears it during his presence in the workplace. It can be held at his breathing zone (nose level). For environmental monitoring, it is placed in a fixed location in the work area. For designing engineering control, it should be placed near the source of emission.

2. Place of Sampling : Purpose of sampling should be decided and accordingly the place, e.g. breathing zone, source of emission, work area, confined space, place of highest concentration, garage, tunnel etc. should be decided.

3. Selection of highly exposed worker : A worker who is closest to the source of toxic emission should be selected. Individual differences in work habits can show different levels of exposure at the same place - the same job, or the same material. Their work methods should be noticed. Air movement pattern should be studied. The ventilation booths, air supply inlets, open doors, windows, combustion or heating processes are some factors which can produce higher concentrations away from the source.

4. **Time of Sampling :** When there are wide temperature difference during different seasons (e.g. summer & winter), samples should be taken during all such seasons. When there are more than one shifts, it should be taken in all shifts. For A.C. area, normally the contaminants remains same throughout the year. The time of highest degree of hazard should be selected.

5. **Duration of Sampling :** The volume of air and duration of sample depend on the type of measurement i.e. 8-hour TWA TLV or 15 minutes STEL value and also on the sensitivity of the analytical procedure or direct-reading instrument.

6. **Types of Samples :** They may be instantaneous or spot samples collected within short period of 2 to 10 minutes and continuous samples collected over a long period in different shifts or on different days for the same spot or the same worker.

7. **Minimum Required Volume (MRV) :** If the volume is insufficient, false result is possible. For detection of lower concentration, larger air samples are required. The minimum required volume is given by -

$$MRV = \frac{S \times 22400}{M \times TLV} \times \frac{760}{P} \times \frac{273+t}{273}$$

where MRV = minimum required volume of sample (litres), S = sensitivity of analytical method mg, M = molecular weight of contaminant, TLV in ppm, P = barometric pressure in mm Hg and t = air temp °C.

If t = 25 °C (or near about) and P = 760,

$$MRV = \frac{S \times 24450}{M \times TLV}$$

and if TLV is in mg/m' instead of ppm,

$$MRV = \frac{S \times 1000}{TLV}$$

1. **Number of Samples :** Again depending on purpose, the number of samples can be decided. For TLV or STEL value, several dozen samples may be necessary to have accurate result Amount should be sufficient for laboratory use and decision.
2. **Accuracy and Precision :** They should be maintained for meaningful data, reliability and compliance of the statutory requirement.

1.6.4 Samples Analysis Methods:

They are classified as under:

(1) Chemical Laboratory Analysis: Micro methods have been developed and accepted as reference methods. They need sophisticated laboratory apparatus and qualified and trained personnel. Their reliability depends on many factors like specificity, accuracy, precision, reproducibility, sensitivity, practical confirmation etc. Choice and purity of reagents are important. Analysis is carried out by (1) Approximation (2) Titration and Gravimetric methods (3) Spectro-photometry (4) Visible

Spectrophotometry (5) Nephelometric method and (6) Calibration Curves. Laboratory equipment includes glassware, accessories, refrigerator, sand bath etc.

(2) Instrumental or physical methods are the advanced methods. They have superseded traditional wet chemical methods of environmental estimations. They require regular calibration, skilled operator and more expense. -The methods include (1) Gas Chromatography (2) Liquid Chromatography (3) Spectrosct)py using visible IR or UV or X-rays (4) Polarography (5) X-ray diffraction analysis (6) Neutron activation analysis and (7) General methods like combustible gas indicators, spectrophotometers and flame ionisation detectors. Sensitivity and specificity are important factors for choice and application of the method.

(3) Analytical methods : These are chemical and physical methods used for determination of contaminants in sample.

1. **Colorometric :** The principle of this methods is the development of he colour by a reagent which is indicative of the concentration of the substance to be analysed. Examples of these methods are determination of zinc, lead, mercury etc. by dithizone extraction.

2. **Ion Exchange :** By this technique it is possible to separate elements from one another. Mercury in urine, fluorine in urine and fluoride sample can be separated for further analysis.

3. **Gravimetric Method :** This method depends on the formation of a precipitate or a residue which can be weighed. Example is analysis of dust samples for free silica.

4. **Volumetric Method :** By the use of standard solution for titration. Examples are acid gases which are titrated with an basic reagent.

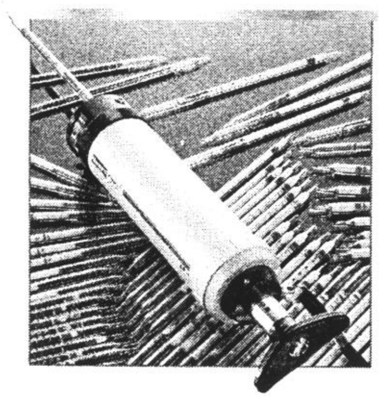
5. **Physical Methods :** The physical methods widely used for the determination of the various contaminants are emission spectroscopy, infrared and ultraviolet spectroscopy, mass spectroscopy, polarography. X-ray diffraction and gas chromatography.

1.6.5 Air Sampling Devices or Instruments :

See fig. 24.1 and 24.2 for different types of air and gas sampling instruments. See Part 8.2.3 of Chapter-25 for- gas monitors.

Various sampling and monitoring instruments are used to measure or/and control toxic hazards of air pollution and other non-chemical hazards also. See Part 12 of Chapter 18.

Sampling devices are of two types. (1) Direct reading devices or instruments (DRI) and (2) Integrated sampling devices.



Direct reading instruments are used for (1) Real time measurement of air borne contaminant (2) identifying presence of acutly hazardous substance (3) locating emission sources (4) evaluating efficiency of operation or its control measure (5) Use as survey instruments.

They include (1) Colour detector tubes for organic or inorganic gases (2) Portable GC for organic vapours and (3) Laser monitors for aerosols and dusts.

Some instruments are mentioned below :

Sampling Instruments : The basic requirements or main parts of any sampling instrument are :

1. **Source of suction,** which may be an electrically or hand-operated pump, an aspirator or squeeze bulb. They are of three types - Low flow. High flow and Dual range.

2. **Absorbing medium -** It should be able to efficiently retain the contaminants to be sampled by adsorption, absorption, chemical reaction or mechanical retention filter or collection media.

   Sorbent tubes, bags, filters, liquid and impingers are used to collect airborne contaminants for analysis. Sorbent tubes (activated charcoal. Silica gel) work on principle of adsorption. They are used for non reactive insoluble gas/vapour and give accurate assessment of TWA exposures. Adsorbed material is desorbed (extracted) and analyzed in laboratory.

   Cyclone device is used to collect and seperate respirable particulate matter. Rapid circulation of air separates perticulates according to size. The grit pot remains in place during sampling.

   Impinger is a glass bubble tube. It contains liquid mediator complete absorption of reactive chemicals like acids and anhydrides

   PVC filters are used for respirable dust' e.g. silica, crystalline.

3. **Flow meter (rotameter)** to indicate and control the rate of suction of air to calculate the amount of air sampled. The flow meter attached to instrument must be calibrated with wet or dry gas meter.

Aircheck Sampler Pump is used to sample gases, dust and particulate matter. Its features are (1) Programmable timer operation (2) Range 1-3500 ml/ min (3) Fault indicator will light if the flow is restricted or battery voltage drops to minimum.

Sampler Pump is useful for specific toxic gases which cannot be monitored through gas detector. It can be used while manual handling of toxic chemical, pumping operation and pump gland/seal leakage etc.

Gas Detector is used to detect all toxic and combustible gases and oxygen content in workroom, manholes of storage tanks, tank cars, confined space, pumping station etc. Its range are 0 to 50 ppm for toxic gas, 0 to 100% for LEL and 0 to 25% for oxygen,. Its operating range are : 0 to 40° C for toxic gas, 18 to 40°C for combustible gas and 0 to 40°C for oxygen. Its humidity range is 10 to 90% RG. Long time extreme humidity reduces the sensor life.

Specific Gas Detectors are also available to measure, record (print) and to give audio-visual alarm when set limit is reached. They give direct reading by digital display. Such instruments are portable but costly. They are available to detect $C1_2$, H_2S, SO_2, CO, phosgene etc. An HS meter operates on electrochemical solarographic cell. They should be properly calibrated and used within their ranges of ppm, LEL, humidity and temperature. Dragger gas detector tubes for such specific gases and sampler pumps are also utilised.

For Toxic Substances : Midget impinger, low volume and high volume air sampler, personal air sampler, electrostatic sampler, hexlet, gravimetric dust sampler, gas detector and doctor tubes. Millipore filterholder and filter papers, phase control microscope, binocular microscope, microscope illuminator, dust counting cells, microscope stage micrometer (2.0 mm x 0.010 mm division), filter/microscope eyepiece, cover glasses for counting chamber, spencer bright line counting chamber, MSA calorimetric carbon monoxide tester, scrubber for use with carbon monoxide tester, MSA combustible gas indicator.

For Medical Investigations : Titmus vision tester, audiometer, diagnostic set, blood pressure instrument, research microscope, heamoglobinometer.

For Physiology Studies : Kofrani Michaelis respirometer, bicycle ergometer. Bailey's sample bottle, Lloyd gas analyser, Haldane - Henderson- Bailey's gas analyser, telemetry system, heart rate monitor, stop watch, metronome, fortine barometer, platform scale weighing machine, treadmill, electronic thermometer, Bennett face mask, Harpenden anthropometer, portable stadiometer, bicondylan vernier callipers ; Godart micro-gas analysis apparatus, vitalor, Wrights peak flow meter, wooden stools with adjustable height.

For Noise Studies: Precision sound level meter with condenser micro phone, battery, wind screen, grip handle etc. Sound and vibration kit consisting of sound level meter, octave filter set, calibrator, wind screen, extension rod, cables and batteries.

For Heat and Ventilation Studies : Air velocity meter, Thermo anemometer. Vane anemometer, thermal kit comprising of dry and wet bulb thermometers and glob thermometers, Assmann Psychrometer (spring operated or motorised), Kata thermometers (125 to 130°F).

For Illumination Studies : Illumination or Lux meter.

For Psychological Studies :. Multi choice reaction time apparatus with a control console with 1/100 Sec, stock and stimulus with 3 colour lights (red, blue and green). Selective reaction timer with electrical stop watch having 1/100-60 sec, scale, flicker fusion control unit, photo electric rotary pursuit and automatic projection techistoscope.

Method of using the instrument should be properly learnt and followed. Zero-setting, probe or other attachment using, calibration, simultaneous use of personal protective equipment (using measuring instrument in highly toxic atmosphere), cleaning, maintenance and repair of equipment etc., should be learnt by practical experience.

1.7 Types of Monitoring:

Monitoring i.e. continuing program of observation, measurement and judgement, of four types is possible - personal, environmental, biological and medical.

1.7.1 Workplace or Area monitoring

Air monitoring is done for the determination of concentration in the workplace area or in the breathing zone of the employee. Air monitoring can be done for

Fig 24.1 Different types of toxic/combustible gas detectors, sensors, personal monitor and gas monitoring system.

Fig 24.2 Oxygen meter, Toxic gas detectors, Explosive meter, Flue gas analyser, Dew point meter & Personal air sampler

8 hours, 15 min. or instantaneous. The results are then compared with exposure indices such as TLV, STEL and Ceiling limits.

The concentration of the contaminants present in the workplace area is determined by the area air monitoring. The purpose of area air monitoring is to identify airborne contamination of the contaminant in worst case situation. Area air monitoring is also used to determine background level of contaminants in a work room. Area air monitoring often is conducted by placing sampling device near contaminant emission areas. Continuous area air monitoring is used to detect fugitive emissions, leaks, ventilation failures, and equipment malfunctions before employee exposure occurs.

Hazards of work environment include all types of hazards affecting work environment and arose due to work itself. Therefore chemical, physical, biological, meteorological factors and hazards of work, working conditions, methods, raw materials, process equipment, process, procedure, waste disposal etc. should be considered here. First, their permissible exposure limits - prescribed by law or standard or reasonably tolerable - should be found and kept as target. Then the actual level (existing limit) of all parameters of the working environment should be measured and compared with the target i.e. permissible level and if the measured level is higher than the permissible, the effects should be continued to bring them down to the permissible level. Form No. 37, Rule 12B, GFR is a statutory format in this regard but as it does not include all work environment (other than airborne contaminants), it should be enlarged to include other work parameters like levels of noise, vibration, radiation illumination, temperature, air changes, ventilation, & waste disposal (pollution parameters) etc.

Here the device is placed at targeted work place or the area to be monitored.

1.7.2. Personal Exposure Monitoring

Refer Part 15.5.2(2) of Chapter-18 for personal monitoring against X-ray for NDT.

The concentration of the contaminants present in the breathing zone of a potentially exposed employee is quantified by personal air monitoring. The purpose of personal air monitoring is to identify individual exposure and to ensure regulatory compliance with exposure indices. Personal air monitoring involves the collection of an air-sample by a sampling device worn by the worker. The sampling device is positioned as close as possible to the breathing zone of the worker so the data collected closely approximates the concentration inhaled.

As the persons are directly affected by the health hazards, 'their personal exposure monitoring is most essential. Environmental monitoring is also carried out to assess the health risks to persons. A filmbadge and shield for the measure and protection of ionising radiation is an example of personal monitoring.

The measurement device (head) or dosimeter is kept in the breathing zone by attaching it to the collar. To monitor noise, the device should be placed close to the ear.

Boron, chromium, cobalt, copper, fluorine, iodine, iron, manganese, nickel, molybdenum, selenium, tin, vanadium and zinc are now generally accepted as being essential to the life. Any deviation in the health changes the value of either of the above mentioned metals in the human systems. The analysis of these metals can provide very early indications of occupational health problems but powerful new analytical techniques are not available to most of the laboratories in the world. Development is needed for simple, economic and reliable test for these estimations.

After personal air monitoring is completed the sampling media is analysed in a laboratory using analytical methods such as Gas Chromatography, Atomic Absorption, High Pressure Liquid Chromatography (HPLC). National Institute for Occupational Safety and Health (NIOSH, USA) and Occupational Safety and Health Administration (OSHA, USA) have developed air sampling methods that provides specific information on sampling media to be used, sampling flow rate to be kept, sample volume to be taken and analytical method to be used.

1.7.3 Biological Monitoring

Biological monitoring is defined as the respective and regular measurement and assessment of agents or their metabolites either in blood, urine, secreta, expired air or combination of these to evaluate exposure and health risk compared to an appropriate reference.

The personal air monitoring provides airborne concentration of a contaminant, not necessarily the absorption of the contaminant by an exposed individual. Biological monitoring has distinct advantages over air measurement, mainly because it is the absorbed chemical, and/or its biomarker, is measured.

Biological Exposure Indices (BEIs) are' analogues to TLV, except for BEIs apply to biological monitoring and TLVs to air monitoring.

Biological or biochemical samples are the blood, urine, faeces, breath (expired air), plasma, body fluid, sweat, tissues, hair, nails, saliva etc. They are analysed to measure any change, deformation or damage due to absorption of a toxic material. Measurement of quantity deposition or effect of lead, mercury, cadmium and fluoride in blood or urine gives evidence of their health effect. By establishing baseline levels, such monitoring indicates need of personal or environmental monitoring and also the need of necessary environmental control or improvement in work method or need of personal protective equipment.

Biological monitoring is not a replacement of any other form of monitoring. It is complementary. Work environment monitoring does not give evaluation of individual's exposure which is given by the biological monitoring.

Analysis of biological samples obtained from exposed workers provides information of body burden of the substance, the amount circulating in the blood or the amount being excreted. Though every tissue and fluid in the body can be analysed, but mostly the urine or blood samples are analysed. Previous exposure of CO and many solvents can be known from the exhaled breath samples. In addition to the air measurement, biological assays and determinants are more reliable indicators (markers) of health risks and strengthen the evidence.

Biological analysis can be performed -

1. for unchanged substance in body fluids and tissues, e.g. Pb, Hg, As, Acetone, MEK, phenol, ' styrene etc. This is called Direct Biological Monitoring.

2. for changed substance i.e. metabolite, e.g. phenol formed in urine due to exposure to benzene, aniline or phenol and Hippuric acid formed in urine diie to exposure to Toluene. This is called Indirect Biological Monitoring.

3. for changed level of enzyme or other biochemical substance present in body fluids or tissues, e.g. depression of cholinesterase activity in red cells due to exposure to organo-phosphorous.

Following tables give some examples.

Indications of Breath, Blood & Urine analysis
Breath analysis may indicate the effect of
Alcohols, aliphatic hydrocarbons, chloro-hydrocarbons, Co, ketones etc.
Blood analysis may indicate the effect of Lead, mercury, CO, zinc, manganese, aluminium, cadmium, methyl bromide etc.
Urine analysis may indicate the effect of Most of the toxic metals, gases and compounds such as mercury, nickel, zinc, cobalt, thallium, vanadium, arisine, stibine, benzene, HCN, HF, HBr; aniline, nitrobenzene, acrylonitrile, fluoride, parathion etc.

Metabolic products as Determinants or Indicators or Markers	
Product in Urine	Indicates presence of
Phenol TTCA Formic acid Thiocyanate Hippuric acid Methylhippuric acids Trichloroacetic acid p-Nitrophenol. 2.5 Hexanedione p-Aminophenol	Phenol, Benzene, Aniline CS_2 Methanol Cyanate, Nitriles Toluene, Styrene, Ethyl benzene Xylene Trichloroethylene Prathion n-Hexane Aniline

BEIs or BELs : The ACGIH of USA publishes biological limits known as Biological Exposure Indices (BEIs) for a limited chemicals. They represent the levels of determinants (i.e. the chemical itself or its metabolite(s), or a biochemical change induced by the chemical) which are most likely to be observed in specimens collected from a worker exposed to chemicals. BEIs apply to 8 hr exposures, 5 days a week. Timing is indicated with BEI. The sample should be collected at the same time, otherwise BEI is not applicable. Some BEIs are reproduced below from the ACGIH booklet (2007).

Adopted Biological Exposure Indices

Substance and Metabolite	Time of Sample	BEI
Acetone in urine	End of shift	50 mg/L
Aniline p-aminophenol in urine	End of shift	50 mg/L creatinine
Benzene t.t. muconic acid in urine S-phenyl mercputrle acid in urine	End of shift End of shift	500 μg/g creatinine 25 μg/g creatinine
Cadmium and Inorganic compounds Cadmium in urine Cadmium in blood	Not critical Not critical	5 μg/g creatinine 5 μg/L.
CO Carboxyhemoglobin in blood	End of shift	3.5% of haemoglobin

CO in end-exhaled air	End of shift	20 ppm
Chlorobenzene 4-chlorocatechol in urine p-chlorophenol in urine	 End of shift End of shift	 100 mg/ g creatinine 20 mg/ g creatinine
Chromium Total chromium in urine Total chromium in urine	 Increase during shift End of work week	 10 µg/L 25 µg/L
Lead In blood	 Not critical	 30 µg/100 ml
Mercury Hg in urine Hg in blood	 Prior to shift End of workweek	 35 µg/g creatinine 15 µg/L
Phenol Phenol in urine	 End of shift	 250 mg/g creatinine
Toluene Hippuric acid in urine O-Cresol in urine T in blood	 End of shift End of shift Prior to last shift of work week	 1.6 g/g creatinine 0.5 mg/L 0.05 mg/L
Xylenes Methylhippuric acid in urine	 End of shift	 1.5 g/g creatinine

These values (markers) - BEIs or BELs - can be developed for those substances only which

1. can appear in biological sample.
2. appear as metabolites.
3. change type or amount of body constituent.
4. change activity of an enzyme or
5. change quantifiable physiological function.

Such values cannot be developed for substances which

1. are body constituents and normal metabolites of the body itself and do not show any change.
2. do not dissolve, are rapidly decomposed or have local effect (e.g. corrosives, irritants).
3. produce allergic effects.
4. produce carcinogenic effects.

Initial studies on animals and later on human volunteers, defined the relationships between exposure, absorption, biotransformation, retention and excretion of exogenous substances. Response (damage) of the organism depends on concentration reached in the sites and the concentration depends on physical, chemical and environmental properties, the mode of impact and the person's own biological factors.

Biological Indicators, Determinants or Markers:

Biological indicators are determined from the biological samples - blood, urine, breath, sweat, faces, hair, nails, body fluid, tissue etc. - and their biological analysis. For correct result time of collection of sample is most important because, different chemicals show their significant effects at different time, e.g. metabolite 'methylhippuric acid' in urine is completed within 16 hr after the end of exposure and therefore its sample should be collected at the end of the shift. Similarly sample for determination of effect of trichloroethylene should be taken at the end of week as its metabolite 'trichloroacetic acid' in urine is metabolised slowly.

Thus after taking biological samples (bioassays) at the correct time after allowing biotransformation (metabolic transformation) biological analysis of these samples is carried out to study the biological indicators, determinants or markers. These indicators are (i) the substance itself i.e. exogenous agent (ii) metabolite formed if any and (iii) the metabolic effect (change) produced.

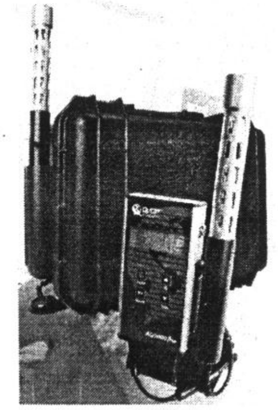
Useful information : Above indicators provide some useful information which cannot otherwise be available, as under :

1. Long-term effect of exposure/absorption.
2. Amount absorbed in body.
3. Routes of absorption.
4. Evaluation of total exposure due to workplace and outside environment.
5. Amount absorbed due to workplace effect, climatic factors, age, sex, genetic characteristics, physical effect, condition of the organs for biotransformation and elimination processes etc.
6. Type and time of risk (exposure) which cannot be proved in any other way.

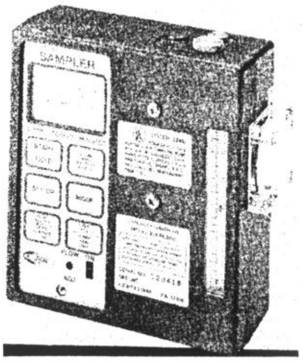
This is the usefulness of biological monitoring.

Medical monitoring means medical examination by the occupational health doctors of the workers exposed to health hazards. Pre, periodical and post medical examination or monitoring gives better judgement. For such facility at workplace and statutory requirement see Part 4.5 of this Chapter.

1.7.4 Air Quality and Stack Monitoring :



Indoor air quality monitor



Air sampler

Section II of the Environment (protection) Act, 1986 prescribes procedure to take samples of air quality. They are to be analyzed by 'environmental laboratories u/s 12 and by government analysts u/s 13. Section 7 puts responsibility on operator of facility to take air samples and to keep them within the prescribed limit. Rule 6 of the Environmental (protection) Rules prescribes procedures for taking samples. Schedules 1,6 and 7 prescribe standards of air quality also in terms of temperature, particulate matter, suspended solids, SOx, NOx, CO and concentration of many gases in the air. See Table 12 and 13 of Chapter 32. Stack height is also prescribed.

Section 22 of the Air (prevention and control of pollution) Act, 1981 requires that the air pollution standards should not be exceeded. Board officers can take samples of air or emission and send them to laboratory for analysis. Board can prescribe stack (chimney) height and air sampling point.

Thus stack monitoring is compulsory to measure SOx, NOx, particulate matter and other gaseous emissions for the compliance of law.

1.8 Control Measures:

1.8.1 Classification of Control Measures:

The control measures can be applied at following three levels.

(1) At Source:

1. Substitution e.g. toluene in place of benzene, silicon carbide in place of silica in grinding stone, or water in place of solvent.
2. Change of process or technology (airless paint spraying).
3. Enclosure of process (cover).
4. Isolation (by space or time).
5. Wet methods (water blasting).
6. Local exhaust ventilation (Capturing at source).
7. Waste disposal (pollution control).
8. Good maintenance.

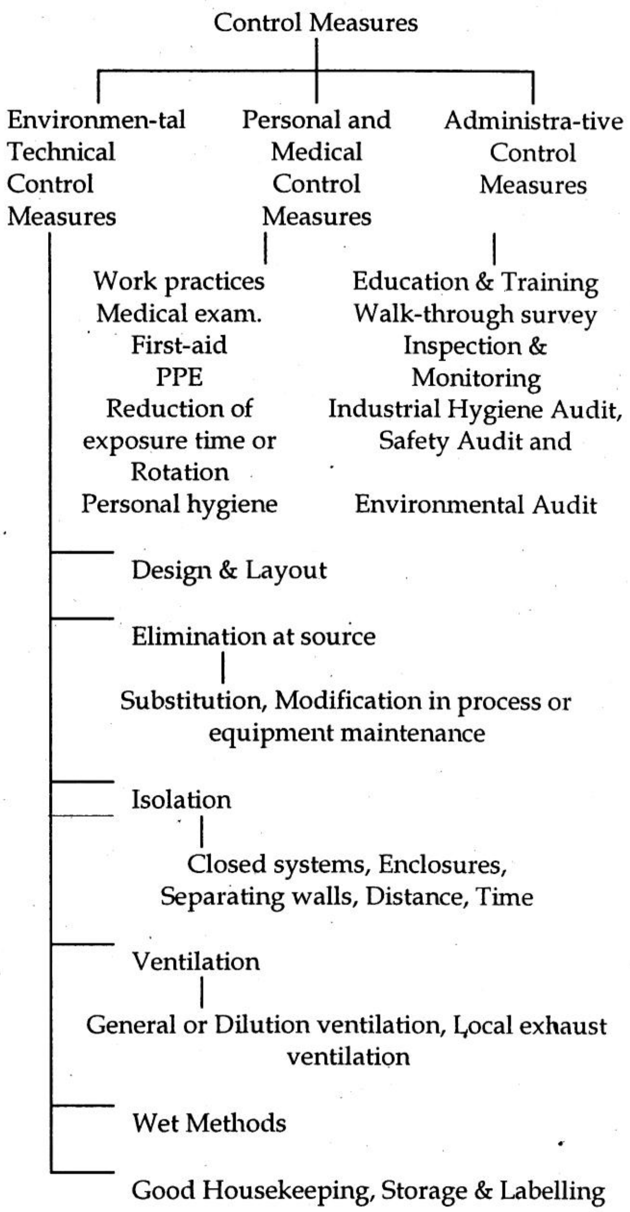
(2) At Airpath:

1. Increasing natural ventilation.
2. Proving exhaust ventilation (fans).
3. Increasing distance between source and the receiver (semi-automatic or remote control).
4. Dilution or Mechanical ventilation (supplied air).
5. Continuous Area monitoring (pre-set alarms).
6. Good housekeeping.
7. Good maintenance.

(3) At Receiver:

1. Personal Hygiene Methods (Washing, bathing, good diet methods, no smoking, no-intoxication etc.).
2. Use of personal protective equipment and good maintenance.
3. Use of protective cream or lotion.
4. Personal monitoring device (Dosimeter).
5. Enclosure of worker (AC cabin).
6. Rotation of worker (Split up of dose).
7. Training and Education.
8. Medical Examination and follow up.

The control measures (technology) can also be classified as under:



1.8.2 Engineering Controls:

In this category are included those procedures which are applied to the working environment rather than to the individual. They are as follows:

1. **Substitution and Modification :** The highly toxic material (carcinogenic, mutagenic or teratogenic) and processes should be replaced by less hazardous materials and processes. Following table gives such examples :

Substance	Substitute
White phosphorous	Phosphorous sesquisulphide
Mercury compounds	Mercury free materials.
Leaded glaze, paint, pigments	Leadless glaze, paint, pigment
Benzene	Cyclohexane or certain ketones
CCl_4	Methyl chloroform, Dichloromethane
Solvents with low B.P. and high V.P.	Solvents with high B.P. and low V.P.

Organic solvents	Detergent and water cleaning solutions
Chlorine	Argon for degassing
Asbestos	Fibreglass
Quartz and	Non-silica aggregates
Sand blasting	Steel or silicon carbide shot
Silica bricks	Magnesite or Aluminium oxide bricks
Sandstone grinding wheel	Synthetic grinding wheel
Broom cleaning	Vacuum cleaning

Precaution required while selecting safer substitute is that it should not bring any new hazard.

Modifications in the process or equipment can reduce the hazard. Reduction in noise, vibration, excessive light and temperature, speed, grinding or mixing speed, mechanical handling instead of manual, use of tongs instead of fingers, sitting posture instead of long-standing etc. help in decreasing the health effects. Following table gives some examples –

Modification	Instead of
Toxic pellet or lump	Powder
Closed charging of toxic material	Open charging of toxic material
Electrical motor	Internal combustion engine
Covered containers	Open containers
Mechanical gauges	Mercury gauges
Mechanical pump seals	Gasket pump seals
Material of the required size	Odd size and then cutting
Copper electric wiring	Aluminium electric wiring
Airless spray	Hand spraying
Low pressure, Low temperature process	High pressure, high temperature process
Water or airjet looms	Ordinary power looms

Use of catalysers (to convert CO into CO_2), silencers, suppressing chemical (urea can suppress generation of NO_2), tank-size reduction, content reduction, dikes to reduce evaporating surface area etc. are also necessary modification/ alterations.

2. **Isolation and Enclosure of a Process :** This has its widest application in the chemical industries where frequently it is possible and practicable to design totally enclosed systems for carrying out the manufacture or processing of chemical compounds. Enclosure may be total or partial. Closed systems, barrier walls, cabins and isolation by distance or time are possible.

3. **Segregation:** This may be accomplished by shifting a potentially dangerous process to a segregated or enclosed area to prevent contamination of adjacent work spaces. In some situations, segregation can be accomplished by locating a process in an open shed or even completely out of doors.

4. **Ventilation :** This is perhaps the most important engineering control measure. Ventilation may be general or local. General ventilation consists in rapid dilution of contaminated air with fresh air usually by fan. Local ventilation usually consists in providing air suction close to the point where potentially harmful dusts, fumes, vapours, mists or gases are generated. Safe collection and disposal of contaminants removed by local exhaust ventilation is necessary. For volatile

chemicals, it is common practice to install a recovery system as part of the ventilating equipment,. See Part 7.3 of Chapter-10 for details.

5. **Wet Process :** The use of water to limit the dispersal of atmospheric contaminants finds its chief application in the control of dust. This procedure is widely used in rock-drilling and useful when sweeping is done in a dusty work room. Water spraying on coal heaps suppresses coal dust.

6. **Neutralisation** or inactivation of chemical compounds is sometimes useful in connection with local exhaust ventilation and in cleaning up contaminated areas. See Chapter-18 also.

7. **House Keeping :** Regular clean up schedules, particularly where dust is a problem are essential in any control programme. See Chapter-8 for details.

8. **Sampling & Monitoring :** It is important to conduct regular appraisals of the working environment by means of dust counts, air sampling and analyses and similar tests, thereby checking the effectiveness of the preventive measures.

1.8.3 Air Pollution Controls :

They make use of -

1. Industrial ventilation systems viz. dilution ventilation, hood, duct, fan etc.
2. Settling chamber and dust collector.
3. Inertial devices viz. cyclone collector, centrifugal collector, multiple cyclones etc.
4. Electrostatic precipitators.
5. Particulate scrubbers viz. cyclone scrubber venturi scrubber, spray chambers etc.
6. Filters viz. filter bed, packed filter, bag filter etc.
7. Absorption devices viz. gas scrubbers, absorption towers.
8. Adsorption devices viz. fixed-bed adsorbers, moving bed adsorbers etc.
9. Combustion devices viz. combustion chamber, flares, incinerators, catalytic afterburners etc.
10. Condensation devices viz. direct contact condensers, surface heat exchangers etc. For the details of such system study Reference No. 5 given at the end of this Chapter.

General safety measures to control air pollution in an industrial area are :

1. Air pollution control technique should be adopted from the design stage.
2. The allowable emission rate should not be exceeded by individual plant.
3. Total load of pollutants in any area should not be exceeded the prescribed limit (community exposure).
4. A continuous air monitoring should be conducted in the locality.
5. Site appraisal Committee (Section 41A of the Factories Act) should consider meteorological and ecological conditions to decide a sitting of a new factory.

Air Pollution Control Systems:

1. The stack height should be sufficient depending upon pollutants, meteorological condition and statutory standards. See Table 12 to 14 of Chapter-32. Heated and unheated emissions should be considered for stack design. Highci stack disperses the pollutants over a wider area thus reducing their concentration.
2. Settling chambers (inertial separators, dynamic separators, wet and multiple cyclones and other devices)
3. Filtration by fibrous mats, aggregate beds filters, paper filters, and fabric filters.

4. Liquid scrubbing by spray chambers, packed towers, plate towers, orifice" scrubbers and mist eliminators.
5. Electrostatic precipitators.
6. Gas solid absorption.
7. Thermal decomposition and
8. Combination systems.

Thermal Incineration is an effective waste disposal methods and is defined as engineered process that use high temperature thermal oxidation to convert waste to a less bulky, less toxic or less noxious material. The flue gases may generally contain CO,, water vapour and inert gases. But depending on the residues being incinerated, it may also contain acidic gases such as halides and their acid oxides of phosphorous, sulphur, nitrogen and entrained salts of metals. Incineration process can be employed to burn solid, liquid or gaseous wastes. Some such processes are given below.

Incineration Process	Temperature Range ^{o}C	Residence Time
Rotary kiln	820 to 1600	Liquids, gases- seconds Solids-hours.
Liquid injunction	650 to 1600	0.1 to 2 seconds
Fluidised bed	450 to 980	Liquids, gases-seconds. Solids-longer.
Multiple heart	Drying zone 320 to 540 Incineration 760 to 980	
Coincineration	150 to 1600	Seconds to hours.
Starved air	480 to 820	0.1 second to hours/
Combustion		

Courtesy : Hitchcok D. - 'Solid Waste Disposal Incineration' Chemical Engineering 86 (II) : 185-194 (1979).

Venturi Scrubber is a simple, high efficiency unit to collect dust or fume by direct contact with water and is useful where the gas to be treated is at elevated temperature or when the contaminant is a difficult or sticky material. A venturi scrubber occupies little space, is easy to maintain and has a further advantage of predictable collection efficiency (dependent upon particle size and density) for a given pressure loss. It may be a low-pressure loss unit (6 to 20 in wg range) or a high pressure loss unit (20 to 60 in wg range).

Refer tables 7 to 15 of Chapter 32 for useful information:

1.8.4 Personal and Medical Controls :

This term is used to describe those procedures which are applied to the employed person (biological sampling, diagnosis and applying remedy). It includes-

1. Preplacement medial examination : Purpose of this examinations is to protect workers with known susceptibility against any potentially harmful exposure, e.g. worker affected by pulmonary tuberculosis should not be placed in exposure of silica and chlorinated hydrocarbon atmosphere.

2. Periodic medical examination : A major purpose is to detect any existing evidence of poisoning at an early stage when corrective measures can be expected to result in complete recovery. Corrections may call for improved industrial hygiene practices for temporary or permanent change of job assignment or both of these.

For medical examinations see Part 4.5 of this Chapter.

3. **Personal Protective Devices :** Protective clothing, masks, and respirators should be properly selected for the purpose for which they are intended and usually worn to prevent injuries. A programme of using, cleaning and replacing worn out parts is highly desirable.
   For details see Chapter-25.

4. **First-aid :** Keep first aider to take charges in the event of an emergency due to poisoning. Give proper first-aid training to workers. For details see Chapter-26.

5. **Laboratory Procedures :** Check blood, urine, stool, lungs, skin etc. to detect onset of symptoms of health effects.

1.8.5 Administrative Controls :

1. **Education & Training :** It is obvious that an informed , educated and trained workman will make less accidents. It is, now, statutory also. As plant and machinery need continuous maintenance, similarly, workmen also need continuous education and training for safe actions, work methods, safe work practices and their role in emergency planning.

2. **Inspection :** Regular walk-through surveys, inspections and monitoring, sampling for physical/chemical health hazards and their analysis and monitoring are always useful to detect the hazards before they worsen. They also suggest the necessary other control measures.

3. **Shift In-charge's Safety Report Book :** It should be a practice that at the end of each shift, before leaving the place, the Shift-in-charge must record all safety points seen and attended or not attended during his shift. The next Shift-incharge, soon after his arrival, must go through this report book and visits those points of the previous shifts and work should be started for unattended points. This cycle should be repeated by all. shifts-in-charge and major point should be reported to the Safety, Hygiene or Medical departments as the case may be. Such practice develops good and continuous safety checks system which is as vital as any other control measure.

4. **Industrial Hygiene, Safety and Environmental Audits :** Refer Chapter-2 for definitions. These are critical, systematic and detailed examination of industrial hygiene, safety and environmental aspects of important health, safety and environmental hazards and effectiveness of their control measures. They go through from policy statement to the final disposal and compliance of statutory provisions (see Chapters 27, 28) and points of previous audit reports and pinpoint what should now be done.

1.8.6 Special Control Measures:

Above mentioned control measures are general measures applicable to most of the industries, but special control measures are required depending on the speciality of the process or material. Such measures may very with the nature of industry. See Chapter-23 for 38 types of different industries and more than 500 control measures.

Biohazards exist due to bacterial, fungal, viral, rickettsial, chlamudial, parasitic agents etc. (see Part 10.9 of Chapter-28) and places where they exist include laboratory, hospitals, agriculture, animal area etc. Their control measures include good housekeeping, personal hygiene, laboratory safety, animal care and handling, biological safety cabinets, use of sterilisation (autoclave) and disinfection and precautions from Acquired Immune Deficiency Syndrome (AIDS) and Legionnaires' disease.

2 PHYSIOLOGY OF WORK:

2.1 Definitions :

Physiology is the science of dealing with functioning of living organisms or their parts. Human physiology is study of the normal functioning of cells, tissues and organs of the human body. The science of physiology is related to Anatomy which is the study of the structure of cells, tissues and organs of the human body. From an anatomical point of view, structure of the body can be classified into systems which have particular functions. To understand the effect of physical and chemical agents on the body, we need to understand the normal functioning of organs or organ systems which these agents target. The systems of human body are skin, respiratory system, cardiovascular system, nervous system, muscles, liver, kidney, gastro intestinal tract (GIT) and ear. The respiratory system, liver and GIT defend the ill-effects of toxic substances.

Physiology of work or Human Physiology may be defined as that branch of knowledge which concerns man as a working being. As a pure science it is a branch of human biology and as an applied science it applies physiological research methods (1) To obtain useful information about physical working conditions (2) To study means to improve them to lighten the worker's task while improving his productivity.

The branch of science dealing with the physiological aspects of man at work is known as Work physiology. It has a basic part, a branch of human biology and an applied part called Industrial Physiology. The object of industrial physiology is to carry out physiological research to know about the working conditions and their improvement methods to make work more comfortable and to increase productivity without unduly straining the worker.

Therefore it studies limits of workload in terms of physiological parameters such as oxygen intake, energy expenditure, heart-rate, sweating rate, oral temperature, muscular work, safe capacity or physical fitness etc., environment parameters and working conditions such as temperature, humidity, working hours, clothing etc., quantity and quality of food, water, nutrition etc. and evolves tests to measure these criteria.

The period during which work continues is known as the work period and the period during which the physiological functions return to the resting level is known as recovery period. The difference between these two levels gives estimate of physiological stress in performing a given task. In order to evaluate total physiological expenditure, one must consider physiological reactions both during the work and during the recovery period. A complete work cycle includes physiological cost of work plus the physiological cost of recovery.

The term ‘Ergonomics’ as used today covers the field of study previously known as applied physiology of work.

Anthropometry is concerned with body build, composition and constitution and the dimensions of the human body in relation to machines, clothing and industrial environment.

Biomechanics studies mechanical forces acting upon anatomical structures during human movement perse or as a result of the interaction between man and the physical environment.

In Part 7.3, Chapter-3 factors affecting work are classified. See their details therein. Physiology of heat regulation is explained in Part 5 of Chapter-10. Heat stress and strain, effects of heat, thermal limits, heat stress indices and their control methods are stated therein.

Factors affecting work performance are given in Part 2.3.1 of this Chapter.

2.2 Physiology of Respiration :

Respiration is aerobic or anaerobic. Aerobic Respiration is the process by which living organisms or their components, take oxygen from the atmosphere to oxidise their food to obtain energy. Anaerobic Respiration is the process by which organisms or their components, obtain energy from chemically combined oxygen when they do no have access to free oxygen. Many organisms can respire anaerobically for a short time only, but certain bacteria depend entirely on anaerobic respiration.

Respiratory Quotient (RQ) is the ratio of the volume of carbon dioxide expired by an organism or tissue to the volume of oxygen consumed by it over the same period.

Respiratory pigment is a substance formed in blood cells or blood plasma that is capable of combining loosely and reversibly with oxygen, e.g. haemoglobin.

2.2.1 Cardiac Cycle or Cardiovascular system (CVS) :

It comprises a closed canalicular network made up of arteries, capillaries, veins and a central pumping organ - the heart. Following a cardiac contraction the blood is distributed to the arteries and then to the capillary areas, returning through the veins back to the heart. The arteries and veins are simple transit vessels whereas the capillaries have an important functional significance since they are involved in the vital exchange of substances between the blood and the inter-cellular spaces, resulting in important modifications in the blood's chemical composition and physical properties.

Cardiac work is the quantity of energy that the heart transmits to the volume of blood to propel it through the vessels. This energy is produced by the oxidation of organic substances such as glucose, glycogen, lactic acid etc., partially converted to mechanical energy during myocardial contraction.

The heart has four chambers - left and right atria and left and right ventricles. There are two separate circulation of blood in these four compartments. The lesser or pulmonary circulation starts at RV and finishes at LA. The greater or systemic circulation starts from LV and finishes at RA. The four cardiac chambers are separated by a system of valves. The two phases in the cardiac cycle are diastole and systole. The cycle occurs around 75 times per minute but it may vary depending on age and physiological condition.

The myocardial fibre (strained muscle cell of special structure) has four basic properties to control cardiac function i.e. rthythmicity, conductivity, irritability and contractility.

The stroke volume has an effect on the arterial wall, the tension of which varies depending on blood pressure. Blood pressure is directly proportional to the volume of blood injected per minute (minute volume Vm) and peripheral resistance.

During effort coronary flow increases considerably whereas myocardial oxygen extraction remains largely the same as at rest. Aortic pressure plays a major role in regulating coronary circulation' - when it increases, it raises the flow and vice versa.

In a normal subject, an average of 90% of the contractile work is used in the propagation of systolic wave, 25-45% of this work is stored in the elastic components, only 10% on average, is not returned and is probably released during the period of isometric relaxation.

Cardiac insufficiency can be defined as the inability of myocardial function to ensure an output that meets the body's requirements. The patient in a state of cardiac insufficiency is not capable to increase his cardiac work to the same degree. The result is a reduction in contractility. The defective heart does not fully utilise the energy obtained from glucose degradation. The result is a reduction in cardiac output. The predominant symptom is dyspnoea, which results from the increase in respiratory work. Due to reduced cardiac output, fatigue, gastrointestinal disorders and renal dysfunction take place. This affects the normal functioning of the various organs.

2.2.2 Muscle contraction & Muscular work :

They are explained as under :

(1) Muscle Contraction

There are about 200 skeletal muscles in the body. Many consist of bundles of muscles, each of which is wrapped - as is the total muscle - in connective tissue in which nerves and blood vessels are embedded. The tissues combine to form tendons that connect the ends of the muscle to bones. The only active action a muscle can do is to contract. It is done by filaments. Elongation is brought about by external forces.

This is a complex phenomenon involving many internal human reactions. Muscle fibres (cells) are controlled by a single motor nerve fibre. This is known as the motor unit. An impulse started in a motor nerve cell (motoneuron) propagates along the nerve fibre and transmitted to the motor endplate where acetyl chlorine is released. This reverses the resting membrane potential. The neuromuscular transmission transduces electrical signals, (nerve impulses) to chemical signals and then back to electrical signals (muscle action potentials). This initiates the mechanical-chemical mechanisms and causes the muscle to react. In the activated muscle, the contractile components (myofibrils), shorten and stretch the elastic components (connective tissue, tendon). When no movement, the contraction is called isometric (static) and when muscle is activated to vary its length, the contraction is called isotonic (dynamic). In the latter case external work can be given by the following equation

Work or energy	=	force x distance
(Nm or Joule, J)	=	(Newton) x (metre)
Power	=	Work per unit time

1 watt (W)
or 1 J/sec = 6.12 kilopond meter per minute
9.81 W = 1 kpm per second
1 HP=736 W=75 kpm/sec - 4500 kpm/min

During work performance a part of mechanical efficiency is dissipated as heat. Thus muscle activation increases heat production which causes perspiration. To prevent overheating during prolonged muscular activity, increased local blood flow and increased heat conductance of skin are essential.

(2) Muscular Work :

(A) Factors affecting Muscular Work :

During muscular work, .physiological functions change from the resting level and heart rate, blood, pressure, cardiac output, respiration, pulmonary ventilation, oxygen uptake, carbon dioxide production, chemical composition of blood and urine, body temperature, rate of perspiration, etc. increase. They come back to resting level when the work stops. The period during which the work continues is known as "Work Cycle" and the period during which the physiological functions return to the resting level is known as "Recovery Period."

By measuring one or more physiological variables during activity, it is possible to determine in what degree the working level differs from the resting level. This gives an estimate of the physiological stress experienced in performing a given task. When the activity ceases, it is possible to follow the return of the same variables to the resting level and to determine the duration of the recovery period, at the end of which the individual has returned to his pre-activity physiological equilibrium. In order to evaluate total physiological expenditure, one must consider physiological reactions, both during the work and during the recovery period. A complete work cycle includes physiological cost of work plus the physiological cost of recovery.

(B) Physiological factors involved in muscular activity are:

1. Fuel or combustion - Nutrients e.g. carbohydrates, fat and protein, their intake and storage.
2. Respiratory quotient - The ratio of carbon dioxide produced to the amount of oxygen consumed.
3. Role of oxygen - Demand, requirement, supply and oxygen extraction.
4. Cardiovascular functions - Cardiac output (stroke volume and heart rate), blood pressure
5. Respiration - Tidal air, pulmonary ventilation (air volume exhaled per minute).
6. Body temperature.

(C) Physiological reactions involved in muscular work are:

1. Intensity of muscular activity - Cardiovascular reactions and aerobic work capacity.
2. Age - Aerobic work capacity, heart rate responses, pulmonary ventilation and blood lactic acid concentration.
3. Sex - As stated in 'Age' above.
4. Body build.
5. Physical fitness or health - Aerobic capacity, heart rate and respiration.
6. Nutrition - Frequency of meals, nature and quality of food and digestive power.
7. Training - Heart rate, blood pressure, stroke volume, respiratory responses, cardiovascular recovery process, aerobic capacity and lactic acid in blood.
8. Temperature and humidity of the work environment - Cardiac output, recovery heart rate, body temperature, work output and posture.
9. Clothing.

Factors responsible for physiological responses to high temperature are:

1. Water and salt content of the body.
2. Individual characteristics - Age, sex, physical fitness, heat acclimatisation and
3. Workload.

Physiological effects of continuous work in Hot Environment are : (1) Cardiovascular stress (2) Heart rate (3) Cardiac cost (4) Blood pressure (5). O_2 uptake and (6) Sweat loss

Physiological effects of repeated work cycles in Hot Environment are : (1) Heart rate (2) Recovery time (3) Cardiac cost and (4) Sweat loss.

Psychic factors affecting muscular (service) functions are attitude and motivation.

Environmental factors that affect are heat, cold, noise, vibration, gas pressure, altitude, air pollution etc.

Nature of work can also affect. It includes intensity, duration, technique, position and rhythm.

All above factors - food and nutritional, physiological, environmental, psychic and nature of work - actuate service functions that deliver fuel and oxygen to the working muscle fibre. This service function capacity transforms food energy (chemically bound) into mechanical energy for muscular work. This ability of the muscle cell to transform energy actuates ability to perform a physical work.

Therefore by paying attention on above factors i.e. giving work according to age and sex, providing rest intervals, reasonable working hours (no overtime), good ventilation, temperature and working conditions, ample drinking water and nutrition, proper clothing, PPE and training etc., good muscular or physical work can be obtained from the workers.

(D) Consequence of Muscular Work :

When muscles work they increase heat production from about 4 kJ/min (resting level) to 200 kJ/min (max.) i.e. about 50 times more. The rate of heat removal, CO, water, waste products etc. must also be increased proportionally. To maintain physical and chemical equilibrium of the cells, a tremendous increase in the exchange of molecules between intra and extra cellular fluid is required. Normal pulse rate 60-72 beats/min can rise upto 220 beats/min, normal oxygen consumption rate 0.2 to 3 lit/min can go upto 4 lit/min and corresponding energy level rises from I Kcal/min to @ 20 Kcal/min. The energy expenditure, core temperature, sweat rate, skin galvanic resistance, heart stroke volume and pulmonary ventilation also increase.

To restore the energy content of the body, working at maximum capacity upto 4 times, more food must be digested, than when the individual is at rest. Moreover, during physical work, many of the hormone producing glands are involved in the regulation of metabolic and circulatory functions of the body.

The energy expended by muscles during work comes from food intake. There are two sources of this energy supply, one is aerobic i.e. direct oxygen intake from air to oxidised food to get energy and the other anaerobic i.e. consuming chemically combined oxygen in the body.

During sever muscular exercise, oxygen demand goes up and up and a stage comes when the body cannot maintain demand and supply. Metabolites like lactic and pyrovic acid get accumulated and the person gets exhausted or feels fatigue. Such physical fatigue, static or dynamic should be removed daily by regular light exercises (Yogasan) and deep breathing in a fresh cool air (in early morning").

2.2.3 Assessment of Workload based on Physiological Reactions:

Hard, heavy work or heat stress imposes excessive physiological strain on the cardiovascular and vasomotor systems. Continuous work is often impossible under such conditions.

Heat produced by the body and the environmental heat together determine the total heat load. Therefore, if work is to be performed under hot environment, the workload category of each job should be established and the heat exposure limit pertinent to the work load should be evaluated against the applicable standard to protect the worker from excessive heat exposure. A workload classification is as follows :

1	Light	Upto 200 Kcal/ hr or 800 Btu/ hr. e.g. sitting or standing to control machines, performing light hard work.
2	Moderate work	200-350 Kcal/ hr. or 800 – 1400 Btu/ hr
3	Heavy work	350-500 Kcal/hr. or 1400-2000 Btu/hr. e.g. pick and shovel work.

A classification applicable to an average Indian worker having 50 kg. body weight is as under :

Variable (Man)	**Physiological Workload (Job)**			
	Light	**Moderate**	**Heavy**	**Very Heavy**
O_2 uptake (lit / min)	0.25 – 0.50	0.50- 0.80	0.80 – 1.00	1.0-1.25
Energy expenditure (Kcal/ min)	1.25 – 2.5	2.5 – 4.0	4.0 – 5.0	5.0 -6.3
Heart Rate (beats / min)	Upto 100	100-125	125-150	150-175

The functions of different human systems are modified according to the physiological demand for the job. The severity of the job can be evaluated b) studying various physiological parameters (reactions) during work. Such parameters are : (1) Oxygen uptake (2) Energy expenditure (3) Heart rate (4) Oral/rectal temperature and (5) Sweating rate.

A proposed classification applicable to Indian workers is as under –

Classification of Jobs (Physiological Load

Physiological Variable (Reactions)	**Very Light**	**Light**	**Moderate Heavy**	**Heavy**	**Very Heavy**	**Extremely Heavy**
O2 uptake (lit / min)	< 0.35	0.35-0.70	0.70-1.05	1.05-1.40	1.40-1.75	> 1.75
Energy expenditure (Kcal/min)	< 1.75	1.75-3.50	3.50-5.25	5.25-7.00	7.00-8.75	> 8.75
Heart rate (beats / min)	75-100	0.75-100	100-125	125-150	150-175	> 175
Sweating rate (ml/hr)	-	-	180-360	360-540	540-720	> 720
Oral Temp ^oC	-	-	37.25-37.50	37.50-37.75	37.75-38.00	> 38.00

Evaluation of workload from above physiological reactions (variables) 0, uptake etc. is in extensive use. Work intensity can be evaluated by measuring pulse rate and blood pressure. Pulse rate measurement is the direct and the simplest method.

Permissible heat exposure limits (TLV) for above workload classification is as under :

Work - Rest Regimen	**Work Load ^oC WBGT**		
	Light	**Moderate**	**Heavy**
Continuous work	30.0	26.7	25.0
75% work, 25% rest, each hour	30.6	28.0	25.4
50% work, 50% rest, each hour	31.4	29.4	27.9

25% work, 75% rest each hour	32.2	31.1	30.1

The ranking of the job may be performed either by measuring the worker's metabolic rate while performing his job or by estimating his metabolic rate with the use of following table.

Assessment of Workload

Average values of metabolic rate during different activities.				
A.	Body position and movement Sitting Standing Walking Walking up hill			Kcal/min 0.3 0.6 2.0-3.0 add 0.8 per meter rise
B.	Type of work		Average Kcal/ min	Range Kcal/min
	Hand work	Light Heavy	0.4 0.9	0.2-1.2
	Work with one arm	Light Heavy	1.0 1.7	0.7-2.5
	Work with both arms	Light Heavy	1.5 2.5	1.0-3.5
	Work with body	Light Moderate Heavy Very heavy	3.5 5.0 7.0 9.0	2.5-15.0

2.2.4 Criteria for Limits of Manual Lifting and Carrying:

(1) Statutory Limits of Lifting: -

See Part 2.1 of Chapter 15.

(2) Criteria for Fixing Limits of Lifting :

In tables of maximum permissible load limits as stated above, three criteria are considered (1) Male or Female as their lifting capability differs at the same age (2) Age as physical muscle strength varies from child to an adult person and (3) Safe load limit which should not cause any injury or back pain.

But other criteria are also considered by researchers in developing some formulae. They are as under

1. Horizontal hand location in front of the midpoint between the ankles at the origin of lift
2. Vertical location at the origin of lift.
3. Vertical travel distance between the origin and the destination of lift.
4. Average and maximum sustainable frequency of lift.
5. Load is lifted by two hands directly in front of the body and no twisting during lifting.
6. The load width is moderate (30 inch or less)
7. Working posture is not restricted.
8. Good couplings (grasp) are applied eg. hand with handle, shoes with floor.
9. Physical environment is favorable.

10. Other work or activity is minimum.
11. Person is physically fit and accustomed to labour.
12. Lift height - floor level to shoulder height and shoulder height to arm reach.
13. Lift frequency - 1 lift or more lifts during seconds, minutes or hour.
14. Lowering frequency - as above.
15. Push force frequency or pull force frequency.
16. Carrying frequency.

Thus material handling process (lifting, lowering, pushing, pulling) is influenced by many criteria, preconditions, assumptions and approaches that need simplification and further evaluation. Therefore simple load tables of excessive weights are preferred.

2.3 Aerobic (Physical) Work Capacity

The evaluation of a worker is made from his physical work capacity i.e. his maximum 0, intake or aerobic capacity, other physiological functions under classified workloads and his tolerance limit to work in hot environment.

The physical work capacity of an individual is measured by the physiological work capacity. This is a measure of his physical fitness and estimated in terms of his maximum oxygen uptake capacity. The upper level of physiological work capacity of an individual depends on his capacity to utilise the inhaled oxygen to its maximum possible limit. Beyond this, any additional work has to be carried out only on oxygen debt. Thus, there is an upper limit of oxygen uptake, being a measure of his maximal aerobic power and the best index to judge one's total physical fitness. This is important for many practical purposes such as selection of right jobs, disability evaluation, rehabilitation of disabled and diseased workers. It is practised in all developed countries.

2.3.1 Factors affecting Aerobic Capacity & Work Performance:

Oxygen intake and oxygen debt are the limiting factors in physical exertion. Factors determining the rate of 0, intake i.e. the efficient supply of 0, to the active tissues are -

1. Ventilation of the lungs.
2. O_2 carrying capacity of the blood.
3. Unloading of O_2 at the tissues, and
4. Minute volume of the heart.

Physical fitness is not a static condition. It varies with age, body dimensions, general health and nutritional state (diet) of the worker. Due to illness or other reason, he may lose his fitness for some time and may regain after some time. A worker doing light work may adjust himself to a low level of physical fitness and vice versa, but a change from light to heavy job necessitates a period of training and adjustment and calls for extra strain on the worker.

Normally female workers can be expected to show 70% aerobic power of males of the same age. Ageing effect decreases heart rate from an average of @ 200 to @ 165 beats/min between the age from 25 to 55 years in both males and females alongwith decrease in functional capacity of other organs.

Maximum aerobic power is determined by measuring the maximum oxygen uptake during dynamic muscular exercise. This can be done in two ways. In the direct method, muscular exercises are performed with increasing intensity until a work rate is established above which there is no further increases in oxygen uptake. In the indirect method, a linear relationship is established between the heart rate and oxygen uptake when the metabolic rate, circulation and respiration have reached a steady state at sub-maximal work rate and the curve is then extrapolated to the maximum heart rate.

2.3.2 Physiological Safe Limit for Continuous Work:

It is obvious that no man should be required to work continuously at his maximum capacity. For safe and efficient work of various systems of the body, a 'safety margin' should be established for 'upper safe limit' or 'acceptable workload' for continuous work.

Besides the knowledge of maximum aerobic power (maximum work capacity) of individual workers, it is essential to know the work limit for sustained physical work for job placement and efficient functioning of the workers in the day to day work. In some work situation the workloads in some tasks are so heavy that the workers are put to undue physiological strain and consequently result in fatigue. Researches in our countries and abroad have suggested that the upper safe limit for continuous work should be fixed around 40 percent of individual's maximum work capacity if physiological fatigue is to be avoided in day's work. Peak loads, even for 20% time of a working day should be reduced by mechanisation to make the heavy job a light one.

This upper safe limit represents the level of physical activity that one can perform in 8 hrs a day in physiologically steady condition without any fatigue or discomfort. Working further in fatigued condition decreases productivity and tends to accidents. Therefore it is essential to reduce stress, strain and fatigue in man.

2.4 Assessment of Work Capacity:

2.4.1 Tests for Physical Fitness :

The test exercises are carried out by ergometers, stepping tests, treadmills, bycycle or running. As a precautionary measure, the person should be medically examined prior to testing and also after maximal testing.

(1) Physiological Test (Step Test) :

The step test was developed in the Harvard Fatigue Laboratory, USA to evaluate the physical fitness of an individual. It is modified for Indian workers and described below :

While carrying out the test, the person has to step up and down on a stool 45 cm. high at the rate of 30 complete steps per minute for a maximum period of 5 minutes or earlier in case of difficulty. The rate of stepping is regulated by a metronome. Immediately after the exercise is over, the subject is seated and his pulse is counted during the period 1 min to ½ min after exercise.

The fitness score is computed as follows :

$$\text{Score} = \frac{\text{Duration of stepping seconds x 100}}{\text{5.5 x (half min recovery pulse count recorded)}}$$

Grading of scores is :

Below	50	-	Poor
	50-65	-	Low average
	65-80	-	High average
	80-90	-	Good

Above	90	-	Excellent

The test score which is computed from the pulse count taken during recovery after exercise is a measure of the individual's cardiovascular efficiency and can be made use of in grading men for their capacity for physical work in general and in hot environments in particular.

(2) Pulmonary function test:

This test is the simplest test in which an ergometer is used to measure exhaled air volume and by comparing it with standard average values, the physical fitness or any disorder is judged.

Other exercise tests are also used to determine physiological load and functional capacities of the cardio respiratory system. In abnormalities e.g. an electrical activity of the heart, cardiovascular disease or improvement after illness or injury.

In young adults 170 beats/min has been widely used as a level at which the intensity of work indicates physical working capacity.

2.4.2 Fatigue and Rest Allowances :

Physiological fatigue is characterised by the gradual decrement of work performance effected by various factors viz. physical, physiological, psychological and wrong working posture. It is manifested by gradual increase in physiological strain as the work of the day progresses.

During work in a hot environment, the body gains heat due to work and external environment. These two factors put a lot of thermal stress on human beings. A continuous work in such environment may lead to exhaustion, if sufficient cooling of the body is not possible. This also leads to lower efficiency and reduced productivity. Under the circumstances a rest interval or pause is essential for the workers to recover from exhaustion as well as to increase efficiency and productivity. Frequent rest pauses reduce fatigue better than a few long breaks.

Rest Allowance in Energetic Work :

Following formula gives percentage rest time Tr as

$$Tr = \frac{Mmax - M}{Mr - M} \times 100$$

where Mmax is the upper limit of the metabolic cost for sustained work, M the metabolic cost of the job (task) and Mr the resting (sitting) metabolism.

$$Tr = \frac{400\text{-}500}{100\text{-}500} \times 100 = \frac{-100}{-400} \times 100 = 25\%$$

This means, rest intervals should have 20% time i.e. 20% x 8 hr = 0.20 x 8 x 60 = 96 min. This can be divided in 3 pauses of 32 min or 4 pauses of 24 min in an 8 hr shift, or 20% per hour i.e., 12 min per each working hour. .

Combination of heavy and light work provide indirect rest. Walking to give or take material, counting for some time, writing record or sharpening tools etc. are examples of light work changes.

According to a German Physiologist (Lehmann), 200 Kcal/hr represents the upper permissible limit, and about 250 'work' Kcal per hour or 4 work Kcal per min. +1 Kcal for resting metabolism represent upper limits for more sustained work. Based on these figures, Spitzer (one of Lehmann's co-workers) has arrived at the following formula to calculate rest allowance for workers engaged in energetic heavy work.

$$\text{Rest Allowance percent} = \frac{(\text{Kcal/min} - 1)}{4} \times 100$$

The above formula may, however, not be applicable to Indians having lower body weights and low physical fitness standard. In their case 3 'work' Kcal per min will represent the upper limit for sustained work. The above formula may accordingly be modified to work out the rest allowances for Indian workers engaged in manual work. -

Above formula represents a method to calculate rest allowance percentage time in total working time. Another method to determine rest pause is from heart beats and is given in the following table -

Rest Allowances at Different Heart Rates

Heart Rate (avg. beats/ min	Energy Expenditure Kcal/min	Rest Allowance (% of working time)	Fraction in 8 hrs working minutes		
			Work	Rest	Total
110	4.3	-	480	-	480
115	4.9	15	420	60	480
120	5.4	30	370	110	480
130	6.3	65	290	190	480
140	7.3	100	240	240	480
150	8.3	136	205	275	480
160	9.2	170	180	300	480
170	10.2	200	160	320	480
180	11.2	235	145	335	480

After working out the time of rest pauses it should be decided that how it should be given to minimise the fatigue.

Reducing Stress and Fatigue :

The decrease in the stress upon the workers and consequently the higher efficiency and morale in the plant may be achieved by :

1. Reducing energetic workload through mechanisation.
2. Reducing the heat load by better ventilation or screening.
3. Machines and tools can be designed for maximum efficiency with minimum physiological cost.
4. The workers can be chosen on the basis of their physiological fitness for specific tasks, to work on furnaces.
5. Provision of air-conditioned rest rooms.
6. Adequate rest periods by adjustment of work and rest periods.

7. Organising workers' team. More workers should be added if the workload in a team is considered very heavy.
8. Compensating for sweat loss by adequate intake of water and salt. There should be easy access of cold drinking water close to the workplace.

2.4.3 Nutrition, Diets, Physical Fitness and their Relationship :

Among factors modifying physiological functions, nutrition or diet is an important factor, because it has direct relationship with calorific value which is essential to compensate energy expenditure (Kcal/min) on heavy or continuous physical (muscular) work.

As workload increases, calorie requirement increases. Insufficient calorie intake reduces work output or maximum aerobic power which can quickly be restored by improvement in diet. A well fed worker can store more energy in his fat and is able to work easily at required productivity level.

Functions of Nutrients : Diet is made of foods and foods are made of specific substances called nutrients. Each nutrient has a specific role e.g. in growth, building and repair of body, in giving heat and energy, in liberating and using energy contained in foods, in regulating other body functions and maintaining a good health.

Life functions (heart beat, breathing, digestion) and all bodily activities (muscular or mental) require, energy and heat and these are provided by the nutrients present in the foods. Balanced diet tries to contain all the nutrients in required proportion.

The energy value of food is measured in the form of beat/given off when the food is burned. The heat required to raise temperature of 1 litre water from 15 °C to 16 "C is called Kilocalorie (Kcal) or a Calorie (Cal). 1 Cal = 4.184 Joule.

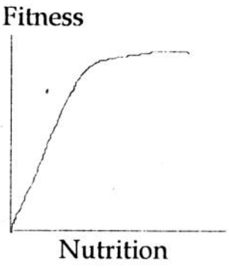
Mainly there are six categories of nutrients Proteins, Carbohydrates, Fats and Oils, Minerals, Vitamins and Water. Proteins are made of amino acids (some 23 types) and useful in body building and repair. Growing children and nursing mothers need extra protein. Cereals, nuts, peas, beans are plant sources and meat, fish, milk, cheese and eggs are animal sources of protein. Plants provide carbohydrates and also proteins, vitamins and minerals. 1 gm of carbohydrate produces @ 4 cal energy. Fats and oils are obtained from plant or animal and provide @9 cal/gm, and aid some vitamins. Minerals are needed in small quantity. Calcium in milk and milk products (except butter) is essential for teeth and bones, clotting of blood after a wound and for normal contraction of muscles. Iron is necessary for red blood cells. Iodine is a part of thyroid hormone which helps to regulate growth, mental development and rate of body functions. Vitamins (20 identified) are equally useful for growth, development and body function. Their quantity required is small. Vitamin A prevents night blindness, B protects nerves, C prevents scurvy and D ensures strong and straight bones. 60 to 70% of the human body is made up of water and it is most essential for life. Water controls the body temperature, digestion, absorption and distribution of foods to body tissues, removal of waste and functioning of the kidneys. During heavy work and in hot environment, extra water is required to compensate sweating and to keep the body temperature within limits.

Energy is always expended in work and food (nutrients) is the basic need to supply this energy. Even a simple meal provided at workplace can remarkably improve production rate and earnings.

A diet which provides enough food of different types and tastes to meet nutritional values is called a balanced diet. It varies from person to person,, states to states and countries to countries because of the varieties of factors.

Food should be fresh, warm and non-contaminated. It should be eaten after washing hands, mouth and teeth.

Nutrition and Physical Fitness Relationship :



Above discussion makes it clear that nutrition has direct relationship with physical fitness. The fitness increases with nutrition to its maximum level beyond which nutrition cannot help

Depending on quantum of physical (muscular) work, type of weather, digesting power, hunger, thirst etc., one should maintain his nutrition standard to maintain good health. More nutrition is necessary by growing children, pregnant women, nursing mothers, hard workers, athletes and people living in cold countries. To regain health after illness or injury, good and gradual nutrition is most essential. We all have to remember this relationship till our life.

3 ERGONOMICS

After studying 'Physiology' it is in chronology to study 'Ergonomics' as it includes physiological movements, measurements, limitations etc.

3.1 Introduction to Ergonomics and its Constituents :

3.1.1 Introduction to Ergonomics :

Refer Part 6.1 of Chapter-14 for meaning of Ergonomics. It is explained there for the purpose of machine guarding.

The term 'ergonomics' is derived from the Greek word 'ergo' meaning work and strength and 'nomos' meaning rule or law. It simply means "fitting the job to the worker (and not the worker to the job)". The object of ergonomics is "to achieve the best mutual adjustment of man and his work to improve his convenience, efficiency and well being". Ergonomic approach includes designing of machines, tools, controls, equipment, process, layout, housekeeping etc. to increase efficiency of both - man and the machine. Application of ergonomics reduces accidents and improves health and efficiency.

The term 'human engineering' is used in USA while the term 'ergonomics' is used in the rest of the world. Both are synonym.

Ergonomics is also defined as 'the study of human characteristics for the appropriate design of the living and work environment'. It is human centred, transdisciplinary and application oriented. It can be applied to jobs, equipment, working place, tools, utensils or any complicated working system (e.g. multiperson sociotechnical system).

Successful application is measured by improved efficiency, safety, productivity and acceptance of the ergonomic design.

The disciplines that can be utilised in ergonomics are : physiology, anthropology, biomechanics, engineering and psychology. They include both technological and human components.

Ergonomists draw data from full spectrum of human and biological sciences, technology and acquire additional data through experiment, survey and reactions to environmental hazards, sensory capacities, decision making abilities, psychomotor performance, ability to make precise, rapid and correct control movements, ability to modify behaviour through training, biological aspects of eating, drinking and waste disposal and psychological factors due to fatigue, emotion, changer etc. also become the subject matter of ergonomics.

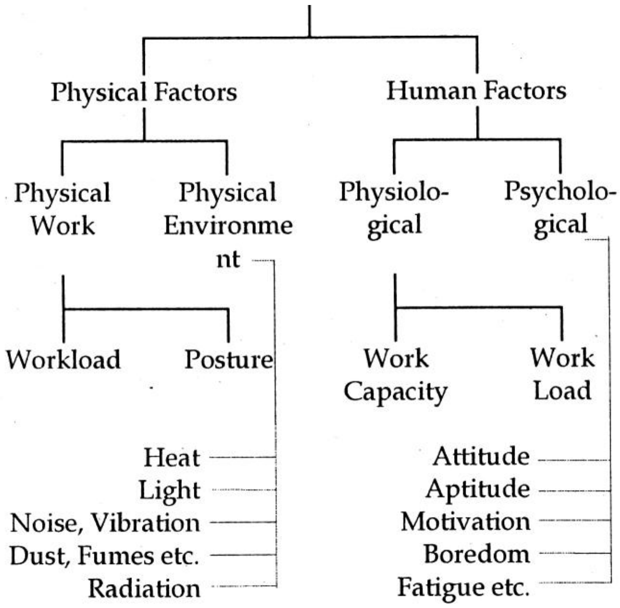
The ergonomic design should begin with an understanding of the user's role and should consider human variability as a design parameter. Tile ultimate design incorporates both human capabilities and built-in safeguards to reduce or avoid the impact of human error.

In short, the aim of ergonomics is to achieve safety, ease and efficiency at work (by considering physiological and environmental factors).

3.1.2 Constituents of Ergonomics :

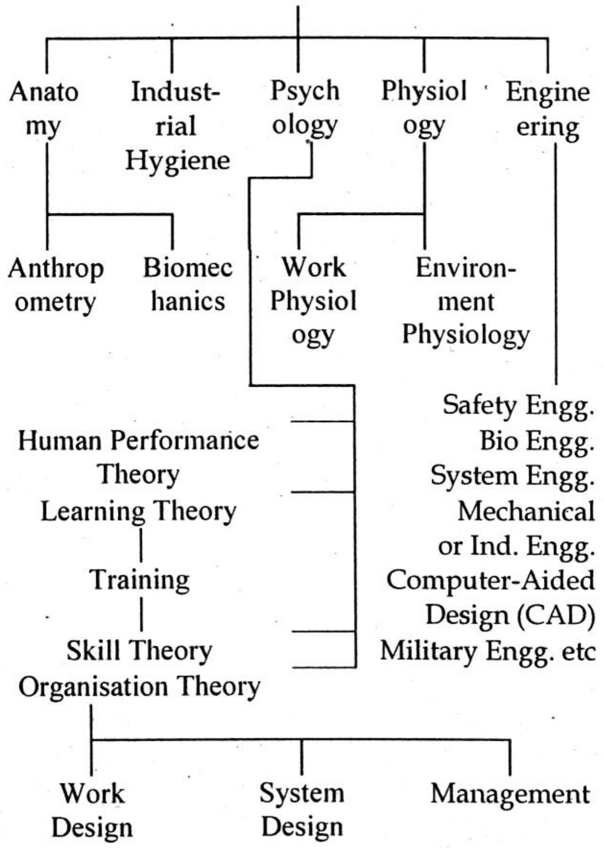
Human factors (HF) was the old discipline concerned with how humans react with their worktasks and environment aiming to make the relationship safer, healthier and more efficient. The new-name of this discipline is Ergonomics. Previously known 'Human Engineer' or "Engineering Psychologist" is now known as "Ergonomist or Ergonomicist (in great Britain). The term Ergonomics is biotechnological and covers the same scope and complexity of interests that human factors embraces. Therefore, human factors are the main constituents of ergonomics. For main division of factors affecting work including human factors see Part-5 of Chapter-3.. In a schematic diagram they are shown below :

Work Performance or Man at Work



Ergonomics studies the 'human factors' and designs the system or suggests application or modification of the existing system to make the work more suitable or convenient to the man at work. Thus in this context, or its procedural aspect, all human factors - physiological and psychological contribute in constituting the science.

But from discipline point of view, main constituents of ergonomics are anatomy, physiology, psychology and engineering. Schematic diagram of disciplines (work areas) constituting the ergonomics is also shown below :



3.2 Application of Ergonomics for Safety and Health :

Application of ergonomics can solve the problems of stress and strain due to work load, high or low temperature, more or low illumination or glare, noise, vibration, radiation, awkward work positions and orthopaedic problems due to them. The field of application is very wide which includes following as some of the areas :-

1. Hand tools.
2. Design of Controls.
3. Design of work.
4. Design of information displays.
5. Man/machine information exchange.
6. Limitations of the sense organs.
7. Age, fatigue, vigilance and accidents.
8. Problems of body size and posture.
9. Effects of climate.
10. Human energy, optimising its efficient use.
11. 'Work tolerance.
12. Anatomy of function.
13. Physiologic measurements.
14. Application of skeletal-muscular forces (e.g. manual handling and lifting.)

Ergonomics is also utilised at design stage where it is called. "System Ergonomics" in contrast to "Classical Ergonomics" which is applied to solve the ergonomic problems as and when they occur once a design has been put in use. System ergonomics is a higher level of practice involving a knowledge of (1) Different tasks the machines can perform. (2) The relative cost. (3) A variety of tasks and satisfactory work for personnel.

In designing work, ergonomics can be applied for the design of systems, work places, environments, interfaces and work situations. Some examples are as under:'

Sr. No.	Type of Design	Examples.
1	Systems	Man-machine relationship, procedure.
2	Workplace	Posture, seat and control design, bench position, displays.
3	Environmental	Required lighting, heating, ventilation, noise, vibration etc.
4	Interface	Exchange of information between man and machine / environment, scales, pointers, letters, numbers, their size, shapes, position, forces etc.
5.	Work situation	Hours of work, rest pauses, shift work, inter personal and organisational aspects of work.

Following are some of the examples of application of ergonomics (human engineering) to matters of health and safety :

1. Stresses of excessive heat, light, humidity, noise, vibration etc., their safe limits, type of worker e.g. age, sex, fitness etc., and task to be performed - all should be considered and suitable environmental conditions should be designed to fit appropriately to the worker and his task.

2. Surrounding space, seat design, bench design and positioning of displays, controls, materials, tools, equipment, instruments etc. should fit the human body so that he can work without excessive effort within the range of healthy posture.

3. Interface display and control design should consider effective information between the man and the machine or environment in type and size of numbers, letters, pointers, shapes and discrimination, identification etc.

4. Working hours, rest pauses, shift work, interpersonal and management problems should be studied and resolved to maintain health and safety of work people.

5. It should be aimed to do work with a minimal use of energy and materials and without waste resulting from mistakes. Human errors should be minimised for safety and health.

6. Design and production of automotive vehicles, communication equipment, farm machinery, military service, aerospace systems, computers and electronic equipment can be made safe and most suitable to the operators.

7. Highway signs, typewriters, data processing systems, machine tools, kitchen stoves, street and highway design, rapid-transit facilities, health facilities, housing , pollution control, education, law enforcement, postal service, airports etc. are newer areas where ergonomic design can give good results and reduce accidents.

8. Deciding allocation of functions between men and machines. Functions' of perceiving, responding to emergency situations, some ' typical judgements etc. are better done by men than by machines. Functions of heavy lifting, computing, auto regulation, handling large amount of information etc.

are better performed by machines than by men. These are to be considered at an early stage of design.

9. Task analysis to decide selection standards, workloads, training requirement, manpower requirement, equipment design can be carried out.

10. Factors of control design, e.g. control display ratio, safeguards against accidental activation, control coding etc. are part of ergonomic design.

11. Workplace dimensions, location of controls and displays, seat and penal design, the design of doors and access for easy entry and exit and protective devices for emergency situations need to be well designed.

12. For good maintenance easy and simple maintenance manuals, tools and test equipment, better location of units for easy access, faultfinding techniques etc. are to be designed properly.

13. Allowance for local weather conditions, ventilation in cramped premises, providing stool to put container to avoid frequent bending, elementary checklists are ergonomic aspects.

14. Manual material handling has a large scope of ergonomic considerations. Process flow, job design, layout, selection of equipment, machine, tools, space requirement, control design, visibility, colour and signs, allowing push and pull instead of lift and lower, avoiding severe bending, lifting and lowering between knuckle (hip) height and shoulder height, avoiding excessive weight, avoiding sharp edges, corners, pinch points, training for safe lifting practice and lifting rules (dos and don'ts), personnel selection etc. must be well considered.

15. Wrong design of hand tools can create bending of wrist, pressure points between the hand and the handle, sustained exertions, vibrations etc. Therefore handtools should be designed in such a way that they eliminate or minimise these hazards. Oblique angle of the handle, proper shape, diameter and length of the handle, rounding off all edges and sharp corners, minimising noise and vibration etc. are useful criteria.

16. Office, other work places and workstation design call for specific criteria. Ideal, practical and detail planning, work process, equipment, workplace layout, final enclosure, mock-up, trial and redesign, clearance for the operator's body, sufficient head room, visual field, auditory information, standing or sitting position (both have advantages and disadvantages), work space dimensions, body position to operate computer, healthy work postures, eye height, elbow height, knee height, seat design to reduce physiological and biomechanical stresses by providing wide range of adjustments and postures to suit the individual (seat height adjustable between 15 to 20 inch, deep 15 to 17 inch, wide 18 inch or more and backrest to support back and neck and opportunity to change body posture frequently) etc. are some important criteria:

17. Controls - continuous or detent - should be designed by considering consistency of movement, control actuation force, multidimensional operation, operator-control orientation, control-effect relationship, time lag, arrangement and grouping, coding and prevention of accidental activation etc.

18. Light signals provide useful safety and functional indications as mentioned below : See also Part 7.3 of Chapter-9.

19. Displays provide necessary information to the operator. They may be visual (lights, scales, counters), auditory (bells, horns), tactile (shaped knobs. Braille writing) or audio-visual (buzzer with light, TV display). Selection depends on type of information to be provided and to whom provided.

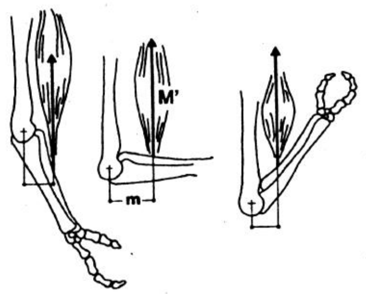
20. Labelling permits rapid and accurate performance of controls, displays and other items that should be identified, read, manipulated or located. Label characteristics are: accuracy, time of response or recognition, distance, illumination, nature of function and consistency. Their visibility, legibility, location, orientation, abbreviation, brevity and standardisation are necessary. Legal notices must be displayed.

From. above varieties of examples it is evident that ergonomics has wide applicability to many functions in addition to health and safety.

3.3 Load Carrying :

3.3.1. Safe Use of Muscle System & Lever System in Load Carrying.

Muscle system consists of about 200 skeletal .muscles in the body. They are in the form of bundles of muscles and wrapped on each other. They are connected with tissue carrying nerves and blood vessels inside. The tissues combine to form tendons which connect the ends of the muscle to bones. The sheaths of the connective tissues provide mechanical properties to the muscle.



A muscle has only action to contract. Elongation is by external force. Filaments of muscle sliding along each other provide automatic contraction after elongation. Signal to contract comes from brain by the neuromuscular system. Signals coming to motor units of the muscle can be observed by electromyogram (EMG).

Lever system is consisted of links (bones) joined in their articulations and powered by muscles bridging the joints. As elbow angle changes, lever arm (LA) also changes with the muscle force (MF).

Safe use of these muscle and lever system of human body is most desirable to prevent injury, damage or pain to the body. Excessive load causes excessive stress in muscle which may result in strain, stretch or pain. Therefore excessive weight limits are legally prescribed. Some safety measures are as under:

1. While handling material, force exerted by hands should be transmitted through the whole body parts including feet to the floor. In this chain of forces, weak link is spinal column, particularly at the low back. This limits the capability of a person to work. Therefore task should not be too heavy.
2. Tasks, equipment and system should be designed to provide ease and efficiency of manual handling.
3. Layout of material transfer and facilities should be convenient and comfortable to the people.
4. Job design should be safe, efficient and agreeable for the worker.
5. Selection of tools, machines, equipment should be proper. Sufficient space for movement, visibility, lighting, colour coding and control design are important.
6. Select persons capable of performing the job. The job should be designed to fit the worker.
7. Give training for safe lifting practices.

3.3.2 Physiological Problems with Load Carrying (Injuries, Fatigue etc.) & their Solutions.

Problems with load carrying activity are as under:

1. Limits of human capability of movement in body joints and in spinal column, body size, sex, age, energy capacity (heart rate), etc. Therefore load carrying capacity varies with age, sex and overall strength of a person..

2. Physical Fatigue due to overexertion that causes temporary decrease in physical performance. Reasons of fatigue are workload i.e. static and dynamic work, lack of rest or sleep, illness, pain, poor food intake etc.

3. Mental fatigue due to psychological factors like monotony, conflict, worry, de-motivation etc.

4. Work and rest cycle depending on intensity of work. Heavy work requires more rest periods at short interyals.

5. Faulty layout of material transfer requiring more time and more effort.

6. Wrong design of job. Where machine is required, job is given for manual working or carrying. Excessive weight, odd size, sharp edges, hot material, oily or slippery surface, invisibility etc are some of such factors.

7. Non-provision of sufficient space for movement, necessary hand tools, proper controls, signs (e.g. arrow) for lifting or placing etc.

Solution to above problems require -

1. Decision whether man is required or machine is required for a particular job.
2. Weight should be within limit i.e. not excessive for a person to be employed.
3. Proper design of job itself and of facilities, tools and equipment etc.
4. Sufficient space for movement, illumination, necessary rest intervals, proper clothing, drinking and food arrangement etc.
5. Proper selection of persons based on their size, sex, age, strength etc so that work matches with the people.
6. Break down whole material movement process from receiving to distribution into different functions or segments and in each such division plan the actives of material handling in detail and separate out jobs for machines and men. Then allocate accordingly.
7. Plan movement of material in horizontal plane. Arrange push or pull instead of lift or lower. Avoid severe bending movement.
8. Delivery of material at workplace should be at hip height instead on ground floor.
9. Lifting and lowering height should be between hip and shoulder height. This will cause less injury.
10. Handling should occur close to and in front of the body.
11. Material should be light, compact and easy to grasp. It should not have sharp edges, corners or pinch points.
12. Containers or bins should be of sufficient size. Material can be put or removed easily.

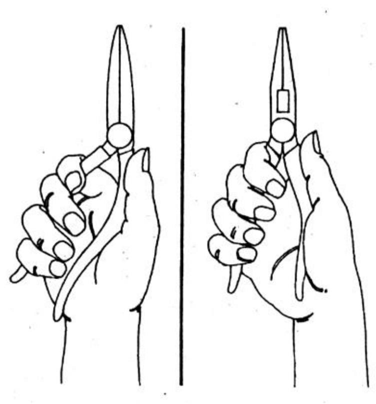
See also part 2 of chapter 15 for manual material handling.

3.4 Hand Tools and their Use :

See Chapter 17 for figures and other details of safe use of hand tools and power tools.

3.4.1. Design of Tools in relation to Body Postures.

Ergonomic design of hand tools is necessary so that tools and their handles properly fit to the hand grip, avoid unnecessary bend, movement or pressure of fingers and wrist, provides smooth surface and shape for safe handling, insulation for electrical tools and requires less force while working. Some such design criteria are as under -



1. Tools should have bend and should be best fitting to the shape, size and functions of the hand.
2. There are different interactions between the hand and the handle, control or support viz. finger touch, palm touch, hook grip, tip grip, pliers grip, side grip, writing grip, disc grip, finger palm enclosure, power grasp etc. Handle, control, knob, lever or support should be properly designed for such couplings between hand and handle, control etc.
3. Cross section and longitudinal shape of the handle must be proper. Circular cross section is mostly preferred.
4. Handle size should accommodate the palm for sufficient grip.
5. Pressure points and rough surface of handle should be avoided.
6. Round off sharp edges or corners on the handles for safe holding.
7. Avoid cooling or heating the hand by appropriate covering (insulation) on handle.
8. Hand tools should have minimum vibration. Gloves should be used if useful.

3.4.2 Safety while using Hand tools.

See part 3.2 of Chapter - 17

3.4.3 Safety while using Power tools.

See Part 4.1 of Chapter - 17

3.4.4 Tool boxes. Kits & Tool maintenance.

See Part 3.4 and 4.2 of Chapter - 17

3.5 Work Station Design:

3.5.1. Introduction to Anthropometry.

Anthropometry and biomechanics are branches of ergonomics dealing with physical dimensions and properties of. the human body.

Anthropometry means measuring the human body. Height, breadth, depth and various distances of the body parts are measured. Curvatures and circumferences are also measured. Measurements are taken in stand-erect or seated position.

Body dimensions are measured by anthropometers, calipers, taps and a scale. Such dimensions are useful in designing work spaces, tools, equipment, seating arrangement, vehicles and workstations so that' they can best fit to the users.

3.5.2. Concept of Percentiles.

Percentile indicates which percentage of a known population is fitted by a design range. Suppose work seat height is to be designed most convenient to majority of men and women, its range should fit to the women in 5^{th} percentile to the man in is 95^{th} percentile. This means much deviation will not be required in this range of seat height (say lowest 35.5 cm to its highest setting at 48.8 cm). Then addition of 2 cm for heal height may be required. 50^{th} percentile corresponds to a single fixed seat height of 41 cm for a mixed malefemale population, but, this will be too high for about 50 % of the people and too low for the rest. Thus designing for the average fits nobody.

5^{th}, 50^{th} and 95^{th} percentiles measurements for human height, depth, breadth, head, hand and foot dimensions are available for ergonomic design purpose.

3.5.3. Health problems related to wrong postures, back pain etc.

Sitting or standing in the same posture for a long time exert muscle tension and spinal compression. Therefore this should be avoided by providing rest periods, physical activities or exercises.

Computer operators keep the head in a fixed position for a long time and therefore suffer pain and tension in the neck area. Intensity, frequency and long hours of muscle contractions cause severe discomfort, pain and other musculoskeletal disorders that last for long periods.

Lumber spine suffers more force while sitting on a stool without backrest than in standing at ease. Leaning back over the backrest and arms hanging down reduces compression force. Straight upright backrests do not support the body and high disk forces may occur. When it is declined back and upper body weight is rested on backrest, internal forces are also declined. Relaxed leaning on a declined backrest is the least stressful sitting posture.

See Part 2.4.1 of Chapter 15 also. See Part 13.4.4 of Chapter-5 for musculoskeletal and trauma disorders to computer operators.

3.5.4. Ergonomic Office Furniture and Utility Tools.

Workstation consists of furniture, equipment, work material and overall environment. Persons do job there. Work posture includes movement of body parts and work activities include visual, auditory, vocal and motor types. Their combined effect is performance output and persons' well being.

Work space design, good lighting and ventilation, attractive and comfortable work situation are basic requirement. Office furniture and utility tools like controls, displays, switches, trays, bins, office equipments and instruments also play an important role.

General system components include computers, keyboards, tables, chairs and cupboards. But operator is the most important component in this system, because work output depends on him and he utilizes other components of the system. He should be most comfortable. His body dimensions are useful in designing workstation dimensions as under -

1. Dimensions should be slightly adjustable according to individual's requirement.
2. Visual tasks - monitor, key board, papers, books etc. - should be at eye height.
3. Keyboard, mouse, notepad, pen and hand controls should be convenient to elbow height and forearm length.
4. Leg room height depends on knee height, and thigh thickness and its depth depend on foot length.
5. Thigh width and lower leg length (Popliteal height) decide the width and height of the seat pan.
6. Functional reach decides height of shelves and other furniture.
7. Furniture should provide user freedom to extend legs or hands, to lean foreword or backward, to rotate left or right and to take any posture.
8. Ergonomic chairs with large backrest are most comfortable as they provide support to back and neck. Seat height must be fully adjustable, (height 35 to 50 cm, depth 35 to 45 cm and width 45 cm). Seat surface should not generate any pressure to the seated person.
9. Armrests are useful in reducing compression load on the spinal column.
10. Visual targets should riot be spaced apart in direction or distance from the eye. They should be easily viewable in the front.
11. All components of workstation should fit each other and each should fit the operators. Flexibility for individual requirement is also necessary.

3.6 Machine Controls and Displays:

3.6.1. Location & Sequence of Operation.

Controls are mostly hand or foot operated. They transmit inputs to machine, vehicle or equipment. They are selected on basis of their functional utility and located in easy reach so that operator's body parts are not overstressed.

Controls are of 'continuous' type (e.g. crank, knob wheel etc) or 'detent type (e.g. key lock or switch, bar knob, thumbwheel & different switches) where step wise operation is required.

Controls having sequential relations should be arranged in functional groups with their associated displays and in operational sequence.

If sequential operation follows fixed pattern like car gear handle, they should be arranged to facilitate operation i.e. top to bottom or left to right. Sufficient spacing s required for movement.

Controls should be located as per operator's requirement i.e. easy operation. Time lag between control input and system response should be minimum and consistent with safe and efficient operation.

Knobs are provided where little force is required and when fine adjustment is necessary.

Hand wheels are used for two hand control. Then knurling (corrugation) should be provided for good grasping.

When levers are used for fine or frequent adjustment (e.g. car gear lever) limb support are useful. e.g. elbow support for large hand movement, forearm support for small movement and wrist support for finger movement.

When several levers are located side by side, the lever handles should be coded. Levers should be labeled for their direction of motion and function. For joystick controls (three dimensional steering), elastic resistance is added for smooth displacement.

3.6.2. Natural Expectation of Control Movement.

Control movement should match with natural expectation e.g. foreword motion for front driving, backward motion for reversed driving, clockwise motion for right direction and anticlockwise for left direction, forward motion for boom descend and viceversa. In electrical switches, downward indicates 'on' and upward indicates 'off position. This is natural expectation.

In key lock switches (e.g. car ignition switch), key's vertical position indicates 'off position, turning clockwise indicates 'start' position and key should not come out without turning the switch i.e. without stopping the vehicle or machine. The 'on' and 'off positions should be labeled.

3.6.3. Preventing Accidental Activation.

Controls should be so designed and located that they will not move or change their position accidentally. They should not come out accidentally or by slight touch from 'off to 'on' position and start the vehicle or machine [Section 24(3) of the factories Act]. Such inadvertent operation can cause 'accident to person, machine or system. To prevent such accidental activation, following measures are useful

1. Cover or guard the control.
2. Provide interlock so that extra movement is required to change the position.
3. Provide resistance by spring action or viscous friction so that extra effort is required for actuation.
4. Provide rotary action for operation.
5. Provide recess, slot, shield etc to contain controls within it and finger is required to insert inside. e.g. push button or switch in recess or guard on foot pedal of a power press.
6. Provide 'on' and 'off .button separately and with different colour.
7. Provide' Dead man control' which will keep the system working till the control is pressed and will stop the system when the control is released, e.g. petrol nozzle trigger (knob) or drill machine push button.

3.6.4. Foot controls.

Foot controls have specific use and where powerful braking force is required or when leg is only convenient limb, viz. brake pedal or acceleration control lever in car or brake pedal for power press, press brake, metal shear and other machines.

3.6.5. Displays and Light Signals.

These are useful to provide, necessary information to operator. They may be dial gauges, pointers, digital, audio, visual, analog etc. Bell, horn and warning notices are also displays which give information. Colored signals have some meaning as under

1.	Red	-	Stop position
2.	Flashing Red	-	Emergency condition.
3.	Green	-	'On' position or 'yes' indication to proceed..
4.	Yellow	-	Wait, delay or be in readiness position. It also indicates caution or rechecking.
5.	White	-	No right or no wrong, transitory condition.

Displays should have clear meaning. They should be easy to understand and visible, properly illuminated, also visible when power fails, coded and labeled according to function.

Numerical display indicates time, temperature, pressure, flow, humidity, pH, speed etc. Moving pointer on a fixed scale 'have many shapes - circular, curved, horizontal straight or vertical straight. Numbers or figures should not be obstructed by pointer.

Displays should be located in viewing area and perpendicular to the line of sight.

Labels should be provided where extra information is necessary.

4 OCCUPATIONAL HEALTH

4.1 Meaning :

Occupational Health is eventually a branch of preventive medicine which examines the relationship between work and health and effects of work on the health of the worker.

Occupational Health includes all factors relating to work and working conditions, methods and environment, that may cause diseases, injuries or deviation from health including maladjustment to work. It implies not only health protection but also health promotion for improving the health and working capacity of the worker, viz. preventive measures against diseases, improvement of nutrition and general mental health.

Occupational Health was defined by ILO/WHO committee in 1950 as "Occupational health should aim at: the promotion and maintenance of the highest degree of physical, mental and social well-being of workers in all occupations, the prevention among workers of departures from health caused by their working conditions, the protection of workers in their employment from risks resulting from factors adverse to health, the placing and maintenance of the worker in an occupational environment adapted to his physiological and psychological ability and to summarise : the adoption of work to man and of each man to his job."

It includes medical examinations of workers, their health records, placement according to health condition and adjusting work to man and man to his work. It is a team work of chemists, .safety professionals, industrial hygienists and doctors.

4.2 Occupational Diseases :

4.2.1 Common Occupational Diseases :

(1) Occupational Lung Diseases :

Normally dusts cause lung diseases and therefore the types of dusts and their effects are discussed below.

(A) Types of Dusts and their Effects :

Dust is a disperse system (aerosol) of solid small particles in air or gas whose size distribution is like a colloid. It originates from mechanical communication of coarser material. Mining, breaking, crushing, grinding, mixing, polishing and handling are the main dust generating processes.

Small particles of O.I to 5 u.m size (respirable dust) can remain in the alveolar passages of which smaller particles (O.I r-lm) behave as colloids or smoke, deposit in lungs or other part and cause health effect. Particles of larger size (>5 (im) are driven back by the clearance mechanism. Asbestos fibre of 3 (urn or less in diameter and upto 100 (im length can reach the alveoli, while the smallest fibres can reach upto pleura and pleural space.

2nd Schedule of the Factories Act prescribes TLV (permissible time-weighted average i.e. TWA concentration per 8 hours) of cotton, asbestos, coal, cement and silica dusts.

Types of dusts can be classified as under :

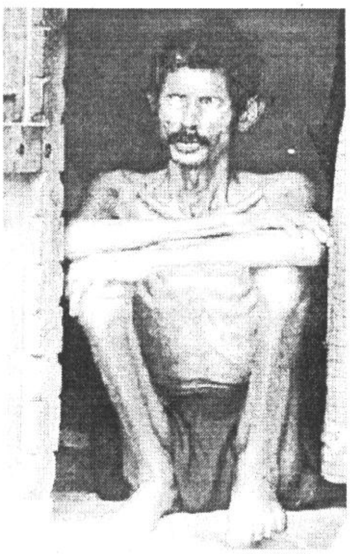
1. Quartz and mixtures containing quarts : Coal dust, mineral ores, sand, rock, fluorspar, quartzite etc. They are found in mining, ceramic industries, refractories, pastering, mixing and insulating materials. They cause nodular fibrosis and silicosis.
2. Asbestos and mixtures containing asbestos : Raw asbestos, chrysotile, amphibole, asbestos cement talk etc. It ir vsed in some 3000 products of textile,, insulation, packing, jointing and building material. It can cause diffuse fibrosis, carcinoma, asbestosis and telcosis.
3. Metals and metal compounds : Metals like iron, nickel, lead, manganese, aluminium, beryllium, chromium, cadmium, vanadium and their oxides are extensively used in metallurgy, metal working, welding, electroplating, furnaces, sintering etc. They can cause irritation, diffuse fibrosis and different types of lung diseases known as siderosis, bronchial carcinoma or asthma, tracheobronchitis, aluminium lung etc.
4. Plant and Animal (organic) dust : Wood, animal hides, skins, hair, feathers, scales, cotton flax, hemp, sisal, jute, mouldy hay, straw, cereals, bagasse, crushed grain and bran, enzymes etc. They are found at wood working, agriculture, poultry, textile, grain or sugar mill etc. and cause irritation, immune reaction, carcinoma, allergic rhinitis, bronchial asthma, farmer's lung, bagassosis, byssionosis etc.
5. Other dusts : These are chemical dust like carbon dust, soot, graphite, phthalic and maleic anhydride and arsenic dust etc. and found in mining, metallurgy, rubber, plastic and chemical industry. They can cause irritation, carcinoma, systemic effect, ulceration, conjunctivitis, graphite pneumoconiosis etc. Inert dusts are also hazardous.

Following table shows some dusts and lung diseases that may be caused by them.

Dusts	Lung Diseases
Quartz (Silica)	Silicosis.
Asbestos	Asbestosis
Talc	Talcosis, mesothelioma, bronchial carcinoma, carcinoma of upper respiratory tract.
Aluminium and its oxides	Aluminum lung, bauxite smelter's lung, CNSLD
Beryllium & its oxides	Tracheobronchitis, penumonitis, beryllosis
Cdadmium and its oxides	Tracheobronchitis, bronchopneumonia, emphysema of the lung.
Chromium, Chromate, Chromoxide	Ulceration and perforatin of nasal sputum, bronchial asthma, carcinoma of nasal cavity, CNSLD.
Hard metals	"Fibrosis, immune reaction.
Iron, Iron oxide	Siderosis.
Manganese, Manganese oxide	Manganic pneumonia, CNSLD.

Nickel, Nickel oxide, Nickel salts,	Bronchial carcinoma, carcinoma of nasal cavity,
Platinum compounds (salts)	Allergic rhinitis, bronchial asthma.
Vanadium pentoxide	Tracheobronchitis, bronchial asthma, CNSLD.
Milled or crushe grain and bran	Allergic rhinitis, chronic rhinitis, bronchial asthma CNSLD.
Wood (exotic types)	Allergic rhinitis, bronchial asthma, carcinoma of the nose and nasal cavity, CNSLD.
Animal hides, skin, hair, leather and scales.	Allergic rhinitis, bronchial asthma.
Mould hay, straw, cereal, and bagassse	Farmer's lung, bagassosis.
Enzymes	Allergic rhinitis, bronchial asthma
Cotton, flax, hemp sisal, jute.	Byssionosis, CNSLD.
Arsenic, arsenic trioxide, arsenic salts.	Ulceration and perforation of nasal septum, trecheobronchitis, carcinoma of nasal cavity.

(CNSLD : Chronic non-specific lung disease)



Effect of Silica Dust

Biological effects have been well established and have recognised specific illness due to specific dust, e.g. silicosis due to silica, siderosis due to iron, byssionosis due to cotton dust etc. Where there is no specific clinical picture, the case is referred as CNSLD i.e. chronic non-specific lung disease. The types of effects are fibrogenic, carcinogenic, systemic, toxic, allergic, irritant and skin effects.

For silicosis, Siderosis and Anthracosis see Part 9 of Chapter 20 and for Byssionosis see Part 10.1 of Chapter 21.

(B) Dust Control Methods :

To prevent lung diseases, some control measures areas under

1. Know the exposure limits of dusts. Dust below 5 microns size is invisible. Depending on toxicity, exposure limits vary from 0.1 to 10 mg/ m^3 See also 2nd Schedule under the Factories Act (Table 15 of Chapter-32). Employ effective measures based on this safe limit and nature of the dust.

2. Elimination of dusty process e.g. improved casting technique to eliminate dusty fettling process.

3. Substitution by a less toxic or non-toxic dust, e.g. shot-blasting in place of sand blasting, metal moulds in place of sand moulds and glass fibre or slag wool in place of asbestos insulation.

4. Segregation and enclosure of the process if dust generation cannot be prevented. Dusty process should be enclosed in a room and be connected with effective exhaust and dust collector. - Complete enclosure is the best segregation, e.g. blasting cabinet, fuming cupboard.

5. Wet methods prevent particles becoming airborne. Powdered material is suspended or dissolved in a liquid. The correct degree of wetting should be maintained and it should not be allowed to dry out.

6. Local exhaust ventilation should be applied to collect the dust from the nearest possible distance. The smaller enclosure gap requires smaller exhaust rate. Suction flow should be away from the

worker's breathing zone. Dust collection, filtration and disposal are the subsequent steps. Various kinds of air cleaning devices are also available.

(2) Occupational Dermatitis :

An inflammation of the skin produces dermatitis which is the most common skin disease. The part of body most exposed is affected first, so it starts on hands. With some dusts and fumes, the first signs may appear around the eyes, neck and face also. The disease can be caused by many chemicals and apparently harmless substances including all forms of mineral oils (including diesel, lubricating and fuel oil); chemicals (alkalis, chromate, dichromate and synthetic resin), solvents (thinners and degreasers such as white spirit, paraffin, trichloroethylene, turpentine, and petroleum product); tar pitch and other coal products including chemicals in the phenol and cresol family; soot; radiation including X-rays and radiant heat; friction particularly when dust or grit gets between clothing and skin.

Contect dermatitis

Chromate and dichromate used in chromium plating, dyeing and tanning produces chrome ulcers or holes as well as dermatitis. In one chemical factory at Vadodara (Gujarat), 43 workers with holes in nasal diaphragm, 3 workers with chrome ulcer and 23 workers with dermatitis were detected. They were working with sodium and potassium dichromate. The liquid or dust from the process gets into cracks or cuts in skin and forms deep holes. Chromic acid, concentrated potassium dichromate, arsenic trioxide, calcium oxide, calcium nitrate and calcium carbide are well known ulcerogenic chemicals. Chemical or thermal burns, blunt injury or infections resulting from bacteria and fungi may result in ulcerous excavations on the part affected.

Occupationally induced changes in skin colour can be caused by dyes, heavy metals, explosives, certain chlorinated hydrocarbons, tars and sunlight. The change in skin colour may be simply a chemical fixation within keratin.

Primary Skin Irritants in industry are organic and inorganic acids and alkalis, some metal salts, nickel, phenol, trichloroethylene, solvents and acne producers.

Primary Skin Sensitizers are dyes and dye intermediates, photographic developers, rubber accelerators and anti-oxidants, insecticides, oils, natural and synthetic resins, coal-tar and its derivatives, explosives, plasticizers and others.

Skin cancer is caused by long periods of contact with a variety of substances including mineral oils, paraffin, tars, arsenic and several kinds of radiation including X-rays and ultra violet light. The cancer will usually develop in direct contact with the above substances. Other parts can be affected.ifthe substance penetrates the clothing.

Dermatitis is a skin disease caused by primary irritants like acids and alkalis, organic solvents, soaps, detergents, lime, cement, turpentine, synthetic coolants, abrasives, nitropaints, hardeners, dyes, peroxides, pesticides, weedicides, gum, inks, chlorinated diphenyls, disinfectants etc. and by sensitizers like formaldehyde, fungicides, azo dyes, chromium, nickel, mercury and cobalt salts.

Dermatitis can also be caused by physical agents (e.g. heat, cold, moisture, radiation, friction, pressure etc.) or biological agents (e.g. bacteria, fungus, virus etc.)

Occupations involved are leather, metal, paint, printing, plastic, rubber, textile, electroplating, engineering, construction, cleaners, chemical, bakers etc.

Signs and symptoms are eczematous lesions.

For diagnosis it is useful to know the occupational history and to observe many workers, in identical situations, who develop cutaneous changes. Patch tests are indicative.

Occupational dermatitis is preventable if timely diagnosed and controlled. Preventive measures are :

1. Engineering measures to control the harmful agents by various methods.
2. Pre-employment or pre-placement medical examination and sorting out the workers having suspected dermatitis or pre-disposition to skin diseases and keeping them away from the jobs having skin hazards.
3. Use of .necessary PPE and barrier creams.
4. Personal hygiene. Adequate washing and bathing facility with warm water, soap, nail cutter and clean towels.
5. Periodical medical examinations of workers and transferring the job of the affected workers.

(3) Occupational Cancer :

Occupational cancer is a form of delayed toxicity, serious in clinical course and outcome, due to exposure to chemical or physical agents (carcinogens) in the workplace.

Following figures of ESIC indicate incidence of cancer in our workers :

Year	Total insured workers (lakh)	Workers having cancer	Cancer workers per 10000 workers
1983-84	63.00	1890	3
1984-85	61.61	1848	3
1985-86	61.52	1235	2
1987-88	61.09	2414	4
1988-89	59.97	599	1
1992-93	66.91	14720	22
1993-94	66.24	6630	10

In Gujarat, in 1993-94, new 36 workers were detected for this disease. Most of these cancers may be occupational.

Carcinogenic substance means a substance or preparation which by inhalation, ingestion or cutaneous penetration can induce cancer or increase its frequency. It causes an increased incidence of benign and/or malignant neoplasm, or a substantial decrease in the latency period between exposure and onset of neoplasm in human or in experimental specie; as a result of any exposure which induce tumours at a site other than the site of administration.

It is unknown that how many chemicals are actually carcinogenic to humans and how many human cancers could be prevented by improving working conditions. There may be mixed reasons occupational and non- occupational also.

The ACGIH has classified carcinogens in five categories:

A1 - Confirmed Human Carcinogen

A2 - Suspected Human Carcinogen
A3 - Animal Carcinogen
A4 - Not classified as a Human Carcinogen .
A5 - Not suspected as a Human Carcinogen

Some such carcinogens are listed below with their TLVs(TWA) and above category.

Carcinogens, TLVs and Category

Substance	TLV (TWA)		Category
	PPM	Mg/m^3	
Acrylamide	-	0.03	A3 skin
Acrylonitrile	2		Skin
Allyl chloride	1		A3
Aniline	2		A3 skin
Antimony trioxide	-	-	A2
Arsenic as As	-	0.01	A1
Asebstos, all forms fibre cc	0.1	-	A1
Benz (a) anthracene	-	-	A2
Benzene	0.5	-	A1 skin
Benzidine	-	-	A1 skin
Benzo (a) pyrene	-	-	A2
Beryllium as Be	-	0.002	A1
1.3 Butadiene	2	-	A2
Cadmium	-	0.01	A2
Carbon tetrachloride	5	-	A2 skin
Chloroform	10	-	A3
Bis Chloromethyl ether	0.001	0.0047	A1
Chloromethyl methyl ether	-	-	A2
Coal tar as benzene soluble	-	0.2	A1
DDT	-	1	A3
Diazomethane	0.2	-	A2
Ethyl acrylate	5	-	A4
Lead chromate			
- as Pb	-	0.05	A2
- as Cr	-	0.012	A2
β-Nephthylamine	-	-	A1
Nickel-soluble inorganic	-	0.1	A4
Compounds o or p-Toluidine	2	-	A3 skin
1, 2, 3	10	-	A3 skin
Trichloropropane			
Uranium compounds as U	-	0.2	A1
Vinyl bromide	0.5	-	A2
Vinyl chloride	1	-	A1

Zinc Chromates as Cr	-	0.01	A1

Courtesy : 2007 TLVs and BEIs, ACGIH.

Some tables are also given below to understand occupation or substance and body part (site) being affected by cancer.

Occupation, Substance and Site of Cancer:

Occupation	Substance (carcinogen)	Site (body part)
Asbestos & products	Asbestos	Lung, pleura
Metal and Mining	Arsenic, Chromium, Uranium, Benzo (a) pyrene (BAP), Nickel	Lung, skin Lung Lung Lung Lung, nasal sinuses
Chemical industry	Vinyl chloride BCME, CMME Dyes-bendizine, s-naphthylamine, 4-aminodiphenyl Auramine, other aromatic amines Isopropyl alcohol	Liver Lung Blader Bladder Paranasal sinuses
Petroleum industry	Polycylic hydrocarbons	Scrotum
Insecticide, Pesticide	Arsenic	Lung
Gas industry	Benzo (a) pyrene (BAP) Coal carbonization products, β-naphthlamine	Lung Lung, Bladder Scrotum
Gas industry	Benzo (a) pyrene (BAP) Coal carbonization products, β-naphthylamine	Lung Lung, Bladder Scrotum
Rubber industry	Benzene Aromatic amines	Lymphatic and Leukaemia Bladder
Leather industry	Leather dust, benzene	Nose, bone marrow
Wood pulp and paper industry	Wood dust	Nose (adenocarcinoma)
Roofing, asphalt work, steel prod.	BAP	Lung
Others – Diethylstil	Diethylstilboestrol Melphalan Mustard gas	Female genital tract, breast Haematolym phopoietic system Lung, pharynx Skin, lung, bladder, GIT

	Soots, tars and mineral oils Conjugated oestrogen Cyclophosphamide	Uterus Bladder

Body part and Substance having risk of Cancer :

Body part	**Substances (carcinogen)**
Bone	Beryllium (benzene – bonemarrow)
Brain	Vinyl chloride
Gastrointestinal tract (GIT)	Asbestos
Heaematolym phopoietic tissue (leukaemia)	Benzene, styrene, butadiene and other synthetic rubber, alkilating agent, cyclophosmamide, melphaln, busuphan, vinyl chloride
Kidney	Lead, coke oven gas, finasetin
Liver	Alcohol, vinyl chloride, steroids, eflatoxin, DDT, PCB, trichlor ethylene, chloroform, aldrin, dieldrin heptachlor, chlordecon, mirex, CCl_4
Liver	Alcohol, vinyl chloride, steroids, eflatoxin, DDT, PCB, trichlor ethylene, chloroform, aldrin, dieldrin heptachlor, chlordecon, mirex, CCl_4
Larynx	Tobacco smoking, alcohol, asbestos, chromium, mustard gas.
Lung	Tobacco smoking, arsenic, asbestos, iron, chromium, nickel, vinyl chloride, cadmium, uranium, bischloromethyl ether (BCME), chloromethyl methyl ether (CMME), benzo(a) pyrene (BAP), coke oven gas, mustard gas, tar, polyclinic hydrocarbons (PCH)
Lymphatic tissue	Arsentic, benzene
Mouth	Alcohol, pan, lime, tobacco, gutkha, textile fibre
Nose	Chromium, nickel, wood dust, leather dust, tanning, formaldehyde, IPA, benzene
Pancrease	Benzidine, PBC
Peritoneum	Asbestos
Pharynx	Tobacco smoking, alcohol, mustard as, textile fibres
Plural cavity	Asbestos
Prostate	Cadmium
Scrotum	Soots, tar β–naphthylamine, chloroprin, polyclinic hydrocarbons (PCH)
Skin	Arsenic, cutting oil, mineral oil, soots, tar, cock oven as, PCH
Bladder	Tobacco smoking, α or β-naphthylamine, benzene, benzidine, 4-aminodiphenyl, alkilating agent, chlorophosmamide, auramine, 4-nitrodiphenyl, aromatic amines
Vagina	Oestrogen
Female genital tract, breast	Diethylstillboestrol
Central nervous system (CNS)	Vinyl chloride

Uterus	Conjugated oestrogen
Buccal cavity	Oil mist, solvents, dyes, cadmium, lead
Multiple myeloma	Solvents

Diagnostic methods for assessing cancer should consider detailed occupational history to know whether in past the worker was exposed to any carcinogen. If worker does not know it, factory records should be gone through or interrogated with his supervisors. A questionnaire may be useful in 'collecting such past information. Screening may be useful to some extent.

Preventive measures are

1. Not to use carcinogenic .substances or processes.
2. Research to find safe substitutes should be developed.
3. To eliminate contact of workers from carcinogenic substances by
   (1) Employing closed system of work (i.e. no manual handling or direct exposure).
   (2) Work environment monitoring, biological monitoring and keeping the exposure far below the permissible limits.
   (3) Using personal protective equipment.
   (4) Following safe waste disposal methods.
4. Avoiding personally susceptible workers at the time of recruitment.
5. Rotating workers exposed to risks and thus reducing their exposure time.
6. Advising to stop smoking and to improve personal hygiene.
7. Referring serious cases to a cancer hospital or onco-surgeon.

4.2.2 Notifiable Diseases under the Factories Act 1948 :

Following four sections of the Factories Act are relevant:

Section	Provision
89	Notice of certain diseases.
90	Power to direct
91	Power to take samples.
91A	Safety and Occupational health surveys.

Under Sections 89 and 90 above, the Third Schedule gives a list of Notifiable (occupational) Diseases as under :

1. Lead poisoning including poisoning by any preparation or compound of lead or their sequelae.
2. Lead tetra-ethyl poisoning.
3. Phosphorus poisoning or its sequelae.
4. Mercury poisoning or its sequelae.
5. Manganese poisoning or its sequelae.
6. Arsenic poisoning or its sequelae.
7. Poisoning by nitrous fumes.
8. Carbon disulphide poisoning.
9. Benzene poisoning, including poisoning by any of its homologues, their nitro or amino' derivatives or its sequelae.
10. Chrome ulceration or its sequelae.
11. Anthrax.
12. Silicosis.
13. Poisoning by halogens or halogen derivatives of the hydrocarbons of the aliphatic series.
14. Pathological manifestation due to (a) Radium or other radio-active substances, and (b) X-rays.

15. Primary epitheliomatus cancer of the skin.
16. Toxic anaemia.
17. Toxic jaundice due to poisonous substances.
18. Oil acne or dermatitis due to mineral oils and compounds containing mineral oil base.
19. Byssionosis.
20. Asbestosis.
21. Occupational or contact dermatitis caused by direct contact with chemicals and paints. These are of two types, that is, primary irritante and allergic sensitizers.
22. Noise induced hearing loss (exposure to high noise levels)
23. Beryllium poisoning.
24. Carbon monoxide (poisoning).
25. Coal miners pneumoconiosis.
26. Phosgene poisoning.
27. Occupational cancer.
28. Isocyanates poisoning.
29. Toxic nephritis.

Rule 104 of the GFR, Rule 116 of the MFR and Rule 97 of the TNFR require that notice of poisoning or disease should be sent forthwith to the Chief Inspector, Certifying Surgeon, Medical Inspector of Factories and Administrative Medical Officer of ESIC. It should be in Form No. 22 (GFR).

4.2.3 Occupational Diseases under the W.C. Act and the ESI Act :

Sch. Ill u/s 3 of the Workman Compensation Act and u/s 52A of the Employees State Insurance Act rives a list of occupational diseases for which legal compensation is available. For detail this Schedule should be referred.

4.2.4 ILO List of Occupational Diseases:

ILO recommendation No. 194 of 2002 gives a list of occupational diseases as under:

(1) Diseases caused by chemical agents or their toxic compounds: - beryllium, cadmium, phosphorus, chromium, manganese, arsenic, mercury, lead, fluorine, carbon disulphide, halogen derivatives of aliphatic or aromatic hydrocarbons, benzene, nitro and amino derivatives of benzene, nitroglycerine, alcohols, glycols or ketones, asphyxiants, acrylonitrile, oxides of nitrogen, vanadium, antimony, hexane, mineral acids, pharmaceutical agents, thallium, osmium, selenium, copper, tin, zinc, ozone, phosgene, irritants like benzoquinone.

(2) Diseases caused by physical agents:- Noise, vibration, compressed air, ionizing radiations, heat radiations, ultra violet radiation, extreme temperatures (sunstroke, frostbite).

(3) Diseases caused by biological agents:-

(4) Diseases caused by target organ systems:- ' Respiratory diseases, Pneumoconioses, bronchopulmonary diseases, occupational asthma. Extrinsic allergic alveolitis, siderosis, chronic obstructive pulmonary diseases, lung diseases by aluminium, skin diseases, occupational vitiligo, musculo-skeletal disorders,

(5) Occupational Cancer caused by: Asbestos, Benzidine and its salts. Bis chloromomethyl ether. Chromium and its compound, coal tars, beta napththylamine, vinyl chloride. Benzene or its

homologues and its nitro & amino derivatives, ionizing radiation, tar, pitch, bitumen, mineral oil, anthrancene, etc. coke oven emissions, nickel compounds, wood dust.

(6) Miners' nystagmus.

4.3 Occupations involving Risk of Occupational Diseases and their Diagnostic Methods:

Following table gives a short synopsis of some occupational diseases, occupations involved and signs, symptoms and diagnosis.

Occupational Diseases Symptoms and Diagnosis				
	Diseases caused by	Occupational involved	Signs & Symptoms	Diagnosis / Indicator (see BEI if available)
Metals :				
1	Lead	Alloys, ammunition, lead batteries, lead lining, rubber, inks, lead burning, paints, ceramics, insecticides	Weakness, insomnia, motor weakness, muscle tenderness, impaired fertility, abdominal pain, lead line on gingival tissues	History, Pb in urine >65 µg/1 blood >30 µg/100 ml. Zinc protoporphyrin level>3 µg/gm HB
2	Phosphorous	Insecticides, fireworks, matchworks, explosives, detergents, chemicals	Irritation of respiratory tract, toothache, swelling of 'aw, facial disorder	History, teeth X-ray, pulmonary oedema in case of PCIs
3	Mercury	Acetaldehyde, acetylene, acetic acid, chlorine, thermometers, mercury vapour tubes, x-ray tubes, antifouling paint	Gingivitis, bitter taste in mouth, bluish line on gums, gastritis, bronchitis, nervous system effect	History, test for presence of tremors at rest or with movement In urine > 50 µg/ *l* In blood > 3 µg/ *l*
4	Manganese	Anti-knock agent in petrol, ceramics, electrode coating, glass, ink, mining, paints, pesticides, steel, alloy, tanning of leather	Chills, fever, headache, weakness, voice sinks, speech irregular, inability to run, cannot walk backwards	History, Mn in urine > 21µg/ *l* Faces > 60µg/ kg Hair > 4µg/ kg
5	Arsenic	Insecticides, fungicides, glass, metallurgy, pigment, rodent poison	Conjunctivitis, visual and nasal disturbances, cancer of skin, lung, larynx, gangrene of fingers	As in Urine > 1 mg/f Hair & nails may be useful
6	Chromium	Chromium plating, salts, leather tanning, photochemical processing, refractory bricks	Ulcers of nasal septum and fingers, irritation and conjunction pharynx and larynx, headache, jaundice, impaired liver function, lung cancer	Increased Cr in urine. Electrocardiogram, sputumgram stain and culture, white blood cell count and arterial blood gas analysis.
7	Beryllium	Alloys (as hardening agent) Nuclear reactors (as moderator), ceramics, fluorescent	Swollen mucous membranes, bleeding points, fissures and ulceration, weakness,	History, clinical tests. Be in lung tissue > 0.05 µg/100 gm is a strong indicator

		powders, lamps and tubes	weight loss, joint pain, breath shortness, skin injuries	
8	Cadmium	Alloys, (cadmium-nickel batteries, electroplating, engraving, soldering, paints for ceramics, glass, leather, plastics, rubber, inks. enamel	Chest tightness, nose irritation, cough, difficulty in breathing, vomiting, lung & kidney damage, dermatitis, anaemia, yellow teeth, metal fume fever, cancer and death	History Cd in blood > 5 μg/*l* indicates exposure
	Dusts :	Diseases of respiratory tract, caused by mineral dusts (silica, coal dust and asbestos; are called pneumoconiosis. They are silicosis and asbestosis. Fibres of sugar-cane cause bagassosis and those of cotton and textile cause Byssionosis.		
9	Silicosis	Sandblasting, cutting of quartzite, agate, gneiss, granite and slate. Manufacture - of glass, porcelain; pottery, mines, quarries, foundry and furnaces	Dyspnoea on exertion, cough, wheezing, chest illness, pulmonary TB or infection respiratory difficulty and death	Periodic radiological examination, egg-shell type calcification of lymph glands in 2-4% cases. Good chest X-ray with history. Should not be wrongly diagnosed as TB
10	Asbestosis	Asbestos mining and lining, insulation, safety garments, cement, fire blankets.	Chest pain, breathlessness, pleurisy, fever, leucocyfosis, cyanosis, finger.	History, chest radiograph, reduction in lung volume and forced vital capacity (FVC).
11	Bagassosis	Plywood	Breathing problem, cough, fever, chest pain, weakness, weight loss, sputum with cough or blood	History, gradual recovery after separating patient from contact of bagasse
12	Byssionosis	Plywood, cardboard, pressboards, paper, poultry feed, fertilizer, fuel, refractory bricks. Moist bagasse in sugar industry is not harmful. Dry bagasse is harmful	Breathing problem, cough, fever, chest pain, weakness, weight loss, sputum with cough or blood	History, gradual recovery after separating patient from contact of bagasse
13	Extrinsic allergic alveolitis.	Organic dust in animal and vegetable matter processing.	Dry cough, breathlessness, fever, muscular pain, sound in chest, asthma	History, sensitisation by antibodies, disturbances in lung function or positive inhalation provocation test.
	Gases, fumes, vapours etc. :			

14	Nitrous fumes	Nitration, use of nitric acid, neutralisation, bleaching of rayon.	Lung irritation, pulmonary oedema, vomiting, drowsiness, dizziness.	History, chest X-ray for basal scars, blood test for methaemoglobin, lung function affected.
15	Phosgene	Dyestuff, coal tar, urea isocyanates, acid chlorides, metallurgy, pharmaceuticals	Eye irritation, throat dryness or burning, vomiting, chest pain, cyanosis, skin or eye burns by splashes	History, electrocardiogram, sputumgram stain and culture
16	Carbon monoxide	Mines, tunnel work, boilers, blast furnaces, garages, industrial gases, metallurgy (as reducing agent), organic synthesis, metal carbonyls	Headache, tachypnoea, nausea, weakness, dizziness, cyanosis, syncope, hallucinations, mental damage. 50 ppm for 90 min cause aggravation of angina pectoris	History, cherry pink colour of blood, depression of ST segment of electrocardiogram, level of carboxyhaemoglobin > 40% collapse >25% headache, nausea
17	Iodine	Photographic film, iodine spray in salt	Irritation to eyes, nose and skin, lacrimation, blepharitis, rhinitis, stomatitis, chronic pharyngitis, headache and chesttightness	Electrocardiogram, sputumgram stain and culture, differential WBC count, arterial blood gas analysis
18	Fluorine	Electroplating, metal pickling, etching of glassware, artificial cryolite, insecticides, uranium compounds, aircraft piston engines, use a& HF acid	Laryngeal spasm, bronco spasm, pulmonary oedema, mild dyspepsia, exposure to mice showed liver and kidney damage	Fever, myalgias, lymphocytosis, radiographs of tibia and fibula show bony spicules, fluoride in urine and mother's milk
19	Chlorine	Chlor-alkali plant, use of Cl_2 gas, chlorination, bleaching process, metal fluxing, water cleaning, synthesis	Irritation of eyes and skin, substernal pain, vomiting with headache, damage, fall of BP arrest	Electrocardiogram, sputumgram stain and culture, differential WBC count and arterial blood gas analysis
20	Bromine	Manufacture or use of bromine, anti-knock compound for gasoline, bleaching agent, dyestuff, gold extraction, fuel additives, military gas	Irritation of eyes, nose, lungs and skin, inflammation of eye-lids, cough, vertigo, headache, nausea, diarrhoea, stomach pain, tongue & palate inflamed, chemical burns of lungs	Electrocardiogram, sputumgram stain and culture, differential WBC count and arterial blood gas analysis

21	Benzene	Chemical synthesis, use as solvent, reagent, fuel, detergents, pesticides, paint remover, shoemaking, producing other oro-anic chemicals	Narcotic action, CNC depression, irritation to skin and nose, euphoria, nausea, vertigo, damage to bonemarrow, blood-forming tissues, leukaemia	Phenol in urine (50 mg/g creatinine). For CNS syniptoms, neurologic examination. Complete blood count necessary
22	Hydrogen sulphide	Disinfectant, thiophene, inorganic sulphides, sulphuric acid, present in sewers, oil wells and petroleum products, natural decay of organic matter	Exposure of 500 ppm causes inflammation of nose, pharynx, bronchi & lungs, eye injury. 10 ppm for many days cause headache, weight loss, CNS disorders	History Periodical medical examination.
23	Acrylonitrile	Acrylic fibres, pesticide fumigant, organic synthesis	Eye irritation, sneezing, headache, vomiting, weakness, skin contact can cause blister and dermatitis, inhalation may cause death	History Measurement of blood pH, plasma bicarbonate and blood lactic acid.
	Chemical Compounds :			
24	Oragano phosphorous	Pesticides – parathion, malathion etc.	Fast absorption through inhalation, ingestion and skin contact, convulsions, vomiting, blurred vision, coma, BP increases and drops before death, oedema of lungs, loss of appetite, cyclical movement of eye-ball (nystagmus)	History 60% or more decrease in blood cholinesterase activity. Serum cholinesterase depressed in serious cases. Changes in blood picture (leukocyte count & formula) with a shift to the left. Increased secretion of saliva, 'tears and mucus
25	Carbon disulphide	Solvent used for alkali; cellulose, fats, oils, resin and waxes. Viscose rayon pesticides. oil extraction	Neurotoxic poison. ; Nausea, vomiting, , headache, excitation of nervous system, vision and sensory changes, chronic fatigue. Sexual, menstrual disorder & abortions in women	TTCA in urine 5 mg/g creatinine (at the end o) shift), blood and urine test iodineazide test of urine medical examinations
26	Halogen derivatives of aliphatic hydrocarbons viz. chloroform, chloromethane, vinyl chloride,	Solvents, refrigerant; anaesthetics, fumigant; plastic intermediate; gauge fluids	Lung irritants, eye and , skin injury, vinyl chloride , is carcinogen, effects on nervous system, headache, nausea, convulsions, paralysis,	History, for CN depression blood glucose rectal temperature to b noted and neurologicc examination. Live function test if liver

	CCl_4 etc.		affected speech, effect on kidneys and liver	suspected
27	Isocyanates	Polyurethane, PUF, paint Pesticides. varnishes	Irritation of skin, eye an mucous membrane respiratory system, asthmatic effect, rhinitis.	History, workers wit respiratory antecedents are more affected
28	Nitro/Amido toxic derivatives of benzene or it' homologues	Antioxidants, dyes explosives, insecticides pigments, plastics, resins rubber, solvents, textiles pharmaceuticals, fuel additives, elastomers	Cyanosis, anaemia, fatigue, nausea, chest pain, numbness, difficulty in breathing. Dermatitis due to DNCB. Liver damage due to 2-4 dinitro toluene. Some are carcinogens.	Urine & blood analysis. Haemoglobin should not be below 13 g/100 ml. Methamoglobin above 10% indicates . high exposure
29	Dinitro phenol, its homologue or salts	Dyes, explosives, wood its homologue preservative and chemical or salts production	Dermatitis. If ingested results in cataracts. Inhalation may damage liver, kidneys and induce fever. Skin contact makes the skin yellowish	History, skin pigmentation, presence of dinitro or aminonitro phenol in urine (Derrien's - Test)
30	Hydrofluoric acid	Fluorides, fluorocarbons, metal refining, pottery, etching glass	Irritation of eye, throat and nose. Skin burns. Oedema of lungs after 12 to 24 hours	History. Differential WBC count, electrocardiogram, sputumgram stain and culture
31	Fluoro-acetic acid, Sodium fluoroacetate & compounds	Chemical weapons, insecticides, pesticides, rat poison	Nausea, vomiting, stomach pain, low BP, convulsions after 6 hrs, effect on CNS and CVS	History, organically bound fluorine in body and increase of citrate in kidneys
32	Nitro-glycerine or nitroacid esters (e.g. nitro-cellulose)	Cardiovascular drugs, explosives	Headache, dullness, reduced BP, nausea, vomiting, weight loss, cyanosis, CNS disorders, hallucinations, heart problems, skin effect, ulcer under nails	History, Electrocardiogram if chest pain is reported
33	Methanol	Antifreeze mixtures, dewaxing preparations, dyes, formaldehyde, inks, paints, plastics, textile soaps, unshutterable glass, water proofing, as solvent	Enter through skin (may cause death), mouth and nose. If swallowed, can cause blindness, headache, vomiting, diled pupils, constant movement of eyeball (nystagmus), skin inury	History Disturbance in vision In urine – Methanol > 10 μg/ml formic acid - present

34	Acetone	Use as solvent. Production of acetic anhydride, chloroform, vitamin C. celluloid, explosives, iodoform, Used in dying, leather, lubrication, rubber, silk, varnish	Irritation to skin and mucous membrane. Difficulty in bread-ling. Damage to kidney and liver. Headache, blood changes, skin dryness & redness.	History, albumin, RBC & WBC in urine indicate damage to kidneys. High levels of urobilin and bilirubin indicate damage to liver.
35	Ketones	Use as solvent. Production of artificial silk, cosmetics, perfumes, plastics, explosives and pharmaceuticals	Narcotic Irritation to respiratory system, CNS affected	Medical examination of nerve, conduction velocity', CNS, eves, kidneys, liver and respiratory system
	Radiation :			
36	Radioactive substances and ionizing, radiation (X, A, B, G rays)	Radiography, gas chromatography, nuclear reactors, uranium mining, aerosol fire detectors, radioactive tracers, radium dial painting, Xray clinics	Exposure above I Gray results in nausea, vomiting, diarrhoea, intestinal symptoms, ulceration in mouth and throat, hair loss. Late effects leukaemia and cancer	Drop in lymphocyte count followed by slower and biphasic fall in granulocyte and platelet counts. Possible fall in RBC count. In intestine, ulceration of mucous membrane possible
37	Cataract by IR radiation	Arc processes, hot furnaces, lasers, molten lass. molten metal	Eye lens or capsule become opaque	History. Regular eye examination.
	Noise & Vibration :			
38	Hearing loss	High noise levels in loom shed, POY spinning dept., compressor room, pneumatic chipping or machining.	Ringing in ear, difficulty in hearing (e.g. ticking clock), sound perceived in abnormal manner	Audiometric examination and noise level measurement in work place
39	Decompression sickness	Work I compressed air or with vibrating tools or equipment, deep sea diving.	Dizziness, nausea, blood formation in ear drum, limb pain, skin effects, headache, coronary dysfunction, bone or joint pain.	Regular medical examination for respiratory and cardiovascular problems. Radiographs of shoulder, hip and knee joints.
	Bio-hazards :			
40	Diseases caused by biological agents (see part 7.2.2 also)	Contact with domestic, laboratory and other animals, laboratories, hospitals, dairy, forestry, meat or bone processing, poultry, tanneries	Anthrax (see part 9.4 also), dermatitis, inflammation, infection, jaundice, fever, upset stomach, muscular pain, headache, skin effect etc.	Redness or discoloration of skin, glandular tumour. In fungal infections swelling of fingers. herpes virus may cause

				meningitis.

Mode of causation may be many but the routes of entry in the body are inhalation, ingestion, skin contact and injection as explained in Part 6.6

Diagnostic Methods or tests are necessary to detect the disease. They are general as well as specific. Before selecting such test it is always useful to know the occupation of the worker, chemicals and other physical, biological agents involved in the occupation, work environment, work methods, protective wears used or not used, personal habits, family history and other possible combined causes which may be contributory to the cause of the disease, illness or poisoning. Some general or common diagnostic methods are given below and others in the table following.

Medical history and records.
Clinical examination.
Eye examination.
Biological examination of blood, urine, faeces (stools), breath, plasma, hair, nails, sweat, tissue, body organ etc.
Haematological indicators.
Spectrophotometric analysis.
Measurement of FEV 10.
Pathological tests.

Audiometry and measurement of noise level.
X-ray and radiographs.
Lung function and FVC test.
Lever function test.
Step test
Medical Examinations :
- Pre employment
- Pre placement
- Periodic
- Special
- Post sickness
- On request
- Retired workers

Cardiogram.
Sonography.

4.4 Evaluation of Injuries :

Evaluation of industrial injuries is required for the purpose of assessing the workmen compensation.

Injuries may be scheduled (Sch I & III, WC Act) or non-scheduled and it may result in (a) Death, (b) Permanent total disablement (c) Permanent partial disablement and (d) Temporary disablement, total or partial, as per section 4 of the WC Act.

For the Scheduled injuries, Sch. I gives percentage of loss of earning capacity for the injury type (b) and (c) mentioned above.

For non-scheduled injury, loss of earning capacity is to be assessed by a doctor as per section 4 (1) (c) (ii) of the WC Act, and while such assessment, the doctor has to give due regard to the percentages of loss of earning capacity in relation to different injuries specified in Sch. 1.

Loss of earning capacity depends on loss .of function which varies from part to part and its,, components are motion, strength and co-ordination.

In upper extremity, loss of each factor in the sholder has following estimation :

Motion	- 50%
Strength	- 30%
Co-ordination	- 40%
Disability of arm radical	- 50%
Disability of hand radical	- 30%
Disability of entire extremity	- 50%

In lower extremity, main function is weight bearing. The components of the function are motion, strength and weight bearing.

For fracture of the central .body part, the assessment is as under :

1.	Lumber region	-	50 to 100%
2.	Dorsal region	-	25 to 50%
3.	Cervical region	-	20 to 30%
4.	Spinous or traverse process	-	5 to 10%
5.	1 rib	-	No disability
6.	3 to 4 ribs	-	5 to 10% when there are after effects
7.	Sterrum	-	5 to 10%

Another assessments are as under :

EYE:

1	Loss of vision of both eyes	-	100%
2	Loss of vision of one eye	-	30%
3	30% loss of vision	-	9%
4	40% loss of vision	-	12%
5	50% loss of vision	-	15%

EAR:

1	Total loss of hearing	-	100%
2	Loss of hearing of one ear	-	15%
3	Loss of voice	-	25 to 50%

HEAD:

1	Headaches and giddiness	-	10 to 20%

See Part 7 for worked examples.
See Part 9 of Chapter 26 also.

4.5 Occupational Health Services & Medical Examinations:

4.5.1 Meaning and Functions of Occupational Health Services :

Occupational health service, is operated ' to achieve the statutory declared aims of occupational health by medical and technical measures. Its role is mainly preventive and to give first aid and emergency treatment. It is certainly useful in early detection of any occupational or non-occupational disease or any mal-adjustment of the man-job relationship.

Occupational health services include

1. Medical examinations : pre-employment, periodic and others.
2. Supervision of the working environment industrial hygiene, safety, job analysis and adaptation of the job to the worker in good working conditions.
3. Advice to management and workers.
4. Health education and training.
5. Health statistics.
6. Medical treatment-first aid, emergency and ambulatory treatment.
7. Health counselling-individual.
8. Nutrition
9. Family planning.
10. Research in occupational health.
11. Co-operation with other services in the undertaking.
12. Collaboration with external services.

Other purposes of industrial medical services are : (1) Identifying the hazards (2) Preventing or minimising the hazards (3) Curative treatment in case of exposure and (4) Determining the compensation for damages.

The services can be broadly divided into four phases : (1) Constructive medicine (2) Preventive medicine (3) Curative medicine (4) Educative medicine.

Constructive medicine includes - (1) Preplacement examinations (2) Periodic health examinations (3) Premature medical retirement.

Purpose of Periodic Health Examination arc : (1) To anticipate and prevent diseases (2) To detect potential illness and troubles in time and (3) To assist workers in maintaining normal health curve.

Periodic Health Check-up includes:

1. Complete clinical check-up.
2. X-ray of chest.
3. Vision testing.
4. Blood routine, sugar and cholesterol.
5. Urine routine.
6. ECG for workers above 40 years.
7. Indirect laryngoscopy for workers above 40 years.
8. Spirometry for workers employed in dusty, and smoky environment.
9. Audiometry for those, working in noisy environment.

See also Form XXII u/r 37 of the Insecticides Rules, 1971 in Part 4.2 of Chapter-28.

Industrial Medical Services in broad sense should be as follows:- -

Sr. No.	Facility	For No. of Workers.	Staff
1	First aid box (post)	Less that 150	Trained first aid attendant in

			each workshop.
2	First aid room of @ 35 m^2	Between 150 to 500	As above plus part time or full time nurse.
3	Medical Examination Room (Ambulance Room)	Between 500 to 1000 Trained first aid.	Trained first aid attendant for each shift plus nurse and Health Officer.
4	Factory Medical Centre	More than 1000	As above (3) plus one or more Health Officer, clerical and laboratory staff.
5	Factory polyclinic with different ambulatory services.	More than 10,000	As above (4) plus one or more specialists.
6	Factory hospital	Very large factory	Hospital staff.

4.5.2 Statutory Requirements :

Section 45 of the Factories Act and Rules there under require first aid and ambulance room facility with a qualified first- aider and prescribed medical and nursing staff readily available at factory premises. Section 41-C and Rule 68R to 68W(GFR) made there under have added following medical services at the work place for workers engaged in hazardous processes.

(1) Health Records (Rule 68R) :

Workers engaged in hazardous process shall be given their health/medical record under following conditions.

1. Once in every 6 months or immediately after his medical examination whichever is earlier.
2. If the worker shows signs/symptom? of any notifiable disease listed in the Third Schedule of the Factories Act (See Part 4.2.2).

3. If the worker leaves the employment.
4. If directed by the authority like the CIF Authorities under the W.C. Act, ESIC anc DGFASLI.

A copy or up-to-date health record including worker's exposure. X-ray film and medical diagnostic report may be given for reference to his medical practitioner. Form XXII u/r 37 of the Insecticides Rules, 1971 is one such statutory form. It is given in Part 4.2 of Chapter-28.

(2) Medical Examination & FMO (Rule 68T & U):

1. Workers employed in hazardous process shall be medically examined by a qualified medical practitioner called as factory medical office] (FMO). It is prescribed u/r 68U as under
   Full time FMO for workers > 200
   Part time FMO for workers 51 to 200.
   Retainer FMO for workers < 50
   1 FMO for more next 1000 workers or par

2. Pre-employment and six monthly periodical examinations are required.
3. Report of above examinations shall be in form No. 32.
4. First employment only after fitness certificate in form No. 33, Appeal regarding unfit, shall lie with the Certifying Surgeon (CS) whose opinion shall be final.

5. FMO will report to the CS, any abnormality/ unsuitability noticed by him. The CS will examine that worker and communicate his findings to the occupier within 30 days.
6. The CS on his own or on reference from the Inspector shall examine a worker employed in hazardous process. His opinion is final. His fees shall be paid by the occupier.
7. The worker suspended from employment on health ground may be re-employed in the same process after obtaining the fitness Certificate from the CS and after making its entry in form No. 32.
8. The worker required to undergo medical examination will not refuse it.

(3) Occupational Health Centres (OHC) (Rule 68U):

Type of OHC is prescribed for 3 classes of factories (1) Workers upto 50 (2) Workers 51 to 200 and (3) workers more than 200.

Size of OHC, equipment, nurse and staff, qualification and training of FMO, syllabus and course are also prescribed.

A certificate of Training in Industrial Health of minimum 3 months or a Diploma in Industrial Health is prescribed as necessary qualification for FMO, in addition to his MBBS degree.

Appointment of FMO shall be notified to the CIF within one month.

(4) Ambulance Van (Rule 68V) :

A hazardous factory employing more than 200 workers shall maintain in good condition, a suitably constructed ambulance van equipped with items prescribed. It should be manned with a full time driver cum mechanic and a helper trained in first-aid. -It will normally be stationed at or near the OHC.

A factory employing less than 200 workers may make arrangements for procuring such facility at short notice from a nearby hospital or other places to meet an emergency

5 STATUTORY PROVISIONS

Section 2(cb) of the Factories Act, 1948 defines "hazardous process" which would cause material impairment to the health or-pollution of the general environment. Sections 7A and 7B impose general duties on the occupier to ensure health and safety at work of all workers. The Section 36 speaks of the permissible limits of gas, fume, vapour or dust in any confined space. Section 41F prescribes for the permissible limits of exposure of chemicals and toxic substances (Second Schedule which is reproduced as Table-15 in. Chapter32). Section 41H creates duty to remove imminent danger to life or health. The whole Chapter IV-A makes the health and safety provisions more stringent. Section 87A creates power to prohibit employment on account of serious hazard. Section 89 requires notice of occupational diseases given in the Third Schedule wherein 29 diseases are named. This is reproduced in Part 4.2.2 of this Chapter. Section 91A provides for safety and occupational health surveys.

Rule 54 and 102 of the Gujarat Factories Rules, 1963 provide many safety provisions for dangerous operations which are more serious and cause occupational diseases and poisoning. Other rules for dust, fume, ventilation and temperature, disposal of waste and effluents, lighting, drinking water, latrines, urinals, spittoons, cleanliness, washing facilities, machine guarding, first-aid, canteen, dining hall, creche, notice of accident, poisoning and diseases are also for the health protection. Schedules for safety in solvent extraction plants, carbon disulphide plants, chemical works pottery, foundry, asbestos, electroplating and carcinogenic dye- intermediates have come into force from 152-95. They should be referred for safety. All schedules under rule 54 and 102 are most important and must be strictly followed. Form No. 37, Rule 12B requires work environment monitoring and record. See Reference No. 38 for more details. Rules 53, 61, 61 A to Q, 62 A toT, 63, 64, 95 and 102A of .the Tamil Nadu Factories Rules 1950 also provide similar details.

See Chapter-28 and its Part 5 for radiation health effects. Part 4 for toxic effects of insecticides. Part 10 for chemical health effects and Part 7 for health hazards to construction workers. These Acts and Rules provide for statutory control measures also.

6 INDIAN STANDARDS

Many IS are available on chemical, health and other safety areas which should be selected from the sectional lists of BIS (Bureau of Indian Standards) Handbook. IS on fire, chemical, textile, engineering, personal protection, plant design, ventilation, lighting etc. are already given in the respective chapters. Some more are mentioned below :

Air pollution-glossary of terms 4167, measurement methods of different exposures 5182 (20 parts), petroleum refiner,- 10179, 8636, 10044, fertiliser plants 8635, 9005, work environment monitoring (airborne contaminants) 9679, water pollution-textile industry 9508, electroplating industry 7453, fertiliser industry 9841, paper industry 5061, steel plant 8073, industrial effluents, sampling and test 2488, (5 parts) toxicity 6582, tolerance limits 2490 (9 parts), noise, ear protectors 9167, noise emitted by machines 4758, assessment of noise exposure 7194, noise reduction 3483, chemical sampling 8883, gas industry, glossary of terms 7062, ergonomic design 10224, safety colours and signs 9457, solid waste-glossary 9569, drinking water 10500, method of sampling and test for water used in industry 3025, industrial radiography 2596, 2478, 2598, radiation protection 6567, 7064.

7 WORKED EXAMPLES

(A) Determining Respirable Dust Concentration

Concentration if expressed as a mass (mg) per unit volume (m3) and shown in following equation:

C(mg/m3) = mass of sample (mg) / Volume of sampled air (m3)

The mass can be simply obtained from the gravimetric determination of the dust, after taking into account any difference with the blanks. The volume can be calculated using following equation

$V(m^3)$ = Flow Rate (L/min) x Duration of monitoring (mins) /1000

Example-1 :

Respirable dust sampling was conducted in Tobacco crushing unit over 8-hours by Industrial Hygienist. The calibration of the sampling train was checked before and after sampling and found to be 1.9 L/min. The mass of the sample on the filter was found to be 3 mg. What is the concentration of respirable dust?

Solve for concentration (mg/m^3) = mass of sample (mg) /volume of sampled air (m^3)

To determine volume (V)
= 1.9 L/min x 480 minutes / 1000
= 912 litres = 0.912 M^3

Concentration of resperable dust C

= 3.0 mg /0.912 m^3 = 3.3 mg/m^3

(B) Calculations For Crystalline Silica Exposures

Where the employee is exposed to combinations of silica dust (i.e., quartz, cristobalite, and tridymite), the additive effects of the mixture will be considered.

Example-2 :

Two consecutive samples from the same employee working in metal ferrous mine taken for a combined exposure to silica dusts have the following results shown below in Table. Calculate for Silica Exposure in terms of percentage of quartz. Permissible limits, TWA and Severity.

Results of Samples of Silica Dust

Sample	Sampling period (min)	Total volume (L)	Respirable weight (mg)	Respirable concentration (mg/m^3)	Laboratory results (%)
A	238	405	0.855	2.1	5.2 quartz 2.3 cristobalite ND tridymite
B	192	326	0.619	1.9	4.8 quartz 1.7 cristobalite ND tridymite
Total	430	731	1.474		
ND = Not detectable					

Calculation of the TWA from the sampling and analytical data:

Step 1. Calculate the percentage of quartz, cristobalite, and tridymite in the respirable particulate collected.

Quartz: 5.2 (0.855/1.474) + 4.8 (0.619/1.474)
= 3.0 + 2.0 + 5.0%
Cristobalite : 2.3 (0.855 / 1.474) + 1.7 (0.169 / 1.474)
= 1.3 + 0.7 = 2.0%

3Step 2. Calculate the Permissible Exposure Limit (PEL) for the mixture.

$$PEL_{mixture} = \frac{10\ mg/m^3}{\%\ quartz\ + 2\ (\%\ cristobalite)\ + 2(\%\ tridymite)\ + 2}$$

= 10 / [5.0 + 2 (2.0) + 2 (0) + 2] = 10 / 11.0
= 0.91 mg/m^3

Step 3. Calculate the employee's exposure. Exposure (Sample wt. A + Sample wt. B)/ Total volume
= (0.855 +0.619)/0.731 =
= 2.0 mg/m^3

Step 4. Adjust (where necessary) for less than 8-hour sampling period.

$TWA = (2.0\ mg/m^3)[(430\ min)/(480\ min)]$
$= 1.8 mg/m^3$

Step 5. Calculate the severity of the exposure.
$(1.8\ mg/m^3)/(0.91\ mg/m^3) = 2.0$

(C) When two or more hazardous substances have a similar toxicological effect

When two or more hazardous substances have a similar toxicological effect on the same target organ or system, their combined effect, rather than that of either individually, should be given primary consideration. In the absence of information to the contrary, different substances should be considered as additive where the health effect and target organ or system is the same.

That is, if the sum of: $C_1/T_1 + C_2/T_2 + ...Cn / Tn = 1$

Where, C1 indicates the observed atmospheric concentration and T, is the corresponding threshold limit)

Example-3

Air contains 400 ppm of acetone (TLV,750 ppm),150 ppm of sec-butyl acetate (TLV,200 ppm) and 100 ppm of methyl ethyl ketone (TLV,200 ppm).

400/750 + 150/200 + 100/200
= 0.53 + 0.75 + 0.5
= 1.78

Threshold limit is exceeded.

(D) Calculation for Workmen Compensation:

Compensation for occupational diseases is payable u/s 3 of the Workmen's Compensation Act, 1923. Subsections (2 to 4) provide as under :

1. Contracting of the disease peculiar to the employment and specified in Part A, B & C of Schedule III (mentioned in foregoing part 7.2.4) is to be considered as an injury h/ accident arisen out of and in the course of the employment.
2. For Part A diseases, compensation is payable irrespective of any length of service as the incidence rate or possibility of such diseases is high and very obvious.
3. For Part B diseases, compensation is payable provided a service of 6 months is completed, as these diseases are very specific to certain chemicals and their incidence rate is slightly lower than that of Part A diseases.
4. For Part C diseases, compensation is payable, irrespective of length of service and even if the affected worker has worked under one or more employers, as these are lung diseases and their effect is delayed i.e. visible after 5 to 10 years of service.
5. Compensation is payable for Part B & C diseases even after the cessation of the service.
6. For Part C diseases and for working under more than one employer, all the employers are liable to pay compensation in proportions decided by the W.C. Commissioner.

7. For any other disease, if it is directly attributable to a specific injury by accident arising out of and in the course of employment, the compensation is payable.
8. Compensation is not payable if any suit for damages is filed in the court or a suit for damages shall not be maintainable if a claim for compensation is filed before the W.C. Commissioner, or if any agreement is made between the workman and his employer to pay in accordance with the WC Act.
9. The doctor shall refer Schedule I while 'assessing percentage loss of earning capacity.
10. The maximum period of half-monthly payment for temporary disablement is 5 years, and wage limit of Rs. 4000 is not applicable in this case.

Examples :

Section 4 and Schedule I, III and IV are to be seen simultaneously. Monthly wage limit is Rs. 4000.

For example, if death occurs due to any disease mentioned in Sch. Ill, payment should be as per Section 4 (1) (a).

Example 4 :

A worker of 24 years (completed) and drawing monthly wages of Rs. 3800, dies due to any disease mentioned in Part A or C or any disease in Part B if his service is of more than 6 months, amount of compensation shall be

= 0.50x3800 x 218.47 (Age factor)
= 1900 x 218.47
= Rs. 4,15,093 or Rs. 8,000
whichever is more.

Note : If monthly wages are more than Rs. 4000 per month, consider Rs. 4000/- only for the purpose of calculation. Age factor is derived from Schedule IV based on completed years of age,

Example .5 :

A worker gets any of the permanent total disablement mentioned in Part I of Sch. I, due to occupational disease in Part III, and his age and monthly wages are 48 and Rs. 5600 respectively. Compensation will be-

= 0.60 x 4000 x 159.80
= 2400 x 159.80
= Rs. 3,83,520 or Rs. 90000
whichever is more. Example 6 :

A worker loses partial vision of one eye (item 26A, part II, Sch. 1) due to occupational cataract by infrared radiation (item II, Part B, Sch. Ill) at the completed age of 40 with monthly wages Rs. 6500. Compensation shall be -

= 0.10 x 4000 x 184.17
= 400 x 184.17
= Rs. 73668.

Example 7 :

A worker suffering from silicosis (e.g. any lung disease) - injury not specified in Sch. I, but certified by a doctor as '80% loss of earning capacity (permanent partial disablement)' at his age of 58 and monthly wages Rs. 9600, his compensation shall be = 0.80 x 4000 x 124.70 = 3200 x 124.70 = Rs. 3,99,040.

Example 8 :

A worker's whole middle finger is amputated (item 31, Part II, Sch. 1) due to chrome ulceration and his lung damaged by 30% permanent partial disablement as assessed by the doctor, due to exposure to chromium vapours, and his age and monthly wages being 38 and Rs. 5600 respectively, his compensation shall be

(1) For finger damage
= 0.12x 4000 x 189.56
= 480 x 189.56
= Rs. 90988.80

(2) For lung damage
= 0.30 x 4000 x 189.56
= 1200 x 189.56
= Rs. 2,27,472

Total Rs. 90988.80 + 227472.00
= Rs. 3,18,460.80

Comparing with permanent total disablement [Sec 4 (1) (C), Explanation - 1]
= 0.60 x 4000 x 189.56
= 2400 x 189.56
= Rs. 4,54,944 or Rs. 90000

whichever is more.

As amount Rs. 318460.80 does not exceed Rs. 454944, total compensation payable in this case is Rs. 318460.80.

Example 9 :

A worker worked in three sugar mills in a continuous period of 16 years and it was detected that he was suffering from bagassosis due to sugarcane dust. This was found at his age of 45 and monthly wages Rs. 7800. The lung damage (permanent partial disablement) assessed by a doctor is 50%. Calculate the compensation payable by each of the three employers.

Compensation

= 0.50 x 4000 x 169.44
= 2000 x 169.44
= Rs. 338880

As per Section (2-A), each employer may pay Rs. 338880/3 = Rs. 112960 to the worker, or in the proportion decided by the WC Commissioner depending on the facts of his case. The employer in whose sugar mill suppose the dust concentration was higher or for longer duration, may be directed by the Court to pay more proportion of the total amount.

Example 10 :

A worker while handling organo phosphorous compound, undergoes toxic effect and remains absent for 3 months as per medical finding of this cause and advice. To what compensation he is entitled for this temporary disablement? He is drawing Rs. 4500 per month

As per Section 4 (1) (d), he is entitled to a half monthly payment of 25% of his monthly wages i.e. 0.25 x 4500 = Rs.ll25 from the 16th day from the date of disablement.

Here ceiling of Rs. 4000 per month is not applicable. It is applicable to death or permanent total disablement only [Explanation II to Sec 4 (1)1.

EXERCISE

1. State, Explain, Discuss:

1. Define and explain the meaning of Industrial Hygiene.
2. How work of Industrial hygienist. Safety Officer and Occupational Health Specialist is useful to each other?
3. Classification of occupational health hazards.
4. Adverse effects of health hazards and their control measures.
5. Biological effects of ionizing radiation and their controls.
6. What is radiation accident? State its control measures.
7. Classification of air borne contaminants.
8. 'What is particulate matter? Explain their types and how they are generated.
9. Routes of entry of toxic material into human body.
10. Toxicity, Toxicology and its main elements.
11. Purpose and Types of Air Sampling.
12. Main parts of any sampling instrument.
13. Biological Monitoring and its Determinants.
14. Three level control measures for health hazards.
15. Types of Engineering controls for health hazards.
16. Types of Medical controls and Administrative controls for health hazards.
17. Physiology and work physiology.
18. Muscular work, physiological factors and physiological reactions.
19. Assessment of workload.
20. Nutrition, Diets, Physical fitness and their relationship.
21. What are Ergonomics and its usefulness for safety?
22. Examples of application of ergonomics.
23. Safe use of muscle and lever systems in load carrying.
24. Physiological problems with load carrying.
25. Ergonomic Office furniture and Utility tools.
26. Types of Dusts and their effects.
27. Different dust control methods.
28. Preventive measures for occupational dermatitis.
29. Preventive measures for occupational cancers.
30. Statutory provisions of Medical Examinations for workers.

2. Write Short Notes on :

1. Branches of Occupational health.
2. Types and limits of atomic radiation.
3. Health Physics. OR Application of ionizing radiation.
4. Decontamination of ionizing radiation.
5. Uses of Radio and Microwaves and their Safety measures.
6. Radar, its Hazards and Control measures.
7. Laser beam, its Hazards and Control measures.
8. Types of gases and vapors.
9. Factors and Types of Toxic effects.
10. Dose response relationship.
11. Recognition and Evaluation of health hazards.
12. Air sampling methods
13. Air sampling strategies.
14. Air sampling devices.
15. Samples Analysis methods.
16. Examples of Direct and Indirect biological monitoring.
17. Air quality and Stack monitoring.
18. Air pollution control systems.
19. Cardiac Cycle.
20. Muscle contraction.
21. Consequence of Muscular work.
22. Criteria for fixing limits of manual lifting and carrying.
23. Aerobic work capacity arid factors affecting if.
24. Physiological safe limit for continuous work.
25. Tests for physical fitness.
26. Fatigue and rest allowances.
27. Functions of Nutrients.
28. Factors affecting work performance.
29. Constituents of Ergonomics.
30. Areas where Ergoftomic design is most useful.
31. Design of Tools in relation to body postures.
32. Concept of Percentiles in ergonomics.
33. Ergonomic design of Machine Controls and Displays.
34. Location of machine controls and their sequence of operation.
35. Natural expectation of control movement.
36. Inadvertent activation.
37. Ergonomic Foot Controls.
38. .Displays and Light signals.
39. Dusts and Lung diseases.
40. Occupational dermatitis OR Occupational Cancer.
41. Diagnostic methods for occupational
42. Types .of occupational health services OR Types of periodic health check-up.
43. Industrial Medical services.
44. Health Records.
45. Occupational Health Centre OR Ambulance Van.

3. Explain the Difference between :

1. Industrial Hygiene and Occupational Health.

2. Occupational health and Public health.
3. Occupational and Non-occupational hazards.
4. Environmental and Non-environmental Occupational hazards.
5. Health effects of Noise and Vibration.
6. Ionizing and Non-ionizing radiation.
7. Infrared and Ultraviolet Radiation.
8. Gases and Vapors OR Gases and Particulate Matters.
9. Corrosive and Explosive OR Mutagen and Teratogen.
10. Ignitable, Flammable and Extremely Flammable.
11. Ceiling limit and Exposure limit.
12. TLV and STEL OR STEL and IDLH.
13. LC50 and LD50 OR Neurotoxin and Hepatotoxin.
14. TLV and BEI OR TLV and Excursion Limit.
15. Qualitative and Quantitative Exposure Assessment.
16. Direct and Indirect Biological monitoring OR Area and Personal Monitoring.
17. Grab sampling and Integrated sampling.
18. Thermal incineration and Venturi Scrubber.
19. Medical Controls and Administrative Controls.
20. Anthropometry and Biomechanics.
21. Respiratory Quotient and Respiratory pigment.
22. Light, Moderate and Heavy work.
23. Skin irritants and Skin sensitizers.
24. Silicosis and Asbestosis.
25. Bagassosis and Byssionossis.

4. Comment of the following explaining whether it is True or False.

1. If industrial hygiene practices are implemented, there will be less work for occupational health specialist.
2. Ionizing radiation is less hazardous than non-ionizing radiation.
3. Vapor particles are smaller than gas particles.
4. TWA,. STEL and Ceiling limit - all are TLVs.
5. Material having LD50 200 is more toxic than that having LD50 20.
6. Fibrosis is caused by hard metals and Siderosis by Iron.
7. CO poisoning is not a notifiable disease.
8. Arsenic may cause lung disease while Vinyl chloride may cause liver disease.
9. Beryllium affects bone while lead affect kidney.
10. Benzene affects prostable while Cadmium affects mouth.

CHAPTER – 25

Personal Protective Equipment

THEME

1. NEED AND LIMITATION

For any accident prevention work, engineering control is the best control, and aid of personal protective equipment should be the last resort or a supplementary control. Nevertheless importance of personal protective equipment (PPE in short) is not less, its scope and utility have been tremendously increased during last few years and wide varieties of such equipment are available in the market. This requires proper selection of quality and utility for specific purpose. The problem is not of the availability, but is of its use by workers on the shop floors. Particularly in a country like ours where the majority of workers are illiterate, not safety conscious and not trained to wear such equipment, the problem becomes more acute mostly in small and medium scale factories.

The statistics of accidents exclusively due to non-use, misuse or defects of PPE is not available as there is no such distinct accident classification. But if we consider causes No. 7 to 15 in Table 5.20, Chapter5, it can be said that in 1997, out of total 246 fatal accidents due to these causes, at least 160 i.e. 65.04% could have been prevented by the proper use of PPE. Total of causation No. 120 to 131 in the last row of Table 5.22, Chapter-5, gives 65.89% (10334 out of 15683 accidents during 1994) fatal and non-fatal accidents. Of this at least half i.e. 33% of total accidents could have been prevented by the effective use of PPE. The conclusion is that @ 30 to 40% of total accidents can be prevented or controlled by the proper use of personal protective equipment. This figure is not small and highlights the need of PPE.

Most of the minor accidents are due to material handling, striking against objects, hurt by falling bodies, falling or slipping, injury by hot substances or chemicals and neglecting PPE. Such accidents can certainly be reduced to great extent by the effective use of appropriate PPE.

The PPE provides good defence against hazards of toxic exposure, oxygen deficiency, dusting, chemical splashes, steam, water and liquids, flying particles, hot substances, radiation, sharp edges, welding, cutting, grinding, striking against and stepping over objects, glare, personal falls and injury due to falling bodies, noise, scrap cleaning, material handling, opening of pipe lines or any hazardous work, electric shocks, burns and fire fighting. Many fatal accidents are caused due to these reasons and use of appropriate ' PPE can prevent or lessen many of them.

Limitation of the protection by PPE should be well understood. Respirators have limited use for the concentration and time mentioned by the manufacturer. They cannot be used in higher concentration for longer time. In heavy concentration, only self breathing apparatus (SBA) is recommended and that too for a limited time. Instead of providing hood and suction on flying particles, there is no meaning of giving respirator to a worker. Instead of providing guard on a grinding wheel, it is meaningless to provide eye protection to workers. Instead of sealing leakage of gas or dust or allowing to continue, it is unsafe to advise the worker to use gas mask. Similarly instead of trying to reduce pollution, it is of no use to tell the workers to use PPE only. It is always safer to improve the working conditions by engineering controls first. Then only the use of PPE may be recommended. It is the second line of defence.

PPE is a second line of defence. The first line is to eliminate or minimise the workplace hazards. PPE cannot eliminate the hazard, it can help eliminate an injury or reduce its severity.

I remember a few fatal accidents from my investigation where I was of the opinion that besides engineering controls, PPE could have prevented such accidents. When an engineering control fails or becomes ineffective, what is the protection? Then this line of defence (i.e. PPE) comes to help and protect in most of the cases. In one case a worker died due to phosphine exposure and in another case due to chloroform vapour in a tank. In third case due to a splash of 2-4 dichlorophenol a worker died within 15 minutes. In still other case, a worker died due to pesticide exposure in delayed effect. All four were young workers and died due to these toxic chemicals. If they would have worn appropriate PPE, they could have been survived. This shows the significance of need of PPE. Though PPE cannot eliminate the hazard (like engineering control) it can certainly protect from it.

The need of PPE can be well judged from:

1. Visual and foreseeable hazards.
2. Accident experiences.
3. Report of the safety committee/ representatives.
4. Safety audits, surveys, sampling, job safety analysis and risk assessment.
5. Legal requirements and remarks of the authorities.
6. Record of the medical department.

The need of PPE exists because

1. Chances of failure of engineering controls, materials, process, equipment and safety devices cannot be denied and in those circumstances, the PPE can act .as a barrier between the man and hazard and to save from the injury.
2. There are certain operations or accidental situations where engineering controls are less possible and PPE becomes necessary. For repair or maintenance or to enter into toxic or oxygen

deficient atmosphere, or while working at height or doing jobs like welding, cutting, grinding, chipping, PPE gives good protection.

3. It effectively avoids the contact of dangerous substances, noise, vibration and radiation.
4. It protects from atmospheric contaminants.
5. It is a legal as well as moral duty to provide suitable PPE.

2 STATUTORY PROVISIONS

No specific personal protective equipment is named by the Factories Act, but working conditions mentioned in sections 14, 30, 33, 35, 36, 37, 38, 87, III and 114 are such that free of charge PPE should be provided by the occupier for the protection from hazards due to dust, fume, gas, vapour, flying particles, glare, revolving machinery, hot or dangerous contents, entry in confined space, explosive or flammable atmosphere, fire, dangerous operations and hazardous processes. Rules prescribed under above sections provide further details. 27 schedules of Rule 102 of the Gujarat Factories Rules indicate need of PPE at many places. Duty is cast upon the workers not to wilfully neglect to make use of such equipment and not to interfere with or misuse them. ' Model Rule 58 u/ s 35 and Model Rule 95 u/s 87 also prescribe PPE for specific processes.

Rule 68B, GFR states that the PPE shall conform to the Indian Standards. OSHA standards prescribe tremendous details for PPE. Noise induced hearing loss is an occupational disease under the 3rd Schedule of the Factories Act. Schedule 23 u/r 102, GFR requires noise reduction below 90 dBA or to provide ear protectors to workers and their auditory examination by a doctor. Sch. 27 required protection against cotton dust.

3 INDIAN AND OTHER STANDARDS

Some IS on PPE are as under:

Head - Helmets, industrial safety 2925, for two wheelers 4151, non-metal for police force 9562, wooden head- form for testing of helmets 7692, miner's cap lamps 5679 3

Eyes and Face- Guide for selection of eye, face and ear protection 8520, 8521, maintenance and care 8940, for welding 1179, methods of test 7524 (Parti & 2), eye protectors, filters 5983, safety glass 2553, eye and face showers 10592

Ears - Guide for selection 8520, ear protectors 9167, earmuffs, method for measurement 6229

Hands - Guide for selection 8807, Gauntlets and mittens, leather 2573, gloves - safety 6994, rubber - electrical 4770, surgical 4148, postmortem 4149

Feet & Legs - Footwear, selection 6519,10667, Ankle boots for general purposes 583, boots and shoes safety, leather 1989, leather for firemen 4128, rubber - canvas for miners 3976, 10665, gaiters, protective 2472, knee boots, rubber 3736, 3738, leather for leg guard 3946, toe caps, steel for footwear 5852, boots for oilfield workmen 9885 (Part I & 2), footwear for steel plants 10348, for mines and heavy metal industry 13295, safety shoes for women workers in mines and steel plants 11225, footwear with direct moulding sole 11226, rubber footwear 11264, PVC boots 12254, chemical resistant 13292, 13695, PVC boots, oils and fats resistant 13038, code of practice for manufacture 13295, lined antistatic rubber footwear 13575, wooden, heavy duty 5520, rubber lined boots 5557, conducting 13996

Body - Guide for selection of body protection 8519, aprons - rubberised acid and alkali resistant 4501, rubber for hospital use 6407, leadrubber, X-ray protective 7352, Clothing - fire resistant 4355, fire (flame) resistant suit 7612, leather 6153, sheath rubber 3701, fabrics, PVC coated for foul weather 3322, belt and strap, leather, lineman's safety 3521, material (nylon webbing) for aircraft safety belts 8947, maintenance and care of safety clothing 8990, evaluation of whole body vibration 13276 (Part I to 3), mechanical vibration and shock affecting man 13281

Lungs - Glossary of terms relating to respiratory protective devices 8347, selection, use and maintenance of respiratory, protective devices 9623, colour identification of air purifying canisters and cartridges 8318, mouth-piece assemblies 14170, full face mask 14166, threads for face pieces 14138. Respirators - chemical cartridge 8522, canister type (gas mask) 8523, filter type for particulate matter 9473, CO filter 9563, bag type, positive pressure, manually operated 6194.

Breathing apparatus 10245 -
Part 1 : Closed circuit (0, cylinder).
Part 2 : Open circuit.
Part 3 : Fresh air line.
Part 4 : Escape type, short duration, self contained.

Breathing apparatus for fire brigade self contained 1910, Resuscitators for use with humans 13366, life jackets 6685

4 SELECTION AND CLASSIFICATION

Once it is decided that PPE is needed,

1. Select proper type of equipment (IS mentioned in Part 3 should be referred) and then
2. Make it sure that the supervisor sees to it that the worker uses and maintains-it correctly. Proper selection, training and use of PPE are essential.

Factors of selection or requisite characteristics of PPE are :

1. It should give adequate protection against the nature, severity and type of hazard.
2. It should be of minimum weight, should give minimum discomfort with protective efficiency.
3. Attachment to the body should be flexible yet effective.
4. The wearer should not be restricted in movement" or perceptions required for the job.
5. It should be durable and attractive.
6. It should not cause any hazard through its material, design, defect, use or failure.
7. It should conform Indian Standards and tests required
8. It should be easy to clean, repair and maintain. The parts, piece and service should be easily available.

If all above criteria are not available effort should be made to get maximum of them.

Classification of PPE for selection and understanding is given below and also in Table 25.1:

- PPE
- Respiratory (Breathing)
  - Air purifying
    - Chemical Filters
      - Chemical gas mask, Chemical cartridge, Self rescue filters
    - Mechanical Filters
      - Dust or Nuisance filters, Micro filters
    - Combination of Chemical and Mechanical Filters
  - Supplied air
    - Air-lined
      - Airline respirator, Suction hosemask, Pressure hosemask or hood, Air Supplied Suits
    - Self-contained
      - Damage type (open-circuit)
        - Compressed air, Compressed oxygen
      - Re-circulating type (closed-circuit)
        - Compressed oxygen, Regenerated oxygen
- Non-respiratory

For Protection of Head, Eyes, Ears, Face, Hands, Arms, Feet, Legs and Body. Special work clothing- e.g. asbestos, aluminised, leather and wool garments, lead clothing, disposal clothing etc.

Table 25.1 Selection and Classification of PPE according to the body part and hazards :

Body-Part	Hazard	PPE necessary
Head	Falling objects, shock, chemical spurting	Safety helmet, hard hats, safety caps, headgear
Eye	Chemical splash, dust, flying, particles, gas, welding radiation.	Spectacles, lenses and goggles for chemical, welding, grinding, furnace, dust etc.
Ear	High level noise (> 90 dB)	Earmuffs, plugs, inserts
Nose	Dust, toxic gases	Dust mask, cloth mask, rubber mask, fume mask, respirators for dust, gas and vapour, rescuer plus pressure suit, breathing apparatus (O_2 or Air), Canister gas masks, air line respirators, chemical / mechanical filters.
Face	Chemical splash, flying objects, hot substance.	Face shield, welding screen, furnace mask, face guard.
Hand	Hot substance, acid, alkali, pigments, chemicals, handling, cut, sharp edge.	Hand gloves of rubber, PVC, hosiery cotton, leather, asbestos, canvas, fibre glass, electrical rubber gloves, surgical gloves, arm sleeves.
Body	Chemicals splashes, hot substance, fire,handling,	Aprons, coats and pants, pressure suit, suits of rubber, PVC etc.
Foot / Leg	Striking against objects, chemicals falling bodies	Leather or rubber sole shoes, steel toe-boots, antiskid sole shoes, ammunition boots, gumboots, leg sleeves.
Overall	Falling from heights, hurt by falling bodies, chemicals	Safety belts, pole strap belt, nylon safety harness, all purpose safety harness belt, vertical lift safety harness, Boatswain's chair, rope ladders, nets, safety hooks.

Selection and classification of Respiratory equipment based on type of hazard :

- PPE
- Respiratory (Breathing)
  - Air purifying
    - Chemical Filters
      - Chemical gas mask, Chemical cartridge, Self rescue filters
    - Mechanical Filters
      - Dust or Nuisance filters, Micro filters
    - Combination of Chemical and Mechanical Filters
  - Supplied air
    - Air-lined
      - Airline respirator, Suction hosemask, Pressure hosemask or hood, Air Supplied Suits
    - Self-contained
      - Damage type (open-circuit)
        - Compressed air, Compressed oxygen
      - Re-circulating type (closed-circuit)
        - Compressed oxygen, Regenerated oxygen
- Non-respiratory

1. Self contained Breathing Apparatus
2. Hose Mask and Blower with escape provision

Selection of Material of Construction of PPE is given in Table 25.2 :

Table 25.2 : Selection of Material of Construction for PPF.

No.	Material	For the protection from
1	Metal	Flying particles, falling body, sharp edge, abrasion.
2	Fibre metal	Sparks, falling body, flying particles, sharp edge, abrasion, machinery
3	Metal screen	Sharp edge & abrasion
4	Plastic, PVC	Hot liquid, moisture, water, petroleum product, acid, alkali, spark, falling body, flying particles, electric shock, sharp, edge, abrasion, skin protection
5	Rubber	Hot liquid, moisture, water, acid, alkali, electric shock, machinery, skin protection
6	Conductive rubber	Explosive substance
7	Chrome leather	Hot substance, flying, particles sharp edge, abrasion, sparks
8	Canvas	Flying particles, sharp edge, abrasion, machinery
9	Asbestos	Heat, hot substance, sparks
10	Acid proof fabric	Acid & alkali
11	Reflective fabric	Hot liquid
12	Flameproof duck	Heat, hot substance, sparks, chemicals, flying particles, machinery
13	Cotton wool	Heat, sparks, machinery, skin protection
14	Cotton canvas	Sharp edge & abrasion
15	Steel hoe boot	Falling body, striking
16	Non-skis shoes	Moisture, slippery surface
17	Wooden sole boot or scandal	Heat, hot substance, moisture, water, acid, alkali, slippery surface, sharp edge, abrasion.
18	Soft silicon rubber or plastic	Moulded type ear plug
19	Plastic goggles with hydrophilic coating	To prevent fogging
20	Wirescreen lenses (face shield)	Heavy fog or dampness
21	Laser safety goggles (Antilaser eyeshield)	Laser beams
22	Aluminised welding helmet	Infrared rays and to reduce heat effects
23	Polarising lenses (filtershade lenses)	To prevent glare
24	Steel, reinforced plastic & hard rubber	Safety toe boot for foot protection
25	Boot with non-ferrous coating and conductive sole	Static charge, friction sparks, and to reduce fire and explosion possibility
26	Congress or gaiter type shoes	Work with hot metal in foundry, quick removable shoes without lash
27	Non-conductive or insulating (non-metallic shoes)	Electric work
28	Flexible metal reinforced stole or inner sole	Construction work and cold metal work with possibility of foot injury
29	Plastic shoe cover or cap	Pharmaceutical factory needing higher

		product safety.
30	Specially made asbestos clothing	To work with hot metal upto 1650 ^oC
31	Aluminised asbestos or glass fibre and wool lining	To work near a furnace at temperature upto 540 ^oC for fire fighting. Such proximity clothing should to be utilized to enter into the fire. they are for working from a distance.
32	Flameproof or flame resistant cloths – THPC, Nomex or Modaphrilic fabrics	Fireproof cloths to work in the fire flames
33	Cushion pads or padded duck	To carry heavy or sharp edged load on shoulder or back.
34	Apron of padded leather, fabric, plastic, hard fibre or metal	For protection of abdomen or middle body parts.
35	Thermal net cotton go quilted material (decron or nylon)	To work in cold weather (unsuitable to work in hot or fire).
36	High visibility and night hazard clothing	For construction and maintenance Police and Fire brigade and Traffic hazards
37	Disposable clothing (Plastic or reinforced paper)	In less radioactive work or drug or electronic industry
38	Leaded clothing (lead glass fibre, leaded rubber, leaded plastic)	Laboratory work, protection against X and Gamma rays
39	Electromagnetic radiation suit	Radar field
40	Conductive clothing	For linemen to work at extra high voltage. Such clothing keeps the linemen at the proper potential.

5 NON RESPIRATORY EQUIPMENT

See Fig. 25.1 for non respiratory PPE.

5.1 Head and Hair Protection :

Head protectors are hard hats, caps and helmets made of aluminium, PVC fibre glass, laminated plastic or vulcanised fibre. They may be fitted with brackets for fixing welding masks, protective face screen or a lamp. The hats and caps are provided with replaceable harness which provides sufficient clearance between the top of the head and shell. Selection is as follows:

	Material	Protects against
1	Asbestos	Sparks, hot materials, heat
2	Plastic rubber	Hot liquids, moisture, acids, alkalis, electric shocks, dermatitis
3	Cotton wool	Sparks and heat, dermatitis, machinery
4	Metal	Falling objects, flying particles, cuts, abrasions.
5	Plastic	Sparks, falling objects, flying particles electric shock, cuts, abrasions.

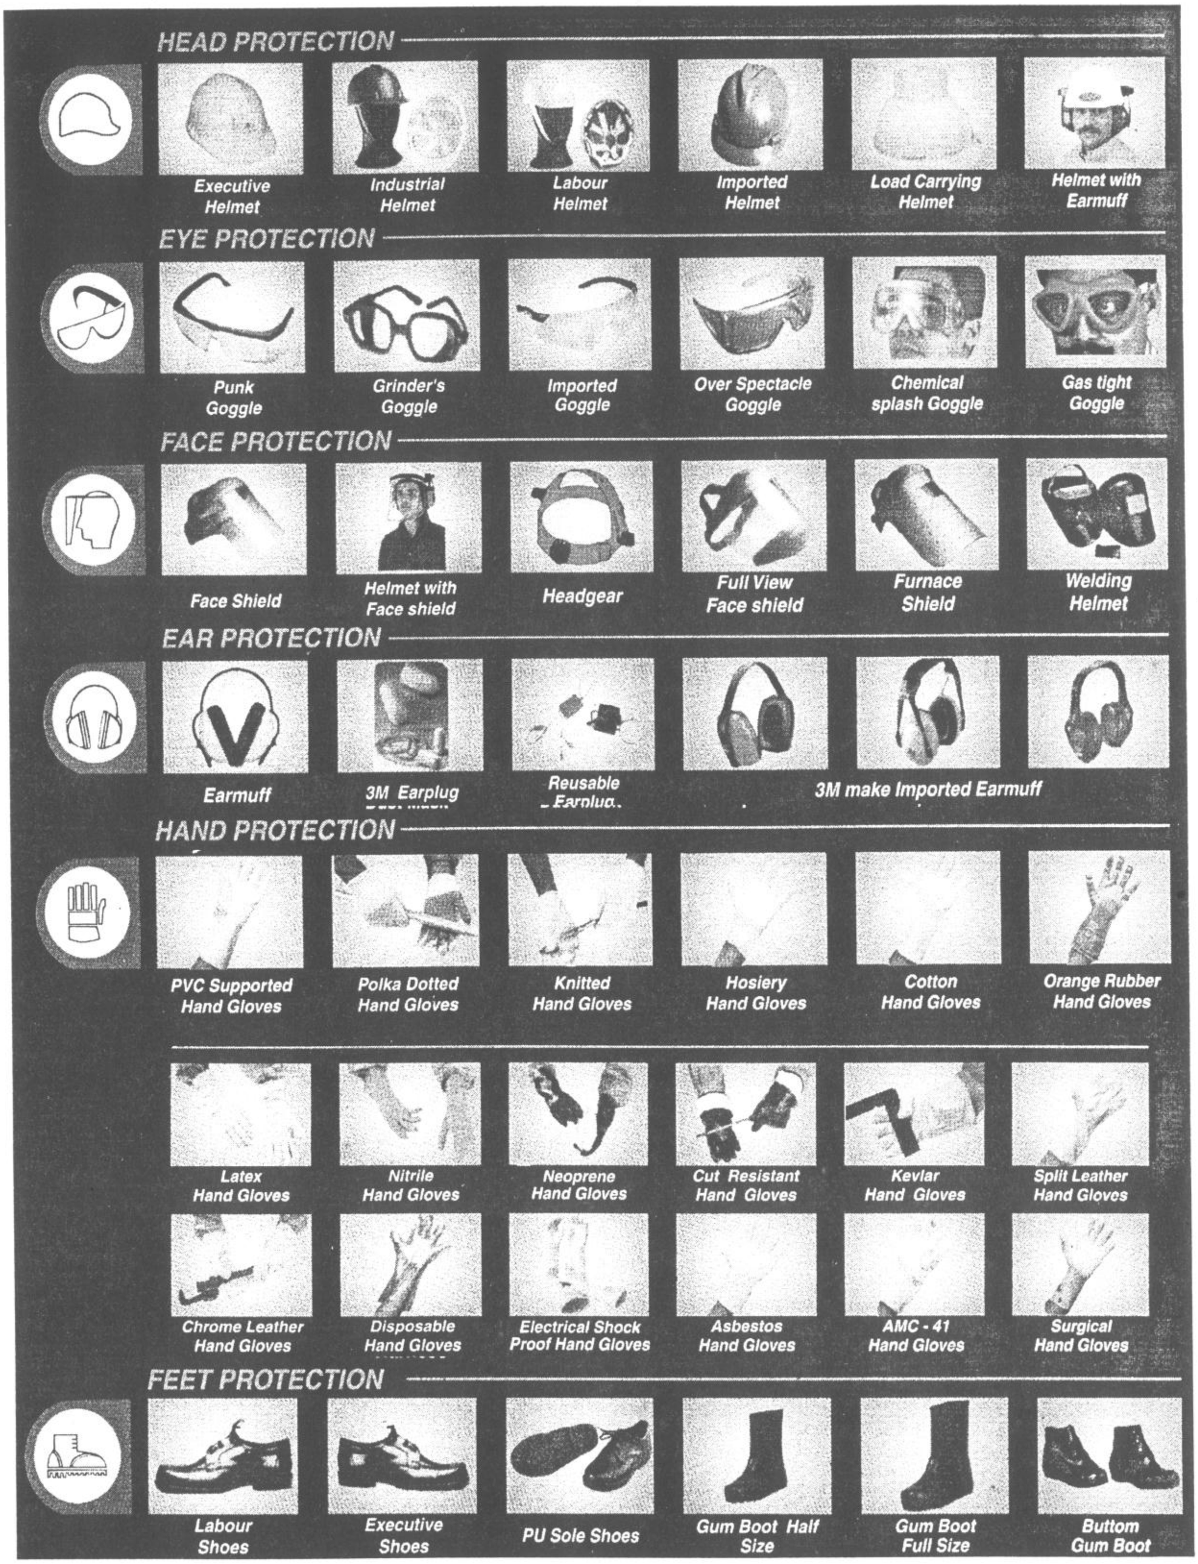

Fig. 25.1 Non Respiretory PPE

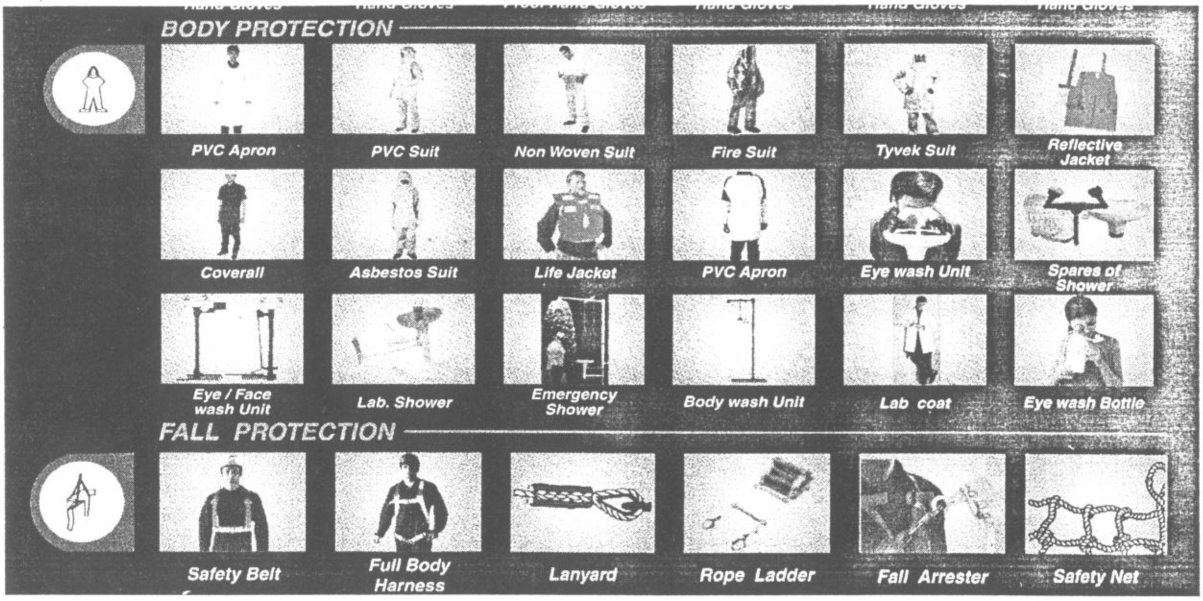

Fig. 25.1 (B) Non Respiretory PPE

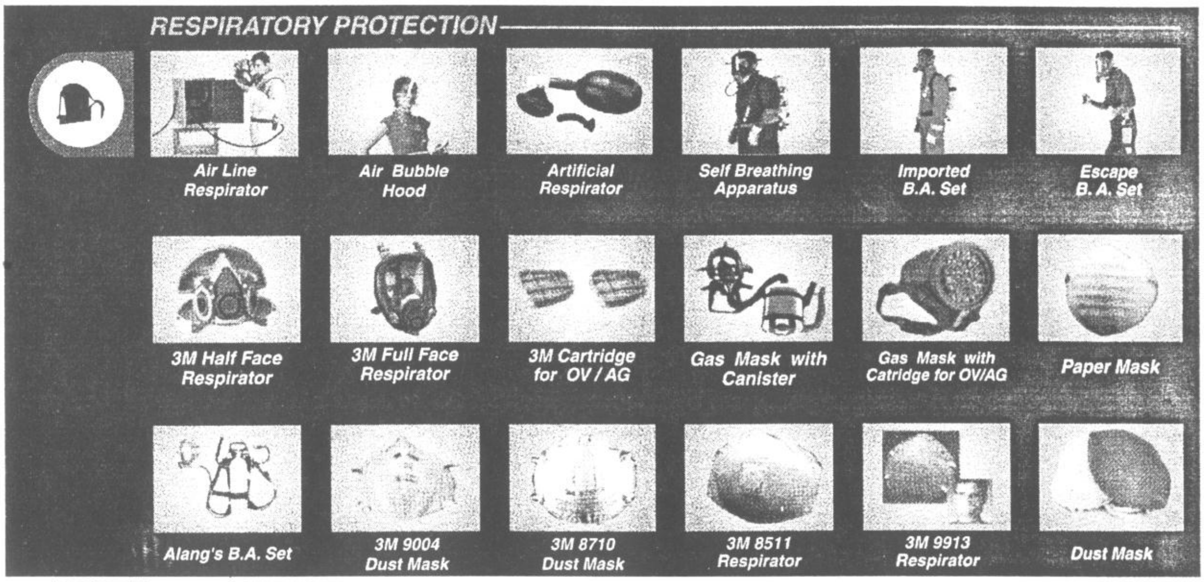


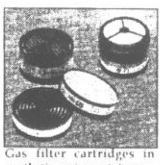
Self contained open circuit breathing apparatus with seamless steel cylinder. CAP.:6L/300 bar& 9L/200 bar.

Life Oxygen pack : Provides supplementary oxygen with inhalator for breathing victim & through a resuscitator for non breathing victim. Cap. : 6LPM CF & 0 to 25 LPM.

Short duration emergency escape breathing app. Half mask attachment & alarm whistle. 2 Ltr steel cylinder

Full face mask with wide vision. Available in Polychloroprene & silicon rubber for use with gas filters.

Half mask with gas filters.



Gas filter cartridges in synthetic resin containers.

Self contained breathing apparatus (SCBA)

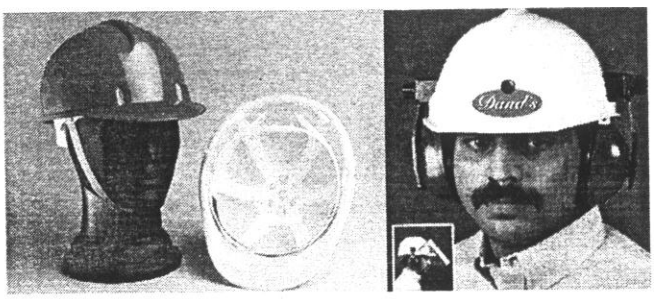
Fig. 25.2 Respiretory PPE

Utility and characteristics of head protectors an shown in Table 25.3

Table 25. 3 : Head Protectors

Type	**Protects Against**	**Characteristics**
Safety Helmet (Hard hat)	Falling objects, hitting against obstructions such as low ceilings, beams, scaffold members etc.	Generally made of aluminium alloy, PVC, fibre- glass, or vulcanized fibre. Saddle (geodetic strap suspension) inside to dissipate impact pressure over wide area of head and to provide clearance between the head and the shell of helmet. Chin strap or other device to prevent displacement. Peak and full brim to protect face, neck, ears. Ventilation holes for comfort.
Electrical Safety Helmet	Electric shock when working near live electrical lines.	Made of synthetic electrically non-conductive materials (PVC etc.)
Welder's Cap	Falling welding spatters from above.	Made of leather with cloth lining inside.
Crash Helmet	Skull injuries in road accidents.	Usually fibre / plastic material with saddle inside, without peak or rim and with chin strap. Covers forehead, temples and lower portion of head (above neck)

Soft caps and hoods are also used for protection against heat, spark and other dangerous materials and are made of appropriate materials. Some time hoods are made with rig frame which is held away from the head.



Long hair or beards may be caught in moving machine parts (e.g. belts, chain, in-running nips etc.) while seeing or leaning down or by heavy static charges. Protective caps covering the hairs are useful.

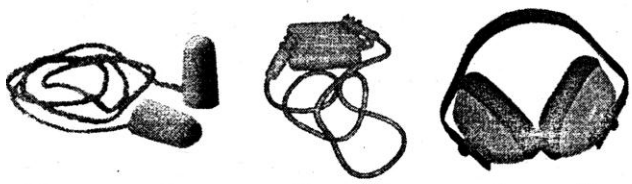
Hair net is not a full protection. The hair cap should be of flame- retardant material for protection against sparks or hot metal. It should be cool, lightweight, adjustable and with visor infront.

Types of equipment available :

Adjustable head gear and chinstrap.
Sand/shot blasting helmet.
Glass fibre safety helmet.
Safety helmet attached to ear muff.
Darvic plastic helmet.
Safety helmet made of aluminium.
Black fibre or moulded fibre glass.
Hard hats and safety caps.
V-Guard protective caps & hats.
Topguard protective caps & hats.
Thermalguard caps & hats.
Skullguard protective headwear.
Shockguard caps & hats.
T-aluminium caps & hats.
Vanguard helmets for lateral protection.
Winter liners.
Foldback faceshield frames for caps & hats.
Welding shields.
Auto change welding helmet.
Universal cap & hat adapters.
Sparkguards.
Goggle retainer (on helmet).
Chin straps.
Defender fire helmets.

5.2 Ear Protection :

See Chapter-12 for permissible noise levels and control measures in detail. Hearing loss is an occupational disease under Sch.3 of the Factories Act, IQAR



Foam ear plug with cord   Ear seal with cord   Ear muff

Noise level above 90 dBA is hazardous for an exposure more than 8 hrs/day or 48 hrs/week. It may cause deafness, fatigue, loss of efficiency, irritation and also loss of hearing. Noise level can be measured by a noise average meter or a noise dose meter. Ear plugs or Ear muffs reduce to @ 25 to 40 dBA. Ear plug is made of plastic, rubber or polyurethane foam. Ear muffs covers external ear and provides better attenuation than ear plug.

See Part 6.7 of Chapter-12 for ear protectors.

Types available :

Ear muffs, or cups (circumaural).
Plugs or inserts.

Dielectric ear muff.
Formable (disposable) aural inserts.
Full enclosure (e.g. astronaut).
Superaural or canal cap.

5.3 Face and Eye Protection :

Eye injuries can be caused by mechanical, chemical, thermal and radiation hazards such as dusts, flying particles, splashes and harmful radiation. Eye protectors are safety spectacles, mono goggles, impact goggles, welding goggles, foundry goggles, chemical goggles, gas tight goggles, face shields, welding helmets etc. Possible hazards are :

1	Large flying particles from	Chipping, fettling, riveting, sledding, chalking.
2	Dust and small flying particles from	Scaling, grinding, stone dressing, wood working.
3	Splashing of metals from	Pouring of liquid metal from ladle, crucible etc., casting of metals, galvanizing and dipping in molten metals.
4	Splashing of liquids, gases and fumes from	Handling of acids and other chemicals.
5	Reflected light, glare and radiant energy from	Foundry work, glass furnaces, gas welding and cutting, arc welding.

Utility and characteristics of eye protectors are shown in Table 25.4.

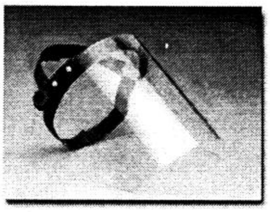
Table 25.4 : Eye Protecors

Type	Protects Against	Characteristics
Spectacle-type Goggles	Flying bodies (dust, metal chips, etc.)	Plain, shatter – proof, toughened glass or plastic lenses. With or without side shields. Metal or heat –resistant frame.
Panorama Goggles	Oil and paint splashes, dust and chip exposure	Light in weight, Non-fogging cellulose clear visor. Ventilation holes on either side. Soft pliable plastic frame wide enough to wear over prescription glasses.
Leather-mask Goggles	Smoke, dust, foreign bodies	Sweat lining along edges, ventilation holes with baffles for light and dust. Shatter-proof lenses.
Chemical Goggles	Chemicals and toxic dusts	Acid / alkali – resistant rubber frame with clear lenses and shielded ventilating ports.
Gas-tight Goggles	Irritating fumes, vapour or gases	Airtight – fitting without ventilating ports.
Welding Goggles	Gas Welding/ Cutting. Flames &	Similar to panorama goggles

	sparks	with filter glass of suitable grade and indirect ventilation ports.
Welding Shields	Arc Welding / Cutting flames and sparks	Fibre or fiberglass shield, hand-held or suspended from helmet, with window for filter glass.

Eye and face protection standards are provided for - Rigid and non rigid welding helmets. Welding hand shields. Attachments like lift fronts, chin rests, aprons, magnifiers, snoods etc.. Face-shields, Flammability, Goggles for welder, cutter, chipper (eye cups) and dust & splashes and Spectacles of metal, plastic or combination.

Face Protection



Face Shield

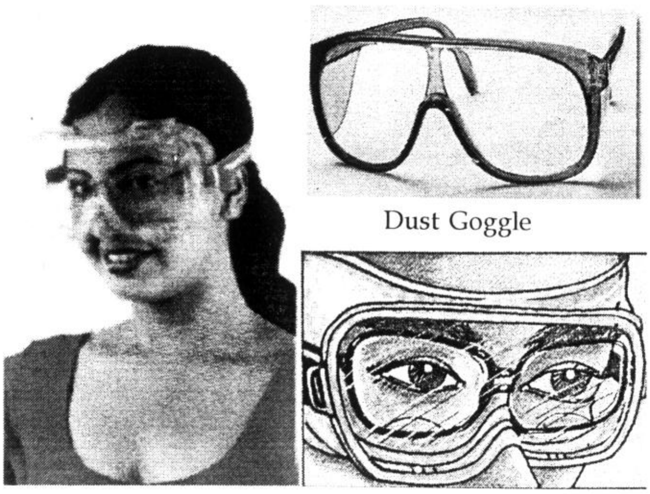
Plastic face shield with acrylic visor, and Darvic guard with fibre/PVC head band, with adjustable head gear helmet attached to face shield.

Welding screen shield.

Furnace masks.

Eye Protection

Large vision red vinyl goggles with perspex lens and sponge lining.



Dust Goggle

Chemical Splash Goggle

Panorama type.
Full view perspex goggle.
Plastic spectacle with ventilated side shields.
Welding goggle.
Fibre goggle for grinding, chipping etc.
Gas tight goggle.
Rubber frame goggle.
Leather mask goggle.
Bakelite general purpose goggle.

Metal frame spectacle.
Stoker's goggle.
Dust goggle.
Furnace goggle.

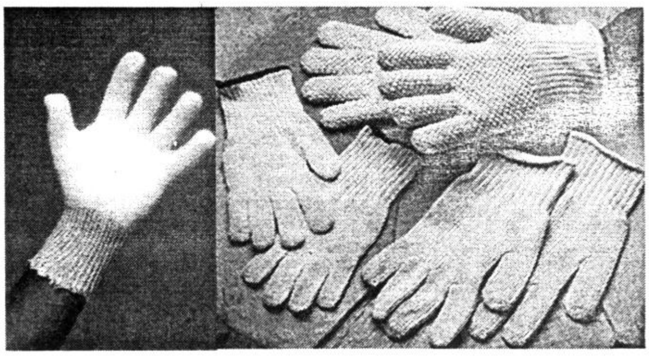
Laser eyewear should be marked with optical density values and wavelengths for which they are to be used. Laser glasses or goggles designed for specific wavelengths should not be used for different wavelengths of laser radiation.

5.4 Hand and Arm Protection :

Protection of hands and arms are required when workers have to handle materials having sharp end, sharp edges, hot and molten metals, chemicals and corrosive substances. The protective equipment may be gauntlet gloves, wrist gloves, mittens, hand pads, thumb and finger guards and sleeves. Gloves, hand leathers, arm protectors, finger stalls, mittens etc. should not be used near moving machinery or machine parts. Selection guideline is given in Table 25.5.

Table 25.5 Selection of Gloves :

	Material	Protects against
1	Asbestos	Sparks, hot materials, heat.
2	Chrome leather	Sparks, hot materials, hot liquids, flying particles, cuts, abrasions.
3	Flame proofed Duck	Sparks, hot materials, heat, flying particles, machinery.
4	Plastic	Hot liquids, moisture, acids and alkalis, demartitis.
5	Rubber	Hot liquids, moisture, acids and alkalis electric shock, dermatitis
6	Chemical resistant material	Acids and alkalis
7	Reflective fabric	Hot liquids
8	Plastic rubber coated fabric	Hot liquids, moisture, acids and alkalis
9	Metal Mesh	Cuts and abrasions
10	Cotton Canvas	Cuts and abraisons



Glove material selection should be asunder :

1. Natural rubber gloves are stretchable and highly resistant to punctures. Thiey perform well in mild caustics and ketone-based solutions and in temperatures ranging from 0°F to 300 "F. These gloves

work well for job which require handling rough materials or sharp-edged objects such as plate glass and lumber.

2. Neoprene is a premium-grade, synthetic rubber. Gloves coated with neoprene are resistant to strong acids, oils, grease, solvents and caustics. They perform well in temperatures from 0°F to 300 °F.

3. Nitrile is a super synthetic compound available in either a smooth or rough finish. They perform well in temperatures from 25°F to 300 'F. Nitrilecoated gloves offer superior abrasion, snag and puncture resistance for tasks such as handling coarse building materials and rough castings.

4. Viton gloves are especially useful for resisting chemical permeation from chlorinated and aromatic solvents as well as many other liquids and vapours.

5. Polyvinylchloride (PVC) plastic gloves resist a broad range of chemicals and abrasives. They provide ample flexibility and durability in temperatures ranging from 25°F to 150 °F. PVCcoated gloves are ideal for jobs which involve handling rough machine parts, castings or petrochemicals.

6. Butyl rubber gloves offer high permeation resistance to many gases and vapours.

7. Latex gloves are not appropriate for primary chemical resistance but offer good protection from standard grit/grime.

Utility and characteristics of hand protectors are shown in Table 25.6.

Table 25.6 : Hand Protectors

Type	Protects against	Characteristics
Leather gloves	Cuts, bruises, abrasions, lacerations during handling of metal sheets and other sharp-edged objects and sparks	Plain, cut-resistant leather with or without metal mesh at palm.
Aluminised fabric gloves	Flames, intense heat radiation, burn injuries	Heat-resistant aluminized fabric or other special material
Asbestos gloves	-do-	Padding inside for comfort and to withstand high temperatures
Acid / Alkali-proof rubber / synthetic gloves	Corrosive chemicals (organic acids or petroleum products)	Rubber, neoprene or vinyl material
Lead – lined gloves	Ionising radiation (X-rays, gamma rays, etc.)	Rubber, leather or plastic with lead lining.
Canvas gloves	Grease oil, dust and dirt which may cause slipping of hands	Fabric or coated fabric
Electirc gloves	Low voltage electric shocks (up to 4000 V) High voltage electric shocks (tested 11 KV)	Made of insulated rubber having required dielectric strength and electrical resistance. Generally red in colour
Barrier Cream	Contact dermatitis from solvents, lubricants and other oils.	

Types available :

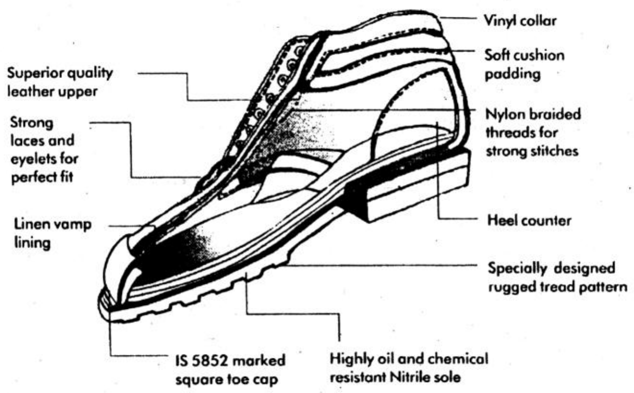
Chrome or plain leather gloves.

Mittens, Gauntlets.
Corrugated rubber gloves.
Cotton gloves.
Asbestos gloves or mittens.
Sleeves made of leather, asbestos, rubber, or PVC.
Iron hand gloves.
Chemical resistant gloves.

5.5 Foot and Leg Protection :

Some typical risks are handling of heavy materials, caustic and corrosive liquids, wet conditions, molten metals, etc. Common foot and leg protective equipment are safety shoes or boots, leggings and footguards. Leg guards (e.g. Cricketer type) are used to protect - shins against impact. Knee pads are worn by mould loftsmen and others who do continual kneeling. Selection is as follows:

Safety shoes/boots may be conductive, non conductive or spark resistant. Rubber boots are useful to work in wet conditions, steel toe boots against impact and puncture resistant soles to walk on surfaces having nails, sharp objects etc.



Conductive shoes allow draining of static charges and non-ferrous shoes reduce possibility of friction sparks and much useful in fire/explosion prone area. Conductive footwear resistance should not exceed 450 kilo ohms.

Conductive shoes are used where floors are nonconductive and grounded such as in manufacture of certain explosive compounds or while cleaning tanks that have contained solvent or volatile hydrocarbons. These shoes have conductive soles and non-ferrous metal parts.

Foundry workers should wear gaiter or congress type safety shoes which have no fasteners or lashes and rapidly removable. The tops of the shoes should be covered by full pant leg, spats or leggings to keep out molten metal.

Electricians need insulated shoes with non-metal parts. Leather shoes are useful to work in wet condition. Wooden soles to walk on hot surfaces and rubber shoes for working with acids and alkalis but not with solvents which dissolve the rubber.

Hazard-wise selection is shown in Table 25.7 and Material-wise selection in Table 25.8 anc 25.9.

Table 25.7 : Feet Protection

Hazards	Protection
Falling, rolling objects and materials	Shoes with steel toe-caps. Aluminium, steel fibre or plastic instep to protect top of feet
Sharp cutting edges, wood chips, glass shards, nails	Steel spring in –soles.
Chemicals, solvents, alkalis, caustics, bleaches, cutting oils and compounds, grease, creosol.	Non-soluble natural rubber, vinyl, plastic footwear, synthetic rubber, neoprene, cord or cork soles
Oily floors	Synthetic rubber or chrome leather soles
Hot surfaces, sparks, metal splashes	Heat-resistant soles, slip-on wooden sandals over shoes; foundry boots with elastic band or buckle for quick removal; trouser legs rolled down over boot tops
Extreme heat and direct flame	Insulated or aluminized over-shoes or boots of fire-resistant material
Fungal infection from prolonged exposure to water	Lined rubber shoes. Silicone- treated leather or rubber shoes for minor or occasional wetness
Sparks can ignite flammable gases, liquids and explosives	Shoes with non-ferrous metal parts, steel toes covered with non-sparking material.
Static electricity built up in the body can ignite volatile material	Shoes with special conductive soles of cork, leather etc.
Skids and slips; icy surfaces	Cleated, wooden, non-slip or neoprene soles. Slip-on non – skid sandals ; strap – on cleats.
Live circuits or equivalent	Electrically non-conductive standard safety shoes.
Sanitation hazards; Contamination and infection	Special plastic over shoes; paper or shower shoes. Disposable strictly not to be re-used.
Safety footwear must be carefully chosen for maximum protection and its suitability for the particular hazard. Care and proper maintenance are of vital importance. Footwear must be regularly inspected. Worn-out or defective shoes should be immediately repaired or replaced. Defective footwear should never be worn. Footwear must always be kept clean and dry.	

Table 25.8 : Material for Knee Pads, Leggings etc.

	Material	Protects against
1	Asbestos	Sparks, hot materials, heat.
2	Chrome leather	Sparks, hot materials, hot liquids, flying particles, cuts, abrasions.
3	Flame proofed Duck	Sparks, hot materials, heat, flying particles, machinery.
4	Plastic	Dermatitis, hot liquids, moisture, acids, alkalis.
5	Rubber	Dermatitis, hot liquids, moisture, acids, alkalis, electric shock
6	Fibre metals	Sparks, flying objects, flying, particles,

		cuts, abrasions, machinery.
7	Chemical resistant material	Acids and alkalis
8	Reflective fabric	Hot liquids

Table 25.9 : Material for Shoes and Boots

	Material	Protects against
1	Steel toe caps	Falling bodies
2	Non-skid shoes	Moisture.
3	Wooden soles	Hot materials, heat, hot liquids, moisture, acids and alkalis, slips and falls, cuts, abrasions.
4	Chrome leather.	Sparks, hot materials, heat, hot liquids
5	Rubber	Hot liquids, moisture, acids and alkalis, electric shock, dermatitis.
6	Conductive rubber	Explosive.

Types Available:

Leggings:

Leather legging and spats.
Asbestos hip leggings.

Boots and Shoes:

Safety leather boots.
Asbestos clogs or boots with leather soles.
Asbestos long boots.
Rubber gum boots.
Leather ammunition boots.
Leather/rubber sole shoes with or without steel toe.
in Oxford, Jodhpuri or Ankle style.
Electric shock-proof shoes tested to 11 KV.
Welder's safety boots.
Miner's boots. Hunter's shoes.

5.6 Body, Skin and Fall Protection :

Body protectors are coats, waist, aprons, overalls, jackets and complete head to toe protective suits. Aprons of different materials are used for protection against blows, splashes, radiant heat, flying particles etc. Pads are used to protect shoulders and back from bruises. Impervious clothing of rubber or synthetic fabrics are used for protection against water, moisture, dusts, vapours and liquid chemicals.

Nature of potential hazard, degree of the hazard involved and nature of activities of the wearer are important in the selection of safety clothing. Although complete coverage of the body and legs is not needed in many cases, unnecessary safety clothing may hamper the efficiency of the wearer. No compromise should be made with strict safety requirements. Selection is as follows :

	Material	Protects against
1	Asbestos	Sparks, hot materials, heat.
2	Chrome leather	Sparks, hot materials, hot liquids, flying

		particles, cuts, abrasions.
3	Plastic or Rubber	Hot liquids, moisture, acids, and alkalis, electric shock, dermatitis, machinery.
4	Canvas	Flying particles, cuts, abrasions, machinery.
5	Chemical resistant fabric	Acids and alkalis
6	Reflective fabric	Hot liquids

Types of body protection available are :

Body Protection :- Asbestos combination suit, asbestos jacket, hood, clogs, boots and gloves, mittens, aprons, spats, leggings, furnace mask; rubber apron with hood combined, low weight rubber coated fabric suit, low weight PVC coated fabric suit, heavy duty PVC suit or rubber coated fabric suit, PVC or rubber coated aprons with sleeves, sand or shot blast helmet rubber mat for electrical purpose, vulcanised fibre face mask for radiant heat, PVC splash proof coat, PVC hood with protected ventilator, PVC pressure suit, PV(boiler suit, overall, coat-pant and hood.

Special work clothing includes leather or wool clothing, asbestos or aluminised clothing and flame retardant or fireproof work cloths.

Safety Belts :- Linesman leather belt, leather safety strap or belt, man-hoisting leather belt, safety belt of harness made from leather or cotton webbing, nylon safety belt. Quick-on coverall harness. Suspension harnesses. Wrist rescue systems. Descent system. Total encapsulating suit harness. Linemen's belts. Structural steelworker's, car dropper's and derrick worker's belts, Shock-absorbing lanyards. Retractable lanyard, Retractable lifeline. Winches, Rope grabs. Horizontal lifeline system. Rail slider anchorage connector. Surehold confined space positioning equipment or system.

Skin covers the whole body and it is the first defensive barrier for body protection. Therefore skin protection cannot be avoided. Types of skin affecting hazards can be classified as under :

- Hazards to Skin
- Physical
  - Environmental
    - Heat, sun, cold, wind, radiation, moisture, drying up (desiccation)
  - Mechanical
    - Blows, pressure, abrasion, cuts, scrapes, laceration, puncture, bruises, vibration (white finger disease)
- Chemical
  - Burns, dermatitis, ulcers, cancer, warts, wrinkles etc. due to a variety of chemicals
- Plant Products
  - Irritation, lesions, itching, dermatitis due to plants, vegetables, fruits, flowers, wood, dust & resins, leaves, roots, stems, bulbs, sap, lacquers etc.
- Living Agents
  - Bacteria, viruses, fungi, parasites, insects, mites, grain itch, copra itch etc.

Preventive measures should include -

1. Frequent skin washing using proper cleansers.
2. Changing contaminated clothing and washing and drying the cloths properly.
3. Removal of irritants and chemicals (including oils) by effective washing using shower bath, eye washer fountain etc.
4. Wash immediately cuts, scrapes, punctures etc. and apply antiseptic bandage and seek medical advice.
5. Use appropriate PPE to protect skin, fingers, foot and body. Selection of proper goggles, gloves, footwear, aprons, overalls and clothing is important. Avoid loose clothing and exposed skin or body parts to moving machinery, high temperature, toxic chemicals (e.g. pesticides) etc.
6. Barrier creams to protect against dermatitis, lubricants, solvents, hydro-carbons etc.

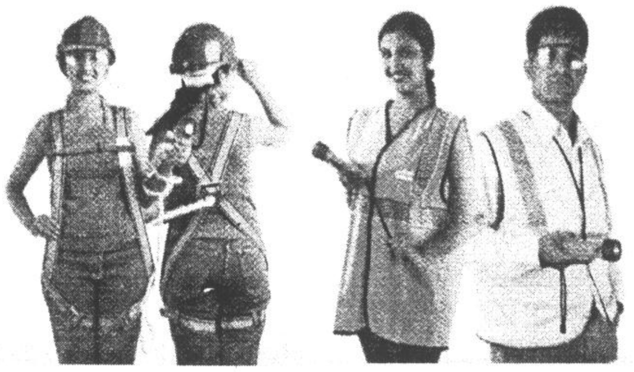
Following types of aprons are useful for skin protection:

Aprons for Skin Protection

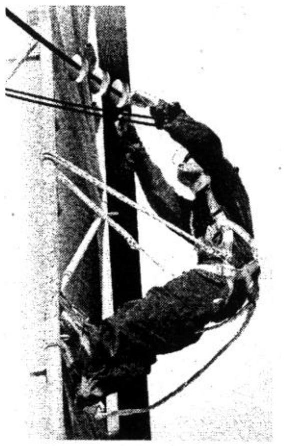
Type of Apron	Protects against
PVC, Acid / alkali proof rubber, Face shield with visor	Chemical splashes
Leather	Hot materials like molten slag, chips, hot or sharp surfaces.

Asbestos	Heat radiation
Lead	Ionising radiation (X-rays, Gamma rays)

Fall protection for the body includes safety belts, lifelines (ropes) and lanyards, harnesses (belts & straps with buckles) and fall-arrester devices or safety net.



Full body harness Reflective jacket



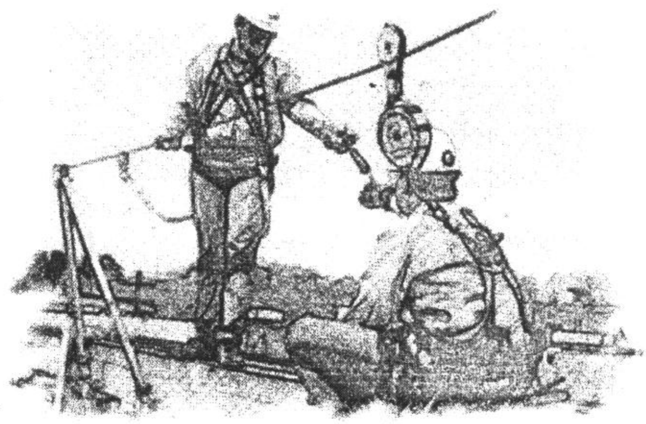
Full body harness with safety Belt and fall arrester device

It is important to note that such safety belts and associated equipment are used when fall hazards cannot be eliminated by strong support like railings, floors, platforms etc.

OSHA Standard has prohibited the use of a body belt-only for fall arrest and a fall arrest system is suggested, since 1-1-1998.

Body belts are used where less than I m free fall is anticipated and a body harness (belts or straps on chest, shoulders and thighs) is used for a limited fall upto 2 m. A harness can spread the shock load over the shoulders, thighs and seat (hips). The body belt or lifeline D-ring should be arranged at the back of the worker. The wearer of the safety belt should not tie off below waist level (to prevent turning down head). A window cleaner's belt length is limited to 8 ft (2.5 m). The chest belt is worn loosely to allow smooth breathing.

The lifeline may be vertical from a fixed anchorage or horizontal between two fixed anchorage



Horizontal Lifeline

independent of the work surfaces Lanyard is a flexible .line up to 6 ft (1.8m) to secure the wearer's harness (D-ring) to a lifeline or fixed anchorage. Lanyards may be made of nylon or other fibrous or metallic material and non-stretchable to limit free fall distance. -Shock-absorber lanyards are available to absorb up to 80% of the stopping force of a normal lanyard. Metal lanyard must not be used where electrical hazard is possible. Snap hooks (locking type •preferable) and D-rings should be maintained in good condition. Knots or lengthening of lanyards must be avoided.

Body belts (work belts) are used to reduce the probability of falls. Chest harnesses are used where there is limited fall hazard (not vertical free fall) such as for removal of a person from a tank or bin. Body harnesses, covering chest, shoulders and thighs, are used to arrest the most severe free falls.

Retrieval method is necessary to shorten the hanging distance after a fall upto 6 ft (maximum limit of free falls, for more fall height, other supporting fixed structure must be provided by fencing, railing, platform, fixed-ladder with platform and handrails etc.). Retractable lifeline, which will be shorten automatically (e.g. spring action) after its full length, can limit falls to inches and avoid prolonged suspension causing high discomfort to a hanging person.

Fall arrester net, if used, should be tied firmly as near as possible under the working place to minimize the fall distance.

Belts, harnesses, lifelines, lanyards, buckles, joints, D-ring etc. should be checked for weak points, washed regularly and kept dried at room temperature.

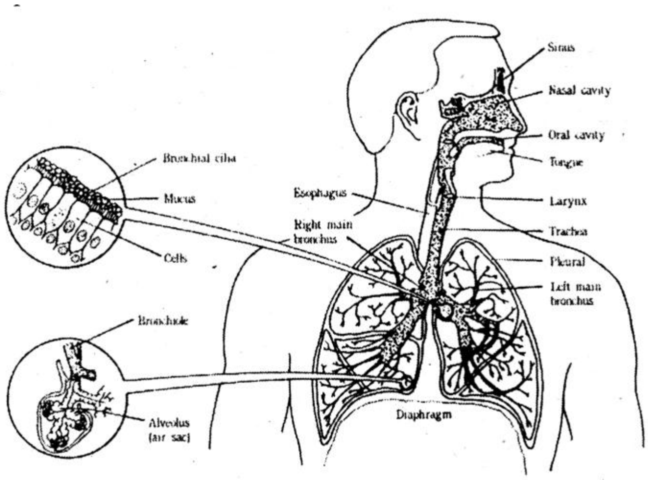
See Chapter-16 for other details.

6 RESPIRATORY EQUIPMENT

See fig. 25.2 for respiratory equipment.

The Respiratory System

Respiration is the act of inhaling fresh air into the lungs and exhaling stale air from them. When we breathe in and out, our chest cavity housing the lungs, expands and contracts. The entire rib cage, curving round the chest, is flexible and expands readily by special muscles.



The nose, mouth, upper throat, larynx, trachea, bronchi (all air passages) and the lungs where oxygen is passed into the blood and carbon dioxide expelled, are the respiratory organs that form the respiratory system. The diaphragm and chest muscles perform the movements of inspiration and expiration. The system is an intricate one with built-in safeguards against normal,, everyday hazards. The nostrils (hairs) filter dust particles from inhaled air; the specially structured nasal passage monitors the air temperature; the mucous secreted by the membrane in the nasal passage continuously drips into the throat, heating and moistening the inspirited air and trapping bacteria and dust. There are many other such barriers but they are obviously no match against sustained onslaughts of unusual and ruinous hazards posed by contaminated or higher concentration of toxic chemicals, dusts, mists, gases and sprays.

Broadly speaking, oxygen-deficient air and harmful toxic contaminants in the atmosphere are the major respiratory hazards.

Atmospheric contaminants include harmless substances to toxic dust, fumes, smokes, mists, vapour and gases. Processes which present hazards of exposure to harmful substances should be closed or ventilated to eliminate or minimise the hazard. If enclosure, ventilation or -other engineering controls are not possible, respiratory equipment should be provided to the workers exposed to such hazard. Even though engineering controls are applied satisfactorily, supply of appropriate protective equipment should be readily available for use, as plant breakdown, maintenance or repairs may have to be carried out in contaminated environments.

Respiratory protective equipment should be considered a last resort, or additional stand-by protection and never a substitute for effective engineering control.

Workers should be aware of other routes of entry also (e.g. skin contact and oral) and looking to such nature or possibility of chemicals, they should adopt other protections also.

Selection of respiratory protection depends On

1. Identification and classification of hazards.
2. Evaluation of the hazard i.e. measurement of concentration and to decide which worker(s), which process, place or environment need respiratory protection, and
3. Selection and application (use) of the appropriate type of the equipment.

Protection Factor (ratio of measured or suspected concentration / TLV) is important in selection of a respiratory PPE. It should be higher if the toxicity of the gas is higher. If varies from 4 to 10. It is like a factor of safety.

6.1 Classification of Respiratory Hazards:

Type of hazards to which a worker is exposed is the basis of selection of the right type of respiratory protective equipment.

Respiratory Hazards:

Before initiating a respiratory protection program, it is important to first understand the types of respiratory hazards inherent to your industry.

Of the three normally recognised ways toxic materials can enter the body - (1) through the gastrointestinal tract. (2) skin and (3) lungs - the respiratory system presents the quickest and most direct avenue of entry. This is because of the respiratory system's direct relationship with the circulatory system and the constant need to oxygenate tissue cells to sustain life.

There are three basic classifications of respiratory hazards: oxygen-deficient air; particulate contaminants; and .gas and vapour contaminants.

6.1.1 Oxygen Deficiency :

Normal ambient air contains an oxygen concentration of 20.8 percent by volume. When the oxygen level dips below 19.5 percent, the air is considered oxygen-deficient. Oxygen concentration below 16 percent is considered unsafe for human exposure because of harmful effects on bodily function, mental processes and co-ordination.

It is important to note that life-supporting oxygen can be further displaced by other gases, such as carbon dioxide or nitrogen. When this occurs, the result is often an atmosphere that can be dangerous or fatal when inhaled. Oxygen deficiency can also be caused by rust, corrosion, fermentation or other forms of oxidation which consume oxygen. The impact or oxygen-deficiency can be gradual or sudden.

Atmospheres in confined spaces such as vats, tanks, hold of the ships, etc. may contain air with oxygen content much lower than normal (21% by volume). This may be due to dilution or displacement of the air by other gases or vapours or because of loss of oxygen due to decay of organic matter, chemical reaction and natural oxidation over a long period of time. A person breathing air with oxygen content of 15% or less may exhibit symptoms ranging from increased rate of breathing, acceleration of pulse rate to unconsciousness and death,. Such oxygen deficiency condition can easily be detected as the flame of a safety lamp will be extinguished in such atmosphere. Oxygen deficient atmosphere is immediately dangerous to life. The respiratory protective equipment in such conditions should either supply normal air or oxygen to the wear. Self contained or combination breathing apparatus is suitable.

6.1.2 Gaseous Contaminants :

Gas and vapour contaminants can be classified according to their chemical characteristics. True gaseous contaminants are similar to air in that they possess the same ability to diffuse freely within an area or container. Nitrogen, chlorine, carbon monoxide, carbon dioxide and sulphur dioxide are examples.

Vapours are the gaseous state of substances that are liquids or solids at room temperature. They are formed when the solid or liquid evaporates. Gasoline, solvents and paint thinners are examples of liquids that evaporate easily, producing vapours.

In terms of chemical characteristics, gaseous contaminants may be classified as follows :

Inert Gases - These include such true gases as nitrogen, helium, argon, neon, etc. Although they do not metabolise in the body, these gases represent a hazard because they can produce an oxygen deficiency by displacement of air.

Acidic Gases - Often highly toxic (corrosive), acidic gases exist as acids or produce acids by reaction with water. Sulphur dioxide, hydrogen sulphide and hydrogen chloride are examples.

Alkaline Gases - These gases exist as alkalis or produce alkalis by reaction with water. Ammonia and phosphine are such examples.

In terms of chemical characteristics, vaporous contaminants may be classified as follows :

Organic Compounds - Contaminants in this category can exist as true gases or vapours produced from organic liquids. Gasoline, solvents and paint thinners are examples.

Organometallic Compounds - These are generally comprised of metals attached to organic groups. Tetra-ethyl-lead and organic phosphates are examples.

These may be toxic or inert gases or vapours. The toxic gases may produce harmful effect even if they are present in relatively low concentrations. The inert gases produce undesirable effects primarily by displacement of oxygen. Vapours are from volatile, evaporating liquids. Gaseous contaminants can also be classified as

1. **Gaseous Contaminants Immediately Dangerous to life:** These contaminants are gases present in concentrations that would endanger life of a worker breathing them even for a short period of time. In other words, a gas is immediately dangerous to life if it is present in certain concentration. Where it is not possible to determine the extent 6f concentration or the kind of gas, all gases should be considered as immediately dangerous to life and health. IDLH values of many gases and dusts are available. Positive pressure self-contained or combination breathing apparatus is suitable.

2. **Gaseous Contaminants not immediately Dangerous to life :** These contaminants are gases present in concentration that could be breathed by a worker for a short time without endangering his life but which may cause possible injury after a prolonged single exposure or repeated short exposures. But even after the concentrations of the contaminant is known, no exact formula can be applied to determine if the contaminant is immediately dangerous to life or not. Air - line respirator, hose mask with or - without blower and chemical cartridge respirator are suitable.

6.1.3 Particulate Matter or Contaminants :

Particulate contaminants can be classified according to their physical and chemical characteristics and their physiological effect on the body. The particle diameter in microns (1 micron = l/ 25400 inch) is of utmost importance. Particles below 10 microns in diameter have a greater chance to enter the respiratory system and particles below 5 microns in diameter are more apt to reach the deep lung or alveolar spaces.

In the healthy lungs, particles from 5 to 10 microns in diameter are generally removed by the respiratory system by a constant cleansing action that takes place in the upper respiratory tract. However, with excessive "dust" exposures or diseased respiratory system, the efficiency of the cleansing action can be significantly-reduced.

The various types of airborne particulate contaminants can be classified as follows :

Fumes - An aerosol created when solid material is vaporised at high temperatures and then cooled. As it cools, it condenses into extremely small particles generally less than I micron in diameter. Fumes can result from operations such as welding, cutting, smelting or casting molten metals.

Dusts - An aerosol consisting of mechanically produced solid particles derived from the breaking up of larger particles. Dusts generally have a larger particle size when compared to fumes. Operations such as sanding, grinding, crushing, drilling, machining or sand blasting are the worst dust producers. Dust particles are often found in the harmful size range of 0.5 to 10 microns.

Mists - An aerosol formed by liquids, which are atomised and/or condensed. Mists can be created by such operations as spraying, plating or boiling, and by mixing or cleaning jobs. Particles are usually found in the size range of 5 to 100 microns.

Majority of particulate contaminants are not immediately dangerous to life. They may be solid, liquid or a combination of solid and liquid and may be classified into three broad groups- dust, mist and fumes. Dust and fumes are solid flying particles, fumes being extremely small. Mists are tiny liquid droplets given off by spraying or .very fast mixing or agitating.

Dust, mist or fume respirator, air-line respirator and abrasive blasting respirator are suitable.

Types of contaminants can also be classified as under:

1. **Toxic particulate contaminants :**
These when inhaled may pass from the lungs into the blood stream and are then carried to the various parts of the body. The effect may be chemical irritation, systemic poisoning or allergic reactions. Common contaminants in this group are antimony, arsenic, cadmium, chromic acid and chromate, lead and manganese.
2. **Fibrosis-producing dusts:**
These dusts do not pass into the blood stream but remain in the lungs and may cause pulmonary impairment. The common example under this group are asbestos, coal, iron, bauxite and free silica.

3. **Nuisance Dusts :**

These may dissolve and pass directly into the blood stream or may remain in the lungs neither producing local nor systemic effects. Examples are saw dust, chalK clay, starch, cement dust etc.

6.1.4 Combination of Gaseous and Particulate Contaminants:

Here gaseous and particulate contaminants occur together as in case of paint spraying where solvent vapour (gas) and paint mists are mixed. They may be entirely of different substances like carbon monoxide and oxides of nitrogen produced by blasting or volatile liquids.

For contaminants immediately dangerous to life, positive pressure self-contained or combination breathing apparatus or gas masks with special filter and for not immediately dangerous to life, air line respirator, hose masks with or without blower and chemical cartridge respirator with special filter are suitable.

6.2 Classification of Respirators :

Respiratory protective equipment are already classified in foregoing Part-4 of this chapter. They are of two types : Air-supplying or Air-purifying. Air supplying respirators include air-line respirator, self breathing (air or oxygen) apparatus, suction hose mask, pressure hose mask etc. Air-purifying respirators include canister, cartridge or filter respirators which need replacement of these parts. They are briefly described below:

6.2.1 Air Supplying Respirators :

(1) Airline Respirators:

Airline respirator consists of a face-piece (half or full mask or a loose fitting helmet or hood) to which air is supplied through a small diameter hose. It may be a continuous flow type or a demand type.

Air Line Respirator

In a constant or continuous flow type, air is supplied continuously to the face piece helmet or hood. air or the excess air entering the face-piece escapes to the atmosphere. Air supplied should be at least 110 litres of air per minute to enter the face-piece and at least 170 litres per minute to enter the helmet or hood.

Abrasive blasting (e.g. shot or sand blasting) respirator is a continuous flow type airline respirator with the addition of mechanical protection for head and neck from abrasive particles.- It may cover shoulder and chest also.

In a pressure demand type respirator, air is supplied to a face-piece when the wearer inhales and the rate is governed by his volume rate of breathing. Air from an air compressor cylinder is supplied to the face-piece through a demand valve which is actuated by the slight negative pressure created when the wearer inhales. On exhalation the demand valve closes and exhaled air escapes to the surrounding atmosphere through exhalation valve. Helmets or hoods are not used with demand type respirator.

Airline respirators provide protection so long as the air supply is maintained but the wearer's travel is restricted by the length of the air supply hose. They are not used in IDLH atmosphere. Air temperature and pressure should be comfortable and the air should be supplied through an air-cleaner. Care should be taken to ensure that the air supply is respirable and is not contaminated and is free from objectionable odours, oil or water mist and rust particles from the supply line. The air line connection should be tight (nondetachable) and should be checked before use. One worker died due to detachment of air supply line when he was working in oxygen deficient atmosphere (95% Nitrogen) to fill a pyrophoric catalyst in a .reactor.

(2) Suction Hose Mask :

It consists of a full face piece connected to a large diameter flexible hose. The worker draws in air by his own breathing effort, the hose is attached to the wearer's body by a suitable safety harness with safety line and the air inlet end of the hose is provided with a filter to arrest particulate matter. Air can be drawn in by respiratory effort of the wearer upto 30 ft length of the hose.

(3) Pressure Hose Mask (Air supplied hoods):

This hose mask or hood is similar to suction hose mask except that the air is forced through a large diameter hose by a hand or motor-operated blower or compressor. The blower is to be operated continuously while the mask is in use. Respirable air of comfortable pressure and temperature should be supplied at least 6 ft^3/min.

(4) Air-Supplied Suits:

Air line respirators are used where normally nose and face are exposed to hazards and not the other body parts. But where all body parts including nose, need protection, for example, to do any repair or emergency work in extremely corrosive atmosphere affecting skin and mucous membranes or acutely toxic and immediately dangerous to life, a full body suit of impervious clothing with respirable air supply, is a must.

The air line is connected to the suit 'itself and also to helmet and distributing air evenly throughout on the body, because without such ventilation and cooling effect, it is very difficult and fatiguing to wear such suit for a longer time. Particularly, in our country where majority of the days are hot, workers are reluctant to wear such full suit. They should be properly explained its need and utility. They should be rotated in case of more inconvenience.

6.2.2 Self-Contained Breathing Apparatus :

They are of two types.

(1) Self-Contained Compressed Air or Oxygen Breathing Apparatus:

This is a device by means of which the wearer obtains respirable air or oxygen from compressed air or oxygen cylinder which is an integral part of the apparatus.

In a demand type Self-Contained breathing apparatus, air or oxygen is admitted to the face piece through a two stage pressure reducing mechanism, only when the wearer inhales and the quantity of air or oxygen admitted is governed by his breathing. The wearer's exhaled breath escapes to the surrounding atmosphere.

In compressed oxygen cylinder recirculating type breathing apparatus, high pressure oxygetl from the cylinder passes through a pressure reducing and regulating valve into a breathing bag. The wearer inhales this oxygen through a one-way breathing valve and his exhaled breath passes into a canister containing chemicals to absorb exhaled carbon dioxide and moisture and then through a cooler into the same breathing bag. Oxygen enters the breathing bag from the supply cylinder only when the volume of gas in the bag has decreased sufficiently to allow the supply valve to open.

From respiratory point of view, self-contained breathing apparatus has no limitation as to the concentration of the gas or deficiency of oxygen in the surrounding atmosphere but other factors may limit the time that the wearer can remain in a contaminated atmosphere. Many gases are very irritating to the skin and many can be absorbed in dangerous amounts through the unbroken skin.

(2) Oxygen-Regenerating Recirculating type Self-Contained Breathing Apparatus:

In this type of apparatus moisture content from the wearer's exhaled breath reacts with granular chemical in a canister to liberate oxygen. Also the exhaled carbon-dioxide is absorbed by the chemicals in the canister. The oxygen enters the breathing bag from which the wearer inhales through a corrugated breathing tube connecting the bag to the face-piece.

6.2.3 Air Purifying Respirators :

Air purifying respirators purify the air of gases, vapour and particulate, but do not supply clean or fresh air. Therefore they must never be used in oxygen deficient atmosphere. Purification of breathing air is done by mechanical filtration, adsorption, chemical reaction or catalysis.

The life of such respirators depends on concentration of the contaminant, scrubbing capacity of the medium (cartridge) and breathing demand of the wearer. The respirator has a face piece and a connected canister (box) or cartridge to purify the air passing through it.

The canister or cartridge should not be used -

1. After its date of expiry or after 100 hours after its first use.
2. When air coming to nose, gives irritation, smell or indication of saturation or non-effect of the scrubbing medium.
3. When oxygen is less than 18% in air.
4. When the gas or vapour has no smell or odour.
5. When the gas or vapour is highly toxic.
6. When the gas or vapour is highly irritating to eyes without necessary eye protection, and
7. Above the limit of concentration marked on it.

Main types of air-purifying respirators are explained below:

(1) Canister Gas Mask :

This consists of a canister, containing appropriate chemical, a full face-piece and body harness to hold the canister. Air is drawn through the canister by the wearer and during its passage through the chemical in the canister the contaminant present in the incoming air is absorbed and reacted with the neutraliser. The canisters are designed for specific gases and it is very important that the appropriate type is used.

The canister gas mask can only be used in atmosphere not deficient in oxygen and not containing more than 20% by volume of most toxic gases. Also, the life of the canister will depend upon the type of canister, the concentration of gas and the activity of the wearer.

(2) Chemical Cartridge Respirator :

This consists of a half-mask attached to one or two cartridges.. Like canisters, the cartridges are filled with appropriate chemicals to absorb gases or vapours drawn through them. This respirator is a non-emergency gas respirator and it should not be used in an atmosphere deficient in oxygen. Like canister gas mask, chemical cartridge respirator provides respiratory protection for a period that depends on vapour concentration and the wearer's activity. It is recommended for low concentration gases and vapours, 0.1% or 1000 ppm of organic vapour, acid gases upto 500 ppm, ammonia upto 700 ppm and mercury vapour.

(3) Self-rescue type Respirators :

This is designed to provide the greatest possible respiratory protection consistent with the practicability of carrying the device at all times so that it is always available for use during escape. It consists a filter element, a mouth piece, a nose clip and means of carrying conveniently on the body. The filter elements are similar to chemical cartridge. The extent of protection afforded is between that provided by canister gas mask and that provided by a chemical cartridge respirator.

Colour code of canister/cartridge as given in IS 8318 and 8523 is given in Table 25.10.

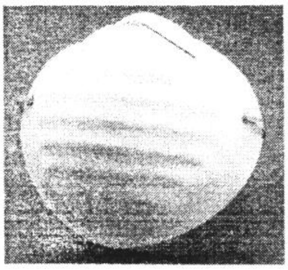
Table 25.10 : Colour Code of Canisters

No.	Gas in polluted air	Colour of canister
1	Acid gas	White
2	Organic vapour	Black
3	Ammonia gas	Green
4	Carbon monoxide gas	Blue
5	Acid gas & Organic vapour	Yellow
6	Acid gas, Ammonia & Organic vapour	Brown
7	Acid gas, Ammonia, Carbon monoxide & Organic vapour	Red
8	Gases & vapours other than above	Olive
9	Radioactive materials (except tritium & noble gases)	Purple
10	Dust, Fume & mist (except radioactive materials)	Orange
11	Any vapour or gas with organic substance	Purple strips
12	Any vapour or gas with Dust, Fume & Mist	Orange strips
13	Chlorine	White with yellow strips
14	HCN gas or vapour	White with green strips

In addition to the above colour identification, full instructions on the canister/cartridge must be read to understand its correct use, suitability, duration, limitation etc.

(4) Mechanical Filter Respirators :

These remove particulate matter from the inspired air which passes through a filter. These filters may be of the single use or re-usable type. If these respirators are used in heavy concentrations of particulate matter, the filling will be clogged with dust particles too quickly and they may have to be replaced every now and then,. Micro filters are special filters designed to arrest ultra microscopic size of dust particles and these are used where extremely fine dusts are encountered.



Such filters screen out dust, fog, fume, mist, spray, smoke etc. through a filter or pad but they cannot be used against 0 deficiency, gases, solvents and vapours.

Powered air-purifying respirators use a blower to pass the contaminated air through an element that removes the contaminant and supplies purified air to the face-piece.

(5) Combination of Chemical and Mechanical Filter Respirators:

They remove toxic gases and vapours and particulate matter from inspired air. Common example of their use is in spray painting work. They are also known as 'Gas Masks'.

Types of respirators are shown in Table 25.11.

Table 25.11 : Types of Respirators

Type	Protects Against	Characteristics
Dust respirator	Nuisance dusts and pneumoconoiosis producing dusts, powders, mists having TLV (Threshold Limit Value) not less than 0.1 mg/m^3 of air	Single or double filters of lint, cotton wool, etc. which can be replaced when plugged with particulate matter. Resin impregnated wool fitler for dust of 10 micron or less
Light Chemical Cartridge Respirator	Light concentration of fumes say 0.1% by volume – of acid fumes 7 paint spray.	Mouth cum nose piece. Activated charcoal used for absorbing gases & fumes.
Heavy Chemical Cartridge Respirator	Light concentrations of acid fumes and specified gases. Usually for concentration not exceeding 0.1% by volume.	Mouth cum nose piece having usually a mixture of calcium hydroxide with sodium or potassium hydroxide used as reacting agent.
Canister Gas Masks	Specified fumes / vapours/ gases not exceeding a concentration of 2% by volume for a maximum period specified by supplier (usually 30 min.)	Face piece or mouth piece connected by a flexible tube to a canister containing neutralizing chemical for specified gases.
Self-contained breathing apparatus (SCBA)	Oxygen deficient environment and toxic gas environment of high concentration.	Compressed air or oxygen cylinder supplies breathing air / oxygen; full face mask connected to the cylinder.

Types of respirators available :

Aluminium, alu-foil, anti-dust, protective hood, air-line reinforced plastic hood, fresh air hose apparatus, pressure hose apparatus, face mask with canister, face mask with screw filter canister, small gas filter, oxygen breather, compressed air breathing apparatus, protective suits for fire fighting and rescue operation, automatic resuscitator, plastic foil respirator, cloth mask, dust guard, full. vision face mask, lung protector, fibre glass hood respirator, pressure fresh air hose apparatus etc.

6.2.4 Selection, Instruction and Training in the use of Respirators :

Respiratory protection programme should include - Policy and administration, identification, measurement, evaluation and control of respiratory hazards. Selection and use of proper respiratory PPE, Training, inspection, maintenance and repair of equipment. Medical surveillance and review of the programme.

The following factors should be considered for selection of the respirators:

1. Nature of the hazard.
2. Severity of the hazard.
3. Type of contaminant.
4. Concentration of the contaminant.
5. Protection factor which should be
   $\geq$ Hazard Ratio = Contaminant concentration / TLV
   Assigned protection factors to respirators are as under:

Air purifying respirators - Half mask 10
- Full facepiece 50

Powered air purifying respirators
- Loose fitting facepiece 25
- Half mask 50
- Full facepiece 1000

Supplied Air respirators (Airline) -
- Continuous flow - Loose fitting facepiece 25 ;-Halfmask50
  - Full facepiece 1000
- Pressure demand with full facepiece 1000 SCBA 1000

6. Period for which respiratory protection must be provided.
7. Location of the contaminated areas with respect to a source of respirable air.
8. Expected activity of the wearer, and
9. Operating characteristic and limitations of the available respirator.

Instructions for care should include the following aspects :
1. Why and how it is to be used.
2. Protecting the equipment from dust, heat, moisture, extreme cold and damaging chemicals. Storing in a dry cool place.
3. Checking that it is in good operating condition. Valves should be maintained in efficient working condition.
4. Fitting of respirator on the wearer and
5. Proper use and maintenance of the respirator.
6. Cleaning and keeping it in a sealed plastic bag with name tag of the user.

Training for respiratory equipment should include following points :

1. Reasons of need of respiratory protection and limitation or inability of other controls or methods.
2. Identification and understanding of the hazard for which the equipment is to be used and selection procedure;
3. Limitation, capability, function and operation of the respirator.
4. Proper fitting, wearing, adjusting face piece & valves and removing of the respirator.
5. Maintenance and storage procedure.
6. Practice to wear first in a safe atmosphere to become familiar with its characteristics.
7. Practice to wear in a test atmosphere under close supervision of the trainer, and to do similar activities and to detect respirator leakage or malfunction.
8. How to ascertain and handle emergency situation.
9. Statutory provisions regarding use of respirators.
10. When and how to replace filters, cartridges, canisters and cylinders.
11. Instructions for special use if any.

The trainer should be qualified safety officer, industrial hygienist, safety professional or manufacturer's representative

6.2.5 OSHA Standard for Respiratory Protection:

Program Requirements:

The OSHA Respiratory Protection Standard (29 CFR 1910.1-34) lists seven key elements that every respiratory protection program should contain. These include :

1. A written plan detailing how the program will be administered.
2. A complete assessment and knowledge of respiratory hazards that will be encountered in the workplace.
3. Procedures and equipment to control respiratory hazards, including the use of engineering controls and work practices designed to limit or reduce employee exposures to such hazards.
4. Guidelines for the proper selection of appropriate respiratory protective equipment.
5. An employee training program covering hazard recognition, the dangers associated with respiratory hazards, proper care and use of respiratory protective equipment.
6. Inspection, maintenance and repair of respiratory protective equipment, and
7. Medical surveillance of employees.

Administration:

The responsibility for administration of these procedures should be assigned to one individual who may, and probably will, have assistance. The necessity for a central authority is to ensure consistent coordination and direction. The actual respiratory protection program will vary widely depending upon many factors and may require input from specialists such as safety personnel, industrial hygienists, health physicists and physicians. But program responsibility should reside with a single individual if the program is to achieve optimum results.

The first step in a respiratory protection program is to establish written standard operating procedures governing the selection and use of respirators.

Finally, there should also be regular inspection and evaluation of the program itself to ensure its continued effectiveness.

For types of respiratory hazards see Part 6.1

Hazard Assessment:

Proper assessment of the hazard is the first important step to protection. This requires a thorough knowledge of .processes, equipment, raw materials, end-products and by-products that can create an exposure hazard.

To determine an atmosphere's oxygen content or concentration levels of particulate and/or gaseous contaminants, air samples must be taken with proper sampling instruments during all conditions of operation. The sampling device, the type and frequency of sampling (spot testing or continuous monitoring) will be dictated by the exposure and operating conditions. Breathing zone samples are recommended and sampling frequency should be sufficient to assess the average exposure under the variable operating and exposure conditions.

If contaminant concentrations exceed exposure limits recommended by the American Conference of Governmental Industrial Hygienists (ACGIH), OSHA or NIOSH, hazard control procedures must be implemented promptly.

Exposure monitoring plays a critical role in the respirator selection process. The results from such tests will help you determine whether respiratory protection is needed and, if it is, the type of respirator required. Generally respirator selection is based on three factors:

1. The results of your atmospheric monitoring or sampling programme,
2. The accepted ACGIH, OSHA or NIOSH exposure limits for the substance(s) present and

3. The maximum concentration (of a substance) for which a respirator can be used.

Exposure limits include ACGIH Threshold Limit Values (TLVs), OSHA Permissible Exposure Limits (PELs), NIOSH Recommended Exposure Levels (RELs) and AIHA Workplace Environmental Exposure Levels (WEELs). These values are guides for exposure concentrations that healthy individuals can normally tolerate for eight hours a day, five days a week without harmful effects. Unless otherwise noted, exposure limits are eight-hour, time-weighted-average(TWA) concentrations.

In general, gas and vapour exposure limits are expressed in ppm by volume (parts of contaminant per million parts of air), while particulate matters (concentrations) are expressed as mg/ 3 (milligrams of concentrations per cubic meter of air). For substances that can exist in more than one form (particulate or gaseous), concentrations are expressed in both values.

It is important to note that exposure limits and other exposure standards are constantly changing as more data is gathered about specific chemicals and substances. As such, you must be certain that you are using the most recent data when determining allowable exposure levels for employees.

Hazard Control:

Hazard control should start at the process, equipment and plant design levels where contaminants can be effectively controlled at the outset. With operating processes,, the problem becomes more difficult. In all cases, however, consideration should be given to the use of effective engineering controls to eliminate and/or reduce exposures to respiratory hazards. This includes consideration of process encapsulation or isolation, use of less toxic materials in the process and suitable exhaust ventilation, filters and scrubbers to control the effluents.

Because it is sometimes not practical to maintain engineering controls that eliminate all airborne concentrations of contaminants, proper respiratory protective devices should be used whenever such protection is required.

Respirator Selection:

Respiratory protective devices vary in design, application and protective capability. Thus, the user must assess the inhalation hazard and understand the specific use limitations of available equipment to assure proper selection.

The respirators fall under two classifications : air-purifying and air-supplied. Air-purifying respirators are used against particulate, gases and vapours. These include negative-pressure respirators that use chemical cartridges and/or filters; gas masks; and positive pressure units such as powered air-purifying respirators (PAPRs), Air-supplied devices rely on a primary air source to deliver a steady flow of respirable air to the user's facepiece. These include SCBA and airline devices.

For training, maintenance and care of PPE, See Part 7.

Medical Surveillance:

Workers should never be assigned to any operations requiring respiratory protection until a physician has determined that they are capable physically and psychologically to perform the work using the respiratory protective equipment.

Although instituting a sound respiratory protection program will take effort and financial investment, the objective of such a program is sound - ensuring that every worker is protected against potentially fatal diseases.

6.2.6 Cleaning Procedures for Respirators:

1. Remove filters, cartridges, or canisters. Disassemble facepieces by removing speaking diaphragms, demand or pressure-demand valve assemblies, hoses, or any components recommended by the manufacturer. Discard or repair any defective parts.
2. Wash components in warm (43°C/110°F maximum) water with a mild detergent or with a cleaner recommended by the manufacturer. A stiff bristle (not wire) brush may be used to facilitate the removal of dirt.
3. Rinse components thoroughly in clean, warm, preferably running water. Drain the components.
4. When the cleaner used does not contain a disinfecting agent, respirator components should be immersed for two minutes in-

   Hypochlorite solution (50 ppm of chlorine made by adding approximately one milliliter of laundry bleach to one liter of water at 43°C/110°F), or

   Aqueous solution of iodine (50 ppm iodine) made by adding approximately 0.8 milliliters of tincture of iodine (6-8 grams ammonium and/ or potassium iodine/lOOcc of 45% alcohol) to one liter of water at 43°C/110°F
5. The importance of thorough rinsing is most important. Detergents or disinfectants that dry on facepieces may result in dermatitis. In addition, some disinfectants may cause deterioration of rubber or corrosion of metal parts if not completely removed.
6. Components should be hand-dried with a clean, lint-free cloth, or air-dried.
7. Reassemble facepiece, replacing filters, cartridges, and canisters where necessary.
8. Test the respirator to ensure that all components work properly.

7 TRAINING, MAINTENANCE, PRECAUTION AND CARE OF PPE

Training :

For proper use of any respiratory protection device, it is essential that the user be properly instructed in its selection, use and maintenance. Both supervisors and workers must be so instructed by competent persons:

Minimum training must include the following:

1. Methods of recognising respiratory hazards.
2. Instruction in the hazards and an honest appraisal of what could happen if the proper respiratory protection device is not used.
3. Explanation of why more positive control is not immediately feasible. This must include recognition that every reasonable effort is being made to reduce or eliminate the need for respiratory protection.
4. A discussion of why various types of respiratory protection devices are suitable for particular purposes.
5. A discussion of capabilities of the device and limitations.
6. Instruction and training in actual use of respiratory protection equipment and close and frequent supervision to assure that it continues to be properly used.
7. Classroom and field training to recognise and cope with emergency situations.

Training should provide personnel with an opportunity to handle the device, have it fitted properly, test its face-to-face piece seal, wear it in normal air for long familiarity period and, finally, to wear it in a test atmosphere.

Training is very important for supervisors who have to supervise the use of any type of personal protective equipment as well as for the users. Generally no one should wear personal protective equipment until he has been thoroughly trained to use it correctly. He should know

1. The hazards for which protection is required, control measures provided or not possible.
2. Reasons of selection of particular type of PPE.
3. The limitations of the equipment.
4. How to wear, use and remove each equipment. Removal is particularly important where the equipment may be contaminated with a highly toxic material.
5. Demonstration how to fit, adjust and use the PPE and practice by the worker for that.
6. How to clean, repair and maintain in good condition the PPE.
7. How to inspect for damaged equipment to ensure adequate protection.
8. How to deal with emergencies, and
9. Location of the equipment before and after use.

Training should be given by a qualified safety professional or manufacturer's representative and may include lectures, demonstrations, drills and on the job guidance. Training should include new and most suitable PPE available in the market.

Maintenance :

It is a cooperative activity between the employee who takes care of his equipment and the safety professional who teaches him how to use it and provides proper instructions. After inspections, cleaning and necessary repair, personal protective equipment shall be stored to protect against dust, sunlight, heat, extreme cold, excessive moistures or damaging chemicals to retain its original effectiveness. When in doubt about the maintenance of any type of personal protective equipment, it is a good practice to contact the manufacturer. All PPE should be cleaned and examined after each use. Respirators should be cleaned daily. Face-piece should be washed in warm water with soap or a detergent. Filter and chemical cartridge should be replaced when needed.

General Precautions to use PPE :

Following precautions are useful for training and practice

1. Hazards at workplace must be thoroughly studied, gas, oxygen, contamination, noise etc. should be measured and their level should be minimised by engineering controls first and then only the need of necessary personal protective equipment (PPE) should be ascertained.

2. PPE should be kept ready and in sufficient number. Gloves, shoes, goggles, aprons, earplugs etc. should be given individually and kept clean by the worker in his locker.

3. PPE should be of approved (IS) quality and tested before use. Manufacturer's instructions, limitations, time limit if any, procedure or method of use, symptoms of malfunctioning, emergency action if it does not work and instructions for maintenance and care should be well understood before using any PPE.

4. Written instructions should be prepared and displayed or given to the workers for the safe use of the equipment. After medical examination of the worker, need and type of the equipment shall be reconsidered. Change if any, should be incorporated.

5. Laziness in using PPE is not good. A cloth in place of effective respirator is insufficient. Avoiding PPE because the use is for a few seconds or minutes, is unsafe.

6. Loose PPE should be kept away from the moving machine parts.

7. While entering in a tank or working at height, safety belt must be worn, in addition to good sitting and supporting arrangement (safe platform or fencing). Gas and oxygen level should be measured and kept safe as far as possible. PPE shall be selected based on its level.

8. Cotton clothing in hot days, woollen clothing in cold days and tight fitting clothing while working near machinery are 'basic requirement. Synthetic cloths are unsuitable to health. PPE on cotton clothing gives more comfort.

9. A man working on electricity should wear nonconductive helmet. Conductive shoes or clothing are required to discharge static electricity induced in a human body.

10. Canister gas mask and dust mask are useful for low concentration (100 to 200 ppm) and for the gas and duration mentioned on the mask only. Filter is to be changed or cleaned soon after choking. Canister gas mask is not useful if oxygen is insufficient (less than 18%) in air. Different types of gas masks are recommended for different level of concentration.

    Canister mask is not safe while working in a tank. When gas is less than 5% of LEL, canister mask may be worn just to clean the tank. If this level is from 5 to 20% of LEL, airline respirator may be used. If concentration is more than this it should be diluted.

    Six months old canister mask should not be used. Every six months its chemical is to be freshly filled. It should not be used after 100 hours after breaking its seal. If face piece is used by another person, it may be reused only after sterilisation. User of a gas mask should get his heart and lungs checked by a doctor.

    Canister mask of a gas which has no smell (e.g. CO, PH_3), should be used new every time. Gas mask should be kept away from moisture and heat and should be regularly checked.

11. Chemical cartridge and dust respirators can be used where flammable gas, fume or dust concentration is so low that canister mask is not necessary. When the gas is poisonous or in high concentration, eye burning, or without smell or where oxygen is insufficient, chemical cartridge or dust respirators cannot be used. The cartridges should be kept dry. If they are moist or giving smell, they should be changed. Valves for inhale and exhale should be checked and kept efficient.

12. Where oxygen is less, gas, dust or smoke are more, toxic gases like $C1_2$, CO, H_2S, PH_3 phosgene exist, proper canister gas mask is not available or where one has to work in a tank for a long time, an airline respirator is useful, because fresh air is available through blower or air compressor and polluted air is being driven away near the nose. But because of the limited length (80 mt maximum), where one has to move at a longer distance or upstairs and downstairs at different floors, only SCBA is useful.

    Connections (joints, clamps, clips etc.) of air line should always be checked before use, otherwise accidental detachment of air supply will cause harm to .the wearer. Air drawing point should not be kept in polluted air. Air filter (cleaner), air control valve, safety valve and alarm are all necessary. Air flow should not be less than 6 ft3/min and its temperature should be comfortable. If hydrocarbon gas content is more than 20% of LEL, it is unsafe to enter into a tank with air hose mask. Air inlet valve should not be completely closed (it should remain partially open).

Cooling effect and circulating air type suits are also available which are useful in working near high temperature.

13. Earplugs should be washed with soap and' water, dried and put into its box after every use. Earplugs used by others should be sterilised before use. Earplugs should be supplied individually to the workers. Ear muffs should also be cleaned before and after use.

14. Fire rescue (proximity) suit should be worn by two persons at a time so that one may act as a standby. Air cylinder and lifeline should also be kept ready.

15. Safety belt should be kept clean, dry and in sound condition. Its connections and wear and tear should be checked before every use. Its free end should be tied with a fixed (immovable) structure while working at height or given in another person's hands while entering in a tank.

    Strength members of a safety belt should be of very sound material other than leather. Buckles should withstand 1315 kg tensile test and be quickly openable.

    Lifeline should not be of pieces tied together. Nylon rope of '/2 inch diameter is safe. Wire rope should be made oily before and after using it in acidic atmosphere. Metallic life line shall not be used near electric work.

16. Nothing should be kept in helmets. It should be checked for crack and proper fitting.

17. Contact lenses are to be protected against gas, vapour, fumes, excessive heat, molten metal and chemical splashes. Therefore safety goggles over the lens or numbered glass are always necessary. Safety .goggles are also necessary with the faceshield. When goggles or faceshield are splashed with chemicals, they should be washed by a water shower before taking out from the face. Plastic lenses are more useful than glasses. Side shields are useful.

18. Mechanical filter respirators are useful for dust and smoke. Filters are to be changed or cleaned when choked. Mechanical filter respirators are not suitable for solvent vapour, toxic gas or oxygen deficiency. In fire fighting work, only SBAis useful and not the gas mask.

19. A respirator should be carefully selected while working in IDLH (immediately dangerous to life and health) environment. An operator is necessary with blower hose mask. One can run away till the air is available from the hose even when the blower is closed. While working with SBA, one should come out after hearing the low pressure alarm.

20. No other gas mask than SBA or air line is useful where oxygen is less than 18%. Level of oxygen should be measured with oxygen meter.

21. When gas concentration is more than its safe limit or within explosive range (between LEL and UEL) or oxygen is less than 18% in a tank, (or confined space), it should be ventilated by air (not by oxygen), the levels should be again measured and when they are safe, permit to enter should be signed.

22. Air supplying hoods are useful in hot or dusty atmosphere to work for a longer time.

23. Where atmospheric pressure is more than 2 bar, oxygen SBA should not be used because of the possibility of oxygen poisoning. Quick start canister used in closed circuit oxygen self generating (recirculating) SBA, may prove dangerous in atmosphere of gas having less than 315 °C auto ignition temperature. Venting device to release excess oxygen is required in that case. Used canister should be disposed safely. SBA should be used by a healthy and trained worker only.

24. In empty air cylinder, oxygen should not be filled. It may cause fire due to contact with oil or grease.

25. Safety toe shoes should withstand 300 ft pound impact load. Resistance of conductive shoe should not exceed 450 kilo ohms.

    Electrician's boots should not have any metal parts, and steel toe if any, should be insulated.

    Sole with flexible metal sheet inside, give protection against nails and sharp edges.

26. Where full hand gloves are not required,, stalls for fingers, mittens or pads for palms, and other PPE for thumb, wrist, palm and elbow are also available.

    Leather gloves are Useful to work with glass or metal sheet or sharp edges but not useful to work above 65 °C temperature.

    Natural rubber is not suitable to work with oil, grease or organic solvent.

    Hand gloves with any metal part are not suitable for electric work. High voltage tested rubber gloves are suitable for such work.

27. After the use is over, PPE should not be left anywhere. They should be returned to the proper person or put in a cupboard meant for it.

28. Arrangement for keeping, cleaning, testing and disposal of PPE should be provided and every such person should be properly trained in addition to the user.

Respirator Care :

Proper inspection, maintenance and repair of respiratory protective equipment is mandatory to ensure success of any respiratory protection program. The goal is to maintain the equipment in a condition that provides the same effectiveness it has when first manufactured. Inspection

All equipment must be inspected periodically before and after each use. A record shall be kept of all inspections by date with the results tabulated. Follow precisely the recommendations of the manufacturer. Maintenance

All respiratory protective equipment shall be cleaned and decontaminated after each use. Repair

Replacement of other than disposable parts must be done only by personnel with adequate training to ensure the equipment is functioning properly after the work is accomplished. Only parts supplied by the manufacturer for the product being repaired shall be used.

8 DETECTION EQUIPMENT

8.1 Classification of Equipment :

Many times with or without the personal protective equipment, various types of detection equipment are to be used as under :

Detecting Equipment (Environmental Surveillance)

- Combination Instruments
  - Passport personal alarm (multigas detector) with sampling probes, Gasport gas tester (detection of CH_4, CO, H_2S & O_2), Portable alarms (pocket instruments to detect combustible gas and O_2), Portable indicator & alarm, Remote alarms
- Combustible Gas Indicators
  - Explosimeter, Combustible gas indicators, Portable combustible gas alarm, Calibration check kits
- Toxic Gas and Oxygen Indicators
  - Organic vapour monitor, Detector tube pump, Gas tester pump, Detector tubes, Oxygen indicators, Mini series gas indicators, HazMat response kit, CO/CO_2 response kit
- Personal Sampling Pumps
  - Pump for personal & area sampling, Micro air sampler, Quick-flow area sampler, Ventilation smoke tube kit, Pump calibration check devices

Use of such detection equipment is necessary to ascertain the working environment for selection of a right type of PPE.

8.2 Detection Methods(Environmental Surveillance) :

Battery-powered, direct-reading detection instruments are classified by two groups — single-gas instruments or multiple-gas instruments — typically monitoring one or a combination of the following atmospheric conditions :

1. Oxygen deficiency or enrichment;
2. The presence of combustible gas; and
3. The presence of certain toxic gases.

Depending on the capabilities of the instrument, monitoring can be conducted simultaneously for oxygen and combustible gas or for oxygen, combustible gas and toxic gases. These devices are commonly referred to as 2-in-l, 3-in-l, 4-in-l or 5-in-l alarms.

No matter which type of instrument is used to check environmental gas concentrations, regular monitoring should be performed because a contaminant's level of combustibility or toxicity might increase even if it initially appears to be low or nonexistent. In addition, oxygen deficiency cAn occur unexpectedly.

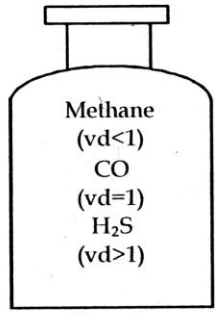
8.2.1 Atmospheric Composition:

To determine the composition of an atmosphere, reliable instruments should be used to draw air samples. If possible, do not open the entry portal to the confined space before this step has been completed. Sudden changes in atmospheric composition within the confined space could cause violent reactions or dilute the contaminants in the confined space, giving a false low initial gas concentration.

When testing permit spaces for acceptable entry conditions, always test in the following order:

1. Oxygen content,
2. Flammable gases and vapours, and
3. Potential toxic air contaminants.

Comprehensive testing should be conducted in, various locations within the work area. Some gases are heavier than air and tend to settle at the bottom of a confined space. Others are lighter and are usually in higher concentrations near the top of the confined space. Still others have the same molecular weight as air, so they can be found in varying concentrations throughout the space. This is why test samples should be drawn at the top, middle and bottom of the space to pinpoint varying concentrations of gases or vapours as shown below.



Gas position according to vapour density.

The results of the atmospheric testing will have a direct impact on the Selection of protective equipment necessary for the tasks in the area. It may also dictate the duration of worker exposure to the environment of the space or whether an entry will be made at all. Substance-specific detectors should be used whenever actual contaminants have been identified.

Combustible Gases:

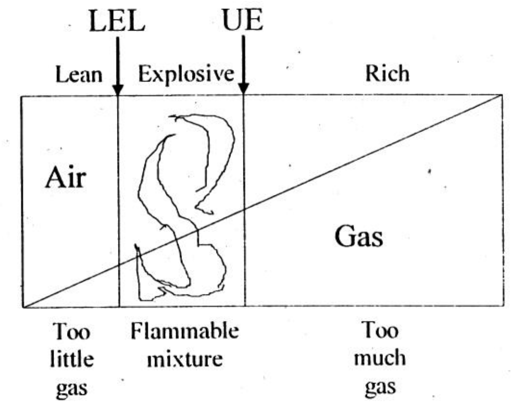
In order for combustion to occur, there must be three elements:

1. Fuel.
2. Oxygen to support combustion and
3. Heat or a source of ignition.

This is known as the fire triangle, but if you remove any one of the legs, combustion will not occur.

The percentage of combustible gas in the air is important. For example, a manhole filled with fresh air is gradually filled by a leak of combustible gas such as methane or natural gas, mixing with the fresh air.

As the ratio of gas to air changes, the sample passes through three ranges: lean, explosive and rich.



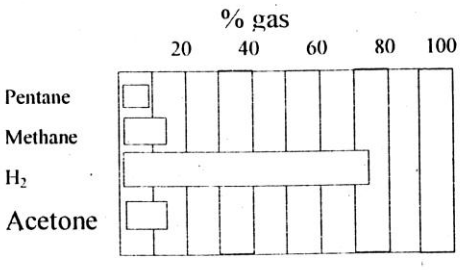
In the lean range there isn't enough gas in the air to burn. On the other hand, the rich range has too much gas and not enough air. However, the explosive range has just the right combination of gas and air to form an explosive mixture. Care must be taken, however, when a mixture is too rich, because dilution with fresh air could bring the mixture into the flammable or explosive range. An analogy is the automobile that won't start on a cold morning (a lean atmosphere because the liquid gasoline has not vaporised sufficiently), but can be flooded with too much gasoline (a rich atmosphere with too much vaporisation). Eventually, when the right mixture of gas and air finally exists (explosive), the car starts.

8.2.2 Working of Combustible Gas Monitors:

To understand how portable combustible gas detection instruments work, it is first important to understand what is meant by Lower Explosive Limit (LEL) and Upper Explosive Limit (UEL). When certain proportions of combustible vapours are mixed with air and a source of ignition is present, an explosion can occur. The range of concentrations over which this reaction can occur is called the explosive range. This range includes all concentrations in which a flash will occur or a flame will travel if the mixture is ignited. The Lowest percentage at which this can happen is the LEL; the highest percentage is the UEL.

Most combustible instruments display gas concentrations as a percentage of the LEL. Some models have gas readouts as a percentage by volume and others display both percent of LEL and percent combustible gas by volume. What's the difference? For example, the LEL of methane (the major component in natural gas) is 5 percent by volume, and the UEL is 15 percent by volume. If we slowly fill the room with methane, when the concentration reaches 2.5 percent by volume, it is 50 percent of the LEL; at 5 percent by volume it is 100 percent of the LEL. Between 5 and 15 percent by volume, a spark could set off an explosion.

Different gases need different percent by volume concentrations to reach 100 percent of the LEL. Pentane, for example has an LEL of 1.5 percent. Instruments that measures in percent of the LEL are easy to use because regardless of the gas, you are most concerned with ho\\ close the concentration is to the LEL.

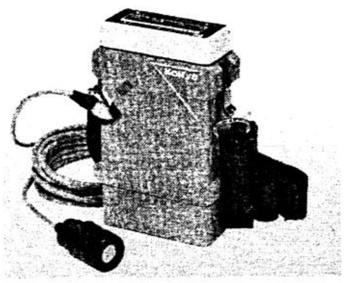


Explosive range

8.2.3 Working of different Gas Monitors :

They are explained below -

(1) Single Gas Monitors for Oxygen Deficiency



Hand held oxygen indicator with wlarm

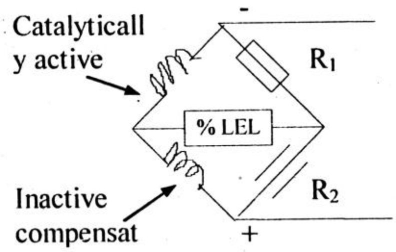
Oxygen indicators measures atmospheric concentrations of oxygen. Concentrations are generally measured over a range of 0 to 25 percent oxygen in air, with readings being displayed on either digital readout or an analog meter.

Oxygen indicators are calibrated with uncontaminated fresh air containing a minimum of 20.8 percent oxygen. With some models, an alarm is activated when oxygen levels drop below 19.5 percent.

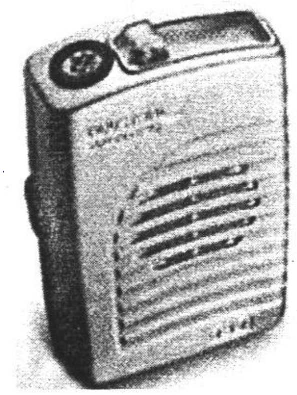
(2) Single Gas Monitors for Combustible Gases

Single-gas instruments for monitoring combustible gases and vapours are generally calibrated on pentane and are designed for general purpose monitoring of hydrocarbon vapours. Such instruments operate by the catalytic action of a heated platinum filament in contact with combustible gases. The filament is heated to operating temperature by an electric current. When the gas sample contacts the heated filament, combustion on its surface raises the temperature in proportion to the quantity of combustibles in a sample.

A Wheatstone bridge circuit, incorporating the filament as one arm, measures the change in electrical resistance due to the temperature increases. This change indicates the percentage of combustible gas present in the sample.



Wheatstone Bridge



(3) Single Gas Monitors for Toxic Gases

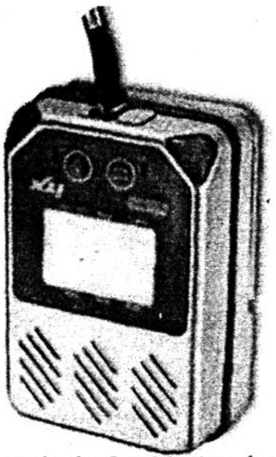
Compact, battery-powered devices can be used to measures levels of such gases as carbon monoxide (CO) or hydrogen sulphide (H_2S), depending on the model selected. Toxic gas monitors use electrochemical cells. If the gas of interest enter the cell, the reaction produces a current output proportional to the amount of gas in the sample. With these instruments, audible and visible alarms sound if the gas concentration exceeds a present level. These devises are well suited for use in confined spaces containing motors or engines, which can generate large quantities of CO, as well as in sewers, waste treatment plants and "sour crude" processing stations which tend to have hazardous volumes of H_2S.

(4) Multiple Gas Monitors for Oxygen and Combustible Gas

In applications where it is necessary to determine oxygen and combustible gas levels simultaneously, 2in-I diffusion-type devices can be used. Sensors measure 0 to 100 percent of LEL and oxygen from 0 to 25 percent Remote sampling requires either a pump module or an aspirator bulb adapter.

(5) Multiple Gas Monitors for Oxygen, Combustible and Toxic Gases

Toxic 'gases and vapours, which can be inhaled or absorbed through the skin, are frequently found in confined spaces. Sometimes, these atmospheric hazards can also displace oxygen and may incapacitate the body's ability to maintain respiration. Some toxic gases and vapours can also cause long-term physical damage to the body in cases of repeated exposure.



Multiple Gas Monitor for six gases and LEL/CH_4 over range protection

A number of instruments are available to assist in detecting toxic gases. Whereas the pocket size monitors operate by diffusion or an aspirator bulb, larger (but still handheld) 2-in-l and 3-in-l instruments have been developed with built-in pumps to draw samples from the immediate area or from outside the confined space work area when used with sampling lines. For 2-in1 devices, side-by-side analog displays show percentage for both oxygen and the LEL. With 3-in-l, 4-in-l. and 5-in-l devices, the user selects either a sensor readout on a digital display or automatic sequential scanning of sensors contained in the instruments. Regardless of the number of sensors selected or the reading being displayed, all sensors should be designed to monitor continuously.

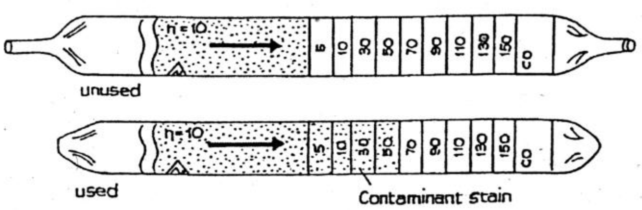
Diffusion-type instruments are available for simultaneously measuring the LEL of combustible gases, oxygen levels and toxic levels (in parts per million) of FL,S, CO and other toxic gases. Alarms also alert the user to low and high oxygen levels. Remote sampling pump adopters are available to convert these diffusion type instruments into pump-style instruments.

(6) Photoionization Devises for Toxic Gases and Vapours

A photoionization detector, featuring microprocessor technology, uses ultraviolet light to ionise molecules of chemical substances in a gaseous or vaporous state. A real-time digital readout allows the user to make an immediate determinations of gas and vapours are measured over a O.I to 200 ppm scale. Some instruments automatically compensate for signal loss due to humidity, which is inherent in all PID detectors.

(7) Detector Tube Sampling Systems

Detector tube-type devices are recommended for conducting quick evaluations of potential hazards *that cannot otherwise be measured*. With detector tubes, a known volume of air is drawn through the tube using a manually operated sampling pump. If gas or vapour is present in the air, chemically treated granules in the tube are stained a different colour. By measuring the length of the colour stain within the tube, users can determine concentration levels.



Most tubes available today are made of glass, have break-off tips, and are filled with treated chemical granules. They generally have a shelf life of 12 to 24 months.

One type of pump frequently used with a detector tube is a compact, bellows-type device. Accurate and repeatable sample flows can be assured by a shaft that guides the bellows during compression. Some models feature an end-of-stroke indicator that lets the user know when a full air sample has been drawn. Models with an integral stroke counter eliminate the tedious recording of multiple pump strokes.

(8) Personal and Area Sampling

Two kinds of sampling- personal and area- are used to determine the concentration of airborne contaminants. Personal sampling pumps are designed to measure individual worker's exposure, so they typically are lightweight, belt-mounted, battery powered devices. Area sampling pumps collect fibres in ambient air, so they usually are stationery. AC powered devices draw air in high volume.

No matter whether personal or area sampling is done, the process of sampling is essentially the same. It entails drawing a predetermined volume of air through a filter designed to trap contaminants. The filter is contained in a plastic cassette, which is attached by plastic tubing to a personal or area sampling pump calibrated to draw a specific, known volume of air into the filter. After air samples are drawn, the filters are sent to a laboratory where they are examined to determine the level of exposure.

Personal sampling determines the concentrations found in the "breathing zone" or the area near the worker's face, which is usually measured at or near the collar or lapel.

Calibration

To ensure the accuracy of all monitoring and detection equipment, calibration should be performed regularly. If the instrument reading differs significantly from the values of the known standard, the instrument should not be used until it has been adjusted or, if necessary, repaired.

See Part 1.6.5 of Chapter-24 also.

9 PPE TESTING PROCEDURES AND STANDARDS

Fit Testing

Respirators should fit properly to provide protection. To obtain adequate respiratory protection, there must be a proper match between respirator and wearer. Respirators not properly fitting cause illusion of protection. To accommodate the variability of face size characteristics among individuals, a number of manufacturers offer face pieces in several sizes and models.

Purpose:

The primary purpose of tit testing is to identify the (1) specific make (2) model, style and size of respirator best suited for each employee.

In addition, fit testing also provides an opportunity to check any problem with respirator wear, methods of donning and wearing the respirator.

Requirement:

1. Fit testing is required for all negative or positive pressure tight-fitting facepiece respirators.
2. The OSHA respiratory protection standard requires that tit testing be performed before an employee first starts wearing a respirator in the work environment, whenever a different respirator facepiece is used, and at least annually thereafter.

Method:

Prior to the actual fit test, the employee must be shown how to put on a respirator

Position it on the face, set strap tension, and determine an acceptable fit. Next, the employee must be allowed to choose a respirator from a sufficient number of models and sizes so that the employee can find an acceptable and correctly fitting respirator.

Once an acceptable respirator has been found — which takes into account the position of the mask on the face, nose, and cheeks; room for eye protection; and room to talk — a user seal check must be conducted.

Types of Fit Testing.

Fit testing may either be qualitative (QLFT) or quantitative (QNFT)

Prior to the commencement of the fit test, the employee must be given a description of the fit test and a description of the exercises that he or she will be per forming during fit testing.

The respirator to be tested must be worn for at least five minutes before the start of the fit test.

The employee must be fit tested with the same make, model, style, and size of respirator that will be used in the workplace.

Qualitative fit testing (QLFT).

Qualitative fit testing involves the introduction of a gas, vapor, or aerosol test agent into an area around the head of the respirator user.

A determination is then made as to whether or not the wearer can detect die presence of the test agent through means such as odor, taste, or nasal irritation. If the presence of the test agent is detected inside the mask, the respirator fit is considered to be inadequate.

There are four qualitative fit test protocols approved in OSHA's standard.

1. The iso-amyl acetate (IAA) test determines whether a respirator is protecting a user by questioning whether the user can smell the distinctive odor of IAA.

2. The. irritant smoke (e.g., stannic chloride) test involves a substance that elicits an involuntary irritation response in those exposed to it.

3. Before conducting a qualitative test, the worker must undergo a sensitivity test to determine if he or she can taste, smell or react to the substance.

4. When performing the iso-amyl acetate test, the protocol requires that separate rooms be used for the odor screening and fit tests, and that the rooms be sufficiently ventilated to ensure that there is no detectable odor of IAA prior to a test being conducted.

Quantitative fit testing (QNFT).

In a quantitative fit test, the adequacy of respirator fit is assessed by numerically measuring the amount of leakage into the respirator.

This testing can be done by either generating a test aerosol as a test atmosphere, using ambient aerosol as the test agent, or using controlled negative pressure (CNP) to measure the volumetric leak rate. Appropriate instrumentation is required to quantify respirator fit.

Fit Test Exercises :

The following test exercises must be performed for all fit testing methods.

Normal breathing in a normal standing position, without talking.

Deep breathing in a normal standing position, breathing slowly and deeply, taking precaution not to hyperventilate.

Turning the head slowly from side to side, while standing in place, with the employee holding his/her head momentarily at each extreme so that the employee can inhale at each side;

Moving the head up and down slowly, while standing in place, inhaling in the up position when looking toward the ceiling;

Bending at the waist as if to touch toes (jogging .in place can be done when the fit test enclosure doesn't permit bending at the waist); and normal breathing (as described above).

Retesting:

If the employee finds the fit of the respirator unacceptable, he or she must be given a reasonable opportunity to select a different respirator and to be retested. In addition, retesting is required whenever an employee reports, or the employer, supervisor, or program administrator observe changes in an employee's physical condition that could affect respirator fit. Such conditions include, but are not limited to, facial scarring, dental changes (e.g., wearing new dentures), cosmetic surgery, or an obvious change in body weight.

Facepiece Positive and/or Negative Pressure Checks :

1. Positive Pressure Check

Close off the exhalation valve and exhale gently into the facepiece. *

The fade fit is considered satisfactory if a slight positive pressure can be built up inside the facepiece without any evidence of outward leakage of air at the seal.

For most respirators, this method of leak testing requires the wearer to first remove the exhalation valve cover before closing off the exhalation valve, and then carefully replacing it after the test.

2. Negative Pressure Check

Close off the inlet opening of the canister or cartridge(s) by covering it with the palm of the hand(s).

Inhale gently so that the facepiece collapses slightly and hold your breath for ten seconds.

The design of the inlet opening of some cartridges cannot be effectively covered with the palm of the hand, which requires' that the test be performed by covering the inlet opening of the cartridge with a thin latex or nitrile glove.

If the facepiece remains in its slightly collapsed condition and no inward leakage of air is detected, the tightness of the respirator is considered satisfactory.

For Standards on PPE see Part 3.

E X E R C I S E

1. Explain, state. Discuss or Mention :

1. Need and limitation of PPE.
2. Requisite characteristics of PPE
3. Types of hazards and hazard-wise PPE necessary.
4. Types and characteristics of head protectors
5. Types and characteristics of Eye protectors
6. Types and characteristics of Hand protectors
7. Types and characteristics of Feet protectors
8. Types of hazards to skin and appropriate PPE for them.
9. Criteria for selection of respirators OR their merits and demerits.
10. Types of respiratory hazards.
11. Types of Gaseous contaminants
12. Types of particulate matters.
13. Classification of Respirators and their advantages and is limitations.
14. When canister or cartridge type respirator should not be used?
15. Colour code of canisters as per IS.
16. Selection, instructions and training in the use of respiratory equipment.
17. OSHA standard for respiratory protection.
18. Training, maintenance and care of PPE.
19. General precautions for using different types of PPE.
20. Types of gas detecting equipment.

2. Write short Notes on:

1. Statutory provisions regarding PPE to be used in a factory.
2. Classification of PPE
3. Types of self contained breathing apparatus.
4. Hair protection OR Face and Eye protection.
5. Types of material for different types of shoes.
6. Preventive measures for hazards to skin.
7. Body belts.
8. Fall arrester net.
9. Respiratory system of a human body.
10. Types of Air supplying respirators.
11. Types of photo-ionization devices for toxic gases.
12. Air supplied suits.
13. Chemical cartridge respirator OR self-rescue type respirator.
14. Working of combustible gas monitors
15. Working of photo-ionization devices for toxic gases.

3. Comment on following explaining whether it is true or false ?

1. PPE is the last resort as safety measure.
2. Non-skid shoes protect against moisture.
3. Chrome leather is not suitable for hot liquids.
4. Conductive rubber protects against explosion.
5. Plastic gloves cannot prevent dermatitis.
6. Aluminium protects against ionising radiation.
7. Oxygen deficiency is not a major respiratory hazard.
8. Gas masks are useful to remove toxic gases as well as particulate matter from the inspired air.
9. Percentage of LEL is a marking criterion in combustible gas monitors.
10. Combustible gas air mixture can be ignited above UEL also.
11. For unknown contaminant canister gas mask cannot be used.
12. Carbon monoxide is a chemical asphyxiant.

4. Explain the difference between :

1. Respiratory and Non-respiratory PPE
2. Head Protection and Fall protection
3. PPE for hand and PPE for arm.
4. Air purifying and Supplied air type respirators.
5. Air line respirator and SBA.
6. PPE for eminent danger to life and that for no eminent danger to life.
7. Conductive shoes and Non-conductive shoes.
8. Steel toe boot and Non-skid boot.
9. Use of Ear-plug and Ear-muff.
10. Wire screen lenses and Polarising lenses.
11. Leaded clothing and Disposable clothing.
12. Fumes, Dusts and Mists.
13. Acidic gases and Alkaline gases.
14. Suction hose mask and Pressure hose mask.
15. Chemical filter and Mechanical filter respirator.
16. Personal sampling and Area sampling.
17. Single gas monitors and Multiple gas monitors.
18. Toxic gas monitor and Gas detector tube.

CHAPTER – 26

First Aid

THEME

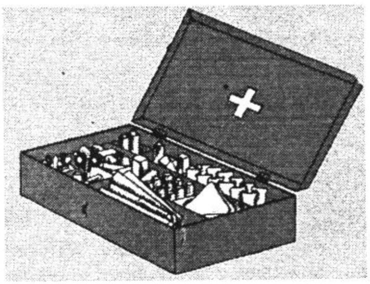
1 NEED OF THE FIRST AID

Prevention is better than cure but when prevention is not possible and an injury does take place, cure is the only prevention of further injury and this cure is primarily to be provided by the First Aid.

First Aid can be defined as an immediate treatment given to the victim of an accident or sudden illness, before -medical help is obtained. It is a combination of simple but quite expedient, active measures to save the victim's life and prevent possible complications. It needs to be immediate in severe accidents complicated by bleeding, shock and loss of consciousness.

See tables in Part 12 of Chapter-5 for statistics of accidents in India and Gujarat. It is evident that majority of these accidents are trifle and curable by first aid only. Even otherwise all industrial injuries need immediate first aid for which statutory provisions are also made as follows.

2 STATUTORY PROVISIONS



Section 45 of the Factories Act requires at least one first aid box or cupboard equipped with the prescribed contents for every 150 workers employed at any one time. It should be readily accessible during all working hours and should be in the charge of a qualified person.

For a factory employing more than 500 workers an ambulance room of the prescribed size and contents and in the charge of medical and nursing staff is also required.

Rule 70 of the Gujarat Factories Rules prescribes the contents of a first aid box depending upon the number of persons employed. Rule 70A requires a displayed staling the names and place of availability of the first aider, nearest hospital and its telephone number. Rule 71 prescribes the. size and other details for an ambulance room or dispensary, a suitable conveyance to remove the victim and a record of all cases treated. Refer these rules for the medical items to be kept ready.

See Chapter-24 for Section 41C and Rules 68 R, T, U & V of the Gujarat Factories Rules for Health Records, Medical examinations. Occupational Health Centre, Ambulance Van etc.

3 INDIAN STANDARDS

A few IS available for first aid are: First aid dressings 11163, pesticide poisoning 4015, radiation protection in medical X-ray equipment of 10 KV to 400 KV 7064, Colour identification of gas cylinders for medical use 3933.

Bandage cotton 863, plaster of Paris 4738, 6237, scissors 6252,10384.

Resuscitators for use with humans 13366:

4 GENERAL PRINCIPLES FOR RENDERING FIRST AID

4.1 Meaning :

First Aid has five main aims : -

1. To preserve life.
2. To promote or assist recovery.
3. To prevent worsening or aggravation of the casualty's condition.
4. To minimise complication and
5. To arrange transportation to hospital if necessary.

First Aid is based on scientific medicine and surgery. It is a skilled assistance and makes use of such materials as may be available. But the first aider is not a Doctor. After the doctor takes charge, the first aider's responsibility ends. He can then stand by to help the doctor.

The first aider should observe carefully, think clearly and act quickly. He should be calm, cool and confident. He should not get excited. He should ask someone to call a doctor/inform hospital immediately giving some details of cases involved. While waiting for the doctor, he should give first aid methodically.

Dr. Y. N.Sinha, Dy. Director (Medical) of CLI, Mumbai explains the general meaning of FIRST AID

1. First thing first.
2. Inform the doctor.
3. Reassure the victim.

4. Shock prevention or treatment.
5. Tourniquet, control bleeding.
6. Artificial respiration.
7. Immobilise fracture.
8. Disposal, send victim to hospital.

4.2 General Rules

The general rules or principles for first aid are as follows :

1. Reach the accident spot quickly. This will help to save life.
2. Be calm, methodical and quick. By doing so you can lessen the pain and the effects of the injuries which may save life. Handling the casualty clumsily will only make the final recovery difficult.
3. Look for the following: Is there failure of breathing? Is there severe bleeding? Is the shock light or severe?
   (1) Attend to these and then treat easily observable injuries.
   (2) Start artificial respiration, if the casualty is not breathing. It must being at once as every second gained is helpful.
   (3) Stop by pressing on the pressure point and press firmly on the bleeding area with a pad and keep up pressing on the bleeding area for at least a few minutes (minimum 3 minutes) by watch. Take help if needed.
   (4) Treat for shock.
   (5) Avoid handling the casualty unnecessarily.

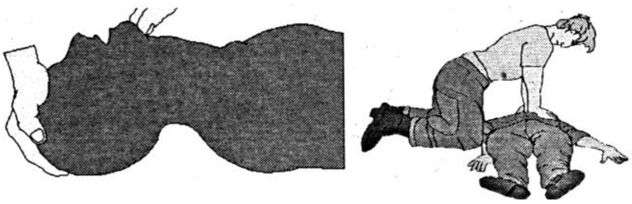
4. **Priority of Treatment** by a first aider should proceed in the following order :
   1 Examination and Diagnosis.
   2 Cardio Pulmonary Resuscitation (every second counts).
   3 Control Bleeding.
   4 Treat Shock and special care of Unconscious cases.
   5 Fracture (Immobilisation).
   6 Burn-Cover with clear washed cloth/ dressing and treat shock.
   7. Eye, Nose and Ear injuries.
   8. Multiple superficial injuries.
   9. Transportation and
   10. Follow up or After-care.

5. Dr. Subhash Mhaskar (Thane) suggests following formula for basic assessment of a serious case -

DR. ABC & Head-Foot Examination :

D = Danger. Please check up first, if there is any sort of danger to the first aider or the patient or to the people around at the 'spot of the accident in form of poisonous gas, electric current, fire etc.

R = Response. Call the patient by his name or pinch him and see the response. If no



response, the patient is unconscious. Then immediately -

(A) = Open the Airway by flitting his head to the back and chin up.
(B) = Check Breathing
(C) = Check Circulation of blood by checking neck pulse. If the patient is not breathing but the neck pulse is present, give mouth to mouth breathing only. If neck pulse and breathing both absent start CPR (Cardio Pulmonary Resuscitation)

Head Foot Exam = If both neck pulse and breathing are present and patient is responding, continue with head to foot examination. Look for injuries bleeding and fractures systematically. Specially look for injuries on head, chest and abdomen. They may not look important in beginning but may prove to be fatal in long term.

6. Use the First Aid equipment, if available. All passenger trains, some Railway Stations, lorries and buses keep them. Make use of the material so obtained. On most occasions standard First' Aid equipment will not be available. You will have to depend on the material at hand and improvise them for your requirements.- In a factory, use the prescribed first aid box.

7. Inspect the area. Take the casualty away from live wires, fallen walls, beams, fire, broken gas chambers, moving machinery etc. to a safer place.

8. Clear the crowd with nice words. Do not allow people to crowd around the casualty. The casualty needs fresh air. If a doctor is present, he will guide you. Any other First Aider must be asked to help. Otherwise take the assistance of bystanders giving them correct instructions.

9. Note the weather. If it is fine, i.e. without rain or heat or a cold breeze, treat in the open. Otherwise move the casualty into an airy room. If no suitable house or a doctor's clinic is not nearby, it is best to protect the casualty with an umbrella or a sheet of cloth or even a newspaper.

10. Reassure, the casualty. Soft words and encouraging talk will make the casualty take things easy and lie quietly. These will help recovery.

11. Arrange for dispatch to the care of a doctor or to the Hospital. At the same time intimate the relatives where the casualty is being taken to.

12. Do not attempt too much. You are only a First Aider. Give minimum assistance so that the condition does not become worse and life can be saved.

The first aider should know the proper use of antiseptic, aseptic and sterilised dressing material, surgical instruments and syringes. Some commonly used chemical antisepsis (to kill micro organisms in the wound) are: Hydrogen peroxide solution. Potassium permanganate. Boric acid. Tincture of Iodine, lodinate, lodoform, Chloramine B, Mercuric chloride. Dioxide, CoUargol, Silver nitrate. Spirit (ethanol). Brilliant green solution, Methylene blue solution, Degmin, Ethacrdidme lactate, Furacilin, Ammonium hydroxide solution, pure- phenol (carbolic acid). Formaldehyde solution and Sulphonamides.

4.3 Ten commandments :

Dr. Subhash Mhaskar of Thane has highlighted in his small pocket-book, the ten commandments of First Aid as under :

1. You shall always try to help the casualty to the best of your knowledge and with sympathy.
2. Never give anything by month to an unconscious patient.
3. Always keep unconscious patient in recovery position.
4. Always look for the breathing and pulse. If it stops, start CPR (Cardio Pulmonary Resuscitation) without any loss of time.
5. In an unconscious patient with poisoning, never induce vomiting.
6. Do not add haldi, chuna or any other thing in a wound
7. In poisonous snake bite, tie a tight bandage before everything and do not release it till the patient is taken to a doctor. Bandage should not block arterial circulation.
8. When neck spine fracture is suspected, absolutely do not allow to move the neck. It can cause instant death.
9. Do not give CPR to a conscious patient.
10. Always take the patient to a doctor. Do not try to take place of a doctor.

Semi or fully automatic external defibrillator should be provided at all prime places, factories, OHC, medical centres etc. It is most useful in cases of cardiac toxicity and sudden heart arrest.

5 INJURIES AND FIRST AID AT A GLANCE

Injuries may be as follows:

The victim may be pinned down under the machinery. There may be lacerations; a part of a limb may be avulsed, there may be multiple fractures of severe traumatic shock. In some cases, it is not possible to extricate or release the victim. In such cases, the machinery should be stopped immediately, power cut off and services of senior forman or the person who is familiar with the machine, requisitioned. Modern machines have automatic releasing devices or you may have to dismantle the parts. The first aider is to attend the victim, control the bleeding, treat shock, reassure and cover any burnt or injured part. If the victim is unconscious ensure that the air way is clear. Arrange for immediate medical aid at the spot and remove to the hospital.

Burns due to chemicals or hot substances, cuts, wounds, shocks, bleeding, unconsciousness, poisoning and casualty may also happen which should be properly approached.

Some typical injuries and first aid for them are briefly described below to study them at a glance.

Shock:

1. Lay the patient on his back. Lower head end.
2. Stop bleeding if any. Stop pain in burns by pouring cold water.
3. Relieve pain by supporting injured part.
4. Keep the patient comfortable, but not hot. Do not cause sweating.
5. Make the air passage clear and clean.
6. Fluids may be given in small amounts unless the patient, is nauseated, unconscious, likely to be operated on, or has an abdominal wound.
7. Reassure and cheer up the patient.

Electric Shock :

1. Separate the patient from electric current by proper technique. Stop the switch or use wooden stick for separation.

2. Make a rapid examination to ensure that the air passages are free. Clean them if necessary,
3. Restore natural breathing by artificial respiration, if breathing has ceased.

Wounds :

1. Stop the bleeding by any one of the following methods :
   (1) Direct pressure.
   (2) Direct finger pressure into the wound in case of larger bleeding wound.
   (3) Tourniquet (seldom needed) use only as a last resort.

2. Avoid touching the wound with hands or unsterile material.

3. Clear the wound with running water and surrounding area with soap or spirit with clear gauze washing away from the wound. Apply ready-made adhesive gauze bandage or sterile gauze and roller bandage as needed.
4. Keep the patient quiet; raising the extremity if it is the bleeding part. Give no stimulants.
5. Never apply antiseptic ointment, lotion or iodine or germicide to the wound.
6. Elevate injured part above the patient's heart level.
7. Try and use rubber gloves.

Abdominal wounds:

1. No time must be lost in sending the patient, to the hospital.
2. Keep the patient flat.
3. Give nothing by mouth.
4. Maintain warmth.
5. If. intestines protrude from the wound do not attempt to touch or replace them.
6. Apply sterile dressing and binder as for wounds.
7. Provide careful and immediate transportation to the hospital.

Eye-Wounds:

1. Removal may be attempted if foreign body is not embedded.
2. Do not apply- oil or ointment.
3. If there is a foreign body embedded in the eye ball, send the patient immediately to the doctor after applying pad and loose bandage.

Chemical Burns of the Eyes :

1. Immediate washing of the eye at least for fifteen minutes is of great importance.
2. Apply sterile bandage and send the patient immediately to the doctor.
3. Neutralising agent or ointment should not be used.

Suffocation :

1. Remove the patient from the source of danger.
2. Make a rapid examination to ensure that the air passages are free and to clean them if necessary.
3. Restore natural breathing by artificial respiration, if breathing has ceased.

Infection :

1. Wash hands with soap and water.
2. Use diluted antiseptic like diluted dettol.
3. Cover the wound with sterilised bandage or clean cloth.
4. Do not tighten the bandage excessively.
5. Do not apply haldi, lime etc. on wound.

Heat stroke :

1. Make the patient lie down.
2. Remove all clothing except underwear.
3. Pour cold water on the head and body.
4. Keep the patient under the fan.
5. Record temperature every 10 minutes and when it falls up to 30 °C, stop pouring water and clean the head and body with towel.
6. Give plenty of cold water with a spoonful of common salt in a glass of water to drink.

Bleeding Nose :

1. Make the patient sit with head downward.
2. Pinch the nose with fingers and thumb.
3. Apply ice or cold compressing or pour cold water on head.
4. Do not plug the nostrils.
5. Do not put water or any medicine through the nostrils.
6. Send for medical attention.

Bleeding Ear :

1. Lay the patient with head slightly raised.
2. Incline the head to the affected side and apply a dry dressing over the ear with loose bandage.
3. Do not plug the ear.
4. Apply pressure in front of the ear.
5. Seek medical attention.

Insensibility:

1. Send for a doctor. Meanwhile do the following:
2. Where the patient's face is pale, lay him flat and face downwards with his head turned to one side. If his face is flushed or blue, raise and support the head and shoulders.
3. Control any serious bleeding.
4. Loosen any tight clothing and let him have plenty of air.
5. Do not give anything by mouth.
6. If doctor is not available send the casualty to hospital.

Heart Attack :

It is very important that the heart attack patient reach hospital in first 2 hours.

The important symptoms of Heart Attack are:

1. Symptoms (3Ps) :

(1) Pain in chest: In the centre of the chest radiating to left arm, jaw or left shoulder. The pain is consisting, severe and lasts for more than 5 minutes. Although pain is an important symptom, there can be painless hpart aH-ark alun
(2) Perspiration: Sudden, severe perspiration without cause.
(3) Palpitation : Without exertion.

2. Sudden vomiting with gases like symptom but with restlessness and perspiration.
3. Sudden breathlessness.

In case of mild heart attack

1. Stop all activities of patient.
2. If available keep Sorbitrate tablet under the tongue of the patient.
3. Give half Aspirin tablet.
4. Watch for pulse and breath.
5. Contact doctor immediately.

In case patient becomes unconscious and breathing and neck pulse stops, immediately call for help and start C.P.R. as per instructions.

Epilepsy :

1. Open the airway.
2. Prevent tongue biting.
3. Keep the patient in recovery position till consciousness.

Bruises :

1. Cold applications at first 24 - 48 hours.
2. Later heat after 24 - 48 hours.

Burns :

1. Act quickly.
2. Put the affected part in cold water.
3. Pour water on burns that cannot be immersed (Cold water relieves pain, reduces fluid loss).
4. Cover with a sterilised dressing.

Dog Bite :

1. Wash the wound immediately with water or dettol.
2. Do not try to stop bleeding.
3. Cover the wound with a sterile dressing.
4. Send the patient to hospital.
5. Watch the dog for 10 days.

Snake Bite :

1. Advice patient not to panic and run.
2. Without delay tie a band or handkerchief tightly 2-4 inches above the bitten part. However, you should feel pulse below the bitten part.
3. Lower the bitten part below the heart.

4. Wash the bitten part with clean water.
5. Examine the pulse and respiration.
6. Carry the patient to hospital for antisnake venom injection.
7. If possible cut at the wound with a snake bite insect, knife or a sharp instrument to allow free bleeding.
8. Never suck the blood from the wound.

Unconsciousness or Coma :

Main cause - Head injury, brain diseases, poisoning, asphyxia, heart attack.

Treatment:

C : Call for help. Lie down the patient in prone position.
O : Observe patient's breathing, heart beat and pulse.
M : Maintain recovery position. Loosen tight clothing. Clean the air way. Give artificial respiration or external cardiac massage.
A : Absolutely nothing by mouth. Arrange for transport to hospital immediately.

6 FIRST AID IN MINOR AND CLOSED INJURIES

6.1 Minor Injuries :

Minor injuries (cuts, punctures, abrasions, scratches, splinters) are frequent in everyday life. In themselves they are not dangerous and do not cause loss of working, ability but when first aid is not properly rendered they can be complicated by purulent inflammation.

Any break in the skin, even in minor injury, should be painted immediately with a 5 per cent iodine tincture and covered with an aseptic bandage. If skin and wound are contaminated, the skin around the wound should be wiped with 0.5 per cent ammonium hydroxide and the wound with 3 per cent hydrogen peroxide. When the edges of the wound are smooth and even but the wound is wider than 0.5 cm its edges should be brought together. For that purpose a piece of adhesive plaster shorter than the wound is cut from a strip and one end .is stuck across one edge of the wound to the skin, the opposite edge of the wound is brought close and fixed by the other end of the plaster. The plaster should not wholly cover the wound, and its ends should be left uncovered. An aseptic bandage is then applied to the wound over the plaster. Minor wounds and abrasions are covered by colloid or a special glue.

It is desirable to cover punctured wounds with a spirit bandage.

With contusion of the fingers or toes there is often bleeding beneath the nails that later can suppurate and cause acute inflammation. To prevent this complication it is necessary for a doctor to release the blood accumulated under the nail and apply a spirit bandage. The procedure is simple and does not require anaesthesia. When foreign bodies (clearly visible metallic needles, filings or chips, splinters of wood etc.) penetrate the skin they should be removed by tweezers, the wound painted with iodine tincture and a spirit bandage applied.

6.2 Closed Injuries :

Closed traumas are mechanical injuries in which the skin and mucous membranes are not broken. They include contusions of various parts of the body (and. the skull and brain), strained ligaments, dislocations, subcutaneous rupture of the muscles, internal organs of the chest and abdomen and bone fractures.

Bruises and contusions may be caused by a blow from a blunt object or by falling. The signs include pain at the site of the injury and the development of a bruise which becomes bluish in a few days.

First Aid: In order to lessen the pain and to prevent bleeding the contused area should be immobilised, raised and cooled by applying an ice bag or acold compress. The cold contracts the blood vessels and reduces bleeding. Two or three days after the bruise warmth should be applied to accelerate resolution of the effused blood (hot compresses, local warm baths).

A hot compress (fomentation) is made as follows: A folded pad of cloth is soaked in water, an 8 per cent solution of surgical spirit or camphor oil, wrung out and applied to the skin. An oilskin or waxed paper of a larger size (two or three centimetres larger than the compress) is laid over it and the whole is covered by a thick layer of cotton wool and secured with a roller bandage. The compress is left for six to eight hours, during which the moist layer dries. After the compress is removed the skin is wiped with alcohol.

Sprains of ligaments are frequent. An awkward movement wrenches joint or a. slip overextends a joint which causes some degree of tearing of the joint capsule or ligaments. Pain and swelling develop around the joint but its outlines are generally not noticeably altered. The victim can use his limb, but with difficulty. Put weight on the foot or move the painful arm. After a few days the skin becomes black and blue.

First aid : The affected limb should be immobilised (an arm put in a sling made from a triangular bandage and affected ankle tightly bandaged),. After two or three days, treatment is begun (hot compresses, local warm baths and massage). '

A dislocation is a more serious injury attended with rupture of the joint capsule and displacement of the joint surfaces of the articulated bones.

First aid : A fixing bandage or a splint is applied and the patient sent to hospital for the dislocation to be reset.

6.3 Fractures :

It may be open or closed. Open fractures in which not only the bone but also the skin are damaged are most dangerous. Germs can get into die wound formed by the break in the skin and cause suppuration gas gangrene or tetanus. In closed fractures the outer coverings (skin and mucous membranes) are intact and prevent the entry of germs.

The signs of fractures of the long tubular bones include pain, haemorrhage, distortion of the injured part of the arm or leg, abnormal mobility in a place where there should be none, crackling, swelling, deformity and inability to make any movement.

The fragments of the bone may be displaced to a varying degree in length, width, or at an angle to each other causing some deformation of the limb.

First Aid ; The limb affected must be immobilised. This is especially important during transportation of the patient. The bone fragments should be tied so that they cannot move. The rules for immobilising fractures should be observed. If they are not observed, grave complications can develoi menacing the patient's life.

Treatment:

1. Immobilise the fractured limb with splint like wooden stick, hardboard or umbrella
2. Make a padding of cotton or hanky on the splints.
3. Do not tighten the splint too tight or loose
4. Elevate the injured limb.
5. Use natural splints, like if a leg is fractured the other leg can be used as natural splint.

Spine Fracture:
Falling from height can cause spine fracture

Treatment:
Move the patient on a hard surface like table or bench etc.

1. Do not allow to sit, stand or walk
2. Tarn the patient by log rolling
3. Shift the patient to hospital.

Backbone (Spinal) Fracture:

1. Transport on a rigid frame. This frame may be improvised by using available boards or a door.
2. The rigid frame may be placed on a stretcher for transportation.
3. If a firm frame cannot be improvised, transport patient on abdomen on a stretcher made of canvas or blanket.
4. In neck fracture cases it is much better to get a doctor to the scene because danger to the life is great.
5. Immediate hospitalisation is necessary.

6.4 Foreign Body in the Body Part :

6.4.1 Foreign Body under the Skin :

Thorns, glass, iron, pieces, needles, etc., get under the skin.

First Aid:

1. Unless very easy to deal with, don't interfere.
2. Dress the wound.
3. Immobilise the part with splints and get medical aid.

6.4.2 Foreign Body in the Eye :

Wings of insects, dust, coal (from boilers -etc.), metal particles from lathes and loose eye-lashes are 1. common objects which get lodged under the eyelids. They cause pain and later redness, if they are not removed at once. Sometimes iron particles and wood splinters get lodged in the corner causing serious trouble. Penetrating foreign bodies, however are danger to the eye itself.

First Aid:

1. Avoid rubbing the eyes. In case of a child, tie his hands at the back.
2. Seat the casualty so that light falls on the eye. Pull the lower lid down. If the foreign body is floating and not embedded, remove it with a narrow, moist swab. The corner of a handkerchief twisted to a fine point will also do.
3. If foreign body is not visible it may be under the -upper eye-lid. Ask the casualty to keep clean water in the hand and blink briskly in the water. If unsuccessful, pull the upper lid forward, push the lower lid upwards and let go of both the lids. The lashes of lower lid usually dislodge the foreign body. Try this two or three times.
4. If the foreign body is embedded in the eye, particularly the cornea (the black of the eye) do not touch it—apply a soft pad, bandage the eye, ask the casualty not to rub the eye and take him immediately to a hospital.
5. Penetrating foreign bodies are easily made out by bleeding, pain etc. It is for the doctor to handle. You just put a pad bandage.
6. When corrosive acid, alkali or juices from plants are suspected, blinking eyelids under water a number of times or flushing with large quantity of water is the best thing to do. Then apply a soft pad, tie a bandage (not tightly) and take the casualty to the hospital at once.

6.4.3 Foreign body in the Ear :

1. If it is insect, fill the ear with glycerine or coconut/mustard oil or warm salt water. The insect will float up and can be removed easily.
2. If there is nothing floating up, leave it alone, don't meddle at all but take him to a doctor.
3. If it is solid, do not try to remove, scratch or probe it. Take him to a doctor.

6.4.4 Foreign Body in the Nose :

1. Do not interfere with the foreign body.
2. Make casualty breathe through the mouth.
3. Take him to the hospital. If a child, tie the hands behind so that he does not interfere with the foreign body.

6.4.5 Foreign Body in the Throat :

1. Some small objects like a safety pin sometimes get stuck in the throat. A draught of water is all that is needed to pass it further down.

2. Some irregular objects, fairly large, get stuck. If visible they can be taken out with the fingers. If a child, hold it up, head downwards and tap on back of neck, the foreign body will fall out.

3. Fish-bone or thorn get lodged by piercing some part of the throat. Keep the relatives and the casualty quiet and remove the casualty to the hospital at once.

6.4.6 Foreign Body in the 'Stomach :

Smooth objects like coins, buttons, nuts, safety pins are swallowed.

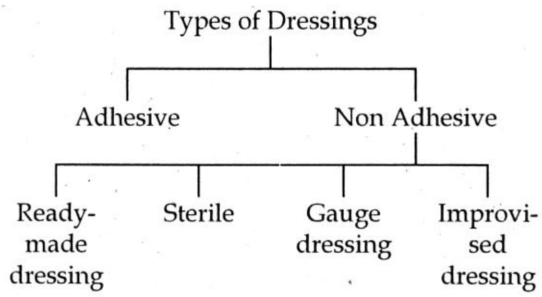
1. The stomach and intestines will adjust themselves in such a way as to throw them out.
2. Do not panic.
3. Show the case to a doctor.
4. There is no need to give laxatives (or bananas as is usually done).

6.5 Dressing & Bandaging :

A dressing is a protective covering applied to a wound to

1. Prevent infection.
2. Absorb discharge.
3. Control bleeding and
4. Avoid further injury.

An effective dressing 'should be sterile (germ-free) and porous to allow for oozing and sweating.



Dressing should be applied gently after washing hands thoroughly. No part of the wound or dressing to be contacted should be touched by fingers. Dressing must be covered with adequate pads of cotton wool, extending well beyond them and retained in position by a bandage or strapping.

Bandages are made from cotton cloth, elastic net or special paper and are used to (1) retain dressings and slings in position (2) maintain direct pressure over a dressing to control bleeding (3) prevent or reduce swelling (4) provide support for a limb or joint (5) restrict movement and (6) assist in lifting and carrying casualties.

Bandages should not be too loose or too tight. A bluish body part or loss of sensation indicates too much tightening.

Bandages are of two types - Triangular and Roller bandages.

A triangular bandage is made by cutting a square piece of cloth 100 cm~ from corner to corner so as to give two bandages. A triangular bandage can be used (1) as a whole cloth spread out fully and (2) as a narrow bandage by folding to the required size. For tying the bandage a 'reef knot' should be used and not a 'granny knot' which is likely to become loose.

There are systematic methods of bandaging with the triangular or roller bandages.

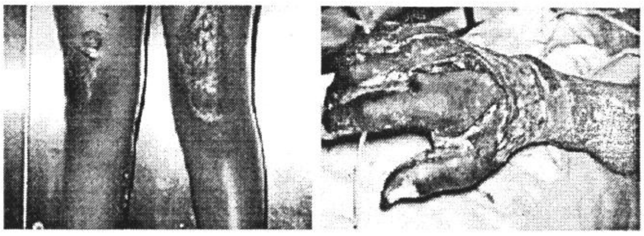
Triangular bandages can be used for scalp, forehead, eye, cheek, front or back of the chest, shoulder, elbow, hand, hip or groin, knee, foot and stump.

Roller bandages are made of cotton with loose mesh, are of various lengths and widths and are used in hospitals and first aid posts. Roller bandages should be applied firmly and evenly. There are 4 methods to apply roller bandages (1) Simple spiral (2) The reverse spiral (3) Figure of Eight and (4) The Spica.

See Reference No. I for details of various techniques of above bandaging.

7 ELECTRICAL INJURIES

Causes of Electrical Injuries : If any part of the body comes in contact with a "live" wire which is exposed and not covered by insulator, or with a cable or rail in which current is leaking , a person gets an electric shock.. In houses, the blowing out of switches or fuses or faulty electrical connections can cause such injury. The injury may be quite mild or so severe as to cause immediate death. Electrical shock is produced only when an electric current passes through the human body which is in contact With earth. It passes even more quickly if the part is wet.



In wet conditions even lower voltage may be dangerous. A very strong current passing to earth through lower limbs may be less dangerous than a weaker current passing through the chest, especially so when it enters through the hands and arms.

The Effect of Electric Shock .

1. There may be fatal paralysis of heart.
2. There may be sudden stoppage of breathing due to paralysis of muscles used in breathing.
3. Heart may continue to beat, while breathing has stopped. In this condition the face appears blue.
4. There may be burns, either superficial or deep. They depend on the strength of the electric current causing the injuries.

First Aid: Intelligent and prompt action is required. If the first aider is not cautious, he may also receive severe electric shock or even die along with the casualty.

1. If the casualty is still in contact with the conductor, switch off the current. If the switch is not found, remove the plug or cut off the current by breaking the wire, ensure that you stand on a dry piece of wooden board. Do not use scissors or knife. Wooden handle is unsafe above 380 V. When the current is of low voltage the first aider should stand on an insulated material which is dry. (Insulating materials are rubber-soled shoes, wooden plank or piles of newspaper). High voltage rubber gloves should be worn. If not, dry coat, cap or other clothing may be used. When the current is of a very high voltage, as in the case of over head (high tension) lines, there is greater danger. The casualty may not be in actual contact with the wire as the current can pass through the gap (causing an arc). The first aider in such circumstances should keep as far away as possible from the electric wires. The casualty is to be dragged out by means of a non conducting material. A walking stick, dry bamboo pole, wooden plank or a dry rope is to be used.

2. If the casualty is not breathing normally, or heart has stopped beating, open his clothes, unbutton the collar, loosen the belt, give artificial respiration and external cardiac massage for a long time.

3. Treat for shock.

4. Treat for burns if any.

5. Transfer to a hospital or seek the help of a medical practitioner who is nearest.

6. Even when the casualty has recovered fairly well after first aid is given, he must be examined by a medical specialist because electric injuries are liable to relapse.

For electrical safety see Chapter-11.

8 ARTIFICIAL RESPIRATION

Treatment when not breathing:

1. Loosen all clothing at waist, chest and neck.
2. Tilt the head backwards, while supporting the back of neck with your palm. This will lift the tongue to its normal position. Thus the air passage will be cleared and the casualty may begin to breath after a gasp.
3. If breathing does not begin after the above treatment, help movements of chest and lungs four or five times. This will be usually enough to start breathing. If breathing does not start even now, mouth to mouth (-to-nose) breathing should be begun.

Mouth-to-Mouth breathing:

1. Place the casualty on his back. Hold his head tilted back.
2. Take a deep breath with mouth open widely.
3. Keep nostrils of casually pinched.
4. Cover the mouth of the casualty with your mouth smugly.
5. Watching the chest, blow into his lungs, until the chest bellows up. Withdraw your mouth. Note the chest falls back (It is hygienic to cover the mouth of casualty with your handkerchief or some clean cloth).
6. Repeat the above 15 to 20 times a minute.
7. If casualty is young (baby or child) the operations are as above, but your open mouth should cover both the mouth and nose of the casualty and blow gently.
8. If the chest does not rise (as in 5 above) look for an obstruction.
   - Turn the casualty to a side and thump his back. This will make the obstructing material come to the front of throat. Open the mouth and remove it with your finger covered with a piece of the cloth.
   - If a child, hold it up by the feet and thump the back.
9. Use mouth-to-nose respiration if mouth to-mouth is not possible, but now the casualty's mouth should be closed by the First Aider's thumb.
10. If heart is working, continue artificial respiration until normal breathing occurs. Send for Ambulance.
11. If the heart is not working, you will notice:

    - The face is blue or pale.
    - Pupils are dilated.
    - Heart beats and pulse at the root of neck (carotid) are not felt.

Then treat as follows: (a) Place the casualty flat on his back on a hard surface (bench, table etc.) (b) Give a smart hit with the edge of your hand on the lower and left angle of the sternum. This usually stimulates the heart to work. (c) In case the heart does not work, persist the striking for 10-15 seconds at the rate of one stroke a second. Feel for the pulse at the root of neck all the time. If the pulse becomes regular and continuous, stop beating, all the while artificial respiration has to go on.

Even if the casualty is breathing, but the breathing is not normal, it is wise to start artificial respiration. Do not begin thumping the heart or compression until you are sure that the heart has stopped beating.

External Heart Compression :

(If there are two trained persons) :

1. This should go on along with artificial respiration. Therefore ask the First Aider giving mouth-to-mouth breathing to sit to the right of the casualty and place yourself on the left side.

2. Feel and mark the lower part of the sternum.

3. Place the heel of your hand on the marked part (make sure that the palm and fingers are not in contact with the chest).

4. Place the heel of the other hand over it.

5. With your right arm, press the sternum backwards, towards the spine. (It can be pressed back 1 to 1.5 inches in adults).

6. Adults should be given about 60 pressures a minute. For children from two to ten years 3 pressures with one hand (heel) will be enough, but pressure should be 80 to 90 times a minute. For babies up to two years, 2 pressures with two fingers is good enough if applied 100 times per " minute.

7. Press firmly but carefully. Carelessness (over pressure) may cause injury to ribs and deeper tissues.

8. If the treatment is effective (a) Colour will become normal (b) Pupil will contract as improvement beings; and (c) Carotid pulse begins with each pressure.

9. When pulse is not restored, continue compression till the patient reaches hospital.

10. Inflation of lungs to heart pressure should be as 2.15. If there is only one First Aider, he has to be very smart and active. Finish 15 heart compression, rush to head-side, give two inflation to the lungs, and get back to the heart and give 15 compression. Repeat these. If there are two First Aiders, No. 1 makes 5 heart compression and then No. 2 gives two lungs inflation. These are repeated. At the same time No. 1 can watch the pupils and No. 2 can feel the carotid pulse.

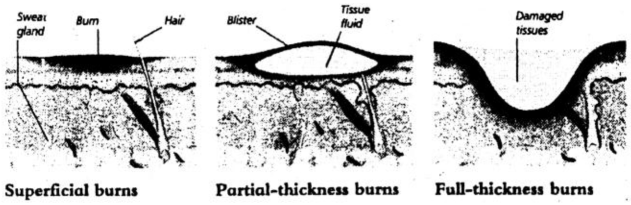
9 BURNS AND SCALDS

Causes of Burns and Scalds :

1. Burns are injuries that result from dry heat like fire, flame, a piece of hot metal, the sun, contact with wire carrying high tension electric current or by lightning or friction. Scalds are caused by moist heat due to boiling water, steam, oil, hot tar etc.
2. Chemical burns are caused by strong acids (Sulphuric acid. Nitric acid etc.) or by strong Alkalis (Caustic Soda, Caustic Potash, quick lime or strong Ammonia).

3. A nuclear burn is caused by the instantaneous flash of intense heat given off by a nuclear explosion. It is capable of causing superficial burns on the exposed skin of persons several miles away.

Degrees or Depth of Burns :

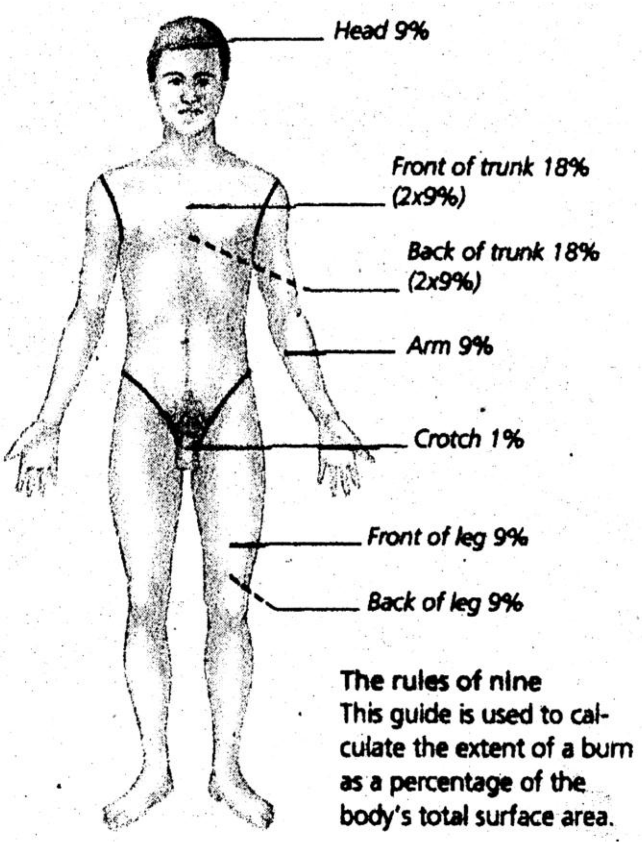


The degrees of burns indicate the degree of damage to the tissues. There are five degrees of burns:

First Degree : When the skin is reddened
Second Degree : When there are blisters on the skin, and
Third Degree : When there is destruction of deeper tissues and of charring.
Fourth Degree : Steam blebs
Fifth Degree : Carbonisation

Percentage of Burn :

The danger from burns depends on the area i.e. percentage of the body part of the burns rather than



the degree. Superficial burns over a large area of the body are more dangerous than the complete carrying of a part of the limb. It must be noted that in the same person, different parts of the body may show different degrees of burns. Any burn of over 30% irrespective of deep degree - should be hospitalised as priority. More than 50% burns are more serious.

Above figure shows the percentage (extent) of burns. It follows the rule of 9. For more area, add the percentage appropriately. For example, burns of both hands and both legs indicate 9+18 = 27% burns.

Helping a person whose clothes have caught fire :

The First Aider should know how to deal with a person whose clothes have caught fire.

1. Put out the flames by whatever means available. Most of the causes of burns occur in homes and drinking water is readily available to quench the flames, water also cool the burnt area causing less damage to occur.
2. Do not allow the person to run about. This only fans the fire and makes the flames spread.
3. Hold a rug, blanket, coat or table cover in front of you, while approaching a man whose clothing have caught fire.
4. Lay him down quickly on the ground and wrap tightly with any thick piece of cloth, rug or coat. Smother the flame by gently rolling the causality or by gentle pats over the covering.
5. If the clothes in front of the body have caught fire, lay him on his back and vice versa, till suitable material is brought to smother the flame.

Rescuing Persons from Fire:

1. In rescuing persons from a room which has caught fire, quick and clear thinking is required.
2. Remember clean air is at ground level. So crawl along the floor to pull out a person who is lying unconscious or is disabled.
3. Have a wet kerchief round your face when you go for rescue.
4. If there is carbon monoxide in the room, these precautions do not protect the rescuer from carbon monoxide poisoning. When there is fire in a closed room, there is always some amount of carbon monoxide, therefore quick action is all important.
5. When there is fire in a room in which the doors and windows are closed, do not open the windows and door to let in air. The rush of air will increase the fire and it will burn more intensely.

First Aid of minor Burns and Scalds:

In the case of minor burns:

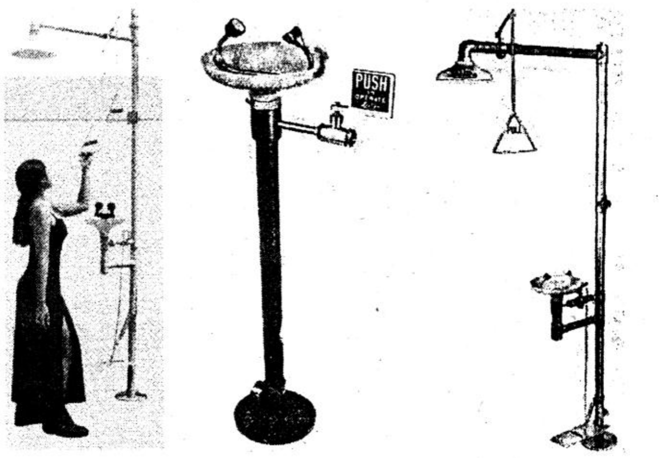
1. Clean the area gently with clean water.
2. Submerge the burned area in cold water.
3. Apply a solution of salt and water (one teaspoonful to a pint of water) in out of the way places.
4. Cover with dry dressing.
5. Do not apply cotton wool direct to the burnt.
6. Do not apply any greasy substance.
7. Give warm drinks for example sweetened tea or coffee.

First Aid of Serious Burns and Scalds :

Immediate attention that required in serious burns are:

1. Keep the casualty quiet and reassure him.
2. Wrap him up in clean cloth.
3. Do not remove adhering particles of charred clothing.
4. Cover burnt area with sterile or clean dressing and bandage. In case of burns covering a large part of the body, it is sufficient to cover the area with a clean sheet or towel.
5. Keep him warm but do not overheat him.
6. If the hands are involved, keep them above the level of the victim's heart.
7. Keep burned feet or legs elevated.
8. If victim's face is burnt, sit up or prop him up and keep him under continuous observation for breathing difficulty. If respiratory problems develop, an open airway must be maintained.
9. Do not immerse the extensive burned area or apply ice-water over it because cold may intensify the shock reaction. However, a cold pack may be applied to the face or to the hands or feet.
10. Shift the casualty to the nearest hospital if he is fit to be moved.
11. If you cannot take him to a hospital, wait for the doctor to arrive.
12. Do not open blisters.
13. Keep him wrapped up in clean cloth.
14. Treat for shock.
15. Remove quickly from the body anything of a constricting nature like rings, bangles, belt and boots. If this is not done early, it would be difficult to remove them later as the limb begins to swell.
16. If medical help or trained ambulance personnel cannot reach the scene for an hour or more and the victim is conscious and not vomiting give him a weak solution of salt and soda at home and enroute :- One level tea-spoonful of salt and half level tea-spoonful of baking soda to each quart of water, neither hot not cold. Allow the casualty to sip slowly. Give above four ounces to adult over a period of 15 minutes: two ounces to a child between I and 12 years of age and about one. ounce to an infant under one year of age. Discontinue fluid if vomiting occurs. Do not apply ointment or any form of grease or other home remedy.

First Aid of Chemical Burns :



1. Wash off the chemical with a large quantity of water for 15 minutes by using a shower or hose if available as quickly as possible. This flooding with water will wash away most of the irritant.
2. Cut out contaminated clothing.
3. Do not touch.
4. Treat as for burns.

Burns of the Eye :

Acid Burns:

1. First aid for acid burns of the eye should be given as quickly as possible by thoroughly washing the face, eyelids and the eye for at least fifteen minutes by water.
2. If the casualty is lying down, turn his head to the side, hold the eyelids open and pour water from the inner corner of the eye outward. Make sure that the chemical does not enter into the other eye. Cover the eye with a dry, clean protective dressing (do not use cotton) and bandage.
3. Neutralising agents or ointments should not be used.
4. Caution the victim against rubbing his eye.
5. Get medical help immediately (preferably an eye specialist).

Alkali Burns:

Alkali burns of the eye can be caused by drain cleaner or other cleaning solution. An eye that first appears to have only a slight surface injury may develop deep inflammation and tissue destruction and the sight may be lost.

1. Flood the eye thoroughly with water for 15 minutes.
2. If the casualty is lying down, turn his head to the side. Hold the lids open and pour water from the inner corner outward. Remove any loose particles of dry chemicals floating on the eye by lifting them off gently with a sterile gauze or a clean handkerchief.
3. Do not irritate with soda solution.
4. Mobilise the eye by covering with a dry pad or protective clothing. Seek immediate medical aid.

10 POISONING, FIRST AID AND ANTIDOTES

Some substances when taken into the body in fairly large quantities or lethal doses can be dangerous to health or can cause death. Such substances are called poisons.

Poisons get into the body by swallowing or by breathing poisonous gases, or by injection through skin.

Poisoning by Swallowing (Mouth route):

Sometimes acids, alkalis, disinfectants etc., are swallowed by mistake. They burn the lips, tongue, throat, food passage and stomach and cause great pain. Other swallowed poisons cause vomiting, pain and later on diarrhoea. Poisonous fungi, berries,' metallic poisons and stale food belong to the later group. Some swallowed poisons affect the nervous system. To this group belong (a) alcoholic drink (methylated spirit, wine, whisky etc.) when taken in large quantities, and (b) tablets for sleeping, tranquillisers and pain killing drugs (Aspirin or Largectil). All these victims must be considered as seriously ill. The symptoms are either delirium or fits or coma (unconsciousness). Some poisons act on nervous system (belladonna, strychnine).

Poisoning by Gases (Nose route) :

Fumes or gases from charcoal, stoves, household gas, motor exhausts, chemicals and smoke from explosions etc.; cause choking (asphyxia) which may result in unconsciousness in addition to difficulty in breathing.

Poisoning by Injection (Skin route) :

Poisons get into the body through injection, bites of poisonous snakes and rabid dogs or stings by scorpions and insects. Danger to life is again by choking and coma.

10.1 General First Aid in Poisoning:

1. Poisoning is a serious matter. Patient must be removed to a hospital/or a doctor be sent for, at once with a note of the findings and, if possible, the name of the poison.

2. Preserve packets or bottles which you suspect contained the poison and also any vomits, sputum etc.,. for the doctor to deal with.

3. If poison is' not known :
   Make a quick assessment of the likely route of exposure by examining the eyes, mouth, nose and skin of the victim for signs of the chemical itself or damage it has caused such as swelling, redness, bleeding, burns, discharge of fluid or mucous or pallor. Drooling, difficulty in swallowing, a distended, painful, hard, or rigid abdomen all indicates possible ingestion of a corrosive or caustic substance. If respiration is rapid, shallow, noisy or laboured, suspect inhalation. If the face has been splashed with chemical, eye contact is likely.

4. Poisoning by inhalation:
   Remove victim from exposure while protecting yourself from exposure.
   If breathing has stopped, administer artificial respiration using a bag-valve mask. Do not use mouth to mouth resuscitation. Instead, use chest pressure-arm lift technique. Maintain an open airway.
   Arrange for transport of the victim to a medical facility.

5. Poisoning by Ingestion
   Do not induce vomiting if he has abdominal pain or burns in mouth. If no such problem, then induce vomiting by syrup of ipecac. Lastly give I or 2 cups of water to drink.

6. Poisoning by skin contact:
   Remove the victim from the contaminated area: Be careful to protect your lungs, skin and eyes while doing so. Remove the victim's clothing, shoes and jewelry from the affected areas, cutting them off if necessary. Do this under a shower or while flushing with water. Continue to flush with water until all traces of the chemical are gone and any feeling of soapiness has disappeared also. Rinse for at least 15 minutes cover the victim with a blanket or dry clothing. Inform and refer the victim immediately to .a physician for his advice.

   In case of inflammation, burns, blisters or pain-

   Loosely apply a dry sterile dressing if available or use a clean dry cloth for it. Inform and refer the victim immediately to a physician for his advice.

   If the victim is in a state of shock -

Lay him down on his side and cover him with a blanket. Elevate his feet. Inform and refer the victim immediately to a physician for his advice. Do not break open blisters or remove skin. If clothing is stuck to the skin after flushing with water, do not remove it.

Do not rub or apply pressure to the affected skin
Do not apply any oily substance to the affected skin.
Do not use hot water.

7. Poisoning by eye contact:
Remove the victim from the contaminated area. Be careful to protect your lungs, skin and eves while doing so. Act quickly. Flush the victim's eyes with clean tepid water for at least 15 minutes. Has the victim lie or sit down and tilt his head back Hold his eyelids open and pour water slowly over the eyeballs starting at the inner corners by the nose and letting the water run out of the corners.
The victim may be in great pain and want to keep his eyes closed or rub them but you must rinse the chemical out of the eyes in order to prevent possible damage.
Ask victim to look up, down and side to side as you rinse
Transport victim to the medical facility as soon as possible. Even if there is no pain and vision is good, a physician should examine the eyes since delayed damage may occur.

If eyes are painful,

1. Cover loosely with gauze or a clean, dry cloth.
2. Maintain verbal and physical contact with the victim.

8. **If unconscious -** (a) Do not induce vomiting (b) Make the casualty lie on his back on a hard, flat bed without any pillow and turn the head to one side. As there is no pressure on the stomach and the gullet is horizontal the vomited matter will not get into the voice box and the tongue will not close the air passage. This is also the best posture for giving artificial respiration, if needed (c) Sometimes when there is excess of vomiting the three-quarterprone posture (i.e. the casualty is made to lie on his side with one leg stretched, the other bent at knee and thigh) will make things easier for the casualty (d) If breathing is very slow or stopped, start artificial respiration and keep it up till the doctor comes, (e) Maintain open airways (f) Do not use mouth to mouth re$uscitation (g) Do not give any thing by mouth (h) In case of signs of shock, elevate-his feet, 20-30 cm and cover him with a blanket (i) Arrange for sending to medical facility.

9. **If conscious -** (a) Aid vomiting by tickling the back of throat or make him drink tepid water mixed with 2 tablespoons of common salt for a tumbler of water (b) Even if conscious, when the poison is a corrosive do not induce vomiting. Signs of corrosives: Lips, mouth and skin show grey white or yellow, patches which are to be looked for :acids, alkalis etc., cause such burns.

First Aid: Factories which use certain poisons shall have the respective antidotes ready and displayed in an easily available place. The personnel should be taught about the use of antidotes - so that anyone can render assistance in case of emergency. For antidotes see Part-10.6.

The poison must be diluted by giving large quantities of cold water (chilled, if possible) This will dilute the irritant and delay absorption and will replace fluid lost by vomiting. Tender coconut water will be even better as this will be a food and also a diuretic.

Soothing drinks should be given. Milk, egg beaten and mixed with water or sojee congee are good for the purpose.

10.2 Alcohol Poisoning :

Alcohol taken in considerable (toxic) quantities may cause fatal poisoning,. A fatal dose of ethyl alcohol is 8 g per I kg body weight. Alcohol affects the heart, blood vessels, gastro intestinal tract, liver, kidneys and mainly the brain. In a case of severe intoxication, sleep is followed by unconscious state. • Vomiting and involuntary urination are frequent symptoms. The respiratory centre is drastically inhibited, which is manifested by irregular breathing. Death ensues when the respiratory centre becomes paralysed.

First aid : Fresh air should be provided (a window open or the victim taken outside) and vomiting induced by 'minor lavageas'. If the patient is still conscious, he should be given hot strong coffee. A respiratory arrest is managed by artificial respiration.

10.3 Poisoning with Acids and Alkalis :

In poisoning with concentrated acids and alkalis, a grave condition rapidly develops, in the first place, to extensive burns in the mouth, throat, oesophagus, stomach and often the larynx. Later, the absorbed toxins affect the vital organs (e.g. liver, kidneys, lungs, or heart). Concentrated acids and alkalis are able to destroy .tissues. The mucous membranes, being less resistant than the skin, are destroyed and necrosis occurs more rapidly involving deeper layers.

Burns and scabs form on the mucous membrane of the mouth and lips. In a bum due to sulphuric acid, the scabs are black, in a burn due to nitric acid they are greyish-yellow, in one due to hydrochloric acid they are yellowish-green and in one due to acetic acid greyish-white.

Alkalis more easily penetrate the skin and affect deeper layers. The burnt surface is loose, decomposed and whitish in colour.

As soon as an acid or alkali is swallowed the patient feels strong pain in the mouth, behind the breast bone and in the epigastrium. When laid down he tosses in bed from unbearable pain. There is almost always tormenting vomiting often with admixtures of blood. Painful shock rapidly develops. The larynx may swell and asphyxia develops. When an acid or alkali is taken in great amount, cardiac weakness and collapse rapidly develop.

Poisoning with ammonium hydroxide takes a grave course. The pain syndromes is attended by asphyxia because the airways are also affected.

The person -who is rendering first aid must find out at once which chemical caused the poisoning because the treatment varies according to the type of poison.

If the poisoning was caused by concentrated acids and the symptoms of oesophageal or gastric perforation are absent, the stomach should be leveraged through a thick stomach tube using for it 610 litres of warm water mixed with magnesium oxide (20 g per litre of liquid) or lime water. Sodium carbonate is contraindicated for a gastric lavage. "Minor lavage " i.e. drinking 4-5 glasses of water and then inducing vomiting, will not alleviate the patient's condition and sometimes may even promote absorption of the poison.

If a stomach tube is unavailable, the patient may be given milk, oil, egg, white, mucilaginous decoctions, or smoothing substances. In poisoning with carbolic acid (Phenol, Lysol) milk, oil or fat should not be taken. Magnesium oxide mixed with water or lime water should be given in this case, as in poisoning by all other acids. Cold compresses or ice should be put on the epigastric region to lessen pain.

When the poisoning is due to concentrated alkalis, the stomach should be immediately lavaged with 6 10 litres of tepid water or a I per cent citric or acetic acid solution within four hours of the poisoning. When a stomach tube is unavailable and the patient's grave condition (swelling of the larynx) prevents a stomach lavage, mucilaginous solutions are given, 23 per cent citric or acetic acid solution (I tablespoonful every 5 minutes), or lemon juice. Rinsing of the mouth or administration of sodium hydrochloride solution is contraindicated.

The patient should be immediately admitted to a medical institution where he will be given the necessary urgent medical help.

It should be kept in mind that when a perforation of the oesophagus or stomach is suspected, they being manifested by severe pain in the stomach and unbearable pain behind the breast bone, drinking and moreover, lavage of the stomach are not permitted.

10.4 Poisoning with Toxic Chemicals :

The latent course of the disease is 15-60 minutes, after which the symptoms of the affection of the nervous system appear (e.g. enhanced salivation, discharge of sputum and perspiration). Breathing accelerates and becomes noisy, as rail heard at a distance. The patient becomes restless and excited. Cramp appears in the legs and the intestine undergoes increased peristalsis which is followed by muscular paralysis and paralysis of the respiratory muscles. The respiratory arrest that follows, causes asphyxia and death.

In accidents connected with the inhalation of the toxic chemicals the victim must be immediately hospitalised. If possible, he should be given 6-8 drops of a 0.1 per cent atropine solution or 1-2 tablets of belladonna. When respiration is arrested, artificial respiration should be carried out. When the poisoning is caused by toxins getting into the gastro-intestinal tract, the stomach should be washed with water mixed with suspension of activated carbon Saline purgatives should also be prescribed. The toxic substances should be removed from the skin and mucous membranes with running water.

10.5 Carbon Monoxide Poisoning :

Carbon monoxide poisoning may occur in the chemical industry where it is used for synthesizing certain organic compounds (acetone, methyl alcohol, phenol etc.), in poorly ventilated garages, in furnaces or in stuffy, freshly painted premises. It may also happen in households when the stove shutters are closed too early in premises with stove heating.

The early symptoms are headache, heaviness in the head, nausea, dizziness, noise in the ears and palpitation. Later muscular weakness and vomiting occur. If the victim remains in the poisonous atmosphere, the weakness intensifies, somnolence, clouding of consciousness and dyspnoea develop. The skin turns pale and sometimes bright red spots appear on the body. In further exposure to carbon monoxide the patient's respiration becomes shallow, convulsions develop and paralysis of the respiratory centre terminates in death.

First Aid : The victim must be immediately removed from the poisonous surrounding, better into the open air in warm weather. If his breathing is weak and shallow or arrested, artificial respiration should be continued until adequate natural breathing or the true signs of biological death appear. Rubbing should be carried out and hot water bottles applied to the legs. A brief whiff of ammonium hydroxide is beneficial A patient with severe carbon monoxide poisoning must be immediately hospitalised in order to prevent possible grave complications in the lungs and nervous system which may develop later.

For chemical safety see Chapter-18.

10.6 Antidotes for some common Chemicals :

Antidotes are therapeutic agents used to counteract the toxic effects of specific xenobiotics. These are heterogenous group of substances consisting of pharmaceuticals, biological agents and immunoglobulin fragments. Different mechanisms of action are involved Some specifically act at the receptor sites while others exert their effect by changing the metabolism of the poison counteracting the toxic injury or just forming the inert complex with the poison.

Antidotes acting at receptor sites: Drug intoxications are mostly treated with these antidotes. However, Atropine is a specific antidote for organophosphate or carbamate pesticide poisoning. Similarly physostigmine for Dhatura and neostigmine for Curare poisonings are useful. Others include, naloxone for opioid, flumazenil for benzodiazepines and physostigmine for atropine poisoning.

Antidotes changing the metabolism of the poison: These antidotes either interfere with the metabolism of the toxic agent thereby reducing the toxicity or strengthen the detoxifying capacity of the body. Antidotes included in this group are ethanol, 4-methyl pyrazole, acetylcysteine, sodium thiosulphate, folinic acid and pyridoxine.

Antidotes binding with the poison and forming less toxic complexes: In this category, poison may be adsorbed or chelated by the antidote. Activated charcoal effectively adsorbs a large variety of drugs and toxins, thereby decreasing their bioavailability and enhancing elimination. Role of multiple doses of activated charcoal as gastrointestinal dialyzer is being recognised in the treatment of poisoning, due to drugs. On the other hand, chelating agents like BAL, penicillamine and DMSA form complexes with heavy metals, thereby preventing or reversing the binding of metallic cations to body ligands.

Antidotes counteracting the toxic injury: The agents in this group reverse a chemically induced damage or functional disturbance and restore physiological conditions. Amyl nitrite, sodium nitrite, sodium thiosulphate, methylene blue, dantrolene, benzyl penicillin, glucagon, oximes, etc. are common examples.

In general, antidotes should be given in adequate doses as early as possible in cases of poisoning. Some antidotes cause serious adverse reactions. Hence, both the risk and the benefits of the antidotal therapy must, therefore, be carefully evaluated and the patient must be monitored regularly. At times the half-life of some antidotes like naloxone, atropine is much shorter than the toxin, in which cases the antidotal therapy must be continued till the symptoms of the poisoning subside.

Table 26.1 gives antidotes or medical treatment for some commonly used chemicals.

Table 26.1 : Antidotes or Medical Treatment for some commonly used Chemicals

Sr. No.	Chemical	Antidote / Medical Treatment
1	Acids and Sulphur Oxides (SOx), or Alkalis	▪ Wash with plenty of water if eyes or skin is affected.

		▪ Do not give chemical antidote because it increases heat and injury with reaction. Do not induce vomiting. ▪ Milk, lemon water or milk of magnesia can be given.
2	Acetonitryl, Acrylonitryl, Lactronitryl, Cyanogen chloride or bromide	▪ Very careful treatment of cobalt E.D.T.A. (calocynor) and if that is not effective give nitrite/thio sulphate treatment
3	Alkali phosphates and Ammonia	Immediately give water or milk and induce vomiting. For the hypocalcimic effect of phosphate give 5 ml intravenous injection of 10% calcium gluconate. If eye or skin is affected wash with plenty of water for 15 min.
4	Ammonia	If skin is affected then wash with plenty of water for 15 min. and then wash with dilute lactic acid and apply soframycin cream. If eye is affected then wash by eye fountain with plenty of water for 15 min. Put one drop of 0.4% Benzocaine (Novocaine) solution in eye. Boric or lactic acid solution eye drops can also be given, If entered in throat then give smell through cotton dipped in ethanol or ether through nose. Administer oxygen in case of breathing difficulty.
5	Aniline, Toludine and Nitrobenzene	Methylene- Blue (1% solution). Ascorbic acid (5% solution) Administer oxygen in case of breathing difficulty.
6	Anticoagulants (Heparin) etc.	Protamin sulphate (1% solution), Vitamin-K (1% solution).
7	Antimony and Stibine	Dymer caprol (BAL)
8	Arsenic	BAL (British Anti Lewistic compound) ie Dimer caprol, penicillamine. Induce vomiting.
9	Arsine (Hydrogen arsenide)	Mercaptide (40% solution, Dimercaptopropanol, penicillamine).
10	Atropine	Pilocarpine (1% solution). Proserin (0.05% solution).
11	Barium and its salt	Magnesium sulphate (30 gm in 250 ml water). Morphine (5 to 10 mg.)
12	Barbiturates	Barmegride (0.5 % solution).
13	Benzene, Toluene & Xylene	Skin is affected then wash with plenty of water. Administer Oxygen or shift to fresh air. Diazepam 0.1 mg / kg. (iv), bed rest.
14	Beryllium	Calcium edentate, Prednisolone.
15	Bis-chloro methyl ether	N-acetyl-L-cysteine.
16	Bleaching solution	Milk, melted ice-cream, eggs, milk of magnesia, aluminium hydroxide gel. Do not give acid antidotes.
17	Bromides	Skin is affected then wash with plenty of water. Give 1 gm. Salt in water by mouth. If this is not possible then intravenous (iv) injection of normal saline. Give milk and water.
18	Boric acid and Boron derivatives	Ipecac solution and activated charcoal. Infra muscular (im) injection of 5% dextrose if nausea.

19	Cadmium	Calcium disodium edetate i.e. CaNa2EDTA by intravenous or muscle.
20	Carbon monoxide	Administer Oxygen (100% pure), intravenous injection of 1 gm/kg of 20%mannitol, or 1 mg./ kg of Prednisolone.
21	Carbon tetrachloride or Chloroform	N-acetyl-L-cysteine.
22	Carbonyls	Tablets of Sodium diethyl dithio carbamate, 2 tablets immediately and then 1 tablet every two days for next two days. Administer Oxygen in case of breathing difficulty.
23	Cardiac Glycosides	Potassium chloride (0.5% solution). Atropine sulphate (0.1% solution), Tefacin calcium (10% solution).
24	Chlorine, Bromine, Phosgene	Skin is affected then wash with plenty of water. Apply Sodium bicarbonate and again wash with water. Eye is affected then flush eye in eye fountain. Put 2-3 drops in eye of Pontocaine 0.5% solution ot Benzocaine (Novocain) 0.4% solution. If inhaled then give smell through ethanol or ether dipped cotton. ; Give milk, buttermilk or lemon water. Give 02 in case of breathing difficulty
25	Chlorates	Ipecac solution, activated charcoal, milk. Don't give Methylene blue. Add 2 to 5 gms. Sodium thiosulphate in 200 ml of 5% Sodium bicarbonate solution and give by mouth.
26	Cosmetics (Bromates)	Intravenous injection of 1 ml./kg Sodium thiosulphate (10% solution)
27	Chromium	Dimercaprol. .Give high vitamins, protein and carbohydrates in food. Methylene blue.
28	Cyanides and Thiocyanate insecticides	Methylene blue or Calocyanides injection. If inhaled gives smell of amyl nitrate ampule (0.2 ml) every 5 minutes. Intravenous injection of Sodium nitrite (3% solution) and Sodium thiosulphate (25% solution) but if blood pressure decreases, then stop it. 4 DMAP (Dimethyl amino phenol) 3 mg/kg, iv, along with thiosulphate. Hydroxocobalamine, 4 gm,iv, in 5% dextrose. Dicobalt edetate, 300 - 600 mp-, iv, over l-5min.
29	DDT (Halogenated insecticides)	Ipecac syrup, activated charcoal. Saline cathartic, Diazepam (10 mg.) by intravenous injection, wash skin with soap and water. In case of breathing difficulty administer Oxygen
30.	Dichlorophenoxy acetic acid insecticides	Ipecac syrup, activated charcoal. Saline cathartic, Lidocane (50-100 mg by intravenous injection)..
31.	Dimethyl sulphate	Skin is affected then apply Magnesium oxide paste and give injection of Corticosteroid.

		In case of breathing difficulty administer Oxygen.
32.	Dichloro methane	Hydro cortisone (200 mg every 4 hours). In case of aspiration pneumonia give antibiotics.
33.	Dinitrophenol or Cresols	5% Glucose saline by intravenous injection.
34.	Ethanol	2 gm. Of Sodium bicarbonate in 250 ml water, Diazepam 10 mg., by intravenous. Skin or eye is affected then wash with plenty of water.
35.	Ethylene or Diethylene glycol	Ethanol, Calcium gluconate Pyridoxine
36.	Fluorine, Hydrogen fluoride and derivatives.	Intravenous injection of 10 ml. Calcium gluconate (10% solution). If serum magnesium level is low then give 10 ml Milk of magnesia every hour. Give more milk and liquids. If eye is affected then wash with plenty of water.
37.	Formaldehyde	Milk, activated charcoal or water.
38.	Formalin	Ammonium chloride or Ammonium carbonate (3% solution).
39.	Hydrogen sulphide, other sulphides and Mercaptans	Shift in fresh air or administer Oxygen. Give inhalation of ethanol or ether drops. Amyl nitrite or Sodium nitrite, Pyridoxine 20 mg./kg. or 10% urea 1 gm./kg by intravenous injection.
40.	Hydrogen cyanide	Give inhalation of 0.2 ml amyl nitrite dipped cotton. Sodium nitrite (1% solution). Sodium thiosulphate (30% solution), Cromosmon (1% methylene blue in 25 % glucose solution).
41.	Iodine and compositions	Milk, Fine starch solution, 100 ml of 1% Sodium gluconate 10% solution.
42.	Iron salts	Careful treatment of deferroxamine therapy.
43.	Lead compounds	$CaNa_2EDTA$, D-Penicilliamine (oral), BAL (with CaEDTA), Induce vomiting, then give Magnesium sulphate in water.
44.	Magnesium salts	Intravenous injection of 1 ml/ kg of Calcium gluconate 10% solution.
45.	Manganese	Calcium edentate
46.	Mercury as Hg, Alkyl or Aryl compounds	Give white of egg in water. Later give milk, Then induce vomiting. BAL, D-Pencilliamine, n-Acetylcysteine, Dimercaptopropane- 1 sulfonate DMPS).
47.	Metals (Heavy metals, mercury, lead, copper, cobalt, arsenic, nickel)	Unithol (BAL, dimercaprol, 5% solution), Tetacin calcium (10% solution), Penicillamine Dextrose (10%) by intravenous injection. Chillating agent for effect of mercury.
48.	Metal Compounds (Heavy metals compositions)	Activated carbon (carbolin) BAL
49.	Methanol	Ethanol (30% solution from inside, 5% solution from outside i.e. by intravenous injection), Epicake Syrup. In case of acidosis give Sodium bicarbonate. In case of delirium give Diazepam 10 mg. by intravenous injection. Folinic acid (Leucovorin), 1 mg/kg, iv, 4 hourly.

50.	Metaldehyde	D-Penicillamine, Ascorbic acid or Thiamine to be given carefully.
51.	Naphthalene	5 gm. Sodium bicarbonate every 4 hrs. and keep urine alkaline. Give 1 ml/kg, furosemide in liquid. Blood transfusion till haemoglobin becomes normal -60 to 80%.
52	Nitrates, Nitrites, Nitrobennzene Sulfonamides Dapsone	Methylene blue, 1-2 mg / kg, iv, over 5 min.
53	Nitrogen oxides (NOx)	Prednison or prednisolone 5 mg. every 6 hrs. interval.
54	Orgnaic phosphate or carbamate insecticides (abet, dizionon, dimate, EPN, Ethyl Phosphamidon, Phosvel, Selithion, Aldecarb, Baygon, Sevin etc.)	Ipecac syrup, Atropine sulphate 2 mg. by intravenous injection every 3-8 mins interval. Prelidoxim by intravenous. Obidoxim (Toxogonin), skin to be washed with soap and water.
55	Orgao phosphorous insecticides (e.g. Malathion, Parathion, Monocrotophos, Phorate)	Atropine injection, atropine sulphate (0.1% solution), Nalorphine hydrochloride (0.5% solution), Trimedoxim bromide (15% solution), Pyridine Aldoxy Methyodate, Diperoxim, Biodexim and Isonitrocin (40% solution), Pralidoxim, RAM, TOXOGONIN.
56	Oxalic acid	Milk, lemon water, chalk or calcium lactate, calcium chloride or calcium gluconate with liquid. 10% calcium gluconate or chloride 10 ml. by intravenous injection.
57	p-Nitro Chlorobenzene (PNCB)	Methylene blue
58.	Phenol & Derivatives	Shift in fresh air, activated charcoal and 240 ml. milk. If skin or eye is affected then wash with plenty of water for 15 min. If skin is affected then wash with Polyethylene glycol(PEG).
59.	Phosgene	Cortisone acetate 1 mg./kg by mouth - thrice a day. In case of breathing difficulty administer Oxygen
60.	Phosphorous, Phosphine & Phosphides	10 ml. Calcium gluconate (10%) by intravenous injection, 5% glucose in water. Travert (10% invert sugar) by intravenous injection.
61.	Potassium permanganate	Hot milk, Methylene blue (1% solution) Ascorbic acid (5% solution)
62.	Silica & Asbestos dust	Reduce dust level by local exhaust ventilation. Use airline respirator.
63.	Silver nitrate & other salts	10% Salt (Sodium chloride) solution, milk and for reducing, pain Demrol or Codeine.
64.	Tobacco & Nicotine	Induce vomiting, Atropine (large dose). In case of difficulty in breathing, administer Oxygen.
65.	Vinyl chloride	Skin is affected, wash with plenty of water. Eye is affected then keep eye open and allow material to vaporise. Don't apply any eye drops In case of breathing difficulty, administer Oxygen. If injected then induce vomiting. Give one spoon mineral oil and after that give sodium/magnesium sulphate (one spoon) in a glass of water. Give strong tea or coffee if feeling exhausted.

66.	Zinf fumes and metal fume fever	Prednisolone, Aspirin, Bed rest.

E X E R C I S E

1 Explain, State, Discuss or Mention

1. General rules or principles of first-aid.
2. Priority steps of first-aid treatment
3. First-aid treatment method for
   (a) Shock (b) Suffocation (c) Heat stroke (d) Bleeding Nose or Ear (e) Heart attack (f) Dog bite OR Snake bite (g) Coma.
4. First aid treatment for different types of wounds.
5. The first-aid treatment for
   (a) Minor injuries (b) Bruises and contusions (c) Sprains of ligaments (d) Spine Fracture.
6. Types of fractures and first - aid treatment for them.
7. In what body parts a foreign body can enter and what should be their respective firstaid treatments?
8. Causes of electrical injuries and first aid for them.
9. Types and methods of Artificial Respiration.
10. Causes of Burns and Scalds.
11. How to help a person whose clothes have caught fire?
12. How to help rescuing persons from fire?
13. First aid of serious burns and scalds.
14. General first aid for poisoning.
15. First aid treatment when poison is not known.
16. First aid treatment for Alcohol poisoning.
17. First aid treatment for poisoning with Acids and alkalis.
18. First aid treatment for poisoning with toxic chemicals.
19. First aid treatment for CO poisoning.
20. Meaning and types of Antidotes.

2. Write Short Notes on -

1. Need of the First - aid.
2. Meaning of First-aid.
3. Dr. ABC and Head-foot examination.
4. Ten Commandments of first-aid.
5. First aid for foreign body in the Eye OR in the Ear.
6. Types of Dressing OR Bandages.
7. Mouth to mouth breathing.
8. External Heart Compression.
9. First aid for minor burns and scalds.
10. First aid for chemical burns.
11. Meaning and types of poisoning.
12. Treatment for poisoning by skin contact OR Eye contact.
13. Antidote treatment for Ammonia OR Chlorine effect.
14. Antidote treatment for Cyanides OR DDT.
15. Antidote treatment for Organo phosphorus OR Tobacco.

3. Explain the difference between with respect to

1. First-aider and Doctor

2. Burn and Chemical burn
3. Shock and Electric shock.
4. Suffocation and Infection.
5. Dog bite and Snake bite.
6. Open injuries and Closed injuries.
7. Foreign body in the Nose and that in the Throat.
8. Dressing and Bandage.
9. Mouth to Mouth breathing and Mouth to Mouth and Nose breathing.
10. Mouth to Mouth breathing and CPR.
11. Burns and Scalds.
12. Chemical burn and Nuclear burn.
13. Degrees of burn and Percentage of burn.
14. Treatment for Acid burns and that for Alkali burns.
15. Treatment for poisoning by Inhalation and that for Ingestion.
16. Treatment for poisoning when a victim is conscious and when he is unconscious.

4. Comment on following explaining whether it is true or false?

1. First aid cannot prevent accident but it can prevent further injury.
2. First aider has to play a role of a doctor.
3. Fracture may be an open or closed injury.
4. Atropine is a specific antidote for carbamate pecticide poisoning.
5. Activated charcoal is an antidote for gastrointestinal poisoning.
6. BAL, as chelating agent is a useful antidote for poisoning due to heavy metals.
7. There is no medical antidote for lung damage due to silica or asbestos dust.
8. Antidote therapy should be continued till the symptoms of poisoning subside.
9. Half-life of some antidotes (e.g. Atropine) is much shorter than the toxin.
10. Sodium thiosulphate is an antidote which changes the metabolism of the poison or strengthens the detoxifying capacity of the body.

CHAPTER – 27

Factories Act and Case Law

THEME

1 HISTORY OF THE SAFETY MOVEMENT AND THE FACTORIES ACT

1.1 Development of the Safety Movement:

1.1.1 The Oldest History of Labour Laws :

Age old concept of safety in India and abroad, with brief history , has been discussed in Part 5 of chapter-I, and Part I of chapter-7. This shows that in ancient India, the class of labourers, artisans and artists was duly respected by the society and the problems of their livelihood, health and safety were also considered as mentioned in old literature and in Kautilya's Arthshashtra(BC 2000).

Legal history dates back to 14th century in England. It is mentioned that the initial enactments by the English Parliament were in the interest of employers and not in the interest of employees. The statute of Labourers of 1349 and 1350 made labour compulsory, confined labourers to their existing places of residence and fixed maximum rates of wages. Some of these restrictions were later on relaxed and others extended by the Apprenticeship Act of 1562. This statute was not finally repeated until 1875.

Due to the change in political power and industrial development in England as well as in USA, laws were passed in the interest of workers from 19th century. Much of this legislation was aimed to promote safety and health of the workers.

As early as 1898, the US supreme court upheld a Utah Statute prohibiting women employment in mines for more than 8 hours a day.

Initially the need of legislation was justified by the courts for children and women and not for adult men. Following old citations clarify this

1. Labour legislation may be enacted which applies to children and not to adults. Regulation of hours of labour may be made for women and not for men'[Muller v/s Oregon, 208 US 412 (1908)].
2. Regulation of hours of labour may be made to apply to especially unhealthful occupations and not to others' [Holden v/s Hardy, 169 US 366 (1898)].

An Oregeon statute of 1903 limited to 10 hours a day the labour of women in factories, laundries and mechanical establishments. The US court upheld this law in 1908, constitutional justifying the injurious effects of long hours of labour upon the health of women. In 1915, the same court also upheld the more drastic California statute limiting the labour of women in certain industries to 8 hours a day and 48 hours a week as a reasonable exercise of law [Miller v/s. Wilson, 236 US 373 (1915)]

Child labour laws were adopted and justified in almost all countries. The state was considered to be a guardian and its parental rights were upheld by the courts to fix the age-limit below which children shall not be employed, to regulate their working hours and to prohibit their employment in dangerous occupation.

1.1.2 History of Labour Legislation in England:

The common law foundation of labour laws in England was described in the words protection and improvement. Three reasons were given for such justification :

1. To protect exploitation of defenceless workers by avaricious employers.
2. Looking to the complexity of industrial organisations and operations, without compulsion of law, it was not possible to safeguard the physical, mental and economic interests of the workers.
3. Protection and improvement of standards of employment were necessary also for social welfare and progress.

In 18th century the development of labour legislation in England was speeded, with the development of more and more industries. The agitation of Robert Peel and Robert Owen resulted in the Health and Morals Act to regulate the labour of bound children in cotton factories in 1802. Children were protected by the second of the Factory Acts enacted in 1819. In 1883 all textile mills were brought under regulation and provisions were made for-

1. Prohibition of child employment under 9 years of age and also during night hours.
2. Children between 9 to 13 years, might work for 8 hours a day.
3. Young persons between 13 to 18 years, might work for 12 hours.
4. Holidays.
5. Certificate of fitness
6. Factory Inspectors for enforcement of the Act.
7. The Children's Half-time Act of 1844 provided for -
    1. Safe guarding of machinery.
    2. Accident reports.
    3. Public prosecution.
    4. Damages(Compensation) for accidents.
    5. Employment of children for half-time only, the other half to be spent in school.

6. Young persons including women, of age 13 to 18, to work for 12 hours a day and not during night.

The Ten-Hour Act, 1847 secured the 10 hour day for women and young persons.

But all these measures failed to reach the thousands of women and children who were working in mines. The Mines and Collieries Act of 1842 was enacted to prohibit the employment of women and children under 10 years of age in underground mines.

The Factory Acts were extended to all large industries in 1864 and to smaller workshops in 1867. In 1878 the Factory and Workshop Consolidation Act repealed all former laws and substituted a Factory Code which made regulations more stringent. The new Factory Code of 1902 raised the minimum age for child workers from II to 12 years.

For workers' social welfare, enactments were passed in England regarding Workmen's compensation, contract labour, sickness insurance, unemployment insurance, old age pensions, etc.

The law relating to factories in England is to be found not only in the Factories Acts of 1937, 1948 and 1961 but also in several orders and regulations issued by the Ministry of Labour.

The Boiler Explosions Act of 1882 and 189C provided for inquiry in an accident of boiler explosion.

1.1.3 Stages of Development of Safety Movement:

As per the Encyclopaedia of Sciences (Macmillar Co.) the safety movement developed in five stages :

1. The improvement of the environment or the removal of physical hazards.
2. The improvement of personal practices through a combination of education and supervision.
3. The management's direct involvement at a lower level in safety problems. This leads to the setting up of various departments specifically charged with responsibility of ensuring the safety, health and the efficiency of the workers such as Personnel, Medical, Safety, Industrial Hygiene and Training.
4. With the growing complexity of industry and the recognition that safety is an essential element in the profitability and the effective functioning of the enterprise, safety was accorded front rank status. It was accepted that safety cannot be viewed in isolation, but has to be considered as an essential element in an integrated approach to the planning, organisation and operation of an industrial enterprise and not something to be super-imposed of an existing organisation. Safety should be considered from the design stage and extended to the product safety and total loss control.
5. It is in fact a co-operative effort on the part of industries to prepare codes and standards to pool and disseminate information of technical aspects relating to safety.

1.1.4 History of Factory Legislation in India :

The first time the public attention was drawn towards a report in 1873, 'Administration of the Bombay Cotton Department wherein the writer Major Moore described the factory conditions in Bombay with reference to long working hours, conditions of women and children of six years working from sunrise to sunset with a small interval of half an hour and only two holidays in a month.

Based on this report the Secretary of State wrote to the Bombay Government in 1875 to appoint a Commission to determine whether legislation was necessary in that subject. As a result the Commission was appointed by a majority of seven against two not in favour of legislation.

About this time Miss Carpenter of Bristol, founder of the National Indian Association, had visite'd India and made inquiries about the Indian factory conditions.

Exploitation of child labour and the unrestricted employment of women were among the worst features of earlier factories in India. Maj. Moore, Mr. Ballard and Mr. Alexander Redgrave were' some of the earliest to urge the necessity for factory legislation in India on the lines of the British Factories Act to check these evils. Almost simultaneously, the Lancashire Cotton interests, apprehensive at the phenomena growth of the Indian Cotton Industry, also started an agitation for achieving the same object, their aim being directed towards neutralising the advantages the Indian capitalists had with regard to cheap labour. Such extraneous considerations resulted in the merits of legislation being obscured and a counter agitation was therefore, started by the Indian capitalists against any form of legislative enactment. A commission set up in 1875 by the Bombay Government at the instance of the Secretary of State recommended prohibition of employment of children under 8 years and a 12 hours day for adults.

1.2 The Factories Act, 1881 :

Some leaders like S.S. Bengalee fought for the labour's cause and were mainly responsible for getting a bill referred to the Indian Legislature in 1879. An organised body of workers also put in a strong plea before the legislature for redress of their grievances. Finally, the first Indian Factories Act, 1881 (15th of 1881) was enacted. The most important provisions therein were:

1. Prohibition of employment of children under 7 years and their double employment on the same day.
2. Working day of 9 hours for children.
3. Four holidays in a month for children.
4. Intervals of rest.
5. Fencing of dangerous parts of machinery.
6. Reporting of accidents.
7. The Act was made applicable to a factory with mechanical power and workers 100 or more.
8. District Officers, were expected to enforce the Act without any addition to their staff.

The clauses related to the work of women and holidays for them were dropped owing to 'the strong criticism by the employers.

The Act, though inadequate from almost all points to the abuses, nevertheless was significant in that it secured recognition of the principle that Government would interfere in the industrial relations to protect the weak and oppressed.

1.3 The Factories Act 1891 :

The inadequacy of the 1881 Act led to continued agitation by workers, under the leadership of Bengalee for its amendment. Meade King in 1882, after investigating labour conditions on behalf of the Bombay Government, made recommendations for amending it. Later on a commission sat in 1884 and considered the question in detail. During the sitting of the commission, the labour movement was increased, the workers met in a conference and .placed their view points before the Commission. Bengalee and Lokhanday took a prominent part in the Conference.

The agitation for protecting labour gathered momentum following the publication in 1886-S7 in England of the report of Mr. Jones who had studied the factory conditions in Bombay during the period 1883-86. In 1890, a Factory Labour Commission was appointed by the Indian Government to again review the position and make suitable recommendations. Finally, the Indian Factories Act, 1891 (No. II of 1891) was passed and came into force from 1-1-1892. Its main provisions were:

1. Registration of a factory on employment of 50 or more workers.
2. Local Government authorised to notify concerns employing even 20 workers
3. Non employment of children under 9 years.
4. Seven hour day for children between 9 & 14 years.
5. Eleven hour day for women with 1.5 hour interval.
6. Restrictions on employment of women and children during 8 p.m. to 8 am.
7. Weekly holidays for all workers.
8. Rest interval of 0.5 hour.
9. Provincial Governments authorised to make rules regarding sanitation and comfort.

1.4 The Factories Act 1911 :

The introduction of electric lights in the factories in 1895 and the devastating effects of plague at about the same time had its repercussions on the availability of labour to meet the increasing capacity for production. Evasions of the Act were widespread. Besides, the ginning factories which were the worst offenders had not been brought within the purview of the 1891 Act, as factories not working for more than 4 months in a year had been excluded.

The safety provisions in the 1891 Act also proved inadequate. This was brought to light by a number of tragic fires in the cotton presses between 1901 and 1905, resulting in over 50 deaths. The government of India took a serious view and introduced in 1905 a Bill for further amending the earlier Act and this was circulated for public opinion.

At the direction of the Secretary of State, the India Government appointed in 1906 a Textile Factories Labour Committee with Frier Smith as Chairman and again in 1907 the second Factory Labour Commission with Hon. Morrison as Chairman to investigate factory working conditions. A bill embodying the recommendations of these bodies was introduced and enacted the Factories Act 1911 (12 of 1911). It came into force from 1-7-1912. Its chief provisions were:

1. Limiting the hours of work of male adults and children to 12 and 6 respectively.
2. Children were required to produce certificates as to 'age and physical fitness.
3. Appointment of full-time inspectors for the enforcement of the Act and inspection and certification of factories.
4. Provisions for health and safety of workers.
5. Seasonal factories were included.
6. Power of local government for exemptions.
7. Prevention and punishment for breaches.

1.5 The Factories Act 1922 :

The inauguration of the ILO in 1919 after the First World War (1914-1918) lead to adoption of Conventions on working hours, minimum age, night work of women and young persons etc. The growth of the labour movement and the stirring of public interest on labour questions in India as aresult of a number of strikes led to the ratification in 1921 of most of the ILO Conventions. A 60 hour week conceded and night work for women and children under 14 was prohibited. In 1922 the Factories Act was amended to include within its scope :

1. Industrial undertakings using mechanical power and employing 20 or more persons.
2. The minimum and maximum age of children were raised to 12 and 15.
3. A six hours working day for children, a half hour rest interval after 4 hours work and prohibition of employment of a child in two factories on the same day.
4. Working hours II per day and 60 per week.
5. Control of artificial humidification.
6. No woman and children employment between 7 p.m. and 5-30 am.
7. Compulsory rest intervals and weekly holidays.
8. Measures for health and safety of .operatives.
9. Power of Government to notify factories employing workers more than
10. Laying down principles to grant exemption.

Minor amendments for administrative purpose were made in 1923, 1926 and 1931. By these amendments penalty was inflicted on parents or guardians for permitting their children to work m two factories on the same day and the Governments were given power to make rules for providing precautions against fire inside factories. General provisions remained the same till the major amendment in 1934.

1.6 The Factories Act 1934 :

Following serious labour unrest in the country, a Royal Commission was set up in 1929 with Mr. John Henry Whitley as President, to review existing law in detail and make suitable recommendations after conducting an enquiry into the labour's living conditions. This resulted in the Act of 1934 (25 of 1934) which came in to force from 1-1-1935. Its main provisions were:

1. Adequate inspection and strict observance of the Act.
2. Applicable to factories employing 20 or more workers and using power.
3. Provisions for seasonal factories working for 180 days or less.
4. Working hours 10 per day and 54 per week for all adults in perennial factories, 10 hours a day and 56 hours a week for continuous work and II hours a day and 60 hours a week for seasonal factories.
5. Daily hours for children (between ages 12 & 15) reduced to 5.
6. New category of adolescent (between the age 15 to 17) included.
7. Certificate of fitness from certifying surgeon for children and adolescents.
8. Spread over of 13 hours for adults and 7.5 hours for children.
9. No women or children employment between 7 p.m. and 6 am.
10. Overtime wages at the rate of 1.25 times the ordinary rate for work exceeding 60 hours a week.
11. A weekly holiday on Sunday and no consecutive work for more than 10 days without a holiday.
12. Provisions for health and safety amplified. Provisions for cleanliness, ventilation, lighting, no overcrowding, drinking water, sanitary facility, washing facility, fencing for dangerous machinery, rest room for more than 150 workers, creche for more than 50 women for their children below 6 years and first aid box were made.
13. Penalty up to Rs. 500 and enhanced penalty for repeated breach were provided.

1.7 The Factories Act 1948 (The present Act) :

The above Act was subsequently amended in 1935, 1936, 1937, 1940, 1941, 1944, 1945, 1946 and 1947 before it's major amendment in 1948.

During the Interim Congress Regime, a five year plan was drawn up to ameliorate the labour conditions in India and also to revise the Factories Act of 1934 on the line of the UK Factories Act 1937 and latest ILO conventions in the matters of safety, health, welfare, working hours, industrial hygiene, medical examination of young persons and submission of plans of factory buildings.

The 1942 Conference was important as being the first attempt at collaboration between Government, employers and workers in matters pertaining to Labour. Arising therefrom, a Plenary Tripartite Conference and a Standing Labour Committee had been set up to advise Government on Labour matters and this resulted in smoothening the way for introduction of legislative measures including the draft Bill.

The Factories Bill was introduced in the Constituent Assembly on 30-1-1948 passed by it on 28-8-1948, received the assent of the Governor General of India on 23-9-1948 and came into force from 1-41949.

Statement of Objects and Reasons :

It was stated in this part that the Factories Act 1934 revealed a number of defects and weaknesses and the provisions for safety, health and welfare were found inadequate and unsatisfactory. The large mass of workers was not covered by the Act and in view of the large and growing industrial activities in the country, radical overhauling of the Factories law was essentially called for and cannot be delayed.

It was also mentioned that "the present Act (of 1934) leaves important and complex points to the discretion of Inspectors placing heavy responsibility on them. In view of the specialised and hazardous nature of the processes employed in the factories, it is too much to expect Inspectors to possess an expert knowledge of all these matters. The detailed provisions contained in the Bill will go a long way in lightening their burden".

The Labour Minister explained in the Legislature on 30-1-1948 an admirable summary of the New Law and pointed out the broad changes that were brought about.

The Act at a glance :.

The main provisions of the Factories Act (63 of 1948) as it was standing before its major amendment in 1976, were as under :

It was containing II chapters, 120 sections and only one Schedule of List of Notifiable Diseases. Chapter wise subjects were as under :

1. Definitions of adult, adolescent, child, young person, machinery, manufacturing process, worker, factory, occupier etc.' and requirement of plans, licence and registration of a factory (workers' 10 with power and workers > 20 without power).
2. Appointment and powers of Inspectors and Certifying Surgeons.
3. Health provisions regarding cleanliness, waste disposal, ventilation and temperature, dust & fume, artificial humidification, overcrowding, lighting, drinking water, latrines &: urinals and spittoons.
4. Safety requirements of machine guarding, lifting machines, pressure plants, floors, stairs, pits, sumps, excessive weights, protection of eyes and precautions against dangerous fumes, explosive gas, dust etc., fire, building and machinery.
5. Welfare facilities of washing, clothing, sitting, first-aid, canteen, rest-room, crecheand welfare officer.

6. Working hours - 8 hrs a day, 48 hrs a week, spread over 10.5 hrs, rest interval 0.5 hr, weekly and compensatory holiday, double wages for overtime, notice of working hours, prohibition of double employment and overlapping shifts, muster roll, restrictions on women employment and exempting rules and orders.
7. Employment of young persons (15th to 18th year), child upto 14th year not allowed, certificate of fitness, medical examination, reduced working hours, muster roll etc.
8. Annual leave with wages, I day for every 20 work days, eligibility etc.
9. Special provisions to notify factories, dangerous operation, notice of accidents and diseases, power to take samples etc.
10. Penalties & procedure (maximum fine Rs. 500, enhanced Rs. 1000).
11. Supplemental i.e. appeals, returns, obligations of workers, rule making powers etc.

1.8 The Factories (Amendment) Act 1954:

The Government of India ratified the ILO Conventions No. 89 & 90 prohibiting employment of women and young persons during night in factories. Therefore sections 66, 70 and 71 of the Factories Act 1948 were to be amended. Simultaneously opportunity was taken to amend other provisions also. Therefore the Factories (Amendment) Act, 1954 (25th of 1954) came into force with following major amendments :

1. Type composing for printing was included in the definition of manufacturing process.
2. Amendment of Section 4.
3. Prohibition of women and young persons from cleaning, lubricating and machinery inmotion.
4. Encasement of machines.
5. Amendment of section 29 to prescribe clearly the safety requirements of lifting machines.
6. Allowing to work 6 hours at a stretch without any interval when the shift is of 6 hours.
7. Exempting overtime work in case a shift worker does not turn up in time.
8. Amendment of sections 66, 70 & 71 in conformity with the ILO Convention No. 89 & 90 prohibiting employment of women and Chilean during night in factories.
9. Revision of Chapter-VIII relating to leave with wages to fix 240 days attendance, to raise the limit of carried forward leaves etc.
10. Recasting of section 93 to clarify the responsibility of the owner and occupier. Few minor changes were also incorporated.

1.9 The Factories (Amendment) Act 1976:

After 1948 and 1954, industrial growth was continued and need of Safety Officer was felt to advise management in the matters of industrial safety and health. Due to so many judgements on the definition of 'worker' and tendency to not include 'contract labour' therein in want of proof of 'Master Servant relationship' and feeling need of changes in many other sections including penal section, the Factories (Amendment) Act 1976 (94 of 1976) was enacted and brought into force from 26-10—1976.

Its main amendments were :

1. Changes in the definitions of manufacturing process, worker, factory and occupier. Contract labour was included in 'worker'.

2. Approval of the plan and prior permission for the site.

3. Alterations in the provisions 'for inspector, certifying surgeons, cleanliness, disposal of waste and effluents, fencing of machinery, work on or near machinery in motion, striking gear and

devices for cutting off power, pressure plant, floors, stairs and means of access, precautions against dangerous fumes, precautions in case of fire, specifications of defective parts, safety of building and machinery, first aid appliances, creches, spread over, overtime wages, register of child workers, leave with wages, dangerous operation, notice of accidents, penalty for offences, determination of occupier in certain cases, limitation of prosecutions etc.

In above alterations the posts of Additional, Joint and Deputy Chief Inspectors of Factories were added, more conditions for cleanliness, fire escape, first-aid etc. were imposed, women strength for creche was reduced to 30, time limit of rules u/s 64 was extended to 5 years, more particulars of attendance in register and no permission to work without that was required by sections 62 (I-A) and 73 (I-A), carry forwarding of 'refused leave with wages', training and research institutes were included in section 86 for exemption purpose, the words 'manufacturing process or operation' were substituted in section 87 and requiring more welfare facilities including protective equipment and clothing under that section, time limit of one month for inquiry into fatal accident was fixed u/s 88(2), fine limit raised to Rs. 2000 from Rs. 500 u/s 92, and for enhanced penalty to Rs. 5000 from Rs. 1000 u/s 94 and provision of minimum fine in case of fatal accident and serious bodily injury (Rs. 1000 for death and Rs. 500 for serious bodily injury, these figures were doubled in case of enhanced penalty) was also made.

4. New additions were made by section 36A regarding use of portable electric light, section 40A for maintenance of building, 40B for Safety Officers, 62(1-A) and 73(1-A) for more particulars in muster roll, 88A for notice of dangerous occurrences and section 91A for safety and health surveys.

In new section 40-A power to give order to carry out measures suggested by Inspector for maintenance of buildings was given and u/s 40B Safety Officers were required for factories employing workers 1000 or more, and the State Government was empowered to notify factories for this requirement and to prescribe rules for the duties, qualifications and conditions of service of Safety Officers. These rules were prescribed in 1983. For these S. 0. Rules, 1983 see Part 8.1 of Chapter-6.

1.10 The Factories (Amendment) Act 1987:

The Bhopal accident created world-wide safety awareness and moved the governments to provide more stringent requirements for health and safety of workers and public. Therefore the Central and State Governments made necessary amendments in their Acts and Rules. A new Act 'the Environment (Protection) Act 1986' was enacted and the Factories (Amendment) Act 1987 was also enacted on 23-5-1987 providing a new chapter IV A on hazardous processes, many other requirements and severe penalties and imprisonment for breaches.

In its Statement of Objects and Reasons it was stated that -

"There has been substantial modernisation and innovation in the industrial field. Several chemical industries have come up which deal with hazardous and toxic substances. This has brought problems of industrial safety and occupational health hazards. It is therefore, necessary to amend the Act to provide specially for the safeguards against use and handling of hazardous substances and laying down emergency standards and measures. The amendments also include procedures for sitting of hazardous industries for the safety of general public. Provision has been made for workers' participation in safety management, and making the punishment stricter."

The Factories (Amendment) Bill, 1986 (Bill No. 141 of 1986) was introduced in Lok Sabha on 2-121986 and received the assent of the President on 235-1987 as the Factories (Amendment) Act 1987 (No. 20 of 1987), and published in the Gazette of India on 25-5-1987. By the Notification dated 29-10-

1987, Ministry of Labour, Govt. of India, the Act came into force from 1-12-1987 except sections 7B, 41F and the 2nd Schedule which came into force from 1-6-1988.

Its major provisions are :

1. Amendment of Section 2 adding the definitions of competent person, hazardous process and also clarifying the occupier for a firm, a company and government factories.
2. Insertions of section 7A and 7B for general duties of the occupier, manufacturers etc., section 87A giving power to prohibit employment on account of serious hazard, section 96A for penalty for breaches of section 41B, 41C and 41H, section 104A for proving limits of what is practicable etc., section 106A for jurisdiction of acourt, section IIIA for right of workers, section II 8A for restriction on disclosure of information and insertion of new Schedules I & II for the list of hazardous industries and permissible levels of certain chemicals.
3. Insertion of a new Chapter IV-A regarding hazardous processes adding section 41 A for constitution of Site Appraisal Committee, section 41 B for compulsory disclosure of information including safety policy and on-site emergency plan and disaster control measures, section 41 C for medical examination, health, records & qualified supervisors, section 41D for Government's power to appoint inquiry committee, section 41E for emergency standards, section 41F for permissible limits of toxic exposures, section 41G for worker's participation in safety management and section 41H for right of workers to warn about imminent danger.
4. Amendments of sections 4, 9 (raising the powers of inspectors), 13, 16, 18, 19, 23, 25, 28, 29, 30, 31, 32, 36A, 64, 70, 71, 80, 87, 89, 90, 91A, 92, 94, 95, 96, 97, 98, 99, 115 and 119. The remarkable amendment is the heavy increase in penalties extending upto Rs. 2 lakhs and Rs. 5000 daily fine, imprisonment upto 10 years and minimum fine of Rs 5000 in case of serious injuries and Rs. 25000 in case of death.
5. Substitutions of section 36 and 38.
6. Omission of section 100 for nomination of occupier.

Therefore, now, looking to the passing of above Act of 1987, the factory managers and occupiers must run their factories strictly according to the law to avoid dire consequences.

1.11 The Gujarat Factories (Amendment) Rules, 1995 : ,

To give effect to the Factories (Amendment) Act 1987, the Government of Gujarat published the draft of Gujarat Factories (Amendment) Rules on 28-10-1993 which became enforceable from 15-2-1995.

First time the provisions regarding competent person, work environment record, health & safety policy, safety committee, centrifugal machines, power press, shears, slitters, & guillotine machines, reaction vessels & kettles, polymerising and curing machines, thermic fluid heaters, fragile roofs, ovens & dryers, ship building, repair & breaking, hazardous chemicals & processes, disclosure of information, qualified supervisors, ambulance van, carcinogenic dye intermediates, asbestos, chemical works, solvent extraction plants, CS, plants, high noise, pottery and foundry were introduced by these rules.

Old provisions regarding ventilation &: temperature, textile machinery, pressure vessels and fire protection were enlarged with further details.

New forms No. IB, 4B, 21A, 26,27, 32, 33, & 37 added. Old 25 forms were substituted by other forms with more details.

Major provisions are as under :

1. Testing or examination of pressure vessels, lifting m/cs., structural stability, dangerous m/ cs., dangerous fumes, and exhaust system by competent persons.
2. Work environment monitoring & record in Form No. 37.
3. Details of safety policy, safety committee, application for site appraisal, test reports of pressure vessels, accident reports. Annual Reports etc.
4. Identification of major hazard chemicals, processes and plant (Rule 68J).
5. Machine wise guarding for textile machinery, power presses and shears.
6. Detailed provisions for fire protection including calculation of fire load.
7. Safety measures to control accidents in ship building, breaking & repairs.
8. Medical care and record for workers.
9. Qualified supervisors for hazardous process.
10. Detailed provisions (new schedules u/r 102) for manufacture of chemicals, electroplating, asbestos, CS, pottery, foundry, carcinogenic dyes, and solvent extraction plant.

For details see Reference No. 10 at the end-of this chapter.

2 THE ACT AND RULES AT A GLANCE

A framework of the Factories Act; 1948 (Amended up to 1987) and the Gujarat Factories Rules, 1963 (amended up to 1995) is given in Table 27.1 to understand the subject matter and inter-relation of Sections, Rules, Schedules and Forms in brief. This helps in speedy search of subjects. The latest Statute book for these provisions must be kept in each factory and with each .Safety Officer.

Table 27.1 : Framework of the Factories Act & Rules

Sec	Subject	Rule No.	Sch.	Form No.
	Chapter – 1 : Preliminary			
1	Title, extent & commencement	1		
2	Interpretation (Definitions) Hazardous processes	2, 2A	1st Sch.	4A, 26, 27
3	Reference to time	-		
4	Power to declare one or more factories	-		
5	Power to exempt during public emergency	-		
6	Drawing, licence and Registration	3 to 11, 3A to 3D	-	1, 1A
7	Notice by Occupier	12, 12A	-	2, 3A
7A	General duties of the occupier including work monitoring and health & safety policy.	12B, 12C	-	37
7B	General duties of manufactures etc.			
	Chapter - 2 : Inspecting Staff			
8	Inspectors	13		
9	Power of Inspectors	14		
10	Certifying Surgeons	15		5, 20, 27A, 30, 32, 33
	Chapter – 3 : Health			
11	Cleanliness	16, 17, 17A	Sch.	7
12	Waste disposal & Effluent.	18		
13	Ventilation & Temperature	18A	Sch.	
14	Dust & Fume	-		26 A

15	Humidification	19 to 29	Sch.	6
16	Over crowding	-		
17	Lighting	30 to 34	Sch.	
18	Drinking Water	35 to 40		
19	Latrines & Urinals	41 to 50		
20	Spittoon	51 to 53		
	Chapter -4 : Safety			
21	Fencing of Machinery	54	1 to 7	8
22	Work near moving machinery	55, 55A, 56		8
23	Work near dangerous machines	57		
24	Power cutting devices	-		
25	Self acting machines	-		
26	Casing of new machinery	-		
27	Work near cotton openers	-		
28	Hoists & lifts	58, 59	Sch.	9
29	Lifting machines, tackles etc.	60, 60 A		10
30	Revolving machinery	-		
31	Pressure plant.	61, 61A, 61B		11, 11A
32	Floors, stairs, means of access			
33	Pits, sumps, floor Opening etc.			
34	Excessive weights			
35	Protection of eyes			
36	Dangerous gas, fumes etc.			
36A	Portable electric light			
37	Explosive / inflame mable gas etc.			
38	Fire			
39	Defective parts, stability etc.			
40	Safety of building & machinery			
40A	Maintenance of building			
40B	Safety Officer			
41	Power to make rules			
	Chapter -4A : Hazardous Process			
41A	Site appraisal committee			
41B	Disclosure of information			
41C	Medical examination, records and supervisors			
41D	Inquiry committee			
41E	Emergency Standards			
41F	Permissible exposure limits			
41G	Safety committee			
41H	Imminent danger.			
	Chapter – 5 : Welfare			
42	Washing facilities			
43	Storing & drying clothing			
44	Sitting			
45	First – Aid			
46	Canteen			
47	Shelter, Rest room, Lunch room			
48	Creche			
49	Welfare Officer			

50	Power to make rules			
	Chapter – 6 : Working Hours			
51	Weekly hours			
52	Weekly holidays			
53	Compensatory holidays			
54	Daily hours			
55	Rest intervals			
56	Spread over			
57	Night shifts			
58	Overlapping shifts			
59	Wages for overtime			
60	Double employment			
61	Notice of working hours			
62	Register of adult workers			
63	Work according to notice and Register			
64	Exempting rules			
65	Exempting orders			
66	Employment of Women	91 A		
	Chapter - 7			
67	Children – not allowed			
68	Non – adult workers.			
69	Fitness certificate			
70	Effect of certificate			
71	Working hours for children			
72	Notice of working hours for children			
73	Register of child workers			
74	Work according to notice and register			
75	Medical Examination			
76	Power to make rules			
77	Employment of Children Act applicable			
	Chapter - 8 : Leave with wages			
78	Applicability			
79	Annual leave with wages			
80	Wages during leave period			
81	Advance payment			
82	Unpaid wages			
83	Power to make rules			
84	Power to exempt factories			
	Chapter – 9 : Special Provisions			
85	Power to apply the Act to certain premises			
86	Power to exempt public institutions			
87	Dangerous operations			
87A	Power to prohibit due to serious hazard			
88	Notice of accidents			
88A	Notice of dangerous occurrences			
89	Notice of diseases			
90	Inquiry for accident or disease			
91	Power to take samples			
91A	Safety & Health surveys			

	Chapter – 10 : Penalties & Procedures			
92	General penalty for offences			
93	Owner's liability in certain cases			
94	Enhanced penalty			
95	Penalty for obstructing Inspector			
96	Penalty for offence u/s 91			
96A	Penalty for offence u/s 41B, C&H			
97	Offences by workers			
98	Penalty for using false certificate of fitness			
99	Penalty for double employment of child.			
100	Omitted in 1987.			
101	Exemption of liability.			
102	Power of court to make orders			
103	Presumption as to employment			
104	Onus as to age.			
104 A	Limits of practicable etc.			
105	Cognisance of offences.			
106	Limitation of prosecutions			
106 A	Jurisdiction of a court.			
	Chapter 11 : Supplemental			
107	Appeals			
108	Display of notices			
109	Service of notices			
110	Returns			
111	Obligations of workers			
111 A	Right of workers			
112	General power to make rules			
113	Power of centre to give directions			
114	No charge for facilities etc.			
115	Publication of rules			
116	Application of Act to Govt. factories			
117	Protection to persons acting under this Act.			
118, 118 A	Not to disclose information.			
119	Effect of this Act,			
120	Repeal and savings			

3 SUBJECTS OF THE SCHEDULES

The Schedules under the Factories Act and The Gujarat Factories Rules contain exhaustive details of the provisions regarding safety and health measures. The subjects of these Schedules are mentioned in Table 27.2.

Table 27.2 : Schedules under the GFR

Sr. No.	Subject of the Schedule	The Number of			
		Sch.	Rule	Sec.	Form
1	Hazardous industries.	1^{st}	-	2 (cb)	-
2	Hazardous chemicals, TLVs & STELs	2^{nd}	-	41F	-
3	Notifiable Diseases	3^{rd}	-	89, 90	-
4	Conditional exemption of factories from painting, colour/ white washing.	Sch.	16 17	11	7
5	Dry / wet bulb temperature in room.	Sch.	18A	13	-
6	When humidification not allowed	Sch.	19	15	6
7	Exemption from minimum lighting	Sch.	34	17	-
8	Textile machinery	1	54	21	-
9	Cottong Ginning machinery	2	54	21	-
10	Wood-working machinery	3	54	21	-
11	Rubber mills	4	54	21	-
12	Centrifugal machines	5	54	21	-
13	Power presses	6	54	21	-
14	Shears, slitters and Guillotine m/c	7	54	21	-
15	Exemption to Hoists & lifts	Sch.	59	28	9
16	Excessive weights (limits)	Sch.	62	34	-
17	Protection of eyes	1, 2	63	35	-
18	Portable FEEs	1	66A	38	-
19	Equipment with Trailer pump	2	66A	38	-
20	List of Hazardous (MAH) chemicals	1	68J	41	-
21	Threshold Quantity for Isolated Storage	2	68J	41	-
22	Threshold Quantity of Hazardous (MAH) chemicals.	3	68J	41	-
23	Hazardous processes/ operations.	4	68J	41	-
24	Safety data sheet (MSDS)	5	68J	41	-
25	Notification of Major Accident.	6	68J	41	-
26	Notification of Activity / site	7	68J	41	-
27	Safety Report	8	68J	41A	-
28	Equipment in Health centre	Sch.	68J	41C	-
29	Facility for storing / drying clothing.	Sch.	69A	43	-
30	Confidential positions.	Sch.	89	64	-
31	Exemption from working hours.	Sch.	91	64	-
32	Aerated water	1	102	87	-
33	Electrolytic plating.	2	102	87	20, 27A
34	Electric accumulators	3	102	87	-
35	Glass manufacture	4	102	87	-
36	Grinding / Glazing of metals.	5	102	87	26A
37	Lead and lead compounds	6	102	87	30
38	Generation of petroleum gas	7	102	87	-
39	Air blasting	8	102	87	26A
40	Liming / Tanning of raw hides.	9	102	87	-
41	Chromic acid or bi-chromates	10	102	87	-
42	Carcinogenic Dye intermediates	11	102	87	20, 33
43	Acids or Alkalis	12	102	87	-

44	Toxic and inflammable solvents	13	102	87	-
45	Manufacturer/ use of CS_2 and H_2S	14	102	87	-
46	Dangerous pesticides	15	102	87	-
47	Water electrolysis and O_2 and H_2	16	102	87	-
48	Asbestos or its articles	17	102	87	20, 26A, 27A
49	Stone or Free silica	18	102	87	26A
50	Chemical works.	19	102	87	-
51	Benzene	20	102	87	-
52	Solvent Extraction plant	21	102	87	-
53	CS_2 plant.	22	102	87	-
54	High Noise levels	23	102	87	-
55	Gas welding of cutting	24	102	87	-
56	Pottery	25	102	87	30
57	Foundry	26	102	87	20, 26A, 27A
58	Cotton dust	27	102	87	
59	Dangerous Occurrences.	Sch.	103	88 A	21A

4 SUBJECTS OF THE FORMS

Some 46 forms have been prescribed under the Gujarat Factories Rules, 1963. To know their subjects and ease for implementation, their headlines are mentioned in Table 27.3

Table 27.3 : Forms under the GFR

Form No.	Subject	Rule No
1	Permission to construct or start a factory, to be submitted in duplicate with plans	3
1A	Stability certificate	3C
1B	Application to the site appraisal committee to be submitted in 15 copies	68-I
2	Application for Registration and licence, to be submitted to triplicate.	4
3	Application for renewal of licence, to be submitted in duplicate.	4, 7
3A	Notice of change of Manager,	12 A
4	Licence to work as a factory	5
4 A	Certificate of competency.	2A
5	Fitness certificate for young person.	15
6	Humidity Register	23
7	Record of Limewashing, Painting etc.	17
8	Register of workers attending moving machinery.	54, 55
9	Test report of hoist of lift.	58
10	Test report of lifting machines	60
11	Test report of pressure vessel	61
11A	Test report of water sealed gas holder.	61 A
12	Register of compensatory holidays	84
13	Overtime register for exempted workers.	85
14	Notice of working hours of adults	87

15	Register of adults workers	88
16	Notice of working hours for child workers	92
17	Register of child workers	93
18	Resister of leave with wages	94
19	Leave books (copy of Form No. 18) for workers	95
20	Health Register.	15, 102
21	Accident report for death or injury	103
21A	Report of dangerous occurrence not resulting in injury	103
22	Notice of poisoning or disease.	104
23	Abstract of the Act & Rules.	106
24	Annual return under the F.A. and other Acts	107
25	Half yearly return	107
26	Application for competency certificate (Person)	2A
26A	Test report of local exhaust ventilation (Dust/ Fume Extraction System).	102
27	Application for competency certificate (Institution)	2A
27A	Fitness certificate	102
29	Muster roll	110
29	Register of Accident / occurrences.	111
30	Special fitness certificate (Lead compound Sch. 6)	102
31	Inspection Books.	112
32	Health Register.	68T, 102
33	Fitness certificate (Hazardous process/ operation)	68T, 102
34	Deleted	-
35	Nomination for leave-wages	100
36	Identity card	110A
37	Format for work environment monitoring.	12B.

5 SOME ABSTRACT OF THE ACT AND RULES

Actually the structure (tables) given in the foregoing part gives also the abstract of safety, health and welfare provisions stating the subject of each section, rule, schedule and the form in one line. This is most useful to study the whole law on a particular topic at a time.

See the statutory Form No. 23 for the Abstract of the Factories Act 1948 and the Gujarat Factories Rules, 1963. This abstract is readily available and is to be displayed on the notice board in each factory. Therefore it-is not repeated here.

Most of the chapters of this book also provide relevant subject under the heading of Statutory Provisions. Thus the abstract of the Factories Act and Rules is already divided chapter wise at proper places. See the theme of each chapter to search the relevant statutory provisions.

See Part 6.3.8 of Chapter-6 and Part 2 of Chapter-? for 'Statutory requirements under the Act & rules.

Notwithstanding that a brief abstract of the provisions pertaining to Safety, Health and Welfare is given below. For full details the readers are advised to refer the Statute Book.

5.1 Safety Provisions :

Chapter 4 and 4A (sections 21 to 41H) and chapter 9 (sections 87 to 91 A) of the Factories Act 1948 and rules made there under (Rule 54 to 68Y and 102 to 104 of the Gujarat Factories Rules 1963) give provisions pertaining to industrial safety. Some major aspects are as under:

Machine Guarding : All moving parts of prime mover, flywheel, turbine, lathe, motor, generator, transmission machinery (shaft, wheel, pulley, belt, coupling etc.) should be securely fenced by guards. Only trained workers are allowed to work (test, lubricate, examine etc.) near machinery in motion and without guard. No women or young person is allowed for such work. Self acting machines (e.g. planning m/c) revolving machines, (e.g. grinding wheel, revolving basket, etc.) dangerous machines (power presses, milling m/cs, guillotine m/cs, circular saws, platen printing m/cs, hoists, lifts and lifting m/cs) and ginning, textile, wood-working and rubber-mill machines and their dangerous parts must be securely guarded and interlocked as prescribed.

Pressure Plant : Section 31 -and Rule 61, 61 A & 61B provide that all vessels operating at a pressure higher than the atmospheric pressure should be considered as "pressure vessels' and examined externally at 6 months, internally at I year and hydraulically at 2 years (4 years for vessel in continuous process) by a competent person. Safety valve, pressure reducing valve or pressure regulator, rupture disk, pressure gauge, stop valve, drain cock etc. should be provided and well maintained. Safe pressure limit shall never be exceeded. Pressure reduction or repair shall be carried out as suggested by a competent person.

Floors, Stairs, Means of Access shall be safely maintained and steps, platforms, fencing; handrails etc. shall be provided.

Pits, Sumps, Vessels, Tarik, Floor- openings etc. shall be securely covered, fenced or guarded.

Excessive weights are prescribed under rule 62 for male, female and use of hand cart No person will lift, carry or move more weight than that. Eyes, shall be protected from flying particles or excessive light as per schedule 1 & 2 under rule 63.

Precautions against dangerous fumes, gases, dust, vapour etc. are necessary. Manhole of prescribed air/gas test, safety work-permit, safety belt, size, enclosure, exhaust/venting, prevention or removal of toxic or inflammable substance etc. are prescribed.

Fire Precaution under section 38 and rules 66, 66A and 67 require measures to prevent out break of fire and its spread, safe means of escape, fire extinguishers, trained staff, hydrants, sprinklers, trailer pump etc.

Safety Officers are required for all factories employing more than 1000 workers and also by those hazardous factories notified by the Government. The Gujarat Safety Officers (duties, qualifications and conditions of service) Rules, 1983 prescribe their duties, status, qualification and need of possessing degree or diploma in Industrial Safety.

Hazardous industries are listed in the 1st Schedule of the Act, hazardous processes in 4th Schedule of Rule 68J(GFR) and hazardous chemicals in Schedules I to 3 of the Rule 68J(GFR). Provision of site appraisal committee is not implemented by many states including Gujarat. Information of hazards and control measures should be given to workers, inspectors and the public. Onsite & Offsite emergency plans, qualified supervisors, medical examinations and health records, occupational health centre, factory medical officer, ambulance van, control of permissible exposure limits (TLV & STEL) given in 2nd

Schedule are required for hazardous factories. Safety policy, safety committee and removal of imminent danger are prescribed.

Safety audit is to be carried out internally once in a year and externally once in two years. Public likely to be affected out side the site is to be informed about major accident hazard and "DOS" and "Donts" for that. Occupier has to dispose off all hazardous material on site before closure of manufacturing process and to inform the inspector (Notification dated 2-6-2006).

For workers in hazardous process pre-employment and six- monthly periodical medical examinations by a factory medical officer, report in form No: 32, 33, qualified supervisors, occupational health centre for workers more than 50 and ambulance van for workers required.. List of notifiable diseases is given in the 3rd Schedule of the Act. It should be reported in Form No. 22 u/r 104. Rule 102 requires medical examination, local exhaust ventilation, washing facilities, protective clothing, medical requisites, spacing, cloakroom, mess room, vacuum cleaning, cautionary notices, prohibition of food, drink etc. in workrooms, waste disposal method etc. under different schedules.

Notices of Accidents and Diseases are required in form No. 21 & 22. Dangerous occurrences (Fire, explosion, gas leak, collapse etc.) are also to be reported in form No. 21A.

Special provisions are prescribed for dangerous machines, reaction vessels, polymerising & curing machines,, thermic fluid heaters, fragile roofs, ovens & driers, ship building, repairing and breaking, hazardous chemicals, processes and chemical works, electroplating, carcinogenic dye-intermediates, asbestos, solvent extraction plants, CS, plants, high noise, pottery, foundry and cotton dust. Amendments of 1995 in GFR provide details thereof. (See Ref No.lO at the end).

5.2 Health Provisions :

Chapter 3 (Sections II to 20) chapter 4A (section 41C) and chapter 9 (Sections 89 to 91A) of the Act and rules made there under (Rule 16 to 53, 68R to 68X, 102 and 104 GFR) give provisions pertaining to occupational health and hygiene. Some major aspects are as under :

Factory should be kept clean, white washed, or colour washed. Doors, windows etc. shall be painted. Waste & effluents be rendered innocuous. Room temperature should be less than 30°C (80°F), air movement more than 30 mt /min, ventilating opening more than 15% of the floor area and mechanical ventilation (air changes) should be six times the workroom volume per hour. Dust & fumes should be removed by exhaust ventilation. Artificial humidification should be controlled as per the table of dry and wet bulb temperatures. No overcrowding permitted. Breath- air volume per worker should be at least 14.2 m3 with room height limited to 4.2 mt. Natural and artificial lighting is required with avoidance of glare, shadows and eye-strain. Light intensity may very from 20 to 1000 Lux depending on nature of work i.e. depth of observation required. Drinking water should be sufficient, clean and cool where more than 250 workers employed. At least one water centre for 150 workers required. Latrines, urinals and spittoons should be clean and in hygienic condition. For males and females, latrines and urinal shall be of prescribed number and dimensions. They shall be whitewashed every four months.

5.3 Welfare Provisions :

Chapter 5 (Sections 42 to 50) and rules made thereunder (69 to 83A, GFR) give provisions pertaining to welfare of workers. Some major aspects are as under:

Facilities of washing/bathing, storing & drying, clothing, sitting, first-aid, ambulance room, canteen, shelters, rest room, lunch room, creche and welfare officers are required. One first-aid box for every 150 workers, ambulance room for more than 500 workers, canteen for > 250, restroom & lunch room for > 150, creche for > 30 female workers and welfare officers for > 500 workers are required. Welfare Officers (Recruitment and Conditions of service) (Gujarat) Rules, 1963 prescribe number of welfare officers, their qualifications, duties, etc. The size and type of rooms for canteen, rest/lunch room, creche ambulance etc. are also prescribed.

For other chapters and the provisions see the full text of the Act.

6 THE CASE LAW

Before studying any law and citations on it (ie case law) it is important to know the meaning of following legal words. -

1. Law, common law and natural justice.
2. Legislation, legislative process, enactment, statute, statutory, mandatory, notification and ordinance.
3. Bill and statement of objects and reasons.
4. Act, preamble and code.
5. Sections, rules, regulations, schedules & forms.
6. Proviso, exception, exemption, explanation, not withstanding that and save as otherwise provided.
7. Penal section, fine, imprisionment, responsibility, occupier and manager.

All offences under the Factories Act and Rules fall under the category of **absolute criminal liability**, which requires no mens rea or guilty intention to be proved (AIR 1966 Mad 448 and 1964 Vol. 2 LLJ, 456). Out of many decided cases a few citations on safety and halth matters are mentioned below to highlight the case law.

6.1 Citations under the Factories Act :

1 Object of the Act is for the benefit and welfare of the labour class only. AIR 1956 Born. 219.

2 Interpretation of the Act should be liberal and beneficial AIR 1956 Born. 33, AIR 1966 Guj. 96, AIR 1965, SC 639.

3 Limitation of prosecution u/s 106 - Knowledge of offence - Date of receipt of accident report by the Inspector is not the date of knowledge of dangerous occurrence. It is the actual date of his personal knowledge. AIR 1973 SC 309.

4 Where the word 'managei, is used specifically, generally he should be taken as accused though the occupier can be selected instead of manager u/s 52, SC ruling 1965 Vol. I LLJ 419.

5 Power presses : 1965 Vol. 2 LLJ 472 where section 21- was discussed, 1966 Vol. 2 LLJ 10, 1972 LIC 949, 1966 Vol. I LLJ 280.

6. Transmission Machinery : Height above 15 feet was considered safe by position for which no fencing necessary. 1965 Vol. 2 LLJ 200. In another case height of 9 feet was considered safe for which no-under guard was necessary 1966 Vol. I LLJ 304.

7. Drill machine : Defence that the factory inspector had not pointed out or suggested for guard, it was not provided, cannot be accepted. It was an absolute duty to provide the guard. 1966 Vol. 1 LLJ 705.

8. Calendar machine : Nip guard was necessary, 1966 Vol. 2 LLJ 867.

9. Spur-gear wheel in oil mill : Defence that the guard was provided but some one else removed it, was not accepted. The words "while the machinery is in motion its dangerous parts shall be securely fenced." were sufficient to constitute the offence u/s 21(l)(iv)(c). State of Gujarat v/ s Jethalal Ghelabhai. SC ruling, 1964, Vol. I LLJ 389.

10. It is the duty of the employer who is running a factory to make every sort of protections for the safety of the employees. AIR 1966 Mad 380.

11. It cannot be said that if something goes wrong with the machinery while it is in motion and a part of it slips down, there is no obligation on the employer to protect aworkman from injury arising under such circumstances. The basic idea is that the safeguard must be in position so that the rotating or moving part of the machinery is incapable or causing any injury. 1966 Vol. I LLJ 304.

12. It is an absolute obligation under the Factories Act to securely fence dangerous parts of machinery. The statute does not say that they should be fenced only if it is commercially practicable or mechanically possible. AIR 1966 MP 324, (1966) 2LLJ 867.

13. The obligation that a dangerous machine shall be securely fenced by safeguards of substantial construction is absolute, and should be complied with regard to all parts of the machinery. (1965) 2 LLJ 472.

14. Manager/Occupier cannot escape conviction for failure in securely fencing every dangerous part of machinery unless he has satisfied all requirements of section 22 (1) of the Act. (1965) I LLJ 528.

15. Mere fact that the die was not provided with any guard by its manufacture, no effective safety guards could be provided to the die without impairing the working of the machine, cannot affect the employer's responsibility under the law to securely fence the die by safety guards of substantial construction. (196465) 26 FJR 162.

16. Section 21(1) (iv) (c) of the Act requires not only that the dangerous part of a machine shall be securely fenced by safeguards, but also that the safeguards are kept in position when the machine is working. AIR 1964 SC 779, (1964) I LLJ 389.

17. The obligation of the occupier to securely fence the dangerous parts of the machinery is absolute whether those parts may be in motion or use or not. (1962) I LLJ 607.

18. Transmission machinery must be securely fenced unless the same, by reason of its position or construction is safe to every person employed in the factory as it would be if it were securely fenced. AIR 1960 Born. 1.

19. In order to claim the benefit of proviso to section 21 (1) (iv) of the .Act for getting the occasion excluded, it is a necessary condition that on such occasion the necessary adjustment operation to the moving part of the machinery must be done by a worker specified in section 22 of the Act in the manner provided therein. (1965) I LLJ 528.

20. Where instead of complying with the statutory requirements contained in section 24 of the Act and providing the equipment indicated therein, it had been the practice in the concerned factory to effect the movement of the belt with some rod, or crude contrivance which was unsafe, the employer was guilty of negligence under the said section. (1964-65) 26 FJR 153.

21. An owner or occupier of a factory cannot plead in his favour ignorance of the law as contained in the provisions of section 28(1) (e) of the Act. He was bound to provide interlocking arrangement required., (1964) 1"LLJ 689.

22. Only two diagonally opposite chains are necessary and sufficient for working of the tackle. If fourth chain of tackle is allowed to remain in a state of disrepair, the manager of the factory does not contravene the provisions of section 29 (1) (a) (ii) of the Act. (1969) Lab I.C. 783.

23. Failure to cover a pit inside the factory having inherent danger amounts to violation of section 33 of the Act (1967) 2 LLJ 616.

24. No manufacturing process shall be carried on in any building until a certificate of stability of the building has been obtained. Failure to do this is an offence. AIR 1957 Allh. 343.

25. The defence undersection 101 of the Act will not be available to an owner of a factory unless he has proved that he had used due diligence to enforce the execution of the Act. AIR 1964 SC 779.

26. Any person found working in the factory can be taken as employed in the factory until it is proved contrary. 1964 (1) LLJ 575.

27. Failure to comply with the provision of sec. 14 is a 'continuing offence'. Prior knowledge of the offence by the Inspector is not a bar in filing a complaint subsequently (1952-53) 4 FJR 231.

    Failure to construct a dustproof husk chamber as required under section 14 is a continuing offence. AIR 1962 MP 311. Omission to securely fence fermenting vats is a continuing offence. AIR 1964 Guj. 125, (1964) 5 GLR 29. Omission to provide a canteen is a continuing offence. AIR 1957 All ere (DB). Carrying on a manufacturing process in a building in the absence of a certificate of suitability of the. building as required by the rules is also a continuing offence. AIR 1955 Born. 161 (DB.)

28. The plea of ignorance of law is not available to the accused under section 28(1) of the Act. 1964 (1) LLJ. 689.

29. Fencing and safeguard should not be such as can be disturbed and removed by a workman. 1972 Mah LJ. 279, 41 FJR 165.

30. A machinery or part thereof is dangerous if in the ordinary course of its working, danger may reasonably be anticipated from it when working without protection, taking into account the various factors incidental to its working, including the carelessness of the workman, AIR 1969 MP 110.

31. S.2 (m), 2 (k)(i) and 2(1) - Factory", meaning of - Sun cured tobacco leaves subjected to processes of moistening, stripping and packing in a company's premises with a view to their use and transport to company's main factory for manufacturing cigarettes- More than 20 persons under supervision of management working in premises - Held that the manufacturing process was carried on in premises and the persons employed Were workers and premises a factory. Lab IC 1970 S C 56A.

32. S. 2 (k)- "Manufacturing process" - Process of cleaning Water and storing and supplying it by pumping is a manufacturing process. Lab IC 1972 970F Raj.

33. Ss. 33 &2 (m) - Contravention of Section 33 in regard to a pit which is in the environments of the factory - Necessary proof. Lab IC 1972 772 Born.

34. S. 2 (k) (i) - "Manufacturing process" - Rice mill - Use of huller and sheller for converting paddy into rice and polishing it* is a manufacturing process Lab IC 1976, 1387 (Kant).

35. S. 92 - Karnataka Factories Rules. 1969 Allegation that first aid box was not maintained according to Rules - Prosecution must prove what was wanting in contents of box Lab IC 1976,538D (Kant).

36. S. 21 (1) (iv) (c) read with Bombay Factory Rules (1950), Sch. I, Chap. IV, R. 54 (2) and (3) - Compliance with safety measures is mandatory- Whether employer had foreseen casualty is totally irrelevent Lab IC 1978, 1220 Born.

37. S. 2 (m) and S. 103 - Ten workers found inside an automobile workshop during working hours - Plea that two of them were workers in a rice mill not acceptable Lab IC 1979, 159A Mad NOC.

38. S. 2(m), 92 and Rule 4, GFR-'Factory'- meaning of - Construction work - Temparory work done with aid of power at certain places do not amount to 'factory' within meaning of Section 2(m) - Prevailing nature of work to be taken into account- Contract between company and contractor regarding work and labour manufacture of certain materials on same premises - Temporary use for manufacturing such articles with aid of power will not include premises in the term factory. FLR 1980(41)75, Gujarat.

39. S. 2(g), 2(k), 2(m) - Manufacturing processMeaning of-lroning of stitched clothes with the aid of power by tailoring firms, held, is an integral part of manufacturing process LLN 1985 Vol-ll 101.

40. S. 21(l)(iv)(c) & 92- Injury to worker due to alleged failure to securely fence dangerous part of machinery- Evidence of Factory Inspector silent on vital point- In the circumstances order of conviction of appellant- manager set aside LLN 1986 Vol 1 332.

41. S. 2(k) - Petrol pump service station carrying on business of sale of petrol, diesel, lubricants etc. and servicing of vehicles is a manufacturing process LLN 1987 Vol 1 912.

42. S 2(k)- Dairy farm- filling of milk pots for distribution- Also electric pump used for lifting water in farm- Held, manufacturing process 1987 Vol II 704.

43. S.2(l) - Effect of addition of words "including a contractor".

The effect of including the said words in the definition of "worker" is that even a worker engaged through a contractor and working in a factory falls within the definition of worker for the purposes of Factories Act. This was done evidently with a view to ensure that the benefits of the several regulatory and welfare measures provided by the Act extends to such contract labour also.

Govt. of A.P. vs. Bhadrachalam Paper Boards Ltd., 1990 (60) FLR 517 (A.P. - D.B.).

44. Workers-Staff engaged in the clerical work in the factory premises- Whether 'workers' within the meaning of section 2(1) of the Act? Yes. State (By Inspector of Factories, Guddalore) vs. A.K. GangllU, 1993 LLR 701 = 1993(67) FLR 627 = 1993 II CLR 57 = 1993 I LLN 791 (Mad. HC).

45. Conviction and sentence of respondent on his pleading of offence under section 92 providing minimum sentence of fine not less than 25000Trial court imposed fine of Rs. 200 onlyWhether order is illegal and perverse? Yes.

State of Glljarat vs. B.S. "niakkar, Manager, Diguijay Cement Co. Ltd., 1993 LLR 843 = 1993 (67) FLR 1134 (Guj. HC). See also 1991 (1) 32 (1) GLR71 and 1992 II GLR 229 for State of Gujarat v/s Dr. CK Patel

46. The period of limitation for prosecution in contravening provisions of the Factory Act will be computed from the date of inspection and disclosure of offence.

State of Gujarat vs MIT & MIR Pvt. Ltd. Surat, ,1994 LLR 116 (Guj. HC)

47. Appointment of certain number of safety officers in a factory having chemical plant and blast furnace is a statutory obligation on the part of the employer.

Tata Iron and Steel Co. Ltd. vs Inspector of Factories, Jamshedpur Circle No. I, Jamshedpur and .Others, 1995 LLR 684=1995 II LLN 474 (Pat. HC).

48. Employees of administrative accounts section of a factory will be eligible for overtime.

Chief General Manager, Telecom Factory, Bombay & Ors. vs. All India Telecom Engg. Employees Union & Ors., 1996 LLR 333 (Born. HC).

49. In the event of conflict between the provisions of standing orders and Factories Act, the latter will prevail.

Maharashtra General Kamgar Union vs. Bharat Petroleum Corp. Ltd. & Ors., 1996 LLR 900 (Born. HC).

50. Failure to provide safety electrical devices (earthing, rubber gloves, shoes etc.) resulting into death of a casual worker will make the employer liable for prosecution and fine. The High Court converted the order of acquittal into a fine of Rs. 50000 (in default, impris.onment for 3 months) each to the manager and occupier, accused, and directed to pay Rs. 50000 to the legal representatives of the deceased worker u/s 357(4) of the Cr. P. C.

State of Karnataka vs. M. Siddappaq & Amr., 1997 LLR 411 (Karn. HC).

51. Factories Act, 1948 - S.2 (n) - Occupier in case of a company.

Occupier in case of a company must be one of the Directors. As such relief claiming appointment of a person other than a Director as an occupier cannot be granted.

Tata Oil Mills Co. Ltd. vs. State of U.P., 1997 (2) LLN 681 (All- D.B.).

52. Factories Act, 1948-S.92 read with Rule 61(1)(c)(i) – Punishment for breach of safety measures.

Respondent runs a factory and the Factory Inspector found that the plant was not fitted with necessary safely valve in contravention of the aforesaid statutory provisions. On a complaint. Metropolitan Magistrate fined him Rs. 500/- on his pleading guilty. Hence this appeal for enhancement of sentence.

Held: Factory owner guilty of contravention of safety measures has to be dealt with severally and seriously even on his pleading guilty to the charge. The workmen exposed to such unsafe working conditions in such factories can be said to be their exploitation by owner of such factories. The sentence of fine of Rs.500/- is enhanced to Rs. 5000/-.

State of Gujarat vs. Sandeep Bhandari 1997 I CLR 1048 (Guj. H.C.).

53 Factories Act, 1948- S.92- Karnataka Factories Rules, 1969- Rule 86- Statutory duty not compiled with.

This is an appeal against an order of acquittal of respondent accused for an offence under S.92 of the Act for contravention of Rule 86. Facts are that worker in the factory of the respondent received electrical shock and died on the spot. It is held that there was sufficient and clinching evidence on record to show that the accused did not provide for rubber gloves and rubber shoes to deceased worker and further that electric installations were not properly maintained by the accused, there was no justification on the part of Magistrate to hold accused not guilty.

State of Karnataka v. M. siddappa 1997 I CLR 705 (Kam.H.C.).

54 How it should be interpreted.

The Act is meant to provide protection to the workers from being exploited by greedy business establishments and it also provides for the improvement of working conditions within the factory premises. Hence a beneficial construction should be given and the provisions of the Act should be so constructed/interpreted so as to achieve its objects i.e., welfare of the workers and their protection from exploitation and unhygienic working conditions in the factory premises. It is also a cardinal principle of interpretation to give effect to the plain, fair and ordinary meaning to the words if such interpretation is not opposed to the intention of the legislature.

Ravi Shankar Sharma vs. State of Rajasthan 1993 L.LC. 987 (Raj. H.C.).

55 S.2(m) - & 2(k)(i) - Stone crashing unit is a factory.

As per the definition of "manufacturing process" as .given in the Act, there can be no doubt that breaking of boulders into chips would be a manufacturing process. For this purpose coming into existence of a new product is not necessary. If that be so, the premises where ten or more persons are working and the operation is carried on with the aid of power has to be regarded as a factory.

M/s. Larsen & Toubro Ltd. vs. State of Orissa 1992 LIC 1513 (On. - D.B.).

56 S.21(l)(i)(iv)(c) and S.92 - Enhancement of sentence.

This criminal appeal is filed for enhancement of sentence of fine of Rs.2000/for an offence punishable under S.92 qf the Factories Act, 1948. It is unfortunate and shocking that the Magistrate failed to note the minimum sentence of fine of Rs.5000/- for the offence. He was even not conscious of the object underlying the beneficial piece of legislation viz. Factories Act, 1948. Such gross defiance of law, prima facie, is serious dereliction of duty and unbecoming on the part of any learned Magistrate. The sentence of fine is enhanced to Rs.5000/-. Action is directed against the Magistrate.

State of Gujarat vs. Ishwarbhai Harkflabhai Patel 1994 II CLR 721(Giij. H.C.).

57 S.36 - (as it stood before its amendment by Act 20 of 1987) - Interpretation of sub-section (5) of S.36 -

There is no absolute duty cast on employer to prevent entry - Burden is on prosecution to prove that employer had not taken all reasonable steps for preventing entry and not on employer to prove that he had taken all reasonable steps. If necessary instructions are issued by employer and worker acts in contravention of those instructions, employer cannot be held responsible for violation of S.36(5).

State of Gujarat vs. Dilipkumar Dahyabhai Patel & Anr. 1995 II CLR 497 (Guj H.C.).

58 S.40-B and W.B. Factories, (Safety Officers) Rules, 1978 - Rule 3(b) - Appointment - Compliance of two pre-conditions

The petitioner, who was appointed as safety officer, challenges, termination of his service to be against the provisions of the Rules.

High Court has not accepted the challenge observing as follows :

Appointment of safety officers, is mandatory on existence of two conditions : (i) wherein 1000 or more workers are ordinarily employed and the State Government issues notification requiring the occupier to appoint safety officer or officers and (ii) wherein the State Government is of opinion wherein manufacturing process is carried which involves risk etc. and issuance of notification in above manner. Issuance of notification is a indispensable condition for employment of safety officers in terms of S.40-B of the Factories Act. In the instant case no such notification was issued. Thus the mandatory requirement of S.40-B cannot be said to have been fulfilled to make employment of the petitioner as Safety Officer within the meaning of clause 3(b) of the Rules of 1978. The termination was thus not violative of the Rules.

Debesh Kumar Bhattacharya vs. Rishra Steel Ltd. & Ors. 1994 II CLR 944 (CaL H.C.).

59 S.41-A - Safety precautions in handling chemicals.

The Union of employees filed writ petition to direct Chief Inspector of Factories to enforce safety precautions in the factory. Inspector of Factories had given certain directions to the management of the factory and thereafter he again visited the factory and submitted report. High Court considered the same and accepted the report and dismissed writ petition. The Union filed this appeal against said order. In appeal it is observed that new complaints regarding atmosphere pollution and provision of insurance cover to employees cannot be entertained as they are not the grievances in the main writ petition.

Addision Paints and Chemicals Ltd. vs. Chief Inspector of Factories 1993 II L.L.N. 728 (Mad.D.B.).

60 Ss82 and 106 - Magistrate dismissing complaint made by Inspector under S.92 on preliminary contention that it was filed beyond period of limitation of three months as prescribed under S.106. In fact complaint was filed within three months of the date on which commission of offence came to knowledge of Inspector - Matter remanded - Practice of disposing of cases on grounds such as (i)complainant absent, (ii) no witnesses examined, or (iii) accused pleading guilty, deprecated.

State ofGujarat vs. Mit and Mir Private Ltd., Swat 1994-1 CLR 149 (Guj. H.C.).

61 S.92 - Karnataka Factor Rules, 1969 - Rules 84 and 88 - Negligent shunting of carriages Occupier not responsible.

Accident took place in Railway Workshop due to negligent shunting of carriages. Occupier is prosecuted for contravention of Rules 84 and 88. He filed this petition praying for quashing of proceedings against him.

Held : Rule 84 prohibits any process of work which is likely to cause risk of bodily injury to be carried on in the factory. It is not complainant's case that the work of shunting which was done within the factory premises was likely to cause risk of bodily injury. Rule 84 is therefore not affected. If due to negligence in carrying out a work which is permissible, an accident takes place, the occupier cannot be held responsible for contravention of Rule 84. So far as Rule 88 is concerned, if bodily injury is caused to a worker not on account of any inherent defect in the construction, situation, operation or maintenance of the means of transport, but on account of negligence of another employee, then it cannot be said that there -is any contravention of Rule 88.

Proceeding of prosecution against petitioner occupier is quashed.

Ramchandra vs. A.R. Vijendra 1994 II CLR 946 (Kar. H.C.).

62 S.92 - Proviso - Minimum sentence is prescribed.

The accused pleaded guilty for having committed offence under S.29(l)(a) and S.29(l)(b) of the Act and was awarded fine of RS.IOO/-. Proviso to S.92 provides that the fine shall not be less than RS.IOOO/-. Merely because the accused pleaded guilty is no reason to award punishment lesser than the minimum.

State of Gujarat vs. Mahavir Prasad Jain 1992 I CLR 863 (Guj. H.C.).

63 Ss.92, 52, 2(m)(ii) and 6 - Opportunity of hearing to find if establishment is a factory.

Prosecution is lodged against the petitioner as failed to comply with the provisions of the Act and Rules. In a challenge against the same, it is urged that before filing the complaint opportunity for hearing should have been given to the petitioner.

Rejecting the submission, it is observed that there is no provision under the Act that before launching prosecution, there should be first determination of the fact whether the establishment is a factory or not. This is a question of fact which can be gone into only during the course of hearing.

Prabhu dayal Gupta vs. State of Bihar 1993 (66) F.L.R. 398 (Pat. H.C.).

64 S.92 and Gujarat Factories Rules - Rule IIO-A Not providing identity cards is serious breach.

Offence of not providing identity cards to workers under S.92 read with Rule IIO-A is not trivial or technical but is grave and serious. For such an offence fine of Rs.20/- is not only unduly lenient and manifestly unjust but is quite ridiculous and travesty of justice. In the circumstances, sentence is enhanced to fine of Rs.l020/-.

State of Gujarat vs. Lallubimi T1iakorb1im Desai 1994 I CLR 610 (Guj. H.C:). S.94 - Plea of guilty not proper.

65 Accused repeated the offence under S.92 of the Act within span of two years. Under S.94 for such repeated offence, the punishment of fine is not less than RS.IOOOO/-. Accused pleaded guilty but in the said plea, the element of defence and justification for wrong doing were incorporated. Such a plea cannot be acted upon. Proceeding remanded.

State of Gujarat vs. Dineshchandra Hirabhai Patel 1993 II CLR 607 (Guj. H.C.).

66 S..94 - Plea of guilty.

The accused gave a plea of guilty in writing wherein he cleverly put some more facts either by way explaining away or justifying the alleged wrong committed by him. Such a plea cannot be said to be plea of guilty at all. Proceeding remanded.

State of Gujarat vs. Harishbhai Veljibhai Tilakkar 1994 II L.L.N. 342 (Guj. H.C.).

67 S.94 - Repeated offences - Judicial Magistrate F.C. has no jurisdiction.

S.94 provides a higher punishment viz. 3 years imprisonment and fine which shall not be less than RS. 10000/- when the offence is repeated. The Judicial Magistrate F.C. cannot impose such sentence and as such he has no jurisdiction to try the said offence. Chief Judicial magistrate is required to try the same.

State of Gujarat vs. Harishbhai Veljibhai TJlakkar 1994 II L.L.N. 342 (Guj. H.C.).

68 High court or Supreme court will not quash FIR lodged by the Factory inspector. S.M. Datta v. State of Gujarat & Anr., 2001 LLR 1076 (SC).

69 An occupier of a factory owned by Government need not be Director of the company. Container Corporation of India Ltd. V. Lt. Governor, Delhi & Ors., 2002 LLR 1068: 2002 LIC 2649: 2002-111 LLJ 447 (Del. HC).

6.2 Section wise Citations :

6.3 SC Judgement on 'Asbestosis' :

Consumer Education & Research Centre & Others v/s. Union of India & Others

The Consumer Education Research Centre filed a writ petition before the Supreme Court under Article 32 of the Constitution by way of public interest litigation highlighting the occupational health hazards and diseases to which the workmen employed in mines and asbestos industries are prone to and seeking remedial measures for the protection of the health of the workers.

ILO Convention 162 was the base of this petition. After going through it and other discussions, the Court held as under -

All the industries are directed :

1. To maintain and keep health record of every worker up to 40 years from the beginning of the employment or 15 years after retirement or cessation whichever is later;
2. The Membrane Filter test, to detect asbestos fibre should be adopted by all the factories or establishments at par with the Metalliferrous Mines Regulations, 1961; and Vienna Convention and Rules issued thereunder;
3. All the factories whether covered by the Employees State Insurance Act or Workmen's Compensation Act or otherwise are directed to compulsorily insure health coverage to every worker;

4. The Union and the State Governments are directed to review the standards of permissible exposure limit value of fibre/ or in tune with the international standards reducing the permissible content as prayed -in the writ petition referred to at the beginning. The review shall be continued after every 10 years and also as an when the ILO gives directions in this behalf consistent with its recommendations or any Conventions;
5. The Union and all the State Governments are directed to consider inclusion of such of those small scale factory or factories or industries to protect health hazards of the workers engaged in the manufacture of asbestos or its ancillary products;
6. The appropriate Inspector of Factories in particular of the State of Gujarat, is directed to send all the workers, examined by the concerned ESI hospital, for re-examination by the National Institute of Occupational Health to detect whether all or any of them are suffering from asbestosis. In case of the positive finding that all or any of them are suffering from the occupational health hazards, each such worker shall be entitled to compensation of a sum of rupees one lakh payable by the concerned factory or industry or establishment within a period of three months from the date of certification by the NIOH.

6.4 SC Judgement on 'Occupier' :

Section 2(n) of the Factories Act was amended in 1987 making any one of the directors of a company to be the occupier. This was appealed in many High Courts and ultimately in the Supreme Court, which gave its judgement on 25-9-1996 in J.K. Industries Ltd. v/s Chief Inspector of Factories and Boilers and Ors., etc. The SC held as under (1996 II CLR 832 and 1996 LLR 961).

1. Factories Act, 1948 - S.2(n). Proviso (ii) - Appellant is a company and runs a factory Whether appellant has to nominate one of the Directors as 'Occupier' or that the company can nominate an other employee as occupier by passing resolution that he will have ultimate control over the affairs of the factory - Held that an occupier of the factory in the case of a company must necessarily be any one of its directors who shall be so notified for the purpose of the Factories Act and that such occupier cannot be any other employee of the company or the factory.
2. S.2(n), Proviso (ii) - As amended by amending Act of 1987 - Whether constitutionally valid Held that the provision is constitutionally valid and is not ultra virus Articles 14, 19(l)(g) and 21 of the Constitution of India.
3. S.2(n) and its proviso (ii) - Whether proviso, detracts from the generality of the main provision - Held that the legislature by providing deeming fiction under proviso (ii) did not detract from the generality of the main provision under S.2(n), but only clarified it.
4. S.2(n) - Meaning of word 'ultimate' appearing therein - Distinction between ultimate control and immediate control - Held that in the case of a company, the ultimate control of the factory always vests in the company, through its Board, of Directors while the Manager or any other employee, of whatever status, can be nominated by the Board of Directors of the owner company to have immediate or day to day or even supervisory control over the affairs of the factory.
5. Ss. 92 and 101 - Third party procedure Safeguards when an occupier is prosecuted Held that an adequate safeguard has been provided under S.I 01, under which for the circumstances mentioned therein, the occupier or manager can absolve himself from the liability if he can establish to the satisfaction of the Court that he is not the real offender but it is the other person charged by him deserves to be punished and that he had been diligent and further that the offence was not committed with his knowledge, consent or connivance.

6.5 SC Judgement - Shriram's Case :

Two judgements were delivered by the Supreme Court (P.N. Bhagwati CJ, D P Madon &GL Oza JJ) in a public interest litigation filed by M C Mehta and another. Petitioner vs. Union of India and others, Respondents and have been reported in (1) AIR 1987 SC 965 and (2) AIR 1987 SC 982. They were also reproduced in the 'Industrial Safety Chronicle' issues of (D.Jul-Sep 1986 and (2) Oct-Dec 1987.

In the First Judgement dated 17-2-1986, eleven stringent conditions were specified by the Court to allow restarting of the plant after oleum leakage from the Shriram Foods and Fertiliser Industries, New Delhi, on 4'h December 1985. This leakage affected a large number of persons both amongst the workmen and the public and according to the petitioner, one advocate died due to inhalation of oleum gas. The prohibiting orders under the Factories Act, safety measures suggested by number of Expert Committees (Manmohan Singh Committee, Nilay Choudhary Committee, Agarwal Committee etc.), inherent hazard or risk in hazardous industries, their need for progress, development and advancement of well being of the people, the interests of the workmen and the community in vicinity to protect their health and safety, effect of closure on @4000 workmen resulting in their unemployment, need of chlorine for Delhi Water Supply undertaking, responsibilities of the occupier and officers and compliance of most of the suggestions, by the factory were considered by the Court and it was held that

1. The management shall fulfil the II conditions set out in Para 20 of the judgement and mentioned below.
2. To pay to the petitioner a sum of RS.IOOOO/- by Shriram as a token of appreciation as well as the cost.

The conditions imposed by the SC in this judgement were:

1. Deposit of Rs.30000/- in the Court to meet the expenses of the members of the expert committee.
2. One operator personally responsible for each safety device.
3. Weekly inspection by the Factory Inspector of safety devices and reporting to the Court.
4. Weekly inspection by the CPCB under the Water Act and Air Act of the effluent and particulate matter and reporting to the Court.
5. Filing of undertaking within 1 week by the management that the officer(s) will be personally responsible for payment of compensation for death or injury in case of future escape of chlorine gas.
6. A committee of 3 Union representatives to look after safety arrangements in the caustic chlorine plant. Necessary training to them within 2 weeks after their nomination.
7. A chart in English and Hindi in each department and at the gate stating the effects of chlorine on human body and treatment measures if affected by the leakage.
8. Training and 6 weekly refresher courses for every worker in the caustic chlorine plant regarding safety precautions for chlorine.
9. Loud speakers all around the factory premises to give timely warning and instructions to the people in vicinity in case of leakage of chlorine gas..
10. Personal protective equipment to the workers and their regular medical check-up.
11. Deposit of Rs.20 lakh in the Court for compensation claims made by or on behalf of the victims of the oleum gas. Furnishing of the bank guarantee for Rs.l5 lakh within 2 weeks.

In the Second Judgement on application by the Shriram Industry to clarify (rather modify) the condition No. 2, 5 and 6 stated above, the Court went through the difficulties contended by the management, and the Court in its judgement dated 10-3-198 modified some of them and held that

1. The permission granted by the Court is subject to the conditions set out in its Order dated l"/ 2-1986 as modified by this Order dated 10- 1986.

2. The measure of compensation in such case (harm caused by the hazardous activity) must be proportionate to the magnitude and capacity of the enterprise to have a deterrent effect. The larger and more prosperous the enterprise, greater must be the amount of such compensation.

6.6 SC Judgement on Radiation Protection :

This judgement was reproduced in October December 1987 issue of Industrial Safety Chronicle of NSC, Mumbai.

In Writ Petition (Civil) No. 761 of 1986 dated 29-4-1987, M K Sharma & others. Petitioners vs. Bharat Electronics Ltd. & others. Respondents, the Supreme Court considered the claim for compensation by workmen on the ground of effects directly flowing out of employment, whether there may be a direct proof or not, and held the desirability of insurance of concerned officers and workmen against the effects of atomic radiation, at the cost of employer.

The Court also directed to send to the petitioner union at reasonable intervals the results of film badge radiation absorption and to maintain the protective lead-shields and bi-annual checks of safety devices by the competent authority.

6.7 TISCO Case of Imprisonment :

Judicial Magistrate First Class Shri Brajeshchandra Za, delivered a strong judgement on 4-10-1999, for breach of Rule 55 A (2&3) of the Bihar Factories Rules, ordering the occupier Shri J. J. Irani and the manager Shri P.N. Roy, both, to undergo imprisonment of two years and. to pay Rs. One lakh as fine (six months more in default of fine). The accused have appealed in the High Court, it is reported.

In TISCO (TATA) factory at Jamshedpur, Bihar, an accident took place on 14-3-1991 at 12 noon in SH Section-3 wherein a worker named Sagar Sinku died on the spot. Factory Inspector Shri Shashibhushan investigated the accident and found that in an open railway wagon (gandola) when ingots were put, scrap was not removed and during movement the heavy scrap was falling and lying on the rail track. Before driving the loco-engine, instability of the heavy material was not checked. Rail-track was also not checked. Therefore while driving, the. wheels were jumped and the loose scrap including an 8 tonne article came out and fell on the worker who died. It was also found that the wagon shutters were not closed and instead of a trained driver, B-grade jamadar was driving the engine. Defence advocates told that the company is giving every thing for safety, accident happened due to human error and there is no fault of the company. The court observed that two witnesses - Sayeed Shaukat ali and Satyanarayan had put the article in the wagon, but the company failed in supervising that the article was put properly and safely or not. Court also criticized the driving by shunting jamadar. (Abstract from 'SalamatT, Vadodara, May-2000 issue).

7 ROLE OF THE ILO FOR SAFETY, HEALTH AND WELFARE

7.1 Introduction :

International Labour Organisation Was established in 1919 with its headquarters in Geneva. It has about 155 member countries and offices and experts in many countries. The opening words of its constitution 'Universal and lasting peace can be established only if it is based on is social justice' indicate its main object. The protection of the worker against 'sickness, disease and injury arising out of his employment' is also one of the essential tasks of the ILO.

Standard-setting is the ILO's oldest activity and it remains its fundamental task. Between 1919 and 2006, the ILO adopted 186 conventions and 195 recommendations. Out of these about 83 Conventions and 85 Recommendations relate directly or indirectly to safety, health and working environment. The ILO has published over 250 studies and publications dealing with safety and health.

It carries out technical co-operation, international supervision, ensuring effective application, labour inspection, occupational health services, meetings, symposia, activities in the field of ergonomics, expert consultancy service, employment injury statistics, vocational rehabilitation. International Occupational Safety and Health Hazard Alert System and International Occupational Safety and Health Information Centre (CIS) for regular ILO publication and computerised data etc. See Part 7.2.3 of Chapter6 for ILO activities.

The last Encyclopaedia of Occupational Health and Safety (Fourth revised edition in 1998) contains four volumes. These volumes are the best guide on many matters of health and safety.

Preparation of international standards for the protection of workers' health is its main aim. Such standards, in the form of Conventions and prevention, labour inspection, occupational health and diseases, maximum weight, electrical accidents etc.

Another major sector of ILO's work consists in the provision of expert advice and technical assistance in matters connected with labour and social policy. Assistance is provided under the United Nations programmes of technical cooperation as well as under the ILO's regular budget. Much of this operational work lies in the fields of manpower training and utilisation, improvement of work methods and organisation, labour administration and the development of effective systems of industrial relations and social security.

These activities are organised by the International Labour Office, and international staff in Geneva with a field network in most parts of the world. The Office is also the permanent secretariat of the Organisation and a clearing house for international information and research. It is headed by a Director General appointed by a Governing Body of 24 government representatives, 12 representatives of management and 12 representatives of labour, which meets three times a year.

In addition to the above activities, matters of concern to particular region and industries are discussed periodically by special conferences and committees. Many specialised technical meetings are organised. An International Institute of Labour Studies, set up by the Organisation at Geneva, provides persons occupying positions of responsibility in the different countries with opportunities for advance study of labour policy questions.

The main activities of the ILO in the field of safety, health and welfare can be broadly classified as under:

1. Conventions and Recommendations.
2. Standards and Codes of Practice.
3. Exchange of technical information & Research.
4. Technical co-operation activities.

They are explained in brief below :

7.2 Conventions and Recommendations:

Since its inception in 1919, the ILO has adopted over 300 international instruments - Conventions and Recommendations. A Convention is a legal document regulating some aspects of labour administration, social welfare or human rights. A Convention creates binding obligations by virtue of its ratification by the member- country concerned. A Recommendation is complementary to a Convention except-that it is not subject to ratification. The very first Convention of the ILO, adopted in 1919, was on working hours in industry, the one, adopted in 1990, is on chemical safety and one adapted in 1993 is on major Industrial Accidents. It reflects the current practices and

These international agreements (Conventions) and recommendations relate to basic rights of labour, employment and training, conditions of work, social security and protection at work and are the result of detailed discussion at the annual International Labour Conference, comprising four delegates (two representing Government, one representing management and one representing labour) from each member country, speaking and voting individually. The .Conventions and Recommendations are not automatically binding, but governments must submit them to their national legislatures. Reports from the different governments on their implementation are examined annually by the Conference and there is also machinery for examination of complaints, including alleged violation of freedom of association.

Though due to socio - economic conditions in the country and the prevailing situation it has not been possible for our country to ratify all of these Conventions. Most of the requirements are met to some extent in organised sectors of our industries such as some big factories, mines and docks.

Some ILO Conventions and Recommendation pertaining to Safety Health and Environment are give: in Table 27.5.

Table 27.5 : ILO Conventions & Recommendations

Subject	Convention No. and Year	Recommendation No. and Year.
Workmen's Compensation	12 (1921) 17, 18 19 (1925) 42, (1934)	22, 23, 24, 25 (1925)
Anthrax Prevention	-	3 (1919)
Lead Poisoning	-	4 (1919)
White Lead (Painting)	13 (1921)	
White phosphorous	-	6 (1919)
Medical Examination	16 (1921), 73, 77, 78 (1946), 113 (1959), 124 (1965)	79 (1946)
Medical Advice	-	106 (1958)
Sickness Insurance	25 (1927), 56 (1936)	29 (1927)
Protection of worker's health	-	97 (1953)
Marking of weight	27 (1929)	
Protection against Accidents	28 (1929), 32 (1932)	33, 34 (1929) 40 (1932)
Sheet Glass works	43 (1934)	
Underground work (women)	45 (1935)	
Safety Provisions (Buildings)	62 (1937) Construction 167 (1988)	53 to56 (1937) 175 (1988)
Labour Inspection	81 (1947) 129 (1969)	5 (1919), 20 (1923), 28 (1926), 81, 82 (1947), 133 (1969)
Labour Standards	83 (1947)	
Labour Inspectorates	85 (1947)	59 (1939)
Radiation protection	115 (1960)	114 (1960)
Power – driven machinery	-	32 (1929)
Guarding of machinery	119 (1963)	118 (1963)
Hygiene (Commerce & Officer)	120 (1964)	120 (1964)

Employment Injury Benefits	121 (1964)	121 (1964)
Maximum weight	127 (1967)	128 (1967)
Medical Care & sickness Benefits	130 (1969)	69 (1944), 76 (1946), 134 (1969)
Prevention of Accidents	134 (1970)	31 (1929), 142 (1970)
Benzene	136 (1971)	144 (1971)
Occupational Cancer	139 (1974)	147 (1974), 194 (2002) list of occupational diseases
Working Environment (Air pollution, Noise & Vibration)	148 (1977)	156 (1977)
Labour Administration	150 (1978)	158 (1978)
Occupational safety & Health	152 (1979), 155 (1981) 161 (1985)	112 (1959), 164 (1981), 160 (1979) 171 (1985)
Labour Statistics	160 (1985)	

ILO Conventions ratified by India are give in Table 27.6

Table. 27.6 : ILO Conventions Ratified by India

Sr. No.	No. and Title of Convention	Date of Registration of Ratification
1	No. 1 Hours of work (Industry) Convention 1991.	14-7-1921
2	No. 2 Unemployment Convention, 1919.	14-7-1921 denounced on 16-4-1938
3	No. 4 Night Work (Women) Convention, 1919	14-7-1921
4	No. 5 Minimum Age (Industry) Convention, 1919.	9-9-1955
5	No 6 Night Work of Young Persons (Industry) Convention 1919	14-7-1921
6	No. 11 Right of Association (Agriculture), Convention, 921	11-5-1923
7	No. 14 Weekly Rest (Industry) convention, 1921	11-5-1923
8	No. 15, Minimum Age (Trimmers and Stokers) Convention, 1921	20-11-1922
9	No. 16 Medical Examination of Young Persons (Sea) Convention 1921.	20-11-1922
10	No. 18 Workmen's Compensation (Occupational Diseases) Convention 1925	30-9-1927
11	No. 19 Equality of Treatment (Accident Compensation) Convention 1925.	30-9-1927
12	No. 21 Inspection of Emigrants Convention, 1926	14-1-1928
13	No. 22 Seamen's Articles of Agreement Convention, 1926	31-10-1932
14	No. 26 Minimum wage-fixing Machinery Convention, 1928	10-1-1955
15	No. 27 Marking of weight (Packages transported by vessels) Convention, 1929.	7-9-1931
16	No. 29, Forced labour convention, 1930	30-11-1954
17	No. 32 Protection against Accidents (Dockers) Convention (Revised) 1932.	10-2-1947
18	No. 41 Night work (Women) Convention (Revised)	22-11-1935 denounced on

	1934.	27-02-1950
19	No. 42, Workmen's Compensation (Occupational Diseases) Convention (revised), 1934.	13-1-1964
20	No. 45 Underground work (Women) convention. 1935	25-3-1938
21	No. 80 Final Articles Revision convention, 1946.	17-11-1947
22	No. 81, Labour Inspection Convention, 1947.	7-4-1949
23	No. 88, Employment service convention, 1948.	24-6-1959
24	No. 89, Night work (Women) Convention (Revised) 1948.	27-2-1950
25	No. 90 Night work of Young Persons (Industry) Convention (Revised), 1948.	27-2-1950
26	No. 100 Equal Remuneration Convention, 1951.	25-9-1958
27	No. 105, Abolition of Forced Labour Convention, 1957	18-5-2000
28	No. 107, Indigenous and Tribal populations Convention, 1957	2-9-1958
29	No. 108, Seafarers' Identify documents Convention 1958.	17-1-2005
30	No. 111, Discrimination (Employment and Occupation) Convention, 1958.	3-6-1960
31	No. 115, Radiation protection, Convention, 1960.	17-11-1975
32	No. 116, Final Articles Revision Convention, 1961.	21-6-1962
33	No. 118, Equality of Treatment (Social security) convention 1962.	19-8-1964
34	No. 122 employment of policy Convention, 1964	17-11-1998
35	No. 123, Minimum Age (Underground work) Convention, 1965.	20-3-1975
36	No. 136 Benzene Convention, 1971	11-6-1991
37	No. 141, Rural Workers Organisations Convention, 1975.	18-8-1977
38	No. 144, Tripartite Consultation (International) Labour Standards) Convention, 1976.	27-2-1978
39	No. 147, Merchant shipping (Mini. Std) Convention, 1976	26-9-1996
40	No. 160 Labour statistics convention, 1985	1-4-1992
41	Protocol of 1990 to Night Work (Women) Convention, (Revised0 1948	21-11-2003

Details of above conventions and recommendations are available on http:// www.ilo.org/ilolex/cgi-lex/convde.

A brief note of some conventions and recommendation is given below. For details the full text should be referred.

(1) Occupational Safety and Health (Conv. 155 and Recom. 164 of 1951) :

This convention was adopted on 22-6-1982 and includes -

1. Scope and Definition regarding branches of economic activity, workers, workplace, regulations and health.

2. Principles of National Policy concerning SHE to prevent accidents and injury. It should include safety of workplaces, working environment, tools, machinery, equipment, work processes and chemical, physical and biological agents, training, communication and cooperation, respective functions and responsibilities.

3. Action at the National level requiring formulation and enforcement of laws and regulations, guidance to employers and workers, functions of authorities, designers and manufacturers, imminent danger, education and training.

4. Action at the level of Undertaking regarding safety of workplaces, machinery, processes etc,-control measures including PP"E, emergency plans, obligations of workers, safety training, reporting of imminent danger and co-operation.

5. Final provisions requiring ratification, denunciation after 10 years etc.

Supplementing above convention, the Recommendation adopted on 22-6-1981 includes -

1. Scope and Definitions of branches of economic activity, workers, workplace, regulation and health.

2. Technical Fields of Action regarding priority to eliminate hazards at source, safe design, maintenance and means of access, lighting, ventilation, cleanliness, temperature, humidity, air movement, testing and inspection of machinery, prevention of harmful stress, material handling, use of electricity, safe use of dangerous substances, radiation protection, noise and vibration, ambient factors, fire and explosion, PPE, welfare facilities, first-aid, emergency plans and health supervision.

3. Action at the National level for policy and technical actions implementation, making codes of practice for safety & health, laws on safety & health, studies & research, information and advice to employers and workers to eliminate hazards, liaison with ILO, system of inspection and co-operation with public authorities.

4. Action at the level of Undertaking regarding safety of workplaces, machinery, equipment &: methods, instruction, training & supervision PPE, working hours, physical and mental fatigue, safety policy and committee, health and safety service, safety standards, records and workers' safety duties.

See Sec. 7A & 41 B of the Factories Act and Rules 68K to 68Q and certain schedules N/r 102, GFR.

(2) Occupational Health Services (Conv. 161 and Recom. 171 of 1985) :

This convention was adopted on 26-6-1985 and

1. Principles of National Policy.
2. Functions by Employers.
3. Organization of occupational health services
4. Conditions of operation and

5. General Provisions.

Here 'Occupational health services' means services entrusted with essentially preventive functions and responsible for advising the employer, the workers and their representatives in the undertaking for maintaining safe and healthy working environment and adaptation of. work not beyond the capabilities of

National policy is suggested on this matter. Employers' functions include risk assessment, welfare facilities, safe workplaces and practices, equipment, ergonomics, health surveillance, vocational rehabilitation, training, first aid, emergency treatment and analysis of occupational accidents and diseases.

Laws and regulations are expected on this aspect. Workers should be informed of their health hazards. Absence due to ill health is to be reported.

Supplementing the above convention, Recommendation was adopted on 26-6-1985 which includes –

1. Development of occupational health services for workers.
2. Preventive role of such health services.
3. Assessment of risks, PPE, monitoring methods and control systems to eliminate or reduce exposure.
4. Functions of occupational health services.
5. Surveillance of workers' health i.e. pre-employment, periodical and post employment medical examinations, detection of exposure levels, biological monitoring, reporting of absences due to health reasons, health records, fitness certificate etc.
6. Training programmes on health and hygiene.
7. Informing workers about their health hazards and health records.
8. First aid and emergency treatment for accidents, immunisation for biological hazards and medical aspects of vocational re-education and rehabilitation.
9. Common services to different undertakings permissible.
10. Standards for. premises and equipment can be prescribed.
11. Health services and safety services can be organised where appropriate.

See Sec. 41-C and Sch. 3 of the Factories Act and Rules 68R to 68 V of the GFR.

(3) Asbestos (Conv. 162 & Recom 172 of. 1986) :

This convention was adopted on 24-6-1986 and includes six parts as under -

1. Scope and Definitions.
2. General principles.
3. Protective and preventive measures.
4. Surveillance of working environment and workers' health.
5. Information and Education.
6. Final provisions.

Definitions of asbestos, asbestos dust, airborne asbestos dust, respirable asbestos fibres and exposure to asbestos are explained. National laws, their enforcement, system of inspection and responsibility of employers and workers are prescribed.

Protective measures include- engineering controls, workplace hygiene, substitution of harmless process, prohibition of crocidolite and spraying of asbestos, labelling of container, exposure limits, respiratory equipment, special protective clothing, demolition work by authorised persons, washing and bathing facility, safe disposal, preservation of record, medical examinations, notification of diseases, education and training.

Supplementing above Convention, Recommendation was adopted on 24-6-1986 which includes

1. Scope and definitions as in Convention.
2. Consideration of code of practice on safety in the use of asbestos published by ILO.
3. Consultation with safety committee or workers representative.
4. Programme to prevent and control workers' exposure. No of persons and duration of exposure should be minimum.
5. Segregation of workplaces and use of control equipment.
6. Supply and use of MSDS.
7. Control of TWA limits and. maintenance of ventilation systems, machinery and protective appliances. Safe cleaning of workplaces.
8. Supply of respiratory equipment, special protective clothing and work clothing at no cost to the workers.
9. Measurement and sampling of exposure levels, medical examinations and health records.
10. Information and education for employers, workers and others.

See Sch. 17 u/r 102, GFR.

(4) Safety in the use of Chemicals at work(Con.l70 and Rec.l77 of 1990)

The ILO Convection No.170 and Recommendation No-177 were adopted on 25-6-1990 for the purposes of:

1. Evaluating chemicals for their hazards.
2. Providing information of chemical hazards from suppliers to employers and to workers.
3. Establishing principles and co-operation to use chemicals safely.

The convection provides for classification systems, labelling and marking of chemicals to identify their hazards, material safety data sheets, responsibility of suppliers, employers and exporting states and duties and rights of workers. Employers' responsibilities include identification of chemicals, safe transfer of chemicals, control of exposure and operations, safe disposal and information, training and co-operation to workers.

The Recommendation applies in conjunction with the Convection and prescribes details of:

1. Criteria for classification of chemicals.
2. Labelling and marking.
3. Chemical safety data sheet.
4. Monitoring of exposure.
5. Operational control within the workplace.
6. Medical surveillance.
7. First aid and emergencies.
8. Co-operation amongst employers, workers and suppliers.
9. Rights of workers.

The criteria suggested for classification include:

1. Toxic properties including acute and chronic health effects, allergenic, sensitising, carcinogenic, teratogenic and mutagenic effects and effects on reproductive system.
2. Chemical and physical properties including flammable, explosive, oxidising and dangerously reactive properties.

Control measures are also suggested to assess, monitor and record chemical concentrations at workplace, to prevent occupational diseases, fire, explosion and other events, to select safe chemicals, processes, technology, engineering controls, working systems, practices, personal hygiene measures, suitable PPE, signs, notices and to make safe provisions for emergency preparedness, storages, labelling, loading/ unloading, transport, waste disposal, medical surveillance and first-aid arrangements.

See Sch. 19. u/r 102, GFR.

(5) Prevention of Major Industrial Accidents (Con, 174 & Recom. 181 of 1993)

This convention was adopted on 22-6-1993 and provides following parts

1. Scope and Definitions.
2. General principles.
3. Responsibilities of Employers - Identification, Notification of installation. Arrangements of installation. Safety report and Accident reporting.
4. Responsibilities of Authorities - Offsite emergency plan. Sitting of MAJH installations and Inspecting staff for them.
5. Rights and Duties of workers and their representatives.
6. Responsibility of Exporting States and
7. Final provisions.

Supplementing above convention, Recommendation was also adopted on the same day which provides for exchange of information with ILO on safety management, process safety, major accidents, lessons from near misses, technical and medical control measures and systems to compensate workers.

See MSIHC Rules 1989 and Rule 68J of GFR incorporating intention and details' of above Convention and Recommendation. See Chapter 28 for such laws.

Each MAH installation employing == 100 workers is required to employ one Safety Officer in Gujarat vide notification dated 28-5-2004 of the Labour and Employment Dept, Sachivalaya, Gandhinagar.

7.3 Standards and Codes of Practice :

Another form of ILO standards are the Model Codes of Regulations. Amongst these is the Model of Regulations for Industrial Establishments for the guidance of governments, applicable to the majority of industrial undertakings and covering all matters concerning occupational hygiene, welfare and health.

Further guidance is provided in codes of practice to be used as reference work by any one in charge of formulating detailed regulations or responsible for the occupational safety and health. More than 20 codes of practice have been drawn up so far, covering either different sectors of activity (such as a mines, agriculture, forestry, construction and public works, ship building and repairing, iron and steel), or particular risks (Ionising radiation, noise and vibration, exposure to airborne harmful substances).

Codes of practice indicate "What should be done, they are. prepared by meetings of experts and their publication is approved by the ILO Governing Body.

These codes are further being supplemented by Guides .or Manuals often taking the form of illustrated texts showing practical ways of solving various problems at plant or work level; e.g. Dust prevention in Mining, Tunnelling and Quarrying; Guide for Labour Inspectors; Accidents prevention (A Workers' Education Manual), Guide on Forestry Work; Guide on Safety in Agricultural Work and a series of manuals on Industrial Radiation Protection, ranging from the relevant Convection (No. 115) to the Mining and Milling of Radioactive ores.

It is fair to say that ILO standards have exerted considerable influence on the laws and regulations of member country. Many texts have been modelled on the relevant provisions of ILO instruments; drafts of new legislation or amendments are often prepared with ILO standards in mind so as to ensure compliance with ratified Conventions or to permit the ratification of other Conventions; trade unions use ILO standards to support arguments in bargaining and in promoting legislation; Governments frequently consult the ILO both formally and informally, about the compatibility of proposed texts with international labour standards.

The ILO has prepared a "Code of Practice of Major Hazard Control", The Code of Practice is written in legislative style so that it can be a model for national legislation in this field.

7.4 Exchange of Technical Information and Research

This activity covers the issue of various publications such as studies, reports on enquiries, monographs, collection of laws, manuals, guides, etc. Thus during the last ten years, the ILO has published over 160 different studies and other publications dealing with occupational safety and health.

The subject-matters dealt with in some more recent publications include, in addition to the manuals and guides already mentioned: report on the maximum weight carried by one worker, the medical inspection of labour, electrical accidents, and related matters. The ILO also publish, at fixed intervals, directories on occupational safety and health services and institutions on safety courses and a catalogue of safety and health films produced the world over.

Together with a number of international and regional organisations and some 30 odd national centres, the "ILO set up in 1960 the International Occupational Safety and Health Information Centre(CIS). The essential aim of the Centre is to make information available rapidly and systematically to interested quarters on all aspects of occupational safety and health in every type of industrial activity. The information is printed on cards and in a bulletin despatched every four weeks to subscribers. The centre is supplied with information by national centres in additions to that submitted directly by the authors or editors of books, studies or articles. Another type of publications by the office are those in the "Occupational Safety and Health" series of which over 30 have so far been produced, starting in 1963. They aim at disseminating technical information among those interested in the ILO's work on the conclusions adopted by technical meetings or panels of experts.

An encyclopaedia on occupational safety and health, mentioned earlier, is intended for a vast readership and should be of interest to all concerned, both in the public as well as in the private sectors who are directly or indirectly responsible for the worker's safety and health, as well as to those who are concerned with these problems in any other context and who sometimes find it difficult to have access to the information required by them since this is often either too specialised or hard to obtain:

7.5 Technical Co-operation Activities :

The main forms of such technical assistance is the assignment of experts to evaluate conditions of safety and health obtaining in a given country and advising Government and Industry on the best means and ways of developing and strengthening the measures aimed at preventing accidents and occupational diseases and improving the conditions of work; this is very often accompanied by the assistance in the preparation of revision of the pertinent legislation and administrative procedures in this field. In many cases, technical equipment, often of the most advanced and sophisticated type, is being provided for the laboratory, demonstration and teaching purposes together with expert advice on their use. The ILO grants fellowships for studies/training in Safety and Health techniques as well as in conducting seminars and training centres in the countries, mostly on a regional basis. Local efforts for the organisation of activities are also being suggested and furthered by the office.

E X E R C I S E

1. Explain, State, Mention or Discuss :

1 Stages of Development of safety movement in the. world.
2 History of factory legislation in India.
3 Development and provisions of the Factories Act 1891 or that of 1911.
4 Provisions of the Factories (Amendment) Act 1976 or 1987.
5 Main safety provisions of the Factories Act 1948 .as on today.
6 Provisions pertaining to the hazardous processes under the Factories Act, 1948.
7 'Shriram' food and fertilizer's case by Supreme court's judgment.
8 Role of ILO for Safely, Health & Welfare.
9 Any one ILO Convention on Safety or Health in detail.
10 Safety provisions of any one machine u/r 54 of the Gujarat Factories Rules, 1963.
11 Safety provisions of any one Dangerous operation u/r 102 of the GFR.
12 Provisions of medical requirements under the Factories Act and GFR as on today.
13 Fire Safety provisions under GFR.
14 Provisions of 'Chemical works' under GFR or of 'Benzene' manufacture.
15 Provisions regarding ‘competent person’.
16 Safe working with pesticides.
17 Safety Provisions for ''pottery' or 'foundry'.
18 Provisions regarding ventilation and Temperature.

2. Write Short Notes on :

1 Earlier views of US courts on labour laws.
2 History of Labor legislation in England.
3 The first Factories Act 1881.
4 The Factories Act 1922.
5 Major Provisions of the Gujarat Factories (Amendment) Rules, 1995.
6 Health provisions or welfare provisions under the Factories act as on today.
7 SC judgment on 'Asbestosis' or on 'Occupier'.
8 ILO conventions.
9 Safety aspects of Hoists & Lifts.
10 Fencing of machinery.
11 Protection of eyes.
12 Thermic Fluid Heater or Ovens & Driers.
13 Reaction Vessel and Kettle.
14 Working on fragile roof.
15 Revolving machinery.
16 Safety provisions to work in explosive or toxic atmosphere.

17 Ambulance room.
18 Constitution and working of safety committee.
19 Safety provisions for pressure vessels or lifting machines.
20 Provisions u/s 41-B of the Factories Act.

3. Explain the Difference between :

1 Provisions of Chapter 4 and 4A of the Factories Act 1948.
2 Convention, Recommendation and Ratification of ILO.
3 Hoist and Lift.
4 Working at height and working in confined space under the provisions of the Factories Act.
5 Fixed guard and interlock guard with example.
6 Onsite and offsite emergency plan.
7 Safety policy and safety committee.
8 TLV and STEL value with example.
9 Accident and dangerous occurrence.
10 'Director' in public limited company and the Government company.
11 Duties of 'Safety officer' and 'Welfare officer'.
12 Hazardous process and manufacturing process.
13 Machinery and transmission machinery.
14 Lifting machine and lifting tackle.

4. Comment on following explaining whether it is True or False?

1 Oldest need of labor laws was felt necessary for children and women and not for adult men for safety.
2 Earlier laws were in favour of employers and not in favour of employees.
3 Offences under the Factories Act do not attract absolute criminal liability.
4 Interpertain of the Factories Act should be liberal and beneficial in favour of workers but strict in favour of occupiers.
5 Height of transmission machinery above 15 ft was considered safe by position.
6 Guard should be provided only when Factory Inspector suggests it.
7 If someone removes the guard, it can be pleaded as valid defence by the occupier.
8 'Manufacturer did not provided a guard and therefore it was not there' can be a defense by the accused'.
9 Ignorance of law can be pleaded as defense.
10 Uncovered pit has inherent danger.
11 Compliance with safety measurers is not mandatory.
12 Contractors' workers are not the. workers under the Factories Act 1948.
13 Judge can inflict any fine, even less than minimum prescribed.
14 Not providing identify cards to workers is not a serious offence.
15 Where canteen is provided, lunch room is not necessary.
16 Two-hand control is not useful while working on power-press.
17 When there are two safety valves on a pressure vessel, their set pressure difference should be more than 10%.
18 Breathing space required by each worker in a work room should at least 16.2 cu.mts.
19 Power includes all types of energy including animal energy.
20 'Acid' under Sch-12 includes chlorosulphonic acid also.

CHAPTER – 28

Specific Safety Laws

THEME

Only an abstract (short summary) of some Acts and Rules is given below. For frill details the statute books must be referred, for the factories Act and Rules Chapter-27 should be referred.

1. LAWS ON BOILER SAFETY :

1.1 Boilers Act, 1923:

The Boilers Act (No. 5 of 1923) was notified on 4-12-1923. It came into force from 1-1-1924. It has 34 sections. It is amended by the Act No. 49 of 2007 which became effective by Notification dtd. 13-12-2007. Section 2 of the Act defines as under :

Boiler means a pressure vessel in which steam is generated for use external to itself by application of heat which is wholly or partly under pressure when steam is shut off but does not include a pressure vessel-

(i) with capacity. < 25 ltrs (such capacity being measured from the feed check valve to ,the main steam stop valve)
(ii) with < I kg/cm' design gauge pressure and working gauge pressure or
(iii) in which water is heated below 100 °C.

Boiler Component means steam piping, feed piping, economiser, super heater, any mounting or other fitting and any other external or internal part of a boiler which is subject to pressure exceeding I kg/ cm2 gauge.

Economiser means any part of a feed-pipe that is wholly or partially exposed to the action of flue gas for the purpose of recovery of waste heat.

Super heater means any equipment which is partly or wholley exposed to flue gases for the purpose of raising the temperature of a steam beyond the saturation temperature at the pressure and includes a reheater.

Steam Pipe : means any pipe through which stream passes if (i) The pressure at which steam passes through such pipe exceeds 3.5 kg/ m2 above atmospheric pressure or (ii) Such. pipe exceeds 254 mm in internal diameter and pressure > I kg/cm2 and includes, in either case any connected fitting of a steam pipe.

Accident as defined u/s 2(a) means an explosion of boiler or boiler component which is calculated to weaken the strength or an uncontrolled release of water or steam therefrom, liable to cause death or injury to any person or damage to any property.

Sec. 18 requires report of accident and inquiry in case of fatal accident.

New definitions of Competent authority, Competent person. Inspecting authority. Technical advisor and structural alteration, addition or renewal are added.

Now not only boiler inspector but competent person can also inspect and certify boiler and its components during manufacture, erection and use. Inspecting authority can do this job during manufacture.

Unregistered or uncertified boiler shall not be used save as otherwise provided in the Act. Prior sanction of the Chief Inspector is necessary before carrying out any structural alteration, addition or renewal in or to any boiler or steam pipe. Any accident to a boiler or steam pipe shall be reported to the Inspector within 24 hours. His report shall be in form E (Rule 48).

Section 27A provides to form a Central Boiler Board consisting of members, nominating by the Central Government the representatives from the Central Government, Bureau of Indian Standards, Boiler and boilar component manufacturers. Users and other interests.

Section 28 provides power and matters of regulations by the Board. Sec. 28Aand 29 are for the rule making power of Central and State Govt. respectively.

Central Boilers Board makes and notifies regulations consistent with this Act. The main duties of the Boiler Inspector are the inspection and examination of boilers and steam-pipes in accordance with chapter IX of the Regulations and Chapter IV and V of the Gujarat Boiler Rules 1966. Reduction of pressure can be suggested. Sanction for repairs to boilers shall be obtained beforehand. Provisional orders should be issued after hydraulic tests.

Penalties have been increased up to Rs. 1 lac or /and 2 years imprionment u/s 24.

1.2 Gujarat Boiler Rules, 1966

These rules were notified and came into force on 20-10-1966. They have 162 rules, of which R.73 to 136 repealed, and Forms A to D.

The Chief Inspector shall issue instructions to owners for safe working of boilers. Form C under rule 8 provides such instructions regarding precautions before starting the fires, raising steam, pressure gauge, steam pressure, safety valve, low water safety valve, water gauges, blow-off cock, scum cock, manhole and other door joints, steam pipes, scale and grease, wear and tear, scale removal. Treatment of feed water and preservation of boilers when not in use. These instructions (Form C) are most important and should be hung up in each boiler house. For safety purpose it must be thoroughly understood and followed.

It should be the first care of the Boiler Owner and the Boiler Attendant to see that the feed water is kept as pure as possible. Impure feed water means additional expense on the upkeep of the boiler.

Steam boilers when not in use are liable to deterioration from corrosion and unless well cared for and made rust-proof, they may depreciate more rapidly than when in use. They should be thoroughly drained" and thoroughly dried and all valves, cocks and openings closed so as to exclude moisture. Another plan is to fill the boiler with water to which about 1/100 per cent, caustic soda has been added.

1.3 Gujarat Boiler Attendant Rules, 1966:

These rules were notified on 23-12-1966. They have 56 rules and Forms A to G.

Boiler shall be in charge of a qualified boiler attendant. Rules for examinations to grant certificate of competency as a Boiler Attendant are also prescribed. Age limit for second class Boiler Attendant is 20 years and that for first class Boiler Attendant is 21 years. For second class Attendant, 3 years relevant experience or training are necessary. For first class Attendant, 2 years service as second class Attendant on a boiler of more than 46 m~ heating surface is necessary.

1.4 Indian Boilers Regulations, 1950 (IBR) :

The Central Boilers Board u/s 28 of the Boilers Act, 1923 published the Indian Boiler Regulations 1950. They came into force from 15-9-1950. They were amended in 1990, 1993, 1994, 1995, 1996, 1997 and 2004. They have 15 chapters, 635 regulations, forms up to XVIG and Appendices A to M.

Definitions:

Definitions of accident, boiler. Chief Inspector, economiser, feed-pipe and owner are the same as given in the Act.

Competent Authority means an authority recognised by the Central Boilers Board to issue certificates to welders for the purposes of regulation 4(b)(ii) and 605.

Inspecting Authority means an authority recognised by the Board as competent to grant a certificate in Form II, IIA or IIB and specified in Appendix-C, which includes Chief Inspectors of boilers of various states of our country as well as foreign and many foreign companies.

Inspecting Officer means an officer appointed by the Inspecting authority or an officer acting on their behalf for the purposes of approval of drawings, stage wise inspection of manufacture, examination of repairs, signing and issue of certificates, material manufactured and boilers constructed.

Thus the central boilers board and authorities and officers recognised by them provide the backbone of boilers safety and checking from design to operation, maintenance and repair stages.

Boilers are classified as under :

Class	Limits of application	Minimum thickness	Constant
I	No limit	0.25 Inch	32
II	(a) WP < 105 psi (b) WP in psi x ID < 5250 inches.	IF ID is upto 36” 5/16 inch	27
III	(a) WP < 30 psi (b) WP in psi x ID < 3000 inches.	ID over 36”, 3/8 inch	23 if stress relieved 21 if stress not relieved

Working pressure (WP) of the cylindrical shell

$$WP(psi) = \frac{(t-2)SC}{D}$$

Where t = Min. plate thickness in 30 seconds of an inch.
D = Max. ID in inches.
S = Min. tensile strength in T/in'
C = Constant as given in above table

In no case, the thickness should be less than that mentioned in above table or the factor of safely less than 4.

Form -6 is the certificate for use of a boiler (reg. 389) with conditions. Appendix-J gives a long list of stages for inspection and testing by the Inspecting Authority. Appendix L provides for testing procedure for safety valve discharge efficiency.

Regulation 396 is regarding safety of persons inside boilers. Effective disconnection from steam or hot water, discharge arrangement for leakage, hand lamp of < 24 volt with lamp guard, key less socket, insulated handle and extension cord' of approved type are required. Power driven equipment should have effective earthing. Method of disconnection should be got approved from the CIB.

Chapter XIV (Reg. 618 to 622) was substituted with effect from 9-10-1993 and renamed as 'Small Industrial Boilers' (SIB).

Shell type SIB should have volumetric capacity > 22.75 ltrs. but < 500 ltrs, pressure up to 7 kg/cm2 or coil type or water tube boiler with capacity < 150 ltrs., pressure < 12 kg/cm2 Guidelines for registration, operation and maintenance are given in Reg. 622. Relaxations are given.

2. LAWS ON ELECTRICAL SAFETY:

2.1 Electricity Act, 2003 :

Replacing the Indian Electricity Act 1910, this Electricity Act 2003 (No. 36 of 2003) came into force on 10-6-2003. It was amended in the same year with effect from 21-1-2004.

It has 18 parts, 185 sections and a Schedule.

Its preamble runs as under :

An Act to consolidate the laws relating to generation, transmission, distribution, trading and use of electricity and generally of taking measures conducive to development of electricity industry, promoting competition therein, protecting interest of consumers and supply of electricity to all areas, rationalisation of electricity tariff, ensuring transparent policies regarding subsidies, promotion of efficient and environmentally benign policies, constitution :)f Central Electricity Authority, Regulatory Commissions and establishment of Appellate Tribunal and for matters connected therewith or incidental thereto.

Section-2 gives 77 definitions like board, captive generating plant, cogeneration, conservation, dedicated transmission lines, distribution system, electric line, electricity, electricity system, generating station, grid, high voltage line, line, main, overhead line, power system, service-line, street, sub-station, transmission lines and works etc.

Sections 3 toll are pertaining to grant of license and its revocation, amendment, purchase etc.

Section 161 regarding Notice of Accidents & Inquiries provides that (1) an accident to any person or animal resulting or likely to result in death or any injury is to be reported to the Electrical Inspector and other authorities in a prescribed time and (2) inquiry and report by the Electrical Inspector into the cause of accident affecting safety of the public and manner of compliance of statutory requirements.

Section 162 is regarding appointment of Chief Electrical Inspector and Electrical Inspector.

Subjects of this Act are asunder :

Part No.	Sections	Subject
1	1-2	Preliminary
2	3-6	National Electricity Policy and Plan
3	7-11	Generation of Electricity
4	12-24	Licensing
5	25-41	Transmission of Electricity
6	42-60	Distribution of Electricity
7	61-66	Tariff
8	67-69	Works
9	70-75	Central Electricity Authority

10	76-109	Regulatory Commissions
11	110-125	Appellate Tribunal for Electricity
12	126-130	Investigation and Enforcement
13	131-134	Reorganisation of Board
14	135-152	Offences and Penalties
15	153-157	Special Courts
16	158	Dispute Resolution
17	159-165	Other Provisions
18	166-185	Miscellaneous

2.2 Indian Electricity Rules, 1956 :

U/s37 of the Electricity Act, 1910, the Central Electricity Board, made these rules which were published and came into force from 26-6-1956.

The rules were amended in 1991, 1993, 2000, 2002. It has II Chapters, 143 rules and 15 Annexure. From safety point of view following two chapters are more important.

Chapter	Rules	Title
IV	29-46	General Safety Requirements.
X	109-132	Additional Precautions to be adopted in Mines & Oil-fields.

A short summary of the rules is given below. For full details, the statute book should be referred.

Rule 2 gives 57 definitions. 'Danger' is defined as danger to life or body part from shock, burn, fire, explosion, injury to persons or property because of the electrical energy.

Flameproof enclosure means an enclosure for electrical machinery or apparatus to withstand internal explosion due to flammable gas or vapour entered inside and preventing this internal flammation to come out to the external flammable gas or vapour in which it is designed to be used.

Guarded means covered, shielded, fenced or otherwise protected by means of suitable casing, barrier, rails or metal screens to remove the possibility of dangerous contact or approach by persons or objects to a point of danger.

'Intrinsically safe' as applied to apparatus or associated circuits shall denote that any sparking that may occur in normal working is incapable to cause explosion of inflammable gas or vapour.

Voltage category is defined as low<250V, medium<650V, high<33KV, extra high> 33KV.

Rule 4 prescribes appointment and qualifications for Electrical Inspectors that degree in electrical engineering with at least 8 years practical experience. For assistant inspectors BE(E) + 3 years experience or DME + 6 years experience is prescribed. Rule 5 gives their powers of entry and inspection.

Chapter-3, rules II to 28 prescribes licensing procedure including maps, forms and conditions.

Chapter-4, rules 29 to 46, give following general safety provisions:

General Safety Provisions:

1. Electric supply lines and apparatus, shall be of sufficient ratings, mechanical strength and so constructed, installed, protected, worked and maintained to ensure safety of human being, animals and property. IS and National Electrical Code shall be followed (R.29).
2. Supplier and consumer, both, will take due precautions to avoid danger from service lines and apparatus on consumer's premises (R.30).
3. Suitable cut-outs (e.g. fuse) in fireproof receptacles shall be provided in every service line (other than earth lines) at consumer's premises (R.31).
4. Earth and neutral conductors shall be identified to distinguish from live conductor and position of switches and cut-out shall be safe (R.32).
5. Earth connection (terminal) shall be provided near the point of start of supply and the consumer shall take steps to protect it from mechanical damage (R.33).
6. Bare conductors should be inaccessible with readily accessible switches to cut off power supply (R.34).
7. Danger notice in Hindi, English or local language with a sign of skull and bones (IS-2551) and the words 'danger and 'volts' is necessary near medium and higher voltage installation (i.e. above 250V). (R.35).
8. For the safety from supply lines and apparatus, earthing of lines, PPE to workers (gloves, rubber shoes, safety belts, ladders, earthing devices, helmets, line testers and hand lamps, for protection from electrical and mechanical injury), and authorised working on live lines are necessary (R.36).
9. Voltage cut off switch (in one operation) is a must in every electric vehicle, crane, etc. and the metal rails, if any, should be electrically continuous and earthed (R.37).
10. Flexible cables to portable apparatus should be heavily insulated and well protected from mechanical damage. For single phase line the cable should be of 3 core and for 3 phase line, it should be of 4 core type with the distinguished ground connection. Metal covering, if any, should be earthed (R.38).
11. Insulating or protecting material of electric line should not be of such material that may produce noxious or flammable gases on excessive heating (R.39).
12. Street boxes should be free from influx of water or gas. They should be inspected regularly for that (R.40).
13. Different circuits should be distinguished from each other (R.41).
14. Voltage should not exceed the limits and AC-DC circuits should not come into contact with each other when live (R.42).
15. Fire extinguishers for electric fire, fire buckets with clean, dry sand, first-aid boxes, two or more gas masks to be used in the event of fire or smoke are necessary (R.43).
16. Notice of instructions to restore person from electric shock and an artificial respirator (resuscitation) necessary (R.44).
17. Fatal accident should be reported within 24 hours and non-fatal accident, in Annex-XIH, in 48 hours (R.44A).
18. Electric work shall be carried out by licensed electrical contractor under direct supervision of a competent person and a person holding permit by the State Government. Unauthorised work shall not be energised (R.45).
19. Inspection of installation at every 5 years by the Inspector. Annex-IXA is an inspection report Form (R.46).

Chapter-V (R.47 to 59) gives general conditions relating to supply and use of energy. Rule 51 for medium, high and extra high voltage installations should be referred. .

Chapter-VI (R.60 to 62) for low and medium voltages (upto 650V) and Chapter-VU (R.63 to 73) for high and extra high voltage (more than 650V) provide for insulation resistance test, earth connection, ELCB, testing, operation and maintenance, condensers and supply to high voltage installation including X-ray unit, etc.

Chapter-VIII (R.74 to 93) gives important safety clearances (see Part 4.6 of Chapter-11) above ground and between conductors and provisions for material strength, stresses, joints, guarding, earthing, safety and protective devices (R.91 for safety of line when it breaks, unauthorised entry near overhead lines) etc.

Chapter-IX (R.94 to 108) is for electric traction, and provides for voltage supply to vehicle, insulation of lines, returns and sections, current density (less than 1.4 Amp/cm2) in rails, height of trolley-wire (more than 5.2 m high) etc.

Chapter-X (R.109 to 132) is regarding safety precautions while working in mines and oil-fields. They include plans, notices, lighting, communications, fire precautions, earthing, protective equipment, voltage limits (Hand lamp or electric interlocking 30V, portable apparatus 125V, at surface or in open 250V), safety with gas supervision etc.

Chapter-XI (R.133 to 143) gives relaxation and penalty provisions.

2.3 Electricity Rules, 2005

U/s 176 of the Electricity Act, 2003 these rules were made and they came into force from 8-6-2005. They were amended in the same year with effect from 26-10-2006.

They have 13 rules. Rule 3 gives requirements of captive generating plant. Other provisions are regarding distribution system, surcharge u/s 38, consumer redressal forum, tariff u/s 79, inter state trading licence etc.

3. LAWS ON FIRE AND EXPLOSION SAFETY :

3.1 Petroleum Act, 1934 :

This Act (No. 30 of 1934) came into force from 303-1937 (enacted on 16-9-1934) to consolidate and amend the law relating to import, transport, storage, production, refining and blending of petroleum. It extends to the whole of India. It has 4 chapters and 31 sections. Its abstract is as under :

Definitions :

Petroleum means any liquid hydrocarbon or mixture of hydrocarbons and any inflammable mixture (liquid, viscous or solid) containing any liquid hydrocarbon.

Flashpoint of petroleum means the lowest temperature at which it yields a vapour which will give a momentary flash when ignited, determined in accordance with chapter - II and rules made there under:

Petroleum class	F.P. Range
A	<23°C
B	23 to < 65°C
C	65 to < 93°C

Motor Conveyance means any vehicle running on land, water or air and in which petroleum is used to generate the motive power.

Control over Petroleum (Chap. 1, Sec. 3 to 13) :

The Central Government may make rules for import, transport, production, refining and blending of petroleum (Sec. 3 to 5).

On receptacles of class A petroleum the words "Petrol" or "Motor Spirit" should be mentioned. This is not required where quantity is less than 10 litres or on a fuel tank attached with a motor conveyance or engine, a pipeline, underground tank or exempted by the Central Government (S. 6).

Licence is not required (i) for class B petroleum if it is contained in a receptacle having less than 1000 litres capacity and total quantity at any one place does not exceed 2500 litres or (ii) for class C petroleum if total quantity at any one place does not exceed 45000 litres and stored or transported as per rules u/s 4 (S. 7).-

No licence is necessary to keep less than 30 litres class A petroleum not intended for sale. Then it can be stored in metal container of maximum 25 litres capacity and non-metal container of maximum I ltr capacity (S. 8).

To use as a fuel in a motor conveyance, not more than 100 litres class A petroleum can be stored or conveyed (S. 9).

No licence is needed by Railway to carry petroleum (R.IO). This chapter is not applicable to any petroleum having flash point above 93°C (S. II).

Testing of Petroleum (Chap. II Sec. 14 to 22) :

The Central Government can make rules for taking samples for testing and authorise any officer for that purpose (S. 14 to 17) to give certificate of testing (S.19) or retesting (S. 20). The officer shall use a standard test apparatus (S.15, 16 & 18). The Central Government has rule making powers u/s 21 and 22.

Penalties & Procedure (Chapter III S. 23 to 28):

General penalty is up to Rs. 1000 or one month or both and enhanced (for repeated offence) penalty up to Rs. 5000 or 3 months or both (S. 23). Petroleum together with receptacles can be confiscated (S. 24). Authorised officer has power of entry and search (S.26) Notice of accident shall be given to the nearest magistrate, police station and to the Chief Controller of Explosives (S. 27). In case of death or serious accident, inquiry u/s 176 of the Cr. P. C., 1973 shall be held by a Magistrate or a Police Commissioner.

Supplemental (Chapter -IV S. 29 to 31):

Rule making power and procedure and inclusion of rules to provide for protection of public from danger of petroleum (S. 29). The Central Government can limit or restrict the powers of any local authority (S. 31).

3.2 Petroleum Rules, 2002 :

These rules were enacted u/s 29 of the Petroleum Act, 1934. They came into force on 13-3-2002. They have 12 chapters, 202 rules, 5 Schedules and 20 Forms under the 2nd Schedule. Its abstract is give below:

Chapter -I : Preliminary (R. I to 13) :

Definitions:

There are 35 definitions. Some are given below.

'Adequate' in relation to ventilation, means the flammable gas-air mixture below the lower explosive or inflammable limit (LEL) or in relation to fire fighting facilities, those as per prevalent recognised standards or codes of safety.

Competent person means a person recognised by the Chief Controller of Explosives (CCE) or by an institution recognised by the CCE.

Container means a receptacle for petroleum of less than 1000 ltr. capacity.

Tank means a receptacle for petroleum of more than 1000 ltr. capacity.

Electric apparatus includes motors, starters, lamps, switches, junction boxes, fuses, cut-outs or any other appliance, equipment or fitting which operates electricity.

Hot work means any work which involves welding, burning, soldering, brazing, blasting, chipping by spark producing tools, use of certain power driven tools, non-flameproof electrical equipment or equipment with internal combustion engines and including any other work which is likely to produce sufficient heat capable of igniting inflammable gases.

Protected area means the safety distance 'specified by the licence condition under these rules.

Protected Works include dwelling house, assemble, dock, fuel yard, furnace, kiln, chimney, petroleum storage, public road, railway siding for oil and overhead high tension power lines.

Inspector, Sampling officer and Testing officer are those authorised u/s 13, 14 and 17 respectively.

There are many other definitions also like installation, OISD, petroleum inbulk, service station, storage shed and some vehicles with tank (R.2).

General Provisions (R 3 to 13):

Delivery and despatch not possible without storage licence. Class B petroleum up to 15000 litres in air tight approved container can be despatched to a person not holding a storage licence for immediate disposal. DCP extinguisher should be carried with a container of more than 2500 litres. Rule not applicable for despatch to the Defence Forces (R.3). Approval of CC is necessary for class A petroleum container of more than 1 litre capacity and class B & C petroleum container of more than 5 litre capacity (R.4). Containers for Class A petroleum should be of sound material an construction, approved type and of the following minimum thickness of iron or steel sheet –

Container Capacity in litres, exclusive of 5% free Space	Minimum thickness in mm
Up to 10	0.443 (27 BG)
Exceeding 10 and up to 25	0.63 (24 BG)

Exceeding 25 and up to 50	0.80 (22 BG)
Exceeding 50 and up to 200	1.25 (18 BG)
Exceeding 200 and up to 300	1.59 (16 BG)

The capacity of any container (Class A) shall not exceed 300 litres. Higher capacities for specified purposes need approval by CC. 5% air space necessary (R.5).

Minimum 5% and 3% air space are necessary for class B and C petroleum respectively (R.6).

Empty receptacles of class A or B petroleum should be kept securely closed if they contain vapour inside (R. 7).

Repair or hot work should be carried out after full cleaning of petroleum and its vapour or after certified by a competent person (R. 8).

Escape of petroleum to be prevented (R. 9). No person below the age of 18 or intoxicated shall be employed (R. 10). Smoking, fires, lights, matches etc. prohibited (R. II). No person shall commit or allow other to commit any act which may lead to any accident by fire or explosion. Compliance of these rules necessary. (R. 12). Fees (R. 13).

Chapter -II : Importation of Petroleum (R. 14 to 27):

Import licence necessary save as otherwise exempted. Rules for importation by sea requires fire fighting facilities as per OISD Std. .156, plans of unloading facility, protected works within 500 mt, EIA and Risk Analysis Report, failure scenarios, LEL distances, damage distances, control measures, anchorage of ships, production of certificate and licence to the Collector of Customs, no landing without his permission, of barges or lighters and transhipment from one ship to another (R. 14 to 24.).

Rules by importation by land also specify fixed places, submission of declaration (Form-1) certificate of storage accommodation (Form-H) and the licence to the Collector of Customs and no unloading without his permission (R. 25 to 27).

Chapter - III : Transport of Petroleum (R.28 to 101) :

Part - I : General (R.28 to 32):

No leaky tank or container containing petroleum shall be tendered for transport (R. 28). Filled containers should be kept upward (R. 29). Petroleum in bulk should riot be carried with passengers or combustible cargo (R. 30). Smoking, matches, lighters etc. prohibited (R. 31). Loading or unloading should not be done between the hours of sunset and sunrise unless adequate lighting and FFE are kept ready .(R. 32).

Part - II : Transport by Water (R. 33 to 50) :

Licence from the licensing authority is necessary (R. 33). Vessel should be made of iron or steel and of ample dimension (R. 34). All tanks on ships should be fitted with manholes with screw cover, air tight joints, filling and suction pipes and valves nearby to the bottom and filling and discharge through pipes and valves only. For class A petroleum,. Tanks should have vent or relief valve with wire mesh (more than II meshes per linear centimetre) and similar ventilators to all spaces around tank (R.35). Other provisions include exhaust outlet with spark arrester, no petrol driven engine, quick action closing valve on fuel feed pipe, suitable ventilators four or more fire extinguishers, 0.20 I113 of dry sand, non-sparking hammer, red flag, life-boats, ventilation and cleaning of holds and tanks, responsibility of master of vessel, loading/unloading through armoured hose and metal pipes electrically continuous and free from leakage, prohibition of naked lights, fire, and smoking, FFE in ready condition, no conveyance of petroleum class A with class B or C and no transport of un-tested petroleum (R. 36 to 50).

Part-111 : Coastwise Transport of Class A Petroleum not in bulk:

Rules 51 to 61 provide conditions and precautions for such transport.

Part-IV: Transport on Land by Vehicles (R. 62 to 86):

Applicable to transport of petroleum class A in more than 100 ltr (R. 62). Tank vehicles should be built, tested and maintained as provisions in 3rd schedule and of the type approved by the CC. Special safety fittings should be got approved (R.63). Class A and B petroleum can be filled up to 97% and Class C petroleum up to 98% of the gross carrying tank capacity (R.64). Tank vehicle should not be used for other purpose or carry other articles except authorised by the CC (R.65, 69). Trailers (R.66). For every mechanically propelled vehicle used to carry petroleum otherwise than class B or C, the eftgine should be diesel engine or internal combustion engine, exhaust pipe should be in front of the tank or load and fitted with an approved spark arrester and silencer or muffler, the engine intake or air cleaner should have flame arrester, fire resisting shield between the cab and the tank or load (i.e. rear side), fuel tank with stout steel guard and lock in the filling caps (R.70).

Electrical installation should not exceed 24 volts, wiring should be heavily insulated and adequate for maximum load, should have over current protection (fuses or automatic circuit breakers) encased in covering, sealed junction boxes, heavy duty switch to cut off battery and generators, motors and switches of flameproof type if not installed within engine compartment (R.71).

Portable fire extinguisher necessary (R.72). Vehicle should be constantly attended by a person who knows these rules (R.73). No parking on a public road or in congested area or in 9 mt. of any source of fire (R.74). Licence to transport necessary (R.75). Loading, unloading in a licensed premises only (R.76). Leaky, defective or unlicensed tank vehicle should not be filled (R.77).

Precautions against static charges include earthing and electrical continuity of pipelines, earth boss with a flexible cable and clamping device, earthing of tank, filling pipe and chassis during loading, dip-rod should not be completely raised above the liquid level during or within one minute of the completion of loading. Filling rate should not exceed I mt/sec until the filling pipe is completely submerged and there after it may be gradually increased but shall not exceed 6 mt/sec at the delivery end. The CC can permit a faster loading rate in case of petroleum having higher conductivity rate (R.78).

Loading/unloading after stopping of the engine and battery isolated. Restart only after the tank and valves are securely closed (R.79). No movement of vehicle during loading/unloading (R.80). Product contamination to be avoided by selecting correct filling hose and refilling of tank of class A petroleum with any other petroleum only after draining of residual oil (R.81). Except during loading/unloading, the filling pipe, discharge faucet and dip pipe shall be kept securely closed (R.83). No loading/unloading during night hours except approved electric lights provided (R.83). No fire, light, smoking or articles to cause fire allowed on vehicle (R.84). No repair of tank unless certified by a competent responsible person (R.85). No petroleum to be carried with passengers save as provided (R. 86).

Part -V : Transport by Pipelines (R.87 to 101) :

This part is applicable to petroleum pipe lines other than those in the area of operation of natural gas and/or oil or within refineries and installations (R.87).

It provides for right of way to be acquired (R.88), approval from the CC obtained (R.89), design as per standard code or OISD Std. 141, made of suitable steel which is safe for conditions under which it is to be used, provision for expansion, contraction, prevention of excessive stresses, by pass relief valves, pressure limiting stations, automatic shut down equipment to prevent pressure rise more than 10% of the designed internal pressure, isolation valves at different locations (R.90), laying criteria (underground as far as possible) (R.91), protection against corrosion (R.92), hydraulic test (at I.I times the design internal pressure and maintaining for 24 hours) at an interval of 12 months (R.93), shut down procedure (R.94), patrolling of pipeline, communication facilities at frequent intervals along the pipeline of length more than 2 km (R.95), checking of gauges at tanks or booster pump stations at least once a year (R.96), addition, alteration only after approval from the CC (R.97) and power of the CC to require relay or repair for public safety (R.99) and of inspection and examination (R.IOO). The fire or major leakage in a pipeline or connected facilities should be reported immediately by the person in-charge of the pipeline to the nearest magistrate or police station and by telegram to the CC, Nagpur (R.IOI).

Repair and maintenance of pipeline u/r 98 includes

1. Inspection by an experienced engineer for assessment of work.
2. written work permit specifying precautions to be observed and procedure to be followed.
3. The section of the pipeline shall be isolated, drained and purged with inert gas or steam or kept filled with water or treatment approved by the CC.
4. Work of cutting or welding to be carried out by an experienced person in accordance with the permit
5. Only mechanical cutters shall be used for cutting the pipeline or any connection thereof unless it has been purged with an inert gas.
6. Separation of pipeline or valve fitted to it only after providing electrical bond between the parts, to be separated and the bond shall not be broken till the parts have been rejoined.
7. Reuse of the repaired section only after hydrotest as stated in rule 93.

Chapter-IV : Electric Installation (R. 102 to 115) :

Electric wiring and apparatus to be used in any place where petroleum is refined, blended, stored, loaded or unloaded, should be in accordance with this chapter (R.102).

Classification of Hazardous Area (R. 103, 104) :

Hazardous area means where (i) Petroleum having FP below 65bC or any inflammable gas or vapour capable of ignition is likely to be present or (ii) Petroleum or any inflammable liquid having FP above 65°C is likely to be refined, blended, handled or stored at or above its FP. (R. 103).

It is classified as under :

Zone	Condition
0	Where inflammable gases / vapours are likely to be continuously present.
1	Where they are likely to be present under normal operating conditions.
2	Where they are likely to be present only under abnormal operating conditions to failure of rupture of an equipment.

Thus zone 0 is more hazardous than zone 1 an zone 1 more hazardous than zone 2. On any question regarding applicability of these divisions, the decision of the CC shall be final (R.104).

Extent of hazardous area is laid down in the 4th Schedule. The CC can increase or reduce it based on special circumstances (R.105).

Fixed Electrical Apparatus (R.106) :

Zone		**Type of Apparatus approved by CC.**
0		Intrinsically safe
1	(i)	Intrinsically safe or a flameproof type, or
	(ii)	Industrial type apparatus housed ii enclosure or in a room made safe b" purging or pressurising atmosphere and interlocked to stop electric supply automatically or to give warning to stop it in case of failure of the purging or pressurising system.
2	(i)	Non sparking apparatus or
	(ii)	Apparatus permitted in Div. 1.

Fixed Electric Wiring (R.107) :

It should be effectively sealed at all joints, mechanically protected, adequately supported and consisting of approved armoured cable or metal sheathed cable or insulated cables in a galvanised conduits with approved flame proof fitting or mineral insulated cable of approved type with flameproof glands at all joints and details mentioned in the rule.

Earthing and Bonding (R. 108) :

Electric systems and equipment should be earthed with resistance of 4 ohms or a value that ensures the safe operation of the protective device in the circuit whichever is lower.

All non-current carrying metallic parts of electric apparatus or other metallic objects should be earthed with resistance of 10 ohms.

All joints in pipelines, valves, plants, storage tanks, associated facilities and equipment for petroleum shall be electrically bonded with the resistance value between each joint not exceeding I ohm.

Other Provisions:

Cathodic protection as in rule 109. Electrified railway systems (overhead lines and live contact rails) are not allowed within a refinery or an installation. They should be terminated outside the area where tank wagons are loaded or unloaded. Both the rails of spur lines shall be insulated from a railway siding which is used for the loading or unloading of tank wagons (R.IIO). Portable electric apparatus or lamp of 25 volts, approved by the CC (Who can permit up to 55 volts) can be used in a hazardous area (R.lll). Maintenance to retain characteristics (R.112). Repair and test after cutting off voltage. In zone I area, after gas-testing and certified safe by a competent person (R.113). Certificate of electric installation by a competent person (R.114). Precautions against corrosion (R.115).

Chapter -V : Storage of Petroleum requiring licence (R.116 to 135):

Licence necessary (R.116). Precautions against fire OISD Std. 117, DCP and other fire extinguishers (R.117). Experienced supervisor necessary (R.118). Cleanliness (R.119). Drainage (R.

120). Wall or fence of at least 1.8 mt. height to prevent unauthorised entry 1.2 mt height for service stations (R.121). Marking of capacity on tanks (R.123). Construction of tank by iron or steel and as per IS. Foundation of non combustible material. Air space 75% or as per Code (R.124)and protection against corrosion by protective coating or cathodic protection etc. (R.125).

Before use the tank should be tested by water pressure by a competent person. It shall not be passed through any pipe or pump ordinarily used for the conveyance of petroleum. Proforma of certificate of such testing is given u/r 126.

Tanks should be earthed by two separate connections placed at opposite extremities. The resistance to earth shall be less than 7 ohm and that of the earth plate shall be less than 2 ohm, (R.127.) Testing of earth connection necessary once in I year by a competent person. Its record should be maintained (R.128). No night working unless approved electric lights provided as per chapter - IV (R.129).

Certificate of Safety is required from a competent person by the licensing authority in a proforma given u/r 130.

Prior approval of specifications and plans of premises required u/r 131. Electric motor or internal combustion engine to drive pumps for pumping petroleum should be got approved by the CC (R.132). Licence number should be marked on premises (R.133). An extract of certain rules to be displayed (R.134).

Chapter - VI : Storage of Class - C Petroleum not requiring licence (R. 136 to 140) :

Provisions of previous chapter-V are not applicable to class-C petroleum to be stored without licence u/s 7 (R.136). It shall not be stored together with other class of petroleum except as permitted by licence (R.137). Bulk storage tank should be approved by the CC. Tanks of more than 5000 litres capacity should have dyke or be placed inside a pit to contain at least the volume of the largest tank within it. A drainage pipe with valve fitted outside shall be provided and kept closed. A distance of more than 1.5 mt. shall be kept between the edge of dyke and any protected works (R. 138).

Class-C petroleum not in bulk, if exceeds at any one time 2500 litres be stored in a storage shed of which either the door way or openings are built up to a height 30 cm above the floor or the floor shall be sunk to a depth of 30 cm,. (R.139).

Prior report to store class C petroleum exceeding 5000 litres without licence shall be sent to the CC staling the location of the premises (R.140).

Chapter-VII of licences (R.141 to 161), Chap. IX of Tetraethyl lead mixtures (R.181 to 185), Chap. X of testing of petroleum (R.186 to 199), Chap. XI of notice of accident (R.200) and Chap. XII of exemption (R. 201, 202) are not discussed here. But abstract of Chap. VIII is given below.

Chapter-VIII: Refining of Petroleum (R. 162 to 180):

Project report with specifications and plans showing the arrangements of tanks, stills, furnaces, electric installations, pump houses, drainage, ETP, FFE, fencing, gates and all plants and buildings where it is proposed to refine, crack, reform or blend, petroleum (it is called refinery in this chapter) shall be sent to the CC in triplicate arid a scrutiny fee of Rs. 5000 (R.162). A copy each of the approved plans shall be kept at the refinery (R.163). Alterations are also to be approved (R. 164).

Fireproof materials should be used in buildings where petroleum is to be handled (R.165). Storage tanks should be more than 90 mt. away from any still, boiler or furnace (not applicable to class C fuel tank for a boiler if the tank capacity not exceeding 24 hours stock) (R.166). Storage tanks of LPG or its filling facility should be more than 90 mt. away from any still, boiler or furnace or 30 mt. away from any storage tank, pump-house or facility for blending or filling of petroleum or from any protected work (R.167). Flare shall also be 90 mt. away from any tank, still, pumphouse or any refinery activity or LPG (R.168).

Effluents and drainage should not cause any pollution or harmful effect on animal or vegetable life. Weekly samples shall be drawn and tested in the refinery laboratory for their oil content, acidity, alkalinity and record be maintained (for at least 6 months) and shown to an Inspector. The sewerage shall be independent of other drainage system. All drains shall have adequate capacity to prevent any flooding or backing up and of such construction to prevent leakage or be affected by the chemicals in contact. Trash racks (grills) to be fitted to prevent entry of rubbish to form a plug. Manholes, verits to release gases, fire-traps and gas traps on the upstream side of the oil interceptors and fitted with vents to liberate gas at a safer height are also to be provided (R.169).

No fire/source of heat or light capable of igniting inflammable vapours shall be allowed except in the firing spaces, stills or boilers. Smoking not permitted except in places specially approved by the CC (R.170).

Work permit from a competent person is necessary for maintenance and repair work and entry into confined spaces, closed drain or manhole. It shall be issued for a limited period during which known conditions will remain safe and after inspection and testing by the competent person, for gases and lead content will be carried out by suitable trained persons and with standard instrument (R. 171).

For fire control a well organised and trained fire fighting service with necessary materials and fixed, mobile and portable equipment is required. OISD Std. 116 should be followed. Adequate water supply should be available at all strategic points by means of an independent ring main or grid with isolating valves. The main shall be kept constantly pressurised by two or more boosting pumps of adequate capacity and working automatically when pressure drop occurs in the main. At least one boosting pump should be independent of power supply (e.g. diesel driven). All mains shall be fitted with hydrants at convenient places not more than 30 mt. apart. If mains water supply is likely to be interrupted, static water supply of adequate capacity shall be provided. Training for personnel necessary (R. 172).

All petroleum as it leaves the stills may be pumped back to services tanks for fuel or refinery storage tank and not be stored in the vicinity of stills and boilers (R. 173) Danger from static electricity shall be prevented (R. 174). Warning notices to be displayed (R. 175). All above ground pipelines and cables shall be identified by taping, stencilling, colouring etc. Pipelines, valves, route of underground cables and route of overhead pipelines and cables crossing roads shall be protected against damage (R. 176). All plants, instruments and equipment shall be inspected, tested and records maintained (R. 177). All operators shall be trained in safe operation. Written procedures shall be established to start up, shut down, gas free plants and emergency actions. Supervisors shall ensure safe operation and safety facilities (R. 178).

An occurrence of fire shall be reported immediately to the CC and to the nearest police station (R. 179). When refinery is closed down the area within the fence shall be cleared of all petroleum having FP $< 93°C$ as soon as possible (R. 180).

Table 1, 2 & 3 for safety distances are important for plant layout. Third schedule gives design and construction of 'Tank vehicles' for transporting petroleum in bulk.

3.3 Explosives Act, 1884 :

This Act (4 of 1884) was enacted on 26-2-1884. It came into force from 1-7-1884. It extends to the whole of India. It has 18 sections.

Its object is to regulate the manufacture, possession, use, sale, transport, import and export of explosives.

Explosive as defined in Sec, 4(d) means gunpowder, nitro-glycerine, nitroglycol, guncotton, di-nitro-toluene, tri-nitro-toluene, picric acid, di-nitrophenol, tri-nitro resorcinol (styphnic acid) cycio trimethylene-tri-nitroamine, penta- erythritol tetranitrate, tetryl, nitro guanidine, lead azide, lead styphynate, fulminate of mercury or any other metal, diazo-di-nitro phenol, coloured fires or any other substance, whether a single chemical compound or a mixture of substances, whether solid or liquid or gaseous used or manufactured with a view to produce a practical effect by explosion or pyrotechnic effect and includes fog-signals, fire works, fuses, rockets, percussion-caps, detonators, cartridges, ammunition of all descriptions and every adaptation or preparation of as an explosive as defined in this clause.

Aircraft carriage and vessel are also defined in this section.

Main Provisions:

1. A person below the age of 18 years, offender of violence or moral turpitude, who is ordered to keep peace or good behaviour or whose licence is cancelled for any offence under this act, cannot manufacture, sell, transport, import or export, deliver or dispatch or possess any explosive defined or notified. (Sec. 6A)
2. Licence can be granted, refused, varied, suspended, revoked and conditions can be imposed (Sec. 6B to 6E). Appeal can be preferred as per sec. 6F.
3. The Central Government has power to make rules regarding inspection, search, seizure, detention and removal (Sec. 7).
4. Notice of accident is required u/s 8 and its inquiry shall be conducted u/s 9. The Central Government can inquire into more serious accidents (Sec. 9A).
5. Explosives with receptacles shall be forfeited by the court after conviction (Sec. 10).
6. Abetment and attempt to commit offence under this Act or Rules is punishable (Sec. 12).
7. Any person found committing any offence punishable under this Act can be arrested without warrant, be removed from the place and conveyed before a magistrate (Sec. 13).
8. The Central Government can delegate its power to State Government or an officer u/s 17A.

3.4 Explosives Rules, 1983 :

U/s 5 and 7 of the Explosives Act, 1884, these rules were published on 2-3-1983. They have 10 chapters, 186 rules, 8 Schedules, 40 Forms under Schedule V and 8 specifications (guidelines) under schedule VII. Last schedule VIII gives safety distances in two tables. Five annexure are given at the end. Exhaustive details are provided of which a short abstract is given below :

Definitions : Chief Controller of Explosive (CCE) is the main authority. He can recognise a competent person by giving him a certificate of competency. Prohibited explosives mean that u/s 6, authorised explosives mean those published by the Government and permitted explosives mean those permitted by the Director General of Mines Safety to be used in underground coal mines.

Detonator, safety cartridge, safety fuse, safety zone etc. are defined. Magazine means a building to store more than 5 kg of explosive and specially constructed as approved by the CCE. Protected works include a dwelling house, college, school, hospital, theatre, factory, storage of hazardous substances, public road, railway, waterways, dams, reservoirs, high tension power lines. Safety zone is a distance required between such protected work and a licensed factory, magazine or store-house.

Safety Distance Categories of Explosives : According to the risks, they are as under :

Category	Explosives
X	Which have a fire or slight explosion risk or both but the effect is local.
Y	Which have a mass fir risk or a moderate explosion risk but not the risk of mass explosion.
Z	Which have mass explosion risk and major missile effect.
ZZ	Which have mass explosion risk and minor missile effect.

On any question of category, decision of the CCE shall be final.

General Provisions (Chap-11, Rule 5 to 20) :

1 Import, export, transport, manufacture, process, use or sell of unauthorised explosives is prohibited. Testing and trial are permitted in a licensed factory. (R.5).

2 Application for authorisation of explosives is necessary. Particulars are prescribed for submission. A sample shall be sent as per instruction from CC (R. 6).

3 Tests prescribed [R. 6 (6)]

(1) Physical properties including consistency, reaction, tendency to absorb moisture, segregation of the constituents, exudation, behaviour at low temperature, specific gravity etc.

(2) Chemical composition- percentage and quality of ingredients.

(3) Stability - effect of environmental conditions which would produce spontaneous ignition or variation in sensitiveness.

(4) Ignition characteristics- ignition point, behaviour, liability to spontaneous ignition.

(5) Mechanical sensitiveness to friction and impact.

(6) Air gap sensitivity and transmission of detonation..

(7) Velocity of detonating.

(8) Strength determination.

(9) Gases evolved upon explosion.

(10) Such other tests specified by the CCE.

(11) Any other test required by CCE.

4. Delivery and Dispatch under licence and not exceeding the quantity (R.7).
5. Packing as per Schedule H and after approval of the sample (R. 8).
6. Marking of packages should mention the word "EXPLOSIVES" (not required for fireworks and safety fuse), name of the authorised explosive, class number and division, safety distance category, names of manufacturer, consignor and consignee, net weight and letter 'V for permitted explosive (R.9)
7. Weight of explosive shall not include the weight of the packing box (10.)
8. Competent person should be in-charge of operations (R.11)
9. Precautions in handling- Floor should be checked, cleaned and swept before and after use. The packages shall not be thrown, dropped, rolled or pulled but shall be passed from hand to hand and carefully deposited. A slung package should be prevented from fall (R. 12).

10. Handing between sunset and sunrise is restricted unless proper lighting and guarding is provided. (R. 13).
11. Within 15 mt. of an explosive storage or at its place of handling or transport, smoking, fires, lights and flammable substances or substances to cause fire or explosion such as acids, petroleum, calcium carbide, compressed gases shall not be allowed (R. 14)
12. No person will carry matches, knives, fuses, iron or steel or wear shoes with iron nails (R. 15).
13. Split explosive shall be safely destroyed (R. 16).
14. Employment of person below 18 years, intoxicated persons and persons of unsound mind is prohibited (R. 17).
15. Precautions against danger from water (in compatible) or exposure to sun or heat are necessary (R. 18).
16. Special precautions against accident (fire or explosion), thefts, entry of unauthorised person near explosives are necessary. (R. 19).
17 Nitro-glycerine or Ethylene glycol dinitrate or explosives of Class-5, unauthorised, deteriorated or damaged explosives shall not be transported without approval of CC, except within the licensed factory solely for the purpose of manufacture of explosives (R. 20).

For classes of explosives see Sch. 1.

Import & Export (Chapter-111, Rule 21 to 31) :

Licence necessary (R. 21). Rules for import and export by sea, land and air are prescribed.

Transport (Chapter-IV, R 32 to 86):

Licence necessary (R. 32). Certain explosives cannot be transported together (R. 33). Safety certificate is required (R. 34). No transport of explosives with passengers (R. 35). Maximum weights as per R. 36. Loading and unloading procedure (R. 38 to 45.). Transport by water (R. 46 to 61) Transport by Rail (R. 62 to 74). Transport by Road (R. 75 to 86). Licence for road van necessary. Towing not allowed. Four wheel chocks to be carried all the time. In case of fire, traffic to be stopped 300 metres away. Accident to be reported. Two fire extinguishers of 2 kg or ..more capacity required with road van.

Manufacture (Chapter-V, Rule 87 to 112) :

Licence necessary (R.87) and not necessary (R. 88). Approval of CC required (R. 89) Factory should have a wall or fencing 2 mt. high to prevent unauthorised entry (R. 90). Interior should be free from grit, iron or steel and kept clean (R. 92) . Surrounding mound or blast wall as approved by CC (R. 93). Oiled cotton, rags or waste not allowed to avoid spontaneous ignition (R. 94). Non-sparking tools made of wood, copper, brass or soft metal should be used (R. 95). Notice of maximum quantity of material and persons in a work room to be exhibited on process building (R. 96). Smoking prohibited (R. 97). Lightning conductor as per IS 2309, yearly checking of earth resistance and its notice are necessary (R.98). During thunder-storms work should be suspended and workers to be withdrawn to a safe place (R.99). Foreign matter in ingredients to be removed (R.IOO). Protection against fire. Cloths without pockets (R.IOI) Residues will be quickly removed (R.102). Before carrying out repairs to building, explosives shall be removed (R.103). Employment of competent person for process supervision (R.104). Birth or fitness certificate is necessary for age between 18 to 21 (R.105). Every vehicle, trolley or receptacle to carry explosives shall be free from iron steel etc. and be covered or closed (R.106). Maintenance of building, plant and equipment should be regular and good. (R.107). Testing facilities as approved by CC (R.108). Safe disposal of waste explosives (R.109). Unsafe process to be stopped (R.IIO). Up to date records to be maintained for 2 years (R. 112).

Possession, Sale and Use (Chapter-VI, Rule 113 to 153):

Licence necessary (R.113) and not necessary (R.114). Use of licensed premises only (R.115). Protection from lightning (R.116). Precautions during thunderstorm (R.117). Building to be kept clean (R.118 & 120). Maintenance of records (R.119). Hazardous articles not to be carried. Search for them and for cloths without pockets and suitable shoes (R.121). Premises to be kept locked (R.122). Security Guards for .round the clock (R.123). Repackaging or opening at safe place and safe distance (R.124). Explosives not to be kept in damaged boxes (R.125) No storage exceeding licensed quantity (R.126). Magazine storage in mode A or B as specified in Sch. VII (R.129). Surrounded by mound (R.131) and on ground floor only (R.132). Storehouse of sound .construction (R.134). Type of premises, ground level minimum floor area 9m2, separate entry and exit (R. 135). Special precautions to be observed for fire works (R.136). Safety distance 15 mt. or more from storage of explosives, flammable or hazardous materials (R.137). No sale of other articles (R.138).

Use of Explosives : Competent person to be employed (R.144). Restrictions on preparation of charges (R.145). Restriction to carry at the blasting site (R.146). Examination before use (R.147). Precautions at site (R. 148),. Warning procedure (R.149). Precautions while firing (R.150), against stray currents (R.151) fire, or accident (R.152). Blasting, operations under the Mines Act, 1952 are allowed.

Licences (Chapter VII, R 154 to 174).

Fees (Chapter VIII, R. 175 to 177).

Powers and Penalties (Chapter IX R. 178 to 181).

Accidents and Enquiries (Chap. X, R. 182 to 186).

Notice forthwith to the CCE, Nagpur, CE under jurisdiction and nearest police station (R.182). Procedure at courts of inquiry (R.183). Inquiry by a District Magistrate or a Police Commissioner (R. 184). Inquiry into more serious accidents (R. 185).

Schedule I (R. 3) Classes of Explosives :

Class 1	Gun-powder.
Class 2	Nitrate-mixture
Class 3	Nitro-compound
Class 4	Chlorate-mixture
Class 5	Fulminate
Class 6	Ammunition
Class 7	Fireworks
Class 8	Liquid Oxygen Explosives.

Detailed list of chemicals is given under each of these classes.

Schedule II (R. 8)	Packing of explosives
Schedule III (R. 21)	Methods of Testing
Schedule IV (R.155)	Licensing Authority
Schedule V	Forms 1 to 40
Schedule VI	Explosives permitted to be imported and transported by air
Schedule VII	Specifications as under

Specification No. For

1	Road Van to carry explosives
2	Motor truck together with compressor unit
3,4 & 5	Metal cases for conveyance of explosives
6	Magazines (Storage), Mode A&B
7	Store-house
8	Compressor mounted motor truck or tractor Sch. VIII Safety distances

3.5 Static and Mobile (Unfired) Pressure Vessels Rules, 1981 :

U/S.5 and 7 of the Explosives Act 1884, the' Central Government notified these rules w.e.f. 5-2-1981. They have 8 chapters, 69 rules, 3 appendices, 2 schedule and 5 forms.

The rules were amended in 1993, 2000 and 2002. Chapter-1: Preliminary (R.I to IIA) :

Definitions : Out of (a) to (z) definitions, majority are scientific and therefore they are reproduced below.

1. "Permanent Gas" means a gas whose critical temperature is lower than 10°C.
2. "Liquefiable Gas" means any gas that may be liquefied by pressure above 0°C, but will be completely vaporised when in equilibrium with normal atmospheric pressure (760 mm HG) at 30°C;
3. Cryogenic liquid means liquid form of permanent gas having normal boiling point below minus 165° C.
4. Critical temperature means the temperature above which gas cannot be liquefied by the application of pressure alone.
5. "Compressed gas" means any permanent gas, liquefiable gas or gas dissolved in liquid or cryogenic liquid under pressure or gas mixture, which in a closed pressure vessel exercises a pressure exceeding one atmosphere (gauge) at the maximum working temperature and includes Hydrogen fluoride. In case of vessels without insulation or refrigeration, the maximum working temperature shall be considered as 55°C.
6. “Design" includes drawings, calculation, specifications, models, codes and all other details necessary for the complete description of the pressure vessel and its construction;
7. LPG i.e. Liquefied Petroleum Gas includes hydrocarbon gases in liquefied state at normal ambient temperature by the application of pressure, and conforming to the IS : 4576.
8. Dispenser means an equipment installed in LPG dispensing station, meant for dispensing LPG as automotive fuel to motor vehicles;
9. "Design pressure" means the pressure used in the design calculations of a vessel for the purpose of determining the minimum thickness of the various component parts of the vessel;
10. "Filling density" means the ratio of weight of liquefiable gas allowed in a pressure vessel to the weight of water that the. vessel will hold at 15°C;
11. "Flammable compressed Gas" means gas 13 percent or less of which when mixed with air forms a flammable mixture or whose flammable range with-air is greater than 12 percent;
12. "Gas Free" in relation to a pressure vessel means the concentration of flammable or toxic gases or both if such pressure vessel is within the safe limits specified for persons to enter and carry out hot work in such vessels;
13. "Pressure Vessel or Vessel" means any closed metal container of whatever shape, intended for the storage and transport of any compressed gas which is subjected to internal pressure and whose water capacity exceeds 1000 litres and includes inter connecting parts and components thereof up

to the first point of connection to the connected piping and fittings but does not include containers wherein steam or other vapour is or is intended to be generated, or water or other liquid is or is intended to be heated by the application of fire or the product of combustion or byelectrical means, heat exchangers, evaporators, air receivers, steam-type digesters, steam-type sterilises, autoclave, reactors, calorifiers, pressure piping components such as separators or strainers and vessels containing a liquid under a blanket of compressed inert gas.

14. "Safety relief device" means an automatic pressure relieving device actuated by the pressure upstream of the valve and characterised by fully opened pop action, intended to prevent the rupture of a pressure vessel under certain conditions of exposure;

15. "Source of ignition" means naked lights, fires, exposed incandescent materials, electric welding arcs, lamps other than those specially approved for use in flammable atmosphere, or a spark or flame produced by any means;

16. "Water Capacity" means capacity in litres of the pressure vessel when completely filled with water at 15°C.

The vessel should be manufactured as per IS 2825 or code specified u/r 12 and approved by the CC, otherwise it cannot be filled or transported. Any person seeking to manufacture such vessels should apply to the CC in Appendix. I with a scrutiny fee of Rs. 500 (R.4).

Storage, delivery and dispatch as per licence only (R.5). Repair after approval from CC and as per IS-2825 (R.6). Before using or refilling any vessel for flammable gases, purging by an inert gas or by the gas to be filled with safe venting is necessary (R.7). Prohibition of employing a person under 18 years or intoxication and smoking or allowing source of ignition or any flammable gas (R.8 & 9). These rules are to be complied with and precautions to prevent accident are necessary (R.IO). Supervision is also necessary (R. 9A).

Procedure for paying fees is given u/r II and that for applying recognition as competent person or Inspector in Appendix III to the CC is -given u/ r II-A.

Chapter-II : Construction and Fitments of Pressure Vessels (R. 12 to 20):

Design Code - For design, construction and testing IS:2825 or other code approved by CC. Test and Inspection certificate issued by the manufacturer and countersigned by an Inspector shall be sent to CC. (R. 12).

Design pressure should not exceed the vapour pressure at 55°C if liquefiable gas is to be stored or the developed pressure at 55°C if permanent gas (whose critical temp. is < 10°C) is to be stored. For an insulated vessel it may be reduced corresponding to the maximum temperature likely to be attamed by the gas in the vessel. Maximum allowable service pressure with allowances for cryogenic liquid (R. 13).

Design for low temperature should be as per code mentioned in R.12. Refrigeration capacity should be adequate to maintain the vapour pressure below the design pressure and the set-pressure of a safety valve. Insulation material should be approved by CC,' cladding thickness more than 3 mm, water-tight and thermal conductance at 15°C should not exceed the limit prescribed by the CC (R. 14).

Filling capacity & pressure as per rule 15. The maximum quantity of liquefiable gas to be filled should not exceed the filling density (i.e. the ratio of the weight of the gas to the weight of water that the vessel will hold at 15°C) and the vessel should not become liquid full due to expansion of the gas at 55°C if the vessel is un-insulated or at such highest temperature attainable incase of refrigerated or insulated vessel. A permanent gas shall not be filled in excess of design pressure of the vessel (R. 15).

Marking on Vessels should indicate (1) Manufacturer's name and identification (2) Standard or code (3) Official stamp of the Inspector (4) Design pressure (5) Date of tests (6) Hydrostatic test pressure (7) Water capacity (8) Gas capacity and (9) Name or chemical symbol of the gas. (R. 16.)

Painting with reflecting surface (R. 17)

Fittings should include Pressure Gauge, Temperature Indicator, Safety Valve, Level Indicator and drains. Connections as per code in rule 12. There should be two (or more) pressure relief valves (SV) spring loaded type, set to start at a pressure below 110% of the design pressure and total relieving capacity to keep the pressure inside the vessel less than 120% of the design pressure. Connections to these Safety Valve should be of sufficient size to allow the required rate of discharge. There should be shut off valve between Safety Valve and the vessel. For static (not mobile) vessels of more than 4500 lit. water capacity, outlet of Safety Valve should extend 2 mt. above the top of the vessel and at least 3.5 mt. above the ground level. They should have loose fitting rain caps. Safety Valve should be tested once in a year by a competent person and record be kept.

All liquid and vapour connections on vessels (except Safety Valve, plugged openings and where diameter is less than (1.4 mm) should have shut-off (stop) valves as close to the vessel as practicable.

There should be an emergency shut off valve (for both liquid and vapour phase) such as an excess flow valve, automatically operated valve or a remotely controlled valve which can be operated from a safe place and which shall not fail. Such emergency shut off (stop) valve is not required if liquid connection is of less than 3 mm dia and vapour connection is of not more than 8 mm dia. Excess flow rate should easily allow the normal flow rate (should not cause valve chatter) but should have closing rate below the rate of discharge from a fracture of the line it is protecting, calculated under the worst condition possible.

Liquid level gauge should show a ready amount of liquid at any time. One maximum level indicator should also be provided. Bleeding device (rotary tube, fixed tube, slip tube) cannot be completely withdrawn in normal gauging operations. (R. 18).

Hydraulic testing of all vessels by a competent person at a pressure marked on the vessel is necessary .at 5 years intervals (2 years for corrosive or toxic gases.). Where water test is not possible or tolerable, CC may permit pneumatic testing along with NDT. Pneumatic test pressure for cryogenic pressure vessel shall be I.I times MPWP. Before each pressure test, the vessel shall be thoroughly cleaned and examined internally and externally for surface defects, corrosion, foreign matter and hazardous material (e.g. pyropheric sludge). After test it shall be thoroughly dried internally and stamped with marks, figures and test date. A vessel failing to pass hydraulic test or found unsafe for use shall be destroyed or rendered unsuitable under intimation to the CC. The competent person shall give a test certificate in prescribed proforma. A record shall be kept of all such tests (R. 19, 20).

Chapter -III : Storage (R. 21 to 33):

General : Compressed gas vessels shall be aboveground, first stage regulating equipment in open, vessels should not be one above the other, vessels in a group should have their longitudinal axes parallel, no location within petroleum or flammable liquid area, sufficient space between two vessels to permit fire fighting operations, two or more vessels in batteries should have their top surface on the same plane and vessels facing their dished ends should have screen wall in between them. Floor slope, sump, dyke and dimensions for corrosive, flammable or toxic gases in liquefied state (R. 21).

Minimum Safety Distances;

See table I to 7 u/r 22.

Foundations as prescribed in R. 23. Supports should be so anchored, weighed or at height to avoid flotation due to flood waters. Bottom supports upto 45 cm (max.) shall be encased in fire-resisting materials of adequate thickness.

Fencing of at least 2 mt. height with 2 exits opening out wards and not self locking. The fencing should enclose vessels, pumping equipment, vaporisers and loading/unloading facilities. (R.24).

Cleanliness An area of 3 mt. around the vessel shall be free from combustible material such as weeds and grass (R. 25).

Earthing Vessels and pipelines should be efficiently earthed and bonded (R. 26).

No smoking Notice with letters at least 5 cms size fixed on fence surface visible from outside where flammable or oxidising gases are stored (R. 27).

Fire Protection for the storage of flammable compressed gases should include sufficient supply of water, hydrants, hoses, mobile equipment, fixed monitors or automatic spray systems, control valves outside the danger area, jet & fog nozzles and at least 2 DCP type fire extinguishers of 9 kg each near each point of access to the installations. Special provision for LPG station (R. 28).

Loading and Unloading Facilities like pumps, compressors, transfer systems and hoses as prescribed in R.29. Remotely controlled shut-off valve for the vessel being filled or emptied. High level alarm interlocked with automatic shut off valve to prevent overfilling. The hoses should withstand not less than 4 times the maximum operating flow pressure in them and should be mechanically and electrically continuous (R.29).

Transfer operation should follow the detailed instructions u/r 30. Supervision by a competent person for compliance of these rules is necessary. Precautions to check vessel before and after filling, condition of piping, valves, fittings, hoses, vehicle and its earthing, prevention of overfilling, removal of spillage etc (R. 30). Provisions for LPG stations (R.30A & B).

Electrical wire should not pass over any storage vessel and all electrical wires installed within the safety zone or storage of flammable gases should be of approved insulated cables type. In a pump room for pumping flammable gases, all electric apparatus and fittings should be flameproof conforming to IS:2148 and frames shall be earthed. Lamps should have flameproof glass fittings conforming to IS:2206 (Part1). Portable hand lamps should have been approved by the CC (R.31). Classification of hazardous area in Zone 0, I & 2 (R. 31 A & B).

Lighting should be of approved type, other wise no operation to be carried out during night (R.32).

Safety Certificate in the prescribed proforma signed by a competent person should be furnished to the licensing authority (R.33).

Chapter - IV : Transport (R. 34 to 44):

This chapter is applicable for the transport of compressed gas by vehicles (R.34). Drawings of the vehicle and its special fittings should be got approved by the CC (R.35). Design considerations are given in rule 36 to 39. Protection of valves, accessories, piping, fittings, pumps and vessel are suggested. Mechanical, electrical and general design safety requirements arfe prescribed- Product should be marked on the vessel (R.40). Fire protection includes prohibition of smoking or carrying matches, lighters or any flammable substance (R.41). Driver should be a trained one. While loading/unloading presence of a competent person is necessary. Safe parking during overnight stop (R.42). A safety certificate in prescribed proforma signed by a competent person shall be furnished to the licensing authority before using any vehicle for such transport (R.43). The vehicle shall be maintained in a fit condition and examined every 6 months by a competent person and certified in a prescribed proforma (R. 44).

Chapter-V (R. 45 to 64) is regarding Licences, Chapter VI (R. 65) for exemption. Chapter VII (R. 66 to 68) for Accidents and Inquires and Chapter VIII (R. 69) for powers of CC and subordinate controllers, of District Magistrates, the Police Commissioners and their subordinates.

Accident should be reported to the CC (by Telegram and a letter within 24 hours) and forth with to the nearest police station.

Appendices are as under :

Appendix – I : Application to manufacture a vessel. .
Appendix – II : Qualification and Experience of Inspector and Competent person.
Appendix – III : Application for recognition as competent person.

3.6 Gas Cylinders Rules, 2004 :

Replacing Gas Cylinders Rules, 1981, these rules of 2004 came into force from 21-9-2004.

It has 10 Chapters, 73 Rules, 6 Schedules and Forms A to G u/sch. V.

Chapter-1: Preliminary (R 1, 2) :

Definitions (R. 2) : Out of 43 definitions majority are scientific definitions. Therefore, they should be referred from the statute book.

Some definitions are given below.

1. **"Auto LPG"** means liquefied petroleum gas meant for automotive fuel conforming to specification IS : 14861;
2. **"Composite Cylinder"** means a cylinder made of resin impregnated continuous filament wound over a metallic or a non-metallic liner. Composite cylinders using non-metallic liners are referred to as all-composite cylinders;
3. **"Compressed Natural Gas (CNG)"** means mixtures of hydrocarbon gases and vapours, consisting mainly of Methane in gaseous form, which has been compressed for use as automotive fuel;
4. **"Gas Cylinder"** or **"Cylinder"** means any closed metal container having a volume exceeding 500 ml. but not exceeding 1000 litres intended for the storage and transport of compressed gas, including any liquefied petroleum gas (LPG) container/compressed natural gas (CNG) cylinder fitted to a motor vehicle as its fuel tank but not including any other such container fitted to a

special transport or undercarriage and includes a composite cylinder, however, the water capacity of cylinders used for storage of CNG, nitrogen, compressed air, etc. may exceed 1000 litres up to 2500 litres provided the diameter of such cylinder does not exceed 60 .cm.;

5. "Liquefied Petroleum Gas" (LPG) means any material, which comprises predominantly of any of the following hydrocarbons or mixture of them with vapour pressure not exceeding 16.87 kg/Cm2 (gauge) at 65° C:- Propane (C_3H_8), propylene (C_3H_6), butane (C_4H_{10}), (n-butane and isobutene) and butylenes (C_4H_8);
6. "Poisonous (toxic) gas" means a gas which has a maximum allowable concentration in air for human respiration not exceeding 100 mg/ 3 at 15"C and I kgf/.cm2 absolute pressure;
7. "Yield strength" means the stress corresponding to a permanent strain of 0.2 per cent of the original gauge length in a tensile test. For practical purposes it may be taken as a stress at which elongation first occurs in the test piece without the increase of load in a tensile test.

Chapter-II : General Provisions (R. 3 to 28) :

1 **Cylinders** and valves should have been constructed as specified in Sch. I, test and inspection certificate should be available with information in Sch. II. Any person desiring to fabricate cylinders valves regulators and other fittings should apply in Sch. Ill (R.3).

2 **Valves** should be of the IS, type and design prescribed in R.4.

3 **Safety Relief Devices** fitted on cylinders should be as per IS 5903. Cylinders containing poisonous or obnoxious gases (as named) should not have such device (R.5).

4 **Marking on Cylinders :** as per rule 6.

5 **Markings of Valves :** as per R.7.

6 **Identification Colours :** as per IS:4379 for industrial cylinders and IS 3933 for medical cylinders. New gases and gas mixtures for which such colours are not provided in IS, shall be painted with following colours.

Type of Gas	Cylinder Shell	Band at neck
Non-flammable & non-Toxic	White	-
Non-flammable but Toxic	White	Yellow (IS 356)
Flammable & Non-toxic (other than LPG)	White	Red (IS 537)
Flammable & Toxic	White	Red & Yellow (IS 537 & 356)

Cylinders of gas mixtures should be marked "Gas mixture" or "mixed Gas" (R. 8).

7 **Labelling** of cylinder shall show the name of the gas and address of its filler. A warning notice should be attached to it with instructions that : (i) the colour of the cylinder will not be changed. (ii) No other gas will be filled in it. (iii) N o flammable material should be stored in or near die room of the cylinder, (iv) No oil or lubricant should be applied on valves or fittings, (v) No cylinder should be accepted whose test date is over(R.9).

8 **Restriction ;** No delivery or dispatch except to licence holder, defence forces, port or railway authorities (R.IO). Restriction on filling named gases and to endanger serviceability (R.19).

9 **Repairing :** not allowed except as otherwise provided in R.ll & 12.

10 **Prohibition** of employment of a person below 18 years or intoxicated (R.13) and on smoking or allowing fires, lights, or flammable substances, except blow pipe flame for repairs (R. 14).

11 **General Precautions** are that the cylinders should be maintained in good condition, oil, or lubricant not to be used on valves or fittings, no exposure to sun, high temperature of flammable/explosive material, security nut on a compressed gas cylinder and uncontrollable leaky cylinder to be removed in an open space and the filler be informed (R.15).

12 **Special precautions** are to avoid accident due to fire or explosion and to comply with these rules and licence conditions (R.I 6).

13 **Competent person** should supervise operations (R.17). '

14 **Handling & Use** include proper support, adequate strength of trolley and cradle, careful handling to avoid shock, no sliding, dropping, knocking, rolling or playing with cylinders, liquefied gas cylinders to be kept upright and work places should not be shown as storage places for the purpose of licensing (R.I 8).

15 **Storage precautions** to be observed are :

(1) To store in a dry, cool, under cover, well ventilated place and away from source of heat or ignition.
(2) Room of fire resistant construction.
(3) LPG and dissolved gas cylinders should be kept in upright position.,

(4) Flammable and toxic gas cylinders should be kept separate by a partition wall.
(5) Conditions to cause corrosion or fire should be avoided.
(6) Filled and empty cylinders should be segregated (R.21).

16 **Electrical installation** should be flameproof conforming to IS 2148 and effectively earthed (R.22).

17 **Impurities** in gas to cause corrosion or explosion should be avoided. The gas should be dry, moisture less than 0.02 g/m' of gas, aqueous phase cannot be separated at 0"C and free from sulphurous impurities (R.23).

18 **Cylinder subjected to fire shall** not be reused except after proper repairs and testing. Such acetylene cylinders are to be condemned or destroyed safely (R.24).

19 **Charging** after prescribed periodical re-testing only (R.26).

20 **Owner** has to keep prescribed record (R.27).

21. **Conversion** to cylinder not allowed without permission (R.28).

Chapter - III : Importation of Cylinders (R. 29 to 34):

Licence necessary (R.29). Importation by sea, land and air after permission from the Custom Collector, Central Government and Director General Civil Aviation only (R.30 to 34).

Chapter - IV : Examination & Testing (R. 35-36) :

Periodicity as per 15 or approval by the CC, testing station should have facilities set forth in Sch. IV (R.35).

Condemning of cylinders as prescribed. Any cylinder which fails to pass any test or examination or loses its tare weight by over 5% or found unsafe, shall be destroyed by flattening or cut into pieces so that it cannot be joined to form a cylinder. All markings shall be defaced and record be kept.

Service life of CNG cylinders 20 years and that of LPG containers 15 years (R.36).

Chapter-V is for dissolved Acetylene gas cylinders (R.37 to 42).

Chapter-VI is for filling, possession and their licence procedure (R.43 to 65), Chapter-VII on power to exempt (R.66) Chapter-VIII on Accidents and Inquires (R. 67 to 69) and Chapter-IX on powers of Controller of Explosives (R.70 to 73).

4. LAWS ON INSECTICIDES :

4.1 Insecticides Act, 1968 :

This Act (46 of 1968) was enacted on 2-9-1968. It came into force from 1-3-1971 (Sec. 4,7,8, & 36) and 1-8-1971 (remaining part). It extends to the whole of India. It has 38 sections and a .schedule listing insecticides amended from time to time.

It is an Act to regulate the import, manufacture, sale, transport, distribution and use of insecticides with a view to prevent risk to human beings or animals and matters connected therewith.

Provisions are made for the Central Insecticides Board, its committees, procedure and officers (S.4 to 8), Registration of insecticides, appeal and revision (S.9 toll), Licensing (S.12 to 15), Central Insecticides Laboratory (S.16), Prohibition of import and manufacture (S.17), Sale, stock, distribute, transport, use etc. (S.18) Insecticide Analysis (S.19), Inspectors (S.20 to 23). Report of Insecticides Analyst (S.24), Confiscation of stock (S.25) Notice of poisoning (S.26), Prohibition of sale etc. for reasons of public safety (S.27), Cancellation of registration (S.28), Offences & punishment (S.29), Defences which may or may not be allowed (S.30), Cognisance & trial (S.31), Special courts (S. 31A), Offences by companies (S.33), Power of Central Govt. and State Govt. to make rules (S.36 & 37) and Exemption (S.38).

By various notifications from 1989 to 1996, many insecticides are banned or restricted in India, e.g. DDT, chlorobenzilate, BBCP, PCNB, Toxaphene, Aldrin, Chlordane Heptachlor, Tetradifon, Nitrofen, Benzene Hexachloride etc.

4.2 Insecticides Rules 1971 :

These rules came into force on 30-10-1971. They have 9 chapters, 46 rules, 2 schedules and 22 forms. Chapter-1 gives definitions.

Tests' means any insects, rodents, fungi, weeds and other forms of plant or animal life not useful to human being s [R. 2 (h)]

'Laboratory' means the central insecticides laboratory. [(R. 2(e))].

Commercial Pest Control Operation means any application or dispersion of insecticide(s) including fumigants in household or public or private premises or land and includes pest control operations in the field including aerial applications for commercial purpose but excludes private use.

Pest Control Operator means any person who undertakes pest control operations and includes the person or the firm or the company or the organisation under whose control such a person(s) is operating.

Chapter-n is regarding the Board and its functions (R.3 to 5), Chapter-111 regarding registration of insecticides (R.6 to 8), Chapter-IV for grant of licences (R.9 to 15), Chapter-V for packing & labelling (R.16 to 20), Chapter-VI for insecticides analysts and Insecticides Inspectors (R.21 to 34), Chapter-VII for transport & storage (R. 35 to 36), Chapter-VIII for protective clothing, equipment and other facilities for workers (R.37 to 44) and Chapter-IX miscellaneous (R.45 to 46).

The first schedule prescribes 22 forms of which the last one (for medical examination of workers) is reproduced in this part. Second schedule u/r 25 prescribes fees for testing or analysing the samples of insecticides.

Insecticides cannot be manufactured, stored or handled with any consumable article (R IO-Q.

Packing and Labelling (R. 16 to 20):

Every container package should be of the approved type. A leaflet should be put inside containing particulars about the plant disease, insects, animals or weeds for which it is to be applied, manner of application, symptoms of poisoning, safety measures and first-aid treatment necessary, antidote, decontamination or safe disposal procedure, storage and handling precautions, effect on skin, nose eye, throat etc. and common name of the insecticide (R. 18).

In labelling, warning and cautionary statement should be included.

(1) For category-I (Extremely toxic) insecticides, the symbol of a skull and cross-bones and the word 'POISON' should be printed in red. Statement "Keep out of the reach of children and if swallowed or if symptoms of poisoning occur call physician immediately" should be added.

(2) For category II (Highly toxic) insecticides, the word TOISON' in red and statement "Keep out of the reach of children" should be printed.

(3) For category III (moderately toxic) the word 'DANGER' arid statement "Keep out of the reach of children".

(4) For category IV (Slightly toxic) the word 'CAUTION' should be mentioned.

Category classification is as under –

Classification of insecticides	Oral route (acute toxicity) LD_{50} mg/kg of test animal	Dermal route (dermal toxicity LD_{50} mg/kg of test animal.	Colour of band on the label.
Extremely toxic	1-50	1-200	Bright red
Highly toxic	51-500	201-2000	Bright yellow
Moderately toxic	501-5000	2001-20000	Bright blue
Slightly toxic	> 5000	> 20000	Bright Green

See Part 24 of Chapter-23 for pesticide industry.

Transport and Storage (R. 35, 36) :

Packages for rail transport shall be packed as per Red Tariff by Railways. No transportation or storage in such a way that insecticides may come in contact with food stuffs or animal feeds. If it is mixed up due to any damage to packages during transport or storage, it shall be examined by competent authorities notified by the State Govt. and safely disposed. If any leak occurs, the transport agency or the storage owner shall take urgent measures to prevent poisoiling and pollution of soil, water etc.

The packages of .insecticides should be stored in separate rooms or almirahs under lock and key. Such rooms shall be well built, dry, well-lit, ventilated and of sufficient dimension.

Protective Equipment and other Facilities for Workers (R. 37 to 44) :

All persons engaged in handling, dealing or otherwise coming in contact with insecticides during manufacture/formulation or spraying shall be medically examined before employment and then periodically once in a quarter by a qualified doctor who is aware of risks of pesticides and report be kept in Form XXII given below. For persons working with organophosphorous or carbamate compound, their blood cholinesterase level shall be measured monthly. The blood residue estimation shall be done yearly of persons working with organo-chlorine compound. Any person showing symptoms of poisoning shall be immediately examined and given proper treatment.

First-aid treatment shall always be given before the physician is called. IS 4015 part I and II shall be followed in addition to any other books on the subject. The workers shall be educated regarding effects of poisoning and the first-aid treatment to be given.

Protective clothing which shall be washable (to remove toxic exposure) and not allowing penetration by insecticide shall be given to workers. A complete suit shall consist (a) Protective outer garment/overalls/ hood/hat, (b) rubber gloves extending half-way up to fore-arm (c) dust-proof goggles and (d) boots.

For prevention of inhalation of toxic dusts, vapours or gases, the workers shall use (a) chemical cartridge respirator, (b) supplied air respirator . (c) demand flow type respirator (d) full or half face gas mask with canister as per requirement. In no case the exposure in air should exceed the maximum permissible level.

Sufficient stocks of first-aid tools, equipment, antidotes, medicines etc. should be kept.

The workers shall be trained for safety precautions and use of safety equipment.

The packages and surplus materials shall be safely washed and disposed to prevent pollution. The packages shall not be left outside to prevent re-use. They shall be broken and buried away from habitation.

Aerial spraying precautions are given 'in rule 43.

Form XXII : Form of Medical Examination
For the Year...........

Serial No. ………………..

Name ……………………………… Age…………..

Father's/Husband's Name ……………………… Full Address ……………………………….

Sex ……………….. Identification mark ………………………

Date of appointment ……………… Occupation : (Pleas specify the nature of duty)

PAST HIST

2. Employee:
3. Employer/manufacturer:
4. Licensing officer at the time of inspection.

N.B. : In organochlorme group of insecticides the blood residue estimation should be done once a year

5. LAWS ON ATOMIC ENERGY & RADIATION :

5.1 Atomic Energy Act, 1962 :

This Act No. 33 of 1962 was passed on 15-9-1962. It has 32 sections. Its preamble says that it is an Act to provide for the development, control and use of atomic energy for the welfare of the people of India and for their peaceful purposes and for matters connected therewith. It extends to the whole of India.

Section 2 defines as under :

'Atomic energy' means energy released from process including the fission and fusion processes.

'Radiation' means Gamma rays. X-rays and rays consisting of alpha particles, beta particles, neutrons, protons and other nuclear and sub-atomic particles but not sound or radio waves or visible, infrared or ultraviolet light.

'Radioactive substance or material' means any substance or material which spontaneously emits radiation in excess of the levels prescribed by notification by the Central Government.

Outer radiation emission rate 0.1 microcurie (or inner 0.002 microcurie) per gram makes the material, legally, radioactive material.

The words fissile material, minerals, plant, prescribed equipment, prescribed substance etc. are also defined. Other provisions are as under :

1. The Central Government's powers to deal with, research into and dispose of atomic energy or radioactive substance, to dedare as 'restricted information' or 'prohibited area', to provide safety measures to prevent radiation hazards, to produce and supply electricity from atomic energy and to do all things necessary for these powers.

2. Any person discovering or suspecting uranium or thorium at: any place in India, has to report to the Govt.

3. The Central Government's power to direct any process to get uranium, under compliance or to prohibit him from doing so. Compensation may or may not be given.

4. The Central Government's power to obtain information regarding materials, plant or processes.

5. Authorised person from the Government has power to enter and inspect any mine, premises, land, plant, articles etc.

6. The Government has power to do work for discovering prescribed substances by giving a 28 days notice to the owner or occupier of the land. Compensation shall be given as per Section 21.

7. The Government's power of compulsory acquisition of rights to work minerals, of prescribed substances or equipment, plant, building, property etc. by giving notice and compensation (u/s 21) to the affected persons.

8. The Government's power to give notice to contracting parties and to transfer their rights and liabilities to the Government, of their business of mining, production or research of prescribed substances or use of atomic energy. Compensation shall be given to the parties.

9. Power of the Government to give, refuse or revoke license for mining, acquisition, production, possession, transfer, use, disposal, export or import of prescribed substances or equipment, plant for atomic energy or research. The Powers also include to make rules for the licence to follow conditions and criteria for safe location, installation or operation of the plant, for radiation protection, liability in respect of hurt to any person or property and to pay compensation for the damage, for working hours, leaves, medical examination of workers, security clearances etc., and for inspection, sealing, seizure, retention, disposal of article etc. .

10. Powers of the Government to requisite any substance and to extract uranium, plutonium or any of their isotopes from it. The compensation shall be paid for it.

11. Powers to make rules for safety of the persons or property from radiation or by the ingestion of radioactive substance, to prescribe qualifications for employment, regulation of working hours, leaves, medical examination, for safety of transport workers, for powers of authority to enter, inspect etc., any premises, vehicle, vessel, aircraft etc. and providing measures for breach of the rule, including sealing of premises, vehicle, vessel etc., and the seizure of radioactive substances and contaminated equipment.

12. The Government can order to disclosure of information and no disclose that restricted information restrict the person shall pertaining to atomic energy.

13. Power of the Government to prohibit entry of any person, without permission, into a prohibited area and taking photograph, sketch, picture, drawing, map, document etc. from there.

14. No patents to be granted for inventions relating to the use of atomic energy, even for ensuring safety in atomic energy operations. Such invention shall be reported to the Government.

15. Procedure relating to payment of compensation for the acquisition of land, property etc.

16. Power of the Central Government to develop national policy in regard to generate electricity in atomic power stations, to regulate its supply, to fix rates,, to enter into agreements with the Electricity Boards etc. and to comply with Electricity Act, 1910 and Electricity (Supply) Act, 1948.

17. The Factories Act, 1948 shall be applicable, through the Central Government, to any factory owned by the Central Government and engaged in carrying out the purposes of this Act.

18. Other provisions are relating to offences and penalties, cognisance of offences, delegation of powers to State Government or its officer etc. and rule making powers u/s 30.

5.2 Radiation Protection Rules, 1971:

The Central Government u/s 30 of the Atomic Energy Act, 1962, made these rules applicable from 3010-1971, to the whole of India. A summary of these 56 rules is, given below:

Section-2 defines adequate protection, competent authority, contamination, employer, radiation worker, operational limits, radiation installation, radiation surveillance, Radiological Safety Officer, sealed and unsealed source, source housing, useful beam etc.

Other provisions are as under :

1. Radioactive material is to be handled as per terms and conditions of a licence.
2. Luminous compounds on watches, instruments etc. are exempted.
3. No person below the age of 18 years can be employed as a radiation worker.
4. Licence can be issued on request under the Act, if the equipment, facilities and work practices afford adequate protection and if the incharge person has adequate qualification to direct the work.

   The validity of licence is 3 years. It can be revoked, modified or withdrawn by the competent authority after giving a show cause notice and an opportunity to make a representation.

   Radioactive material shall be used only for the purpose, location and quantities specified in the licence.

5. Radiological Safety Officer shall be designated by the employer (himself or an employee) with the approval of competent authority to perform following duties and functions (R. 13) :
   (1) Steps to ensure that operational limits are not exceeded.
   (2) To instruct the radiation workers about hazards of radiation and safety measures to minimise exposure to radiation and contamination.
   (3) To carry out leakage tests on sealed sources as specified in rule 34.
   (4) To regulate the safe movement of radioactive materials including waste.
   (5) To investigate and suggest remedial measures in respect of any situation that could lead to radiation hazards.
   (6) To make available' necessary reports and remedial measures to his employer.
   (7) To ensure the safe disposal of radioactive wastes in a manner approved by the competent authority.
6. Hazardous situation is to be reported to the competent authority.
7. Radiation surveillance procedure notified by the competent authority is to be followed by the employer. This may include (R. 15) :
   (1) Design, construe don, operation and use as per specifications and prior approval of the competent authority.
   (2) Working conditions, monitoring and personal protective equipment.
   (3) Personal monitoring of radiation workers.
   (4) Medical examinations of the radiation workers as per rule 19 or 20.
   (5) Records of radiation and radioactivity level measurements, personal monitoring and medical examinations stipulated by the competent authority.
   (6) Any other procedure specified by the competent authority.
8. Prior approval before any modification to the plant or any change in working conditions.
9. Radiation symbol to be displayed at workplaces and on containers containing radioactive materials. Its colour shall be as may be specified by the competent authority.
10. History records of radiation workers to be maintained in a form specified by the competent authority.
11. Pre and periodical yearly medical examinations of radiation workers, of blood, excreta, skin, hands, fingers, finger nails, eyes and chest (X-ray).

    The frequency* and types of above examinations may be modified by the competent authority where necessary (Rule 19 & 20).

    Complete records of above examinations shall be maintained. Its excerpts shall be sent to the competent authority in the form specified by him. The competent authority shall preserve such records for the life time of the worker or for 20 years after he ceases to do work of radiation, whichever is shorter.
12. The competent authority may specify steps to reduce the excessive exposure and the employer shall comply with them and also provide the exposed worker an alternative work not involving radiation exposure. If such worker is declared fit to resume radiation work, his employer shall permit him to do that work. Then his work shall be planned by the competent authority.
13. The competent authority or a person duly authorised by him has wide power to inspect new, modified or running radiation installation, work being conducted, protective device, transport etc. and make tests, measurements and other things to verify adequate protection.

    Power includes power to seal or seize radioactive material or equipment and give directions for compliance.
14. Registers of particulars of sealed and unsealed sources shall be maintained (Rule 33).
15. In case of leakage of a sealed source, the Radiological Safety Officer shall place that leaking source in a properly shielded leak-proof container with care to prevent spread of contamination, act to safeguard the workers and others, vacate affected area, clean up contamination if any, and inform the employer.

16. Lost or missed radioactive material shall be searched and the competent authority shall be informed immediately.
17. Telegamma sources shall be covered with appropriate source housing. In case of power failure, the useful beam should be automatically cut off. Manual device to interrupt the useful beam is required (Rule 37 to 39).
18. In medical institutions where radioactive material remains on or inside the body of the patient, separate rooms and wards for the treatment shall be provided.
19. Where gamma radiography is done, the area shall be cordoned off to control entry into it of other persons.
20. Sealed source devices such as static eliminators, thickness, density or level gauges, package monitors shall be provided with efficient cover plate, shutter or shield capable of being easily operateable to attenuate the useful beam.
21. Interlock switches in radiation installations should be of the fail-safe type.
22. Unsealed sources shall be kept in securely closed container and properly labelled.

    Radiological Safety Officer has to take more precautions where unsealed sources are handled such as safe working methods, facilities to minimise radiation level and airborne contamination, forbidding wrong working habits (mouth operated devices, open wounds, smoking, eating, drinking, application of cosmetics etc.), appropriate protective clothing, safe use of PPE and checking contamination on it and safe collection of radioactive wastes .(R.44 & 45).
23. Ventilating systems should be enclosed with ducts and filters to avoid spread of any airborne contamination.
24. In case of spillage, steps to arrange decontamination of affected personnel and areas, steps to prevent further spread of contamination and informing the employer.
25. Other provisions for experiments on animals, luminising compounds, approved procedure for mining, processing etc., disposal of animal carcasses, autopsies of cadavers, licence, personnel monitoring and power to exempt are given in rules 48 to 56.

Notes on Regulatory Aspects

Radioisotopes and radiation have found a variety of applications in industries, such as non-destructive testing, level indication system, thickness gauges, density gauges, etc. There are over 1200 industrial institutions in India, employing radiation source, in one form or the other. It is a well known fact, that ionising radiation such as X-rays, gamma rays, beta rays, etc. are deleterious to health. It is therefore, essential to minimise radiation exposures to the user as well as to the public. If the use of these radiation sources is not adequately controlled, it is likely to result in unnecessary radiation exposures to individuals. However, if necessary safety precautions, as per the stipulated norms, are observed by the user, the ill-effects of radiation can be minimised, thus, rendering the application quite safe for the user.

The prospective user should approach the Competent Authority for obtaining permission to handle radiation sources. He must give the requisite details in the prescribed application form regarding the type of source, its activity, proposed use, name of the. user, his qualification and experience in the handling of radiation sources, etc.

A precommissioning inspection of the installation is properly done by members of Radiation Protection Services Division (RPSD), Bhabha Atomic Research Centre (BARC), Bombay-400 085, in order to confirm the above.

A separate storage enclosure should be available at the site for safe storage of the source housings, prior to their installation and also to store, spare source housings and decommissioned gauges awaiting ultimate disposal, if any. The source storage should be so chosen, that it would be free -from potential fire hazard, flooding, water logging, pilferage etc. Advice on the nature of storage facility required may be obtained from the Competent Authority.

All the persons who are involved in the operation and maintenance of these gauges, should have adequate knowledge' in the design, construction and principle of the gauges and they should have undergone appropriate training on the radiation safety aspects. Further, if deemed necessary, all those persons who are involved in the maintenance of radioisotope gauge may have to be monitored regularly, by the personal monitoring service, run by RPSD, in order to, ensure that dose limits are not exceeded. The decision regarding the need for the persons to be monitored by the personnel monitoring service will be taken after the precommissioning inspection of the installation by members of RSPD.

A GM type radiation survey meter (model MR 121) manufactured by the Electronic Corporation of India Ltd. (ECIL), Hyderabad or its equivalent should be available with the user of the nucleonic gauges, for regular monitoring of radiation levels around the gauge installation and also for deciding the area to be cordoned off around the source, if an emergency arises.

The user should designate a Radiological Safety Officer, who possesses a certificate in radiation safety which is recognised by RPSD and who has received instructions in the Radiation Protection, Rules 1971 and all notifications and orders issued there under, relevant to the proposed application of radiation and who has demonstrated competence in the handling of radiation exposure devices and related instruments and radiation survey meters, which would be used in the course of this assignment. Formal approval should be obtained by the user, from the Competent Authority, for the appointment of Radiological Safety Officer.

The requisite authorisation for the procurement of nucleonic gauges from any Indian manufacturer or the requisite 'No Objection Certificate' for the import of nucleonic gauges of specific type from abroad will be issued by the Competent Authority after the fulfilment of the above requirements by the applicant. All these regulatory controls have been evolved, in order to ensure safety to persons and property, during the use of these gauges.

6. LAWS ON TRANSPORTATION SAFETY :.

6.1 Motor Vehicles Act, 1988 :

Replacing the Act of 1939, this Act (59 of 1988) came into force from 1-7-1989. It was amended in 1994. It extends to the whole of India. It has 14 Chapters, 217 sections and 2 schedules.

Statement of objects and Reasons:

The 1994 Act inter alia provides for

1. Definitions of new type of vehicles.
2. Simplification of procedure to grant a driving licence.
3. Restrictions on alteration of vehicles.
4. Exemptions for non-polluting vehicles.
5. Ceilings removed to curb benami holdings.
6. States .can appoint ST Appellate Tribunals.
7. Punitive checks on substandard components and stocking/sale by the traders.
8. Increase in compensation amount.
9. Removal of time limit for filling claims.
10. Certain punishments made stringent.

11. New formula for compensation based oil age income.
12. The Law .Commission's recommendation regarding claim jurisdiction incorporated.

Definitions : In 49 definitions, new definitions of 'manufacturer' (of motor vehicles) and local authority as ST undertaking are added. Heavy goods means more than 12 Tonnes weight. Light motor vehicle should not exceed 7.5 tonnes. Vehicle having less than 25 CC engine capacity is not a motor vehicle.

Motor vehicle or vehicle means any mechenically propelled vehicle adapted for use upon roads whether the power of propulsion is transmitted thereto from an external or internal source and includes chassis to which a body has not been attached and trailer, but does not include a vehicle running upon fixed rails or a vehicle of a special type adapted for use only in a factory or any other enclosed premises or a vehicle having less than 4 wheels fitted with engine capacity of not exceeding 25 cc.

Licensing of Drivers (Chapter 2, Sec. 3 to 28) :

Without licence no person can drive a motor vehicle. Age limit require to drive a motor cycle of capacity less than 50 CC is 16 years, to drive a transport vehicle it is 20 years and in other cases it is 18 years. For breach the owner of the vehicle, is responsible. The licence is non-transferable. (S. 3 to 7).

Procedure for application and grant of licence is given u/s 8 to II. Matters of licensing and regulation of driving schools are given in Sec. 12. Driving licence is effective throughout India (S. 13). Renewal procedure is given u/s 15, revocation on ground of disease or disability u/s 16 and appeals u/s 17. Grounds of disqualification (drunkard, addict, criminal, fraud, nuisance or danger to public) and revocation are given u/s 19.

Currency of licence u/s 4 is as under :

1	Learner's license	6 months
2	Licence to drive transport vehicle	3 years
3	Licence to drive transport vehicle carrying dangerous goods and renewal with condition to undergo 1 day refresher course of the prescribed syllabus.	1 year.
4	Any other case	20 years or age of 50 years whichever is earlier.
5	After the age of 50 years	5 years
6	After the date of expiry of licence	1 month.

Other provisions are as under :

Power of Court to disqualify	Sec. 20
Suspension of driving licence	Sec. 21, 22
Effects of disqualification	Sec. 23
Endorsement and transfer	Sec. 24, 25
State Register of driving licences	Sec. 26
Rule making power of Central Govt.	Sec. 27
Rule making power of State Govt.	Sec. 28

Others:

Chapter-3	Licensing of Conductors
Chapter-4	Registration of Motor vehicles

Chapter-5	Control of Transport vehicles
Chapter-6	ST undertakings
Chapter-7	Construction, Equipment and Maintenance of motor vehicles.
Chapter-8	Control of Traffic
Chapter-9	Vehicles temporarily leaving or visiting India.
Chapter-10	Liability without fault.
Chapter-11	Third party risk insurance
Chapter-12	Claims tribunals
Chapter-13	Offences, penalties and procedure.
Chapter-14	Miscellaneous
Chapter-15	Traffic Signs
Schedule -2	Compensation of third party claims.

Construction & Maintenance of Vehicles (Chap. 7):

Control of the vehicle should remain effective. Right hand steering is required unless it is equipped with a mechanical or electrical signalling device of a prescribed nature (S. 109).

Central Government can make rules on the following matters

1. Width, height, length, overhead of vehicles and loads to be carried.
2. Size, nature, price, and condition of tyres and marking of date of manufacture and maximum load carrying capacity.
3. Brakes and steering' gear.
4. Safety glasses including prohibition of tinted safety glasses.
5, Signalling appliances, lamps & reflector.
6. Speed governors.
7. Emission of smoke, visible vapour, sparks, ashes, grit or oil.
8. Chassis number, engine number and date of manufacture.
9. Safety belts, handle bars of motor cycles, autodippers and other equipment essential for safety of drivers, passengers and other road users.
10. Standards of components used as in-built safety devices.
11. Transport of dangerous goods.
12. Standard for emission of air pollutants.
13. Installation of catalytic converters.
14. Placement of audio-visual or radio or tape recorder etc. in public vehicles.
15. Warranty after sale and norms therefore.

Exemption can be given subject to conditions (S.IIO).

State Governments can make rules on the above matters and on the following matters also

1. Seating arrangements in public service vehicles and protection from weather.
2. Prohibiting or restricting the use of audible signals at certain times .or in certain places.
3. Prohibiting the carrying of appliances to cause annoyance or danger.
4. Periodical testing and inspection and fees to be charged.
5. Use of trailers with motor vehicles.
6. Particulars to be exhibited.

Control of Traffic (Chap. 8) :

Following provisions are made -

1. Limits of speed, maximum &: minimum (S. 112).
2. Limits of weight and use (S. 113).
3. Requiring the .vehicle to be weighed. (S. 114).
4. Restriction on use of vehicles (S. 115).
5. Requiring erection of traffic .signs (S. 116).
6. Parking places and halting stations (S. 117).
7. Driving regulations (S. 118).
8. Duty to obey traffic signs (S. 119).
9. No left hand driving in public place (S. 120).
10. Signals and signalling devices (S. 121).
11. Leaving vehicle in dangerous position (S. 122).
12. Not to travel on running board, top bonnet or body of the vehicle (S. 123).
13. Prohibition to travel -without pass or ticket (S. 124).
14. Obstruction of driver (S. 125).
15. Stationary vehicles (S. 126).
16. Removal of vehicles abandoned or left unattended on a public place (S. 127).
17. Safety measures for drivers and pillion riders. No driver will carry more than one person on a two wheeler. (S. 128).
18. Wearing helmet confirming to IS, while driving motor cycle. A Sikh's turban is exempted. (S. 129).
19. Duty to produce licence and certificate of registration. Police Officer in uniform can demand a driving licence. RTO can demand insurance certificate, fitness certificate, permit and a conductor's licence (S. 130).
20. Precautions at unguarded railway level crossings. Ensure that no train or trolley is approaching from either side (S. 131).
21. Duty to stop in certain cases like accident to a person, vehicle, property or animal (means horse, cattle, elephant, camel, ass, mule, sheep or goat) (S. 132).
22. Duty of owner to give information regarding driver to a police officer (S. 133).
23. Duty of driver in case of accident and injury to a person. He will carry unless it is not practicable due to mob fury, the injured person to the nearest doctor or hospital who will immediately attend without waiting for any procedural formalities unless the injured person desires otherwise. He will also give information to a police officer and the insurer (S.134).
24. The State Government can make schemes for investigation of accident cases and wayside amenities (S. 135).
25. Inspection of vehicle involved in accident (S. 136).
26. Rule making power of the Central Govt. (S. 137).
27. Rule making power of the State Govt. (S. 138).

6.2 Central Motor Vehicles Rules, 1989 (including Rules pertaining to Transport of Hazardous Goods) :

Under the Motor Vehicles Act, 1988, these Central Motor Vehicles Rules, 1989 were notified on 2-6-1989. They came into force from 1-7-1989 save as otherwise provided in rule 1(3). They were amended in 1993, for transportation of hazardous materials vide Notification dated 26-3-1993, New Delhi. Amendment also came on 28-3-2001.

In Chapter-5 (Construction, Equipment and Maintenance of Motor Vehicles) Rule No. 91, 92 and 129 to 137 are pertaining to transport of dangerous or hazardous goods and their abstract is given belfflu.

Definitions (R. 91) :

'Dangerous or hazardous goods' means the goods of dangerous or hazardous nature to human life specified in Table I, II and III to Rule 137.

Consignor means the owner of hazardous goods.

Emergency information penal means the penal specified in rule 134.

Primary risk is the most potent risk and subsidiary risk is in' addition to that.

General (R. 92):

A motor vehicle including construction equipment vehicle shall be used or allowed to be used in a public place in compliance with this chapter. If the vehicle does not remain under effective control it shall not be used except by towing.

Class Labels, Safety Equipment & Tachograph (R. 129):

Every owner shall display on goods carriage and on every package mark of class label specified in Table I to Rule 137. If the package represents two hazards given in Table III to rule 137, two labels shall be displayed on the package. The label on the package should be appropriate to the type of hazardous goods as specified in Table to Rule 137. Such goods carriage shall carry safety equipment to prevent fire, explosion or escape of hazardous goods and shall be fitted with tachograph conforming to IS, to record the lapse of running time of the motor vehicle, time speeds maintained, acceleration, decceleration etc.

Spark Arrester (Rule 129A) :

Goods carriage carrying dangerous or hazardous goods to human life, shall be fitted with a spark arrester.

Manner of Display of Class labels (R. 130) :

Size of class label on a goods package (e.g. box, drum etc.) should be more than 25 I1lm2 and display angle 45°. Adhesive material should be waterproof. It should not obscure any other markings necessary. On front and rear both the sides it should be displayed.

Consignor's duty (R. 131) :

Every consignor shall supply to the owner of the goods carriage accurate and sufficient information about the hazardous goods so as to enable such owner and his driver to comply with Rules 129 to 137 and be aware of the risk to the health or safety of any person.

Valid registration to carry hazardous goods listed in Table-111, first aid, safety equipment, antidote; training to driver to control transport emergency are also necessary.

Carriage Owner & Driver's duty (R. 132) :

They will satisfy themselves about the information given to them by the consignor. The driver will b given .relevant information in Annexure-V which will be kept in the driver's cabin and available during transportation.

Valid registration to carry hazardous goods, firs aid, safety equipment, tool box, antidotes, fixing of trip route and valid driving licence are also necessary.

Driver to take precautions (R. 133) :

Driver 'shall observe at all times all the precautions to prevent fire, explosion or escape o hazardous goods, shall ensure parking in a safe place and under control and supervision of himself or some other competent person above the age of 18 years. The driver will keep a TREMCARD and information u/ 132(3) in his cabin.

Emergency information Penal (R. 134) :

Such panel (marked on goods carriage i.e. vehicle shall contain -

1. The correct technical name of the hazardous goods in letters bigger than 50 mm size.
2. Class label of more than 260 mm^2 size.
3. Telephone number of emergency services to I contacted in case of fire or any accident with letters and numbers of more than 50 mm size an also the name and telephone number of consignor or other person to receive advice c emergency measures.
4. A sticker on vehicle showing goods being carried on in that trip.

See fig. 28.1 for dimensions of "Emergency Information Panel" and fig. 28.2 for its placement on goods carriage.

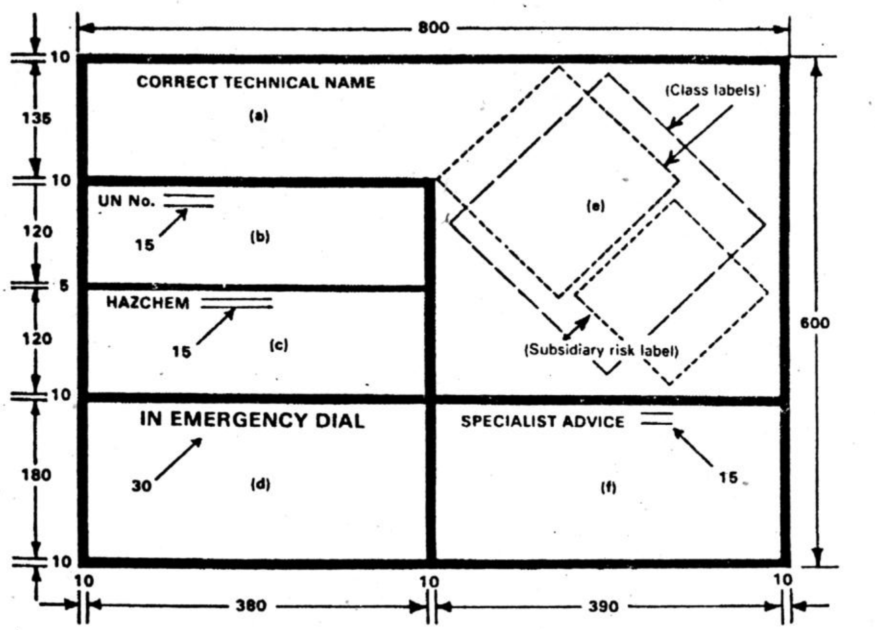

Fig. 28.1 Dimensions (all in mm) of emergency information panel.

EMERGENCY INFORMATION PANELS

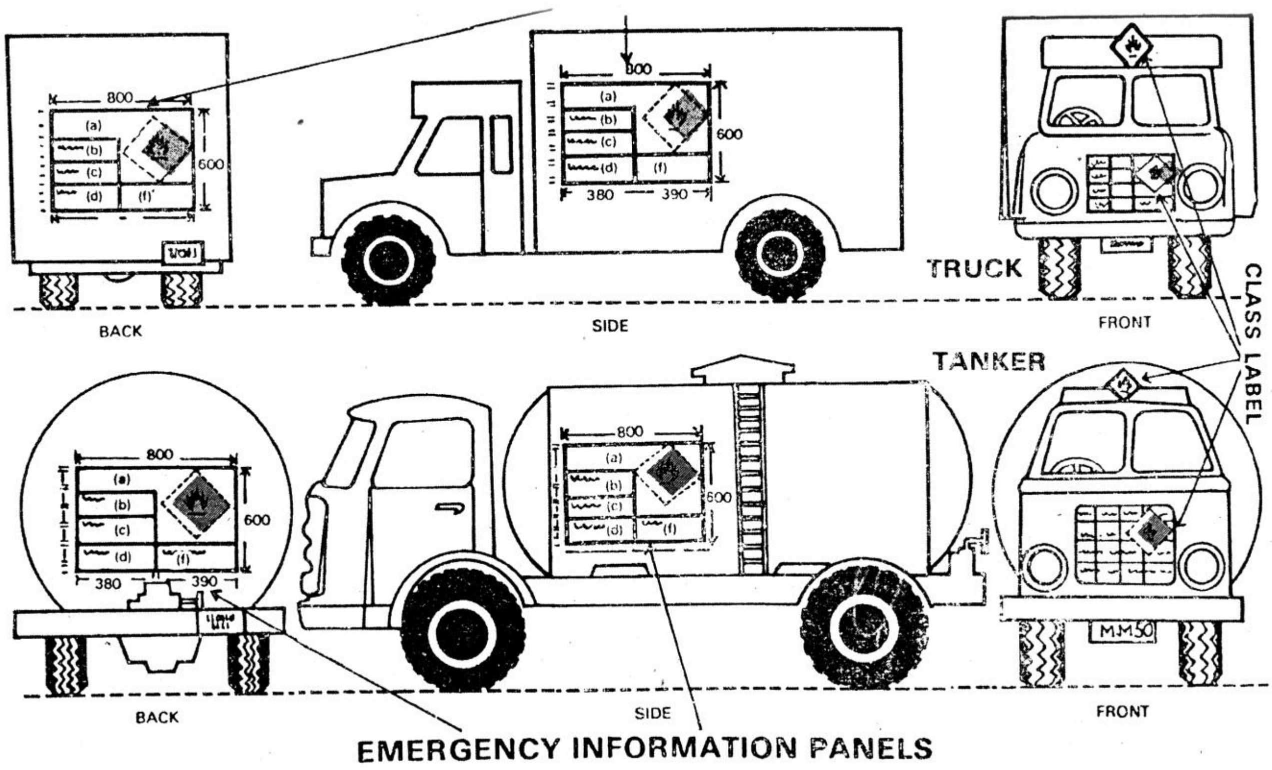

Fig. 28.2 Placement of Emergency Information Panels on goods carriage.

Driver to be instructed (R. 135) :

The owner of goods carriage shall ensure the satisfaction of the consignor that the driver has received adequate instructions and training to understand -

1. Nature of the goods.
2. Nature of the risks there from.
3. Precautions while driving or parking.
4. Action to be taken in case of emergency.

Report of Accident (R. 136) :

The driver transporting any hazardous goods shall forthwith report any accident involving such goods to the nearest police station and also the owner of the goods carriage or the transporter.

Class Labels (R. 137) :

See Table I for eight types of Class Label for Hazardous Goods

Table -1 : Eight 'Class Labels' for Hazardous Goods

Class No.	Type of Goods	Class Label		
		Symbol	**Colour of Symbol**	**Colour of Background**
1 1.1 1.2 1.3 1.4 1.5	Explosives “ “ “ “ “		Black	Orange
2	(1) Non-flammable compressed gases		Black or White	Green
	(2) Flammable gas		Black or White	Red
	(3) Poison (Toxic) gases		Black	White
3	Flammable liquids		Black or White	Red

4 4.1	Flammable Solids		Black	White with vertical red strips
4.2	Substances liable to spontaneous combustion	 Black	Upper half white, lower half red	
4.3	Substances which, in contact with water, emit flammable gases		Black or White	Blue
5 5.1	Oxidising substances		Black	Yellow
5.2	Organic Peroxides		Black	Yellow

6 6.1	(1) Poisonous (toxic) substances		Black	White
	OR (2) Harmful, poisonous (toxic) substances, away from foodstuffs		Black	White
6.2	Infectious substances		Black	White
7	Radioactive substances		Black	Top half yellow, bottom half white
8	Corrosives	 Black	Upper half white, lower half Black with white border	

Table - II : Indicative Criteria :

(a) Toxic chemicals :
1. Oral in rats LD,, > 5 to 200 mg/kg.
2. Cutaneous in rats or rabbits LD, = 10 to 400 mg/kg.
3. Inhalation (4 hrs) in rats LC, == O.I to 2% mg/l

(b) Flammable chemicals :
1. Flammable Gases BP = 20°C at normal pressure.
2. Highly flammable liquids - BP> 20°C at normal pressure and FP< 21°C.
3. Flammable liquids - FP < 55°C and which remain liquid under pressure.

(c) Explosives - Chemicals which may explode under the effect of flame or whidi are more sensitive to shocks or friction than dinitrobenzene.

Table - III : List of Hazardous & Toxic Chemicals;

Chemicals are listed and classified as

C = corrosive, E = Explosive, F = Flammable,
O = Oxidising, R = Reactive and T = Toxic

For the details the list should be referred.

IS:1446 gives classification of dangerous goods and classifies risks, subrisks, chemical substances and dangerous goods.

7. LAWS ON CONSTRUCTION SAFETY :

7.1 Building and other Construction Workers (Regulation of Employment and Conditions of Service) Act, 1996;

This Act (No. 27 of 1996) came into force from 1-3-1996. It extends to the whole of India,. The Act has II chapters and 64 sections.

Preamble : It states that this Act is to regulate the employment and conditions of service of building and other construction workers and to provide for their safety, health and welfare measures and for other matters connected therewith or incidental thereto.

Amenability : The Act applies to every establishment (an individual, firm, association, company, contractor. Government etc.) which employs or had employed on any day of past one year ten or more building workers in any building or other construction work.

It does not apply to an individual who constructs his own residence costing less than Rs. 10 lakhs.

Definitions : Section 2 defines appropriate government (means Central or State Govt), Board, building or other construction work, building worker, Chief Inspector, Director-General, employer (Govt authority, contractor), establishment, fund, wages etc.

Scope : The' Act has chapters on advisory and expert committees, registration of establishments and building workers as beneficiaries, welfare boards, working hours, welfare and other conditions, safety and health measures, inspecting staff, special provisions, penalties (max. Rs. 2000 or 3 months or both) and procedure and miscellaneous.

Welfare : Powers are given to the States to constitute a Welfare Board and the Central/State Government can make rules for prescribing working hours, intervals, rest day, double wages if worked on rest day, overtime wages at twice the ordinary wages, records & registers, latrines & urinals for more than 50 workers, temporary living accommodation (free of charge) which shall be removed or demolished after the work is over, first aid and canteen facilities for employing more 'than 250 workers.

The Act prohibits to employ person who is deaf or has a defective vision or a tendency to giddiness to avoid accident,

The Act provides for drinking water points situated 6 mt. away from any washing place, urinal or latrine, and creche rooms for more than 50 female workers for their children under the age of six years.

Safety and Health Measures (Chapter 7, Sec. 3841):

They are as under :

1. For 500 or more workers. Safety Committee is necessary.
2. For 500 or more workers qualified Safety Officer is necessary.
3. Notice of accident is required for disablement of more than 48 hours. If 5 or more persons die, inquiry within one month is required.
4. Central/State Government has power to make rules pertaining to
   (1) Scaffolding at various stages, means of support and safe means of access.
   (2) Precautions while demolition, shoring etc.
   (3) Competent person to control hazards of explosion or flying material.
   (4) Competent persons to drive or operate transport equipment such as locomotives, trucks, wagons, cranes , trailers, etc.
   (5) Hoists, lifts, lifting gear, their testing, heat treatment and precautions while raising or lowering loads etc. and requirement of competent persons.
   (6) Sufficient .and suitable lighting.
   (7) Adequate ventilation at work place, confined space and prevention of dust, fumes, gases, vapours etc.
   (8) Precautions while stacking, unstacking, stowing, unstowing and handling of materials or goods.
   (9) Safeguarding of- machinery.
   (10) Safe handling and use of pneumatic tools, equipment, etc.
   (11) Fire precautions.
   (12) Maximum weight to be lifted or moved.
   (13) Safety of workers while transporting them by water and their rescue from drowning.
   (14) Safety of workers from live electric wires, overhead wires and electrical machinery, apparatus and tools.
   (15) Safety nets, safety sheets and safety belts as per need.
   (16) Standards of compliance with regard to scaffolding, ladders, stairs, lifting appliances, ropes, chains, & accessories, earth moving equipment and floating operational equipment.
   (17) Precautions while pile driving, concrete work, work with hot asphalt, tar etc. insulation work, demolition, excavation, underground construction and handling materials.
   (18) Safety policy.
   (19) Information of Bureau of Indian Standards under the Bureau of Indian Standards Act, 1986, (63 of 1986). regarding use of any articles or process covered under that Act.

(20) Medical facilities for building workers.
(21) Any matter concerning the safety and health of building/construction workers.

5 The Central Government may frame model rules in respect .of matters stated above which shall be followed by the State while making their rules.

Inspection Staff (Chapter-8, S.42,43) : The Central Govt. may appoint the Director-General of Inspection and the State Govt may appoint the Chief Inspector of Inspection of Building and Construction and both the Governments may appoint necessary Inspectors for local limits. All such Inspectors are public servants u/ s 21 of the IPC. Any document or information shall be produced to the Inspector u/s 175 & 176 of the IPC, and Sec. 94 of the Cr. P. C. is also applicable for the power of search & seizure. Wide powers are prescribed u/s 43 for the Inspectors.

Special Provisions (Chapter-9, S.44 to 46) : An employer is responsible to provide constant and adequate supervision to prevent accidents and to comply safety provisions under this Act (S.44), to pay wages and compensation to building workers (S.45) and to give notice of commencement of building or other construction work at least 30 days before to the Inspector concerned (S.46).

Next Chapter-10 (S.47 to 51) provides for penalties and procedure and Chapter-11 (S.56 to 64) for delegation of powers, returns, protection of action taken in good faith and power' of Central Government to give directions, to remove difficulties and to make rules.

The Building and other Construction Workers" Welfare Cess Act, 1996 (No. 28 of 1996), received the assent of the President on 19-8-1996 and came into force from 3-11-1995. An employer is required to pay cess more than 1% but less than 2% of the cost of construction for the purposes of the Act No. 27 of 1996. The local authority or the State Government can collect the cess in advance while giving approval of a building or construction and shall pay to the Board after deducting the cost of collection not exceeding 1% of the amount collected. Late payment interest is 2% per month on the unpaid amount and a penalty not exceeding the amount of cess is also chargeable after giving opportunity to be heard.

7:2 Building and other Construction Workers (Regulation of Employment and Conditions of Service) Central Rules, 1998:

U/s. 62 and Sec. 40 of the Act (previous Part 7.1), the Central Government made these rules. They came into force from 19-11-1998.

They apply to the work under the jurisdiction of the central Government. They have 5 parts, 30 chapters, 252 rules, 12 schedules and 26 forms. Section-2 gives 74 definitions most of which are technical terms. Thus these rules are very exhaustive and contain many technical details.

Partwise subject division is as under :

Part I	Preliminary, Chap I, II, R. I to 9.
Part II	Central Advisory Committee, Registration of Establishments, Chap III to V, R. 10 to 33.
Part III	Safety & Health, Chap VI to XXV, R. 34 to 233.
Part IV	Hours of work. Welfare, Payment of Wages, Registers & Records etc.. Chap XXVI to XXIX, R. 234 to 249.
Part V	Miscellaneous provisions. Chap XXX, R. 250 to 252.

Thus out of 252 rules, 200 are pertaining to Safety & Health and mostly require engineering knowledge.

Chapter wise subject matter is as under :

Chapter-1 Preliminary (R. I to 4) :

Short title, application, commencement, definitions, interpretation of words not defined and savings.

Chapter-11 Responsibilities and Duties of Employers, Architects, Project engineers & Designers, Building workers etc. (R. 5 to 9):

Rule 5 pertaining to duties of employer and Rule 8 regarding duties of workers are important They have to comply with the provisions of these rules, maintain lifting appliance, transport equipment and all safety devices conforming to safety standards, testing etc., discover and report defects if any, not to remove or interfere with fencing, gangway, gear, ladder, life saving appliances etc., to use only safe means of access and to keep latrines, urinals, washing facilities and canteen in clean and hygienic condition.

Chapter-111 Central Advisory Committee (R. 10 to 22):

Constitution of the Committee, terms of office, membership, staff, meetings, quorum etc. are prescribed.

Chapter-IV Registration of Establishment (R. 23 to 27):

Application for registration in triplicate in Form1, with fees (by DD) to the Registering Officer, grant of certificate of registration (Form-11), Register of Registration (Form-111), and conditions of registration. Fees as under :

Building workers upto 100	-	Rs. 100
101 to 500	-	Rs. 500
501 and more	-	Rs. 1000

Chapter-V Appeals, Copies of Orders, Payment of Fees, etc. (R. 28 to 33) :

Appeal and hearing procedure is prescribed. All fees are to be paid by a crossed DD.

Chapter-VI Safety & Health, General Provisions (R. 34 to 54):

Noise level within limits (Sch. VI), fire protection, emergency action plan for site employing more than 500 workers, fencing of machinery, manual lifting within limits (adult man 55 kg, adult woman or adolescent male 30 kg and adolescent female 20 kg), Health & Safety policy for employing 50 or more workers. Carbon monoxide below 50 ppm and removal of hazardous dust, gas, fumes and oxygen deficiency from any confined space, overhead protection for a building under construction of 15 mt or more in height, the width of protection should be more than 2 mt and height less than 5 mt above the base of the building, protection against slipping, tripping, cutting, drowning and falling hazards, safety net and other adequate equipment to prevent fall, PPE for protection of eye, head and safety from corrosive chemicals, control of electrical hazards, vehicular traffic, stability of structures, illumination of passageways, stacking of materials, disposal of debris, numbering and marking of floors and use of safety helmets and shoes conforming to IS.

Chapter-VII Lifting Appliances and Gear (R. 55 to 81):

All lifting appliances including their parts and working gear, whether fixed or movable should be of sound construction, sound material, adequate strength and maintained in good repair and working condition (R. 55). Provisions for test and examination by a competent person at every 5 years in the manner specified in Sch. I, automatic safe load indicators, safe installation, winches, buckets, safe working load, loading safely and within SWL, operator's cabin, operating instructions, hoists, fencing, rigging of derricks, securing of derrick foot, yearly examination of lifting gears, ropes, heat treatment, register of testing (Form V to X and XXVI), vacuum and magnetic lifting gear, knotting of chains & wire ropes, carrying of persons, attachment of loads, tower cranes and qualification of operator are also prescribed.

Chapter-VIII Runways and Ramps (R. 82 to 85):

Runways or ramps to be used by building workers should have width more than 43 cm, plank thickness 2.5 cm or more, open sides above 3 mt should have guard rail of I mt height and sufficient strength. Runway or ramp to be used by transport equipment should have a width more than 37 mt with timber curbs of 20 cm x 20 cm in width and placed parallel to and secured to the sides of such runway or ramp. Slop of ramps less than I in 4, continuous rise less than 3.7 mt and no more rise without broken by horizontal landing of length 1.2 mt or more. Runway or ramp to be used for wheel-barrows, hand carts or hand trucks should have width more than a metre with plank thickness more than 5 cm.

Chapter-IX Work on or adjacent to Water (R. 86, 87):

Water transport vessel with responsible person, life buoys on deck, prevention from drowning by fencing and suitable rescue equipment etc. are prescribed.

Chapter-X Transport and Earth moving equipment (R. 88 to 95) :

They should be of sound construction and sufficiently strong for the purpose, of sufficient size, duly certified, inspected weekly and safe carrying capacity marked. Power trucks and tractors with effective brakes, head lights, tail lamps, tie chains etc.

Power shovels and excavators, bulldozers, scrappers, mobile asphalt layers and finishers, pavers and road rollers should have silencers, tail lights, power and hand brakes, reversing alarm and search light for forward and backward movement. Pavers should have guards to prevent workers walking under their skip. While moving downhill the engine should be in gear. Open light is not permitted to see level of asphalt. Load bearing capacity of the ground should be examined before using a road roller.

Chapter-XI Concrete Work (R. 96 to 107) :

In addition to general provisions regarding use of concrete, specific safety and health provisions are prescribed for preparation and pouring, erection of concrete structures, buckets, pipes & pumps, mixing and " pouring of concrete, panels & slabs, stressed and tensioned elements, vibrators, inspection & supervision, beams, floors and roofs, stripping and re-shoring.

Chapter-XII Demolition (R. 108 to 118) :

Provisions are made for preparation before demolition, protection of adjacent structures, demolition of walls, partitions etc., method of operation, access to floor, demolition of structural steel, storage of material, floor openings, inspection, warning signs, barricades and mechanical methods of demolition (i.e. by swinging weight, clamshell bucket, power shovel, bulldozer etc.).

Chapter-XIII Evacuation and Tunnelling Works (R. 119 to 168) :

Subjects prescribed are notification of intention to carry out such work, project engineer, responsible person, warning signs and notices, register of employment, illumination, stability of structure; pilling, shoring & bracing, safe access, trenches, depth of trenches, positioning and use of machinery, breathing apparatus, safety measures for tunnelling operation, pneumatic tools, shafts, lift for shaft, means of communication, signals, clearances, shelters, use of internal combustion engine, inflammable oils, coupling and hoses, hose installation, fire resistant hoses, flameproof equipment, storing of oil and fuel underground, use of gases underground, water for fire fighting, flooding, steel curtains, rest shelters, permissible limit of exposure of chemicals (Sch. XII), ventilation, air supply intake point, emergency generators, air mains, bulk head and air-locks, diaphragms, portable electric hand tools (upto 24 volts), circuit breaker, transformer, live wires, welding sets, quality and quantity of air (more than 0.3 m3/ min/person), working temperature (less than 29"C), man-locks and working in compressed air environment, safety instruction and medical lock.

Chapter-XIV Steep Roof (R. 169 to 171):

Safety measures are prescribed for work on steep roofs, construction and installation of roofing brackets and crawling boards.

Chapter-XV Ladders & Step-ladders (R. 172 to 174):

Provisions are made for their construction and safe use, rungs and materials.

Chapter-XVI Catch platform and Hoarding, Chutes, Safety belts & Nets (R. 175 to 180) :

Provisions are made for catch platforms (minimum width 2 mt, inclined height 1.5 mt and open end with fencing of 1 mt height), hoarding for protection of workers, chutes and its use, safety belts, • nets, their use and storage.

Chapter-XVII Structural Frame & Frame work (R. 181 to 185) :

Provisions are made for trained workers for erection of structural-frame and framework, formwork, false work, shoring and deshoring, erection and dismantling of steel and prefabricated structure.

Chapter-XVIII Stacking & Unstacking (R. 186, 187) :

This should be in a safe way, on firm foundation, not against weak partition or wall, safe means of access for a height above 1.5 mt, under supervision, 10 cement (lime etc.) bags in a pile and adequate support for more height, storing of cement or lime in dry place, bricks, tiles or blocks on firm ground, steel according to its shape, size and length and at the lowest level, pipe should not fall by rolling, angle of repose (See Table-21 of Chapter32) of loose materials to be maintained and dust mask for handling of dust laden material.

Chapter-XIX Scaffold (R. 188 to 205) :

Provisions are made for scaffold construction (bamboo or metal), supervision by a responsible person, maintenance, standards, ledger, putlogs, working platform, board, plank and decking, repair of damaged scaffold, opening, guardrails, scaffold used by building workers of different employers, protection against electric power line, screening net and wire nets, tower scaffold, gear for suspension of scaffold, trestle scaffold and cantilever scaffold, scaffold supported by building, use of winches and climbers for suspended scaffold and safety devices for suspended scaffold.

Chapter-XX Cofferdams and Caissons (R. 206,207):

These should be of good construction, sound material, of adequate strength and inspected by a responsible person. Safe means of access, work under supervision and work in compressed air as per standard laid down procedure. Pressure plant and equipment should be examined by a competent person and maintained in good repairs and working condition. Safety valve, pressure gauge (dial range within 1.5 to 2 times the maximum working pressure) and stop or isolation valve are also necessary.

Chapter-XXI Safety Organisation (R: 208 to 211):

Safety Conimittee is necessary where 500 or more building workers work. Equal number of members from employer and employees. Meeting monthly. Senior person having overall control over the affairs of the construction site should be the chairman. Main function prescribed. Agenda and minutes should be circulated and shown to the Inspector on demand.

Safety Officer is necessary where 500 or more building workers work. Their number, qualification, condition of service (including status and scale), duties and facilities are prescribed in Sch. VIII. Requirement of Safety officers is as under :

Up to 1000 building workers	-	1 Safety Officer
Up to 2000	-	2 Safety Officer
Up to 5000	-	3 Safety Officer
Up to 10000	-	4 Safety Officer

For every additional 5000 workers, one more safety officer is required.

Qualification required is B.E., B. Tech or B. Arch with 2 years experience or Diploma holder with 5 years experience and a degree or diploma in industrial safety with an elective subject of construction safety. Other experience is also prescribed. Their duties are reproduced below from Sch. VIII.

(i) to advise the building workers in planning and organising measures necessary for effective control of personal injuries;

(ii) to advise on safety aspects in a building or other construction work and to carry out detailed safety studies of selected activities;

(iii) to check and evaluate the effectiveness of action taken or proposed to be taken to prevent personal injuries;

(iv) to advise purchasing and ensuring quality of personal protective equipment confirming to national standards;

(v) to carry out safety inspections of building or other construction work in order to observe the physical conditions of work, the work practices and procedures followed by building workers and to render advice on measures to be adopted for removing unsafe physical conditions and preventing unsafe actions by building workers;

(vi) to investigate all fatal and other selected accidents;

(vii) to investigate the cases of occupational diseases contracted and reportable dangerous occurrences;

(viii) to advise on the maintenance of such records as are necessary with regard to accidents, dangerous occurrence and occupational diseases;

(ix) to promote the working of safety committees and to act as an advisor to such committees;

(x) to organise, in association with concerned departments, campaigns, competitions, contents and other activities which will develop and maintain the interest of building workers in establishing and maintaining safe conditions of work and procedures;

(xi) to design and conduct, either independently or in collaboration with other agencies, suitable training and educational programmes for prevention of accidents to building workers;

(xii) to frame safe rules and safe working practices in consultation with senior officials of the establishment;

(xiii) supervise and guide safety precautions to be taken in building and other construction work of the establishment.

Fatal accident shall be reported - within 4 hours and non-fatal - causing disability of more than 48 hours - accident shall be reported within 72 hours to the Regional Labour Commissioner (Central), Board, Director General and the near relative of the deceased. It should be in the Form No. XIV.

Procedure for enquiry into cases of accident or dangerous occurrence is also prescribed u/r 211,

Chapter-XXII Explosives (R. 212, 213) :

All explosives at construction site should be used, stored or handled as per MSDS and provisions of the Explosives Act and Rules. Prohibition of smoking and sources of ignition, safe distance and use of nonsparking tools while opening packing, prior warning and danger signals before use, avoiding injury and use under supervision are all necessary.

Chapter-XXIII Piling (R. 214 to 222):

Provisions are made for good design, construction, operation, inspection and maintenance of pile driving equipment, considering ergonomic principles, electrical safety, air or steam hammer, stability of adjacent structure, protection of operator, instruction and supervision, entry of unauthorised person, working platform on piling frames and pile testing.

Chapter-XXIV Medical Facilities (R. 223 to 232):

Provisions are made for pre and periodical medical examination of workers as per Sch-VII, by the doctors and hospitals approved by the Central Government, certificate of medical examination in Form No. XI, record in Form No. XII, duties of construction medical officers, occupational health centre for hazardous processes mentioned in Sch. IX with services and facilities laid down in Sch. X and qualification of a Construction Medical Officer in Sch. XI, ambulance room equipped with the articles specified in Sch. IV with necessary staff and records, ambulance van specified in Sch. V, stretchers, occupational health services, notice of poisoning or occupational diseases specified in Sch. II and notice in Form No. XIII, first-aid boxes with articles specified in Sch. Ill and emergency care services or treatment with essential life saving aids and appliances as mentioned in R. 232.

Chapter-XXV Information to Bureau of Indian Standards (R. 233):

Details regarding performance, deviation or shortcomings of the building materials, articles or processes against IS prescribed shall be furnished to the Bureau of Indian Standards. In case of no IS prescribed, suggestions for improvement shall be given to the Bureau to consider and form necessary standards.

Chapter-XXVI Hours of work. Rest intervals and Weekly off etc. (R. 234 to 237) :

Provisions are made for 9 hours a day or 48 hours a week, rest interval of at least half an hour before more than 5 hours work, spread-over 12 hours on any day, double wages for overtime work or working on rest day, weekly rest day with its previous intimation notice, substituted holiday on one of the five days immediately before or after such rest day and to be given before ten days continuous working.

Chapter-XXVII Notices, Registers, Records and Collection of Statistics (R. 238 to 242) :

Notices of rates of wages, hours of work, wage period, date of payment of wages, names and addresses of the concerned Inspectors and date of payment of unpaid wages in English, Hindi and local language with a copy to the concerned Inspector are required.

Notice of commencement and completion of work in Form No. IV before 30 days and notice of change in this notice within 2 days of the change are also necessary.

Following registers are required :

Register	Form No.
Register of workers	XV
Muster roll	XVI
Register of wages	XVII
Wage –cum-muster roll where a wage period is 15 days or less	XVIII
Register of deductions for damage or loss	XIX
Register of fines	XX
Register of advances	XXI
Register of overtime	XXII
Wage book (for a wage period one week or more)	XXIII
Service certificate	XXIV

Registers under Payment of Wages Act, Maternity Benefit Act and Contract Labour Act shall be deemed to be the respective registers. A combined or alternative form in lieu of above Forms shall require -prior approval of the Central Government. All registers/records should be maintained up-to-date, kept at the workplace, preserved for 3 years and produced on demand before the authority.

An annual return in Form No. XXV shall be sent before 15th February to the registering authority with a copy to the Inspector concerned.

Chapter-XXVIII Welfare (R. 243 to 247) :

Separate latrines or urinals (as required u/s 33 of the Act) for male and female workers, canteen for more than 250 workers at a distance 15.2 mt away from any latrine, urinal or source of dust, smoke or obnoxious fumes. Tea and snacks shall be served at a workplace 200 mt from the canteen.

Chapter-XXIX Wages (R. 248, 249) :

Wages shall be paid before 7th day (workers<1000) or 10th day (workers>1000) of the wage period concerned. In case of termination it shall be paid before the expiry of the second working day from the date of termination. A notice of wage period, date, time and place of payment shall be displayed in English, Hindi and the local language.

Chapter-XXX Powers of Director General and Inspectors (R. 250 to 252) :

Powers to engage experts and agencies and powers of Inspectors including prohibition order are prescribed.

The Building and other Construction Workers' Welfare Cess Act 1996 and Rules 1998 provide for levy and collection of cess on the cost of construction to generate fund for Building and other Construction Workers Welfare Board constituted under the main Act (Part 7.1).

7.3 Gujarat Building and Other Construction Workers (Regulation of Employment and Condition of Service) Rules, 2003

U/s 62 and 40 of the Act (stated in Part 7.1) the Government of Gujarat published these rules by notification dt. 18-8-2003. They came in to force from this date.

They are similar to the Central Rules stated in part 7.2 above.

Chapter 3 provides for constitution and working of State Advisory Committee. Rule 27 prescribes fees for 'Certificate of Registration' based on proposed number of workers. Chapter 7 provides for State Welfare Board for construction workers. Sch. 8 prescribes number of Safety Officers their qualification, duties etc. Sch. 12 prescribes TLV and STEL values for certain chemicals.

8. LAWS ON DOCK SAFETY :

8.1 Dock Workers (Safety, Health & Welfare) Act, 1986 :

This Act (No. 54 of 1986) was enacted on 712-1986. It came into force from 15-4-1987. It extends to the whole of India. It has 25 sections. It provides for the Safety, Health and Welfare of dock workers and for matters connected therewith. Definitions (S.2):

Appropriate Government means, in relation to any major port, the Central Govt., and, in relation to any other port, the State Govt.

Cargo includes anything carried or to be carried in a ship or other vessel.

Dock Work means any work in or within the vicinity of any port in connection with loading, unloading, movement or storage of cargoes and includes preparation of ship or. other vessel and cleaning, painting, chipping of any hold, tank, structure or lifting machinery or any other storage area in board, ship or dock.

Dock Worker means a person employed or to be employed directly or through any agency, on dock work.

Inspectors and the Chief Inspector of Dock Safety (S. 3 to 8) :

The appropriate Govt. can appoint them. They can enter any ship, dock, warehouse to check any dock work, make examination of the ship, dock, lifting machinery, cargo, gear, staging, transport equipment, premises etc, require documents, take evidence, copies, photograph, sketch, sample etc., hold inquiry into any accident, issue show cause notice relating to safety, health and welfare provisions, prosecute or prohibit any dock work in dangerous condition until measures have been taken to remove that danger. Inspector will not disclose information or complaint received by them. Appeal to the Chief Inspector should be made within 15 days.

Other Provisions:

The appropriate Govt. may constitute an Advisory Committee for advice regarding administration of this Act and the regulations (S. 9). It can also appoint a competent person to inquire into any accident or occupational disease to dock workers (S. 10). Dock workers will not misuse anything provided to secure health, safety and welfare of dock workers, will not do anything to endanger self or others and, will not neglect to make use of anything provided as mentioned earlier.

Subjects of Regulations (S. 21) :

Regulations may provide for safety of working place, approaches, lighting, ventilation, temperature, fire & explosion prevention and protection, safe means of access, opening and closing of hatches and protection of dangerous openings, safety from fall, lifting and cargo handling appliances, workers employed in terminals, fencing of machinery, live electrical conductors, steam pipes, hazardous openings, staging, rigging and derricks, testing of lifting m/c, ropes, slings etc., escape routes, safe methods of working and handling dangerous substances or working in harmful environment, employing persons for handling cargo or any work on ship, transport of dock workers, precautions against noise, vibration and air pollution at workplace, protective equipment and clothing, sanitary, washing and welfare facilities, medical supervision, ambulance room, first-aid and rescue facilities, safety and health organisation,' training of dock workers, investigation of accidents, dangerous occurrences and diseases, forms of notices, authorities to be reported, submission of statement of accidents, man-days lost, volume of cargo handled and particulars of dock workers.

8.2 Other Acts, Rules & Regulations for Dock Workers :

(1) Dock Workers (Safety, Health and Welfare) Regulations, 1990:

They came into force from 16-3-1990. They apply to major ports in India as defined in the Major Ports Act, 1963. They have 7 parts, 112 regulations, 14 forms and 4 schedules.

Regulation 2 has 27 definitions including container, container terminal, conveyor, dangerous goods, dock, hatch, lifting appliance, loose gear, pulley block, responsible person, safe working load, transport equipment etc.

Reg. 3 is regarding power of inspectors. •

Part 3 (Reg. 9-94) is on safety containing subjects of fencing, railings, staging, life saving appliances, illumination, fire protection, excessive noise, means of access, ladders, lifting appliances and gear, test and examinations, winches, ropes, heat treatment of loose gears, marking of SWL, pulley blocks, power trucks, hand trucks, fork lifts, dock railways, conveyors, handling of cargo, stacking and unstacking, cargo platforms, winch and crane operations, signaller, handling of dangerous goods, general precautions, explosive and inflammable cargo, broken or leaking containers, toxic solvents, fencing of terminals, stuffing and destuffing, fencing of motors, transport of dock workers by land .and water, reporting of accidents, notification of diseases, safety officers and renewal of licences.

Part 4 (Reg. 95-99) is on Health containing provisions of cleanliness, drinking water, latrines and urinals, spittoons and ventilation and temperature.

Part 5 (Reg. 100-109) is on Welfare containing provisions of washing facilities, first aid boxes, ambulance rooms, shelters, canteens, medical examinations/notices and welfare officers.

Part 6 (Reg. 110-118) is on Special provisions like statement of accidents, training, emergency action plans, safety committees, occupational health services and general safety.

(2) Dock Workers (Safety Health and Welfare) Scheme, 1961:

Under section 4 of the Dock Workers (Regulation of Employment) Act, 1948 this Scheme is formed. It came into force on 1-10-1961. It has 5 parts, 60 paras, 4 schedules and 2 forms.

Para 2 gives 8 definitions including competent persons, dock, port authority etc.

The scheme contains the provisions of - powers of inspectors, notice of accidents and dangerous occurrences, diseases, duties of port authorities, obligations of dock workers and provisions regarding health and welfare of dock workers.

Part 4 on Safety (para 22 to 57) contains provisions of fencing of dangerous places, gates, floor loading, stairs, means o escape in case of fire, testing, annealing, special gear, ropes, drivers of cranes, cargo platforms, conveyors, power trucks, and hand trucks, locomotives and wagons, stacking and un stacking, precautions against falling material, corrosive and caustic substances, dust fume, etc., oxygen deficiency, fumigated spaces, machinery, ladders, fire protection and rescue.

9. LAWS ON LIFTS AND ESCALATORS

9.1 Gujarat Lifts and Escalators Act 2000

Preamble of this Act states that its object is to regulate construction, maintenance and safe operation of lifts and escalators and the machinery and apparatus pertaining thereto in the State of Gujarat.

It came into force from 15-6-2001 and extends to whole of the State of Gujarat. It has 26 sections.

As clarified in the Statement of Objects and Reasons, this Act replaces the Bombay Lifts Act 1939

Sec 2 gives 14 definitions.

'Lift' means an appliance designed to transport persons or materials between two or more levels in a vertical or substantially vertical direction by means of a guided car or platform;

'Lift car' means the load carrying unit with its floor or platform car frame and enclosing body work;

'Lift installation' includes the lift car, the lift way, the lift way enclosure and the operating mechanism or the lift and all ropes, cables, wires and plant, directly connected with the operation of the lift;

'Escalator' means a power driven inclined continuous stairway used for raising or lowering passengers;

'Escalator installation' includes the escalator, the track, the trusses or girders, the balustrade, the step treads and landings and all chains, wires and plants directly connected with the operation of the escalator;

'Rated speed' means the speed at which the lift or escalator is designed to operate;

Permission before installation (erection) is necessary (S.3).

After completion of installation, owner should apply within one month to get licence to operate the lift or escalator. Validity of licence is 3 years. Before 30 days of expiry, renewal application is necessary (S.6). No operation without licence. Conditions are to be fulfilled (S.7). Addition/alteration requires prior permission (S.9). For violation of the Act, Rules or Conditions; licence can be suspended or cancelled.

Owner has to give facilities for inspection (S.12). The Chief Inspector may authorise a person for erection, maintenance, inspection and test. (S13).

Accident (death or injury) is to be reported to the Lift Inspector, Police Commissioner and District Magistrate. (S14) . -

Inspectors under the Electricity Act will be the inspectors under this Act.

Every lift or escalator shall be inspected by lift inspector before grant of licence u/s 4 and thereafter at every 3 years. The owner of the lift or escalator shall get his lift or escalator inspected and tested by an authorised person (u/s 13) at every six months and submits such inspection and test report to the Chief Inspector. The authorised person shall also submit his report to the Chief Inspector. (S 16).

9.2 Gujarat Lifts and Escalators Rules 2001

U/s 24 of the Act, these rules were notified. They came into force on 16-6-2001. It has 73 rules and 21 Annexure. Forms are contained in annexure.

In Rule 2, there are 81 definitions most of which are technical terms. Some are given below

(1) "Automafic control" means a method of operation by which a momentary pressure on a push button sets the car in motion and causes it to stop automatically at any required lift landing;
(2) "Buffer" means a device designed to stop a descending car or counter weight beyond its normal limit of travel by storing or by absorbing and dissipating the kinetic energy of the car or counterweight;
(3) "Car frame" means the supporting frame or sling to which the platform of the lift car, its safety gear, guide shoes and suspension ropes are attached;
(4) "Control" means the system governing starting, stopping direction of motion, acceleration, speed and retardation of moving member;

(5) "Counter weight" means a weight or series of weights to counter-balance the weight of the lift car and part of the rated load;
(6) "Door-imperforated" means a door which is not having any perforations other than those required for vision panel for maximum size 100 Square centimetre;
(7) "Emergency stop push or switch" means a push button or switch provided inside the car designated to open the control circuit to cause the lift car to stop during emergency;
(8) "Gear less machine" means a lift machine in which the motive power is transmitted to the driving sheave from the motor without intermediate reduction gearing and has the brake drum mounted directly on the motor shaft;
(9) "Geared machine" means a machine in which the power is transmitted to the sheave through worm, or worm and spur reduction gearing;
(10) "Lift machine" means the part of the lift equipment comprising the motor(s) and the control gear therewith, reduction gear (if any), brake(s) and winding drum or sheave, by which the lift car is raised or lowered;
(11) "Over speed governor" means a device which brings the lift car and/or counterweight to rest by operating the safety gear in the event of the speed in a descending direction exceeding a predetermined limit;
(12) "Safety gear" means a mechanical device attached to the lift car or counterweight or both, designed to stop and to hold the car or counterweight to the guides in the event of free fall, or, if governor operated, of over-speed in the descending direction;
(13) "Sheave" means a rope wheel, the rim of which is grooved to receive the suspension ropes but to which the ropes are not rigidly attached and by means of which power is transmitted from the lift machine to the suspension ropes;
(14) "Slack rope switch" means switch provided to open the control circuit in case of slacking of rope(s);
(15) "Trailing cable" means a flexible cable providing electrical connection between the lift car and a fixed point or points.

Chapter-2 on 'General requirements' requires-

Prior permission to install lift or escalator with drawings (R3), licence to use (R4), renew at 3 years (R8), compliance of safety provisions ie chapter-3 & 4 (R7), terms & conditions to be fulfilled by the owner (R9), appointment of lift attendant (except residential premise) (R-12), intimation of accident in Annex-XVI within 48 hours (R-13) conformity with Indian Standards (R-17), conformity with National Building Code (R-18) conformity with Electricity Act and Rules (R-20), factor of safety 5 and more, periodical inspection and testing (R-23), quiet operation(R24) and separate electric circuit for lift or escalator.(R25)

Chapter-3 on lifts

Prescribes detailed engineering provisions of lift wells (R 26), lift well enclosure (R 27), lift pite '(R28), bottom & top car clearances &: gravity stopping distance (S=5/V2 v is initial velocity)(R-29), counterweight clearance (R 31), landing doors imperforate, their strength, fire resistance of more than one hour (R 32), door interlocking (R-33), guide rails (R 34), buffers of spring or oil, (R 35), counter weights (R36), lift car-its enclosure, door, floor, emergency stop device, light, alarm, stop switch, fire lift (R37), load/ capacity plate, car area depending on load (R38), car frame (R39), safety gears with speed governor to stop descending car, such device on counter weight to stop ascending car, slack rope safety gear, stopping distances at governor tripping speed (R40), machine room (R42), outline dimensions (R43), sheaves &: pulleys (R44), lift machine (R 45), suspension by three ropes, no use of chain, rope dia > 10 mm, factor of safety 10 to 12 (R 46), controllers & operating devices (R47), terminal stopping and final limit switches (R48), electric wiring & switches (R49), testing at site (R50) and other precautions like no operation by unauthorised person etc (R51).

Chapter -4 on Escalators

Prescribes angle of inclination -30 to 35 degree from horizontal with vertical rise not more than 6 mts (R52), width of escalators, not more than 33 cms of step width (R53), balustrading (R 54), hand rail moving with the step, height > 30 cms (R55), step dimensions depth > 40 cms, rise < 22 cms and width 40 to 102 cms (R56), comb plates (R57), trusses or girders (R58), track arrangement of step wheel, running gear and step chain brakes (R59), capacity & loading (R60), rated speed < 38 mt/min (R61), independent motor drive & brake (R62), chain with factor of safety >.10 (R63), safety devices including start switch, stop switch and speed governor (R64), machine room (R65), lighting of step tread > 20 lux (R66), access to interior of escalator (R67), tests for rated load, over speed, reversal, broken chain and stop buttons (R68) and other precautions like attendant, no inadvertent starting, fire extinguisher, cleaning, lubrication etc. (R69)

Annex XIII requires appointment of at least one mechanical engineer (BE with 4 years & DME with 8 years experience) and one electrical engineer (BE with 4 years & DEE with 8 years experience), workshop with prescribed instruments to get certificate of authorization u/r II. See Annex - XIV also.

Different authorizations for erection &: maintenance of lifts or escalators and their periodical inspection and testing are available.

Annex-XVIII u/r 23 for initial and periodical inspection report of lift and Annex-XIX of escalator are most important.

10. LAWS ON ENVIRONMENTAL PROTECTION:

10.1 Water (Prevention and Control of Pollution) Act 1974 :

This Act (No. 6 of 1974) was enacted by the Parliament on 23-3-1974. It is applicable to the States from their dates of their adoption. It was amended in 1978 and 1988. '

It has 8 chapters and 64 sections. It applies to certain States and the States who adopt it.

The Act intends to provide for the prevention and control of water pollution, maintaining or restoring of wholesomeness of water. Boards, its powers and functions for matters connected therewith.

Chapter-1 gives following definitions :

Board means the Central or a State Board.

Outlet includes any conduit pipe or channel, open or closed, carrying sewage or trade effluent or any other holding arrangement which causes or is likely to cause pollution.

Pollution means such contamination of water or such alteration of the physical, chemical or biological properties of water or such discharge of any sewage or trade effluent or of any other liquid, gaseous or solid substance into water (directly or indirectly) as may or is likely to create a nuisance or render such water harmful or injurious to public health or safety or to domestic, commercial, industrial, agricultural or other legitimate uses, or to the life and health of animals or plants or of aquatic organisms.

Central Board, State Board, Sewage effluent and Trade effluent are also defined and distinguished.

Stream includes river, water course, inland water, sub-terranean waters and sea or tidal waters to the extent notified.

Sewer means any conduit pipe or channel, open or closed, carrying sewage or trade effluent.
Subjects of other chapters are as under :

Chapter I	:	Preliminary (S. 1,2)
Chapter II	:	Central & State Boards (S.3 to 12) Chapter ID : Joint Board (S. 13 to 15).
Chapter IV	:	Powers & Functions of Boards (S. 16 to 18).
Chapter V	:	Prevention and Control of water Pollution (S. 19 to 33A)
Chapter VI	:	Funds, Accounts & Audit (S. 34 to 40) Chapter VII : Penalties & Procedure (S. 41 to 50)
Chapter VIII	:	Miscellaneous including rule making powers of the Central and State Govts. (S. 51 to 64).

Functions of the State Board given u/s 17 are more important.

Some provision of Chapter-V are explained below -

A State Board can require from any industry, operation, process, treatment and disposal system to furnish information regarding construction, installation or operation of such establishment (S.20), can take samples of effluents in a manner prescribed for analysis at the occupier's cost (S.21), shall send a copy of the report of analysis to the occupier (S.22), has power of entry and inspection of plant, record, register, document, material etc. (S. 23) and of prohibiting use of stream or well or sewer or on land for disposal of polluting matter by prescribing standards and no person shall make water pollution (R. 24) or make any new outlets or new discharges without previous consent of the State Board, which will make inquiry and grant consent with conditions imposed (which shall be binding to the applicant) or refuse it with reasons recorded in writing. If the consent is not given or refused within 4 months, it should be deemed to have been granted unconditionally (R. 25 & 26).

An aggrieved person has right to appeal u/s 28. Revision is possible u/s 29.

Any accident, act or event causing water pollution should be forthwith intimated to the State Board (S. 31). The State Board can take steps to remove pollution or such discharges (S. 32) or apply to courts for restraining apprehended water pollution and the court can order the person to remove that pollution or authorise the Board to do it at the cost of that person (S. 33). The State Board has power to give directions to any person, officer or authority for closure, prohibition or regulation of any industry, operation or process or the stoppage or regulation of supply of electricity, water or any other service (S. 33A).

Annual report (financial year wise) to be submitted by SPCV to state Govt. and by CPCB to Central Govt. (S. 39)

10.2 Water (Prevention and Control of Pollution) Rules 1975 :

The Central Government u/s 63 of the Water Act made these rules effective form 27-2-1975. The) were amended in 1976, 1978, 1986, 1987 and 1989.

They have II chapters, 35 rules, 4 schedules and 15 forms under schedule 1. Their subject matter is a; under.

Chap-1 : Preliminary (R. 1,2)
Chap-2 : Service conditions of Members (R. 3 to 6)
Chap-3 : Power & Duties of the Chairman and Member Secretary and appointments o officer and employees (R. 7 to 9)

Chap-4 : Temporary association of persons witt Central Board (R. 10)
Chap-5: Consulting Engineer (R. 11 to 16).
Chap-6: Budget of the Central Board (R. 17 to 23)
Chap-7: Annual Report of the Central Board (R. 24)
Chap-8: Account of the Central Board (R. 25)
Chap-9: Analyst of the Central Board (R. 26, 26A)
Chap-10 : Central water laboratory (R. 27, 28)
Chap-11 : Powers & functions of the Central Board in relation to Union territories (R. 29 to 35).

In addition to above mentioned Central Rules, State Rules are also available as under.

Gujarat Water (Prevention and Control of Pollution) Rules, 1976 :

They were notified and came into force from 268-1976. They have 25 Rules and Forms A to H-V.

State water laboratory means that established u/ s 52 of the Act. Other provisions are pertaining to fees and allowances to members, quorum, order of business, minutes, appointment of consulting engineers, powers and duties of the chairman and those of member secretary, application for consent and its investigation, budget, annual report and statement of accounts etc.

10.3 Air (Prevention and Control of Pollution) Act, 1981:

This Act (No.l4 of 1981) was enacted on 293-1981. It came into force from 16-5-1981. It extends to the whole of India. It has 7 chapters and 54 sections.

It was amended ml987.

Chapter-1 gives following definitions (S I and 2):

Air pollutant means any solid, liquid or gaseous substance including noise present in the atmosphere in such concentration as to be injurious to human beings, other living creatures, plants, property or environment.

Air pollution means the presence of any air pollutant in the atmosphere.

Approved appliances means any equipment or gadget used for bringing of any combustible material or for generating or consuming any fume, gas or particulate matter and approved by the State Board for the purpose of this Act.

Chimney includes any structure with an opening or outlet from or through which any air pollutant may be emitted.

Control equipment means any apparatus, device, equipment or system to control the quality and manner of emission of any air pollutant and includes any device used for securing the efficient operation of any industrial plant.

Emission means any solid, liquid or gaseous substance coming out of any chimney, duct or flue or any other outlet.

Industrial plant means any plant used for any industrial or trade purposes and emitting any air pollutant into the atmosphere.

The words 'approved fuel' and 'automobile' arc also defined. Other chapters are as under :

Chapter - II :	Central & State Board (S.3 to 15)
Chapter - III :	Powers & functions of Boards (S.16 to 18)
Chapter – IV : :	Prevention & Control of Air pollution (S.19 to 31A)
Chapter – V :	Funds, Accounts & Audit (S.32 to 36).
Chapter – VI :	Penalties & procedure (S 37 to 46)
Chapter - VII:	Miscellaneous including rule making powers of the Central and State Govt. (S. 47 to 54).

Functions of the central and State Pollution Control, Boards are given in Chapter III.

Some provisions of Chapter-IV are as under :

The State Government may after consultation with the State Pollution Control Board, notify any area as air pollution control area for the purposes of this Act, prohibit the use of any polluting fuel in any area, require use of an approved appliance, prohibit burning of any polluting material in any area (S.19) and instruct the motor vehicles authority to ensure compliance of the standards of automobiles emission laid down by the State Board (S.20).

No industrial plant shall be established or operated without the previous consent of the State Board. An application for consent should be in a prescribed form. The State Board can grant or refuse within 4 months, or cancel any existing consent or refuse further consent after expiry if the conditions are not fulfilled. Every person getting consent has to comply with the following conditions.

1 The control equipment approved by the State Board, should be installed and operated.
2 The existing control equipment shall be altered or replaced as per the directions of the State Board.

3 The control equipment should be maintained at all times in good running condition.
4 Chimney, approved by the State Board shall be erected or re-erected.
5 Such other conditions as the State Board may specify
6 The conditions should be fulfilled within a stipulated time.

Due to any technological improvement or otherwise the State Board can vary its conditions. If the consent is transferred to another person, the transferee will be responsible for compliance (S. 21).

Standards laid down by the State Board shall not be exceeded (S.22). The Board has power to approach the court for restraining persons from causing air pollution. The court can direct that person to stop pollution or authorise the Board to implement the direction at the cost of that person (S.22A).

An accident, unforeseen act or event of emission beyond the prescribed standard shall be forthwith intimated to the State Board and to the prescribed authorities, who shall take, as early as practicable, remedial measures to mitigate that emission at the cost of the person concerned (S.23).

Board officers have power of entry and inspection to check conditions, control equipment, industrial plant, record, register, document, material etc. (S.24) and can call for any information regarding types and level of emission and any compliance necessary (S.25), can take samples of air or emission in the manner prescribed and can send the sample to the laboratory for analysis (S.26). The Board analyst shall submit the report of analysis in triplicate to the Board, of which one copy will be sent to the occupier by the Board (S.27).

The State Government can establish one or more State Air Laboratories (S.28) and can appoint analysts (Govt. analysts). The Board can also appoint analysts (Board analysts) (S.29) whose report can be used as a evidence in any proceeding under this Act (S.30).

An aggrieved person can appeal within 30 days to the prescribed authority (S.31).

Central or State Board has power to give directions to any person, officer or authority who shall comply with such directions. Such power includes the power to direct closure, prohibition or regulation of any industry, operation or process or the stoppage or regulation of supply of electricity, water or any other service (S. 31A).

10.4 Air (Prevention and Control of Pollution) Rules, 1982 :

The Central Government u/s 53 of the Air Act made these rules effective from 18-11-1982. They have 7 chapters, 17 rules, 3 schedules and 9 forms. The subject matter is as under :

Chapter - I	Preliminary (R.l,2)
Chapter - II	Procedure for the Board and its committees (R.3 to II).
Chapter - III	Allowances to a committee member to attend the meeting (R.12).
Chapter - IV	Temporary association of persons with the Central Board (R.13, 14).
Chapter -V	Budget of the Central Board (R.15).
Chapter-VI	Annual Report of the Central Board (R.16).
Chapter - VII	Account of the Central Board (R.17).

In addition to above mentioned Central Rules, State Rules are also available as under.

Gujarat Air (Prevention and Control of Pollution) Rules, 1983.

They were notified and came into force from II11-1983. They have 25 Rules, 2 Schedules and Forms I to II.

Rule 2 gives 12 definitions.

Furnace means any structure or installation where any form or type of fuel is burnt or otherwise a high temperature higher than ambient is maintained.

State Laboratory means that established u/s 17 of the Act.

Other provisions include terms, conditions and functions of the State Board, appointment, fees and tours of consultant, air pollution control area, application for consent and its inquiry, manner of taking samples of air, functions of state air laboratory, qualifications for Govt. analyst and board analyst, appeals, budget, annual report and statement of accounts etc.

10.5 Environment (Protection) Act, 1986 :

This Act (29 of 1986) was enacted on 23-51986. It came into force, from 19-11-1986 in the whole of India. It has 4 chapters and 26 sections.

The Statement of Objects and Reasons of the Act identifies the need for a general legislation on environmental protection to enable co-ordination of activities of the various regulatory agencies, creation of an authority which will assume a lead role for studying, planning and implementing long-term requirements of environmental safety and give direction to and co-ordinate a system of speedy and adequate response to emergency situations threatening the environment.

Its preamble states that it is an Act to provide for the protection and improvement of environment and for matters connected therewith

Chapter -I : Preliminary (S.I, 2) :

Some definitions are as under :

Environment includes water-air and land and the inter-relationship which exists among and between , air and land and human beings, other living creatures, plants, micro-organism and property [S.2(a)].

Environmental pollutant means any solid, liquid or gaseous substance present in such concentration as to be injurious to environment, [S.2(b)].

Environmental pollution means the presence of any environmental pollutant in the environment, [S.2(c)]

Handling in relation to any substance, means the manufacture, processing, treatment, package, storage, transportation, use, collection, destruction, conversion, offering for sale, transfer or the like of such substance [S.2(d)].

Hazardous Substance means any substance or preparation which by reason of its chemical or physiochemical properties or handling is liable to cause harm to human beings, other living creatures, plant, microorganism, property or the environment., [S.2(e)].

Chapter - II : General Powers of the Central Government (S. 3 to 6):

The Central Govt. has power to take all necessary measures to protect and improve the quality of environment and to prevent, control and abate environmental pollution, co-ordinate action by the State Govts, officers and other authorities and has power of planning and execution of a nation wide programme, laying down standards for the quality of environment, standards for emission of pollutants, procedures and safeguards for the prevention of accidents which may cause environmental pollution and for the handling of hazardous substances, examination of processes, materials and substances and empowering officers for that, carrying out research and investigation, establishing environmental laboratories, collection and dissemination of information, preparation of manuals, codes or guides for prevention, control and abatement of environment pollution and constituting authorities to carry out these functions (S.3).

The Central Govt. can appoint officers for above purposes (S.4), can give directions to any person, officer or authority including direction of closure, prohibition or regulation of any industry, operation or process or stoppage or regulation of supply of electricity, water or any other service (S.5). It has power to make rules (S.6, 25, 26) and power to delegate its powers and functions (S.23).

Chapter-III : Prevention, Control and Abatement of Pollution (S. 7 to 17) :

Environmental pollutants in excess of .standard prescribed shall not be discharged (S. 7). While handling hazardous substance prescribed procedure and safeguards shall be followed (S. 8). Excess discharge shall be forthwith reported to the authorities and steps shall be taken to prevent or mitigate such accidental pollution. The authorities shall also take similar steps at the cost of the person concerned (S. 9).

Persons empowered by the Central Government have powers of entry and inspection, examination and testing of any equipment, industrial plant, record, register, document, material etc. (S. 10), to take samples of air, water, soil or other substance from any factory, premises or other place in a manner prescribed and to send them to the laboratory for analysis (S.ll), to establish environmental laboratories (S.12). Sec. 14 is regarding Central Analysts (S. 13) whose report can be produced as an evidence in proceeding under this Act, (S. 14).

Provisions are made for penalty (S. 15) and offences by companies (S. 16) and Government Departments (S. 17).

Chapter - IV : Miscellaneous (S. 18 to 26):

Provisions are made for protection of action in good faith (S.18). Cognisance of offences by the authority as well as any person who has given notice of at least 60 days of the alleged offence and his intention to complain, to the authority concerned (S.19). Information, reports or returns (S.20) and no civil court has any jurisdiction in respect of anything done by the authority or the Central Government (S.22). This Act has overriding effect notwithstanding anything inconsistent with any other Act but if any offence is punishable under this Act and also under any other Act, then the offender shall be punished under the other Act and not under this Act (S.24).

10.6 Environment (Protection) Rules, 1986 :

The Central Government u/s 6 & 25 of the Environment (protection) Act made these rules effective from 19-11-1986. They were amended in 1987, 1988, 1989, 1991,1992, 1993 and from 1996 to 2006 every year.

They have 14 rules, 7 schedules, (No.2 omitted) 4 Annexures under schedule IV, 5 Forms under AnnexureA and different Notifications dating from 212-1991 and onwards specifying guidelines, area categories, requiring environmental clearance from the listed projects (schedule) and forming the expert committees for environmental impact assessment. An abstract of provisions is as under:

Areas means all areas where the hazardous substances are handled.

Recipient system means the part of the environment such as soil, water, air or other which receives the pollutants.

Central Board means the Central Pollution Control Board u/s 3 of the Water Act and State Board means a State Pollution Control Board u/s 4 of the Water Act or u/s 5 of the Air Act,

Standards : The standards for emission or discharge of environmental pollutants are specified in schedule I to IV. The Central or State Board may specify more stringent standards. These standards shall be complied with by an industry, operation or process within a period of one year of being so specified. The board can reduce this period. Industries, operations or processes not mentioned in Sch. I shall not exceed the general standards specified in Sch. VI. No emission or discharge shall exceed the relevant concentration set out in column (3) to (5) of Sch. VH of National Ambient Air Quality Standards (NAAQS) (R. 3).

See Parts (Tables) 10 to 14 of Chapter-32.

Others : All directions u/s 5 should be in writing and specify action to be taken and its time of compliance. Procedure is prescribed (R.4). Factors to be considered while 'prohibiting or restricting the location of industries are given in R.5. Procedure for taking samples (R.6), Notice in Form I to take sample (R.7), Procedure for submission of samples alongwith From n and form of laboratory report in Form III (R'8), Functions of laboratories (R.9), Qualifications of Govt. Analyst (R.IO), Manner of giving notice of alleged offence in Form IV (R. II), Notice, of accidental discharge to the authorities (R.I 2) and Sch. V, Factors to be considered while prohibiting or restricting the handling of hazardous substances (R.13) and submission of Environmental Statement for the financial year ending 31st March in Form V before the next 30th September every year to the Board (R.14) are prescribed.

Schedule-1 (Rule-3) : gives industry wise pollution parameters and their standards for 98 types of industries including stack height and test method for some parameters and also known as Minimum National Standards (MINAS).

Schedule-II (Rules-3) : was inserted on 12-9-1996 and omitted on 31-12-1993. thus now it does not exist.

Schedule-III (Rule-3) : gives ambient air quality standards for noise for 4 categories of area and time. Limits in dB vary from 40 to 75.

Schedule-IV (Rule-3) : specifies standards for vehicular emission, types of fuel and tests and exhaust gas values in Annexures I to IV. Parameters considered are CO, HC and NO..

Schedule-V (Rule-12) : gives authorities to be informed in case of excessive discharge. This includes authorities under the Atomic Energy Act, Factories Act, Mines and Minerals Act, Ports Act, Plantations Labour Act, Motor Vehicles Act and Merchant Shipping Act.

Schedule-VI (Rule-3A) : gives general standards for discharge of pollutants in five parts : (A) Effluents (B) Waste water generation (C) Load based standards for Oil Refinery and large Pulp & Paper mill (D) General emission standards based -on concentration, equipment and load/mass (E) Noise standards for automobiles and domestic appliances and also gives guidelines in Annexure I fell for the purposes of Part A to D.

See Table-14 in Chapter-32.

Schedule-VII (Rule-SB) : gives National Ambient Air Quality Standards (NAAQS) in terms of time weighted average concentration in ambient air (ug or mg/nr") for six main pollutants – SO_2, NO_2, Pb, CO, SPM (Suspended particulate matter) and RPM (respirable particulate matter) with their method of measurement. This table may be useful in keeping work environment record (e.g. Form 37 GFR). See 2nd Sch. under the Factories Act for in-plant exposure limits.

See Table-15 in Chapter-32.

Appendix -A prescribes Form I (R.7), II & III (R.8), IV (R.11) and V, Annual Environmental Statement (R.14).

10.7 Hazardous Wastes (Management and Handling) Rules, 1989:

The Central Government u/s 6,8 & 25 of the Environment (Protection) Act made these rules effective from 28-7-1989.

They were amended in 1996, 2000, 2003 i

They have 21 rules, 8 schedules and 13 forms.

Application (R.2) : These rules apply to hazardous wastes as specified in Schedules, but do not apply to Waste water and exhaust gases, wastes arising out of operation from ships beyond 5 km, radio-active wastes, biomedical wastes, municipal solid waste; lead acid batteries wastes as there are separate rule for them.

Definitions (R.3):

There are 36 definitions some of which are a under:

Applicant means a person or organisation the applies in Form-1 for granting authorisation for handling of hazardous waste.

Authorisation means permission for collection transport, treatment, reception, storage and disposal of hazardous wastes granted by the competent authority in Form-2.

Hazardous waste means any waste which b reason of any of its physical, chemical, reactive, toxic, flammable, explosive or corrosive characteristics causes danger or is likely to cause danger to health or environment, whether alone or when in contact with other wastes or substances, and shall include wastes listed in Sch. 1, 2 & 3.

Disposal means deposit, treatment, recycling and recovery of any hazardous wastes;

Facility means a location wherein the processes incidental to the waste generation, collection, reception, treatment, storage and disposal are carried out.

Hazardous Wastes Site means a place duly approved by the competent authority for collection, reception, treatment, storage and disposal of hazardous wastes.

Operator of a facility means an owner or operator of the facility defined above.

The occupier generating hazardous wastes listed in the Schedules 1, 2 & 3 shall take all practical steps for safe disposal of the wastes either himself or through an operator of a facility. The occupier should supply specified (safety) information to the operator of a facility (R. 4).

Application for authorisation in Form-1 by the occupier or a facility operator and grant of such authorisation with conditions in Form-2 after satisfying that they possess appropriate facilities, technical capabilities and equipment to handle the wastes safely. Such authorisation lasts for validity specified by SPCB unless sooner suspended or cancelled and then needs renewal in Form-1. It can be refused also (R. 5).

If the conditions are not fulfilled, the granted authorisation can be cancelled or suspended by the State Pollution Control Board or Committee after a show cause notice and subsequent instruction for the safe storage of the hazardous wastes (R. 6).

Packing, labelling and transport of such wastes should, be in accordance with the Motor Vehicle Act and rules made there under and in a condition to withstand physical and climatic factors. Label as in Form 8 necessary (R. 7).

The occupier or operator of a facility shall identify wastes disposal site. EIA and public hearing are necessary (R.8).

Design and operation of the landfill site shall be as approved by SPCB (R. 8A & B).

The occupier generating waste and operator of a facility shall maintain records in Form-3 and shall send annual returns in Form-4. (R.9).

Any accident during transport or at the facility shall be reported immediately to the State Pollution Control Board or Committee in Form-5. (R.IO).

Import and export of hazardous wastes specified in Sch. 8 is not permitted for dumping and disposal. It may be permitted for processing or re-use as raw material and after getting necessary information in Form 6 & 6A from the exporter and importer both and after examining each case on Jnerit. The importer shall maintain records in Form-7A'"and allow inspection by the authority (R.II& 12).

Rule 13 to 15 are also for import and export. Rule 19 and 21 are for re-refining and recycling. R.20 states responsibility of wastes generator.

An appeal shall lie before the State or Central Government depending on order and as provided in R. 18.

Subjects of Schedules are as under :

Sch. No.	**Subject**

1	Process wise list of hazardous wastes
2	Concentration wise list of hazardous wastes
3	List of wastes for import and export
4 & 6	Recycling of wastes
5	Re-refining of wastes
7	Authorities
8	List of wastes prohibited for import and export.

10.8 Manufacture, Storage and Import of Hazardous Chemicals Rules 1989 :

U/s 6, 8 and 25 of the Environment (Protection) Act. 1986, these rules were made enforceable from 27-11-1989. They were amended in 1994 & 2000.

They have 20 Rules and 12 Schedules asunder:

R1 - Short- title and commencement.
R2 - Definitions.
R3 - Duties of Authorities : To inspect the industrial activity at least once in a year and to perform duties mentioned in Sch. 5.
R4 - General responsibility of the occupier.
R5 - Notification of major accident.
R6 - Industrial activity to which rules 7 to 15 apply.
R7 - Approval & Notification of sites.
R8 - Updating of the site notification following changes in the threshold quantity.
R9 - Transitional provisions.
R10 - Safety Reports and Safety Audit Report.
R11 - Updating of reports u/r 10.
R12 - Requirement for further information to be sent to the authority.
R13 - Preparation of on site emergency plan by the occupier.
R14 - Preparation of off site emergency plan by the authority.
R15 - Information to be given to persons liable to be affected by a major accident.
R16 - Disclosure of information.
R17 - Collection, Development and Dissemination of information.
R18 - Import of hazardous chemicals.
R19 - Improvement notices.
R20 - Power of the Central Government to modify the schedules.

Then schedules as under -

Sch.1 - Indicative criteria and list of chemicals.
Part-I Toxic, flammable & Explosive chemicals.
Part-II List of 684 hazardous chemicals.
Sch.2 - Isolated storage other than those covered by Sch. 4. Threshold quantities of 30 chemicals are given.
Sch. 3 - List of hazardous chemicals for application of R. 5 and 7 to' 15. Part - I named chemicals, 179. Part - II classes of chemicals not named in Part - I (flammable gases and liquids)

Sch.4 - Hazardous operations and processes.
Sch.5 - Authorities and their duties (addition).
Sch.6 - Notification of a major accident.

Sch. 7 - Notification of sites.
Part-I regarding site,
Part-II regarding pipeline.
Sch. 8 - A safety report.
Sch. 9 - Safety data sheet (MSDS).
Sch. 10 - Record of hazardous chemicals imported.
Sch. 11 - Details of on - site emergency plan.
Sch. 12 - Details of off-site emergency plan.

Thus these rules impose greater duty on occupiers and authorities in identifying major accident hazard (MAH) installations and taking safety measures for them.

10.9 Rules for the Manufacture, Use, Import, Export and Storage of Hazardous Micro-organisms, Genetically Engineered Organisms or Cells (1989) :

The Central Government u/s 6, 8 and 25 of the Environment Protection Act 1986, notified these rules on 5-12-1989 and brought in force from 1-10-1993 with a view to protect the environment, nature and health in connection with the application of gen-etechnology and micro-organisms.. It has 20 rules and a Schedule of Animal and Human pathogens. They apply to the whole of India.

Application (R.2):

These rules apply to :

1. Manufacture, import and storage of microorganisms and gene-technological products.
2. Genetically engineered organisms, microorganisms and cell and correspondingly to any substances and products and food stuffs etc. of which such cells, organisms or tissues hereof" form part.
3. New gene-technologies apart from those mentioned in Rule-3 and to organisms/microorganisms and cells generated by the utilisation of such other gene-technologies and to substances and products of which such organisms and cells form part.

The rules are applicable for sale, storage, handling, export, import production, processing, packaging, repackaging, drawing off such organisms and also to manufacture of drugs and pharmaceuticals, food-stuff, distilleries and tanneries etc. which make use of such organisms one way or the other.

Definitions (R. 3) :

Five scientific definitions are reproduced below:

1. "Biotechnology" means the application of scientific and engineering principles to the processing of materials by biological agents .to produce goods and services.
2. "Cell hybridisation" means, the formation of live cells with new combinations of genetic material through the fusion of two or more cells by means of methods which do not occur naturally.,
3. "Gene Technology" means the application of the gene technique called genetic engineering, include self cloning and deletion as well as cell hybridisation.
4. "Genetic engineering" means the technique by which heritable material which does not usually occur or will not occur naturally in the organisms or cell concerned, generated outside the organism or the cell and is inserted into said cell or organism. It shall also mean the formation of new combinations of genetic material by incorporation of a cell into a host cell, where they occur

naturally (self cloning) as well as modification of an organism or in a cell by deletion and removal of parts of the heritable material.

5. "Micro-organisms" shall include all the bacteria, viruses, fungi, mycoplasma, cells lines, algae, protodones and nematodes indicated in the schedule and those that have not been presently known to exist in the country or not have been rliurnvprpd in far

Competent Authorities (R. 4) :

Six committees are specified to recommend safety regulations, to bring out manuals of guidelines to ensure environmental safety, to lay down procedures for restriction or prohibition, to prepare uptodate onsite emergency plan, to approve or control the use of hazardous micro-organisms and experimental field trials, to inspect, investigate and take punitive action in case of violations, to review periodically the safety and control measures and to monitor safety regulations in installations at the district level as under

1. Recombinant DNA Advisory Committee (RDAC).

2. Review Committee on Genetic Manipulation (RCGM).

3. Institutional BioSafety Committee (IBSC).

4. Genetic Engineering Approval Committee (GEAC).

5. State Bio-technology Co-ordination Committee (SBCQ.

6. District Level Committee (DLC) in chairman ship of the District Collector. Other members are Factory Inspector, representative of Pollution Control Board, Chief Medical Officer or DHO as member (Convener), Agriculture Officer, representative of Public Health Engineering Dept. District Microbiologist /Pathologist (technical expert) and Municipal Commissioner.

Classification : Micro organisms are classified in two major heads as animal pathogens and plant pests and sub classified as bacterial, fungal, parasitic, viral, Rickettsial and Chlamydial agents and special category as listed in the Schedule (R. 5, 6).

Approval, Prohibition etc. : For any dealing or production, approval of the GEAC is necessary. Deliberate or unintentional release is not allowed. For food stuffs, additives and other products, approval is necessary. Before obtaining such approval an on-site emergency plan and site examination are necessary. Approval may be granted with conditions for 4 years, renewable for 2 years at a time. The GEAC will supervise the conditions (R. 7 to 14).

Report of Accident is required at District and State level. Effective steps will be taken to minimise or prevent the harmful effects to environment, nature or health (R. 16).

Off-site Emergency Plan is to be prepared by DLC with the help of occupiers handing hazardous micro-organisms (R.17).

Other provisions are also made for inspection and information regarding penalties (R.15), finance (R.18), appeal (R.19) and exemption from R. 7 to II (R.20).

The Schedule gives classification and names of animal and human pathogens and plant pests.

10.10 Chemical Accidents (Emergency Planning, Preparedness and Response) Rules, 1996 :

The Central Govt. u/s 6, 8 and 25 of the Environment (Protection) Act, 1986 made these rules. They were notified and brought into force on 1-8-1996. They were amended in 1998.

They contain 13. rules and 8 schedules. Their abstract is as under : Definitions (R. 2):

They contain 12 definitions some of which are as under:

Chemical accident - See part 3.8 of Chap-2.

Industrial pocket means any industrial zone earmarked by the Industrial Development Corporation of the State Government or by the State Government.

Major Accident Hazards (MAH) Installation See part 3.55 of Chapter 2.

Off-site emergency plan means the plan prepared as per Sch. 12 u/r 14(1) of the MSIHC Rules. (similarly On-site emergency plan means that prepared as per Sch. II u/r 13(1) of the MSIHC Rules.).

'Major Chemical accident"

See Part 3.54 of Chapter 2.

Different Crisis Groups : The constitution of the Central, State, District and Local Crisis Group shall be as specified in Sch. 5,6,7 &: 8 respectively. The members of the Central, State and District Crisis Groups are empowered u/s 10(1) of the EP Act 1986 to enjoy those powers. The MAH installations shall aid, assist and facilitate the functioning of the District and Local Crisis Groups. Meeting of the Central, State, District and Local Crisis Group shall be held at 6 months, 3 months, 45 days and 30 days respectively. Functions of the Central, State, District and Local Crisis Groups given in Rule 5, 7, 9 and 10 respectively are summarised in the following Table.

Functions of the Crisis Groups (Rule 5, 7, 9 & 10):

Central Crisis Group (Rule 5)		**State Crisis Group (Rule 7)**	
1	Expert guidance	Same as functions No. 1 to 7 mentioned for group	
2	Monitoring of post accident situation and remedial measures to prevent recurrence.	8	Assistance of the State Govt. in planning, preparedness and mitigation of major accidents.
3	Post accident analysis and evaluation of responses.	9	Quarterly report to the CCG.
4	Review of District offsite emergency plans and reports received.		
5	Respond to queries		
6	Statewise list of experts.		
7	Financial and other help.		
8	Informatin to public.		
District Crisis Group (Rule 9)		**Local Crisis Group (Rule 10)**	
1	Expert guidance.	1	Preparation of local emergency

			plan for the industrial pocket and dovetailing of this plan with the Dist. Off-site emergency plan.
2	Preparation of Dist. Off-site emergency plan.	2	Training of persons and public
3	Review of all on-site emergency plans of MAH units.	3	Half-yearly mock drill and report to DCG.
4	Management of chemical accidents in the district.	4	Respond to public inquiries.
5	Monitoring of every chemical accident	5	Information to public.
6	Continuous information to the CCG and SCG.	6	Assistance to MAH units for informing persons likely to be affected.
7	Report of chemical accident within 15 days to SCG.		
8	Yearly mock drill and report to SCG.		

Information to the Public : The Central, State and Local Crisis Group shall provide information on request regarding chemical accident prevention, preparedness and mitigation to the public in their respective jurisdiction. The Local Crisis Group shall assist the MAH installations in taking appropriate steps to inform persons likely to be affected by a chemical accident (R. 13).

Crisis Alert system : The Central Govt. shall set up functional control room, information network with state and district control rooms, appoint staff and experts in control room, publish lists of (i) MAH installations (ii) Major chemical accidents in chronological order (iii) Members of the Central, State and District Groups and take measures to create awareness amongst the public to prevent chemical accidents (R. 4).

Schedules:

Sch. I to 4-the same as Sch. I to 4 of the MSIHC Rules 1989 or R 68J, GFR 1963.

Sch. 5 to 8- List of members for CCG, SCG, DCG and LCG respectively.

10.11 Bio-Medical Waste (Management & Handling) Rules, 1998 :

Wastes generated from hospitals, medical & health institutions, R & D organisation, laboratories and slaughter houses etc., where biological organisms are involved, have become an important source of environmental and public health problems. Generally these wastes are being disposed in the Municipal dumps.

The public have become aware of this problem and the issue was discussed in various forums. The major concern is proper disinfection, treatment and disposal of bio-medical wastes.

To evolve a proper system for regulation of treatment and disposal of medical wastes and in exercise of the powers conferred by Sections 6, 8 & 25 of the Environment (Protection) Act, 1986, the Ministry of Environment & Forests, Govt of India framed these rules and made effective from 27-7-1998. They were amended in 2000 -& 2003.

There are 14 Rules with 6 Schedules and 5 Forms. These Rules provide Duty of Occupier, Treatment & Disposal, Segregation, Packing, Transportation &: Storage, Prescribed Authority, Authorisation, Advisory Committee, Monitoring in Armed forces medical centres by CPCB, Annual Report, Maintenance of Records, Accident Reporting, Appeal and common disposal/ incineration sites.

Out of 19 definitions, some are as under :

"Animal House" means a place where animals are reared/kept for experiments or testing purposes;

"Authorisation" means permission granted by the prescribed authority for the generation, collection, reception, storage, transportation, treatment, disposal and/or any other form of handling of bio-medical waste in accordance with these rules and any guidelines issued by the Central Government.

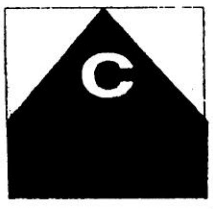
"Biologicals" means any preparation made from organisms or micro-organisms or product of metabolism and biochemical reactions intended for use in the diagnosis, immunisation or the treatment of human beings or animals or in research activities pertaining thereto;

"Bio-medical waste" means any waste which is generated during the diagnosis, treatment or immunisation of human beings or animals or in research activities pertaining thereto or in the production or testing of biologicals. There are ten categories of wastes and are listed in the Schedule-1. "Bio-medical waste treatment facility" means any facility wherein treatment, disposal of bio-medical waste or processes incidental to such treatment or disposal is carried out and includes common treatment facilities;

The Schedules are as under :

Sch. No.	Title
I	Categories of Bio-Medical waste.
II	Colour coding and type of container for disposal of Bio-Medical wastes.
III	Label for Bio-Medical waste containers / bags. (As shown below)
IV	Label for Transport of Bio-Medical waste containers / bags.
V.	Standards for Treatment & Disposal of Bio-Medical wastes like incineration, autoclave, liquid wastes, microwave system and deep burial;
VI	Schedule for Waste Treatment facilities like Incineration/ Auto Clave/ Microwave system.

Biohazard



Cytotoxic

The Forms are :

I	Application for Authorisation
II	Annual Report
III	Accident Reporting
IV	Authorisation
V	Application for Appeal

Schedule-I : Categories of Bio-Medical

Category No.	Waste Category	Treatment & Disposal
1	Human Anatomical Waste	incineration@/ deep burial*
2	Animal waste	incineration@/ deep burial*
3	Microbiology & Biotechnology waste	Local autoclaving / microwaving / incineration @
4	Waste Sharps	Disinfection (chemical treatment@ / autoclaving/ microwaving & mutilation / shredding*
5	Discarded medicines and Cytotoxic Drugs (wastes comprising of outdated, contaminated and discarded medicines)	incineration@/destruction and drug disposal in secured landfills
6	Solid Waste	incineration@/ autoclaving / microwaing
7	Solid waste	Disinfection by chemical treatment@ / autoclaving / microwaving and multilation / shredding##
8	Liquid Waste	Disinfection by chemical treatment@@ and discharge into drains
9	Incineration Ash	Disposal in municipal
10	Chemical Waste	Chemical treatment @ & discharge into drains for liquid and secured landfills for solids
@@	Chemicals treatment during at least 1% hypochlorite solution or any other equivalent chemical reagent. It must be measured that chemical treatment ensures disinfection.	
##	Multination / shredding must be such so as to prevent unauthorized reuse.	
@	There will be no chemical pre-treatment before incineration. Chlorinated plastics shall not be incinerated.	
*	Deep burial shall be option available only in towns with population less than five lakhs and rural areas.	

Duty of Occupier:

It shall be the duty of every occupier of an institution generating bio-medical waste which includes a hospital, nursing home, clinic, dispensary, veterinary institution, animal house, pathological laboratory, blood bank by whatever name called to take all steps to ensure that such waste is handled without any adverse effect to human health and the environment.

Treatment and Disposal:

1. Bio-medical waste shall be treated and disposed off in accordance with Schedule-1, and in compliance with the standards prescribed in Schedule-V.

2. Every occupier, where required, shall set up in accordance with the time schedule in Schedule VI, requisite bio-medical waste treatment facilities like incinerator, autoclave, microwave system for - the treatment of waste, or ensure requisite treatment of waste at a common waste treatment facility or any other waste treatment facility. (R.5)

Segregation, Packaging, Transportation and Storage:

Biomedical waste shall not be mixed with other wastes. Segregation as per Sch.U and labelling as per Sch. III. For wastes being transported information as per Sch. III. Use of authored vehicle only. Untreated wastes not to be stored beyond 48 hrs. ,Role of municipality (R.6).

Maintenance of Records:

1. Every authorised person shall maintain record related to the generation, collection, reception, storage, transportation, treatment, disposal and /or any form of handling of biomedical waste in accordance with these rules and any guidelines issued.

2. All records shall be subject to inspection and verification by the prescribed authority at any time. (R.11)

Accident Reporting:

When any accident occurs at any institution or facility or any other site where bio-medical waste is handled or during transportation of such waste, the authorised person shall report the accident in Form-III to the prescribed authority forthwith. (R.12) SC Judgement:

In WP(Civil) No. 286/94 between BL Wadherav/ s Union of India, while monitoring its own judgement of 11-3-96, the Supreme Court went through 14 directions issued to various authorities and their compliance. Most of the Hospitals and Nursing homes in Delhi, agreed to provide incinerators or equally effective alternative for waste disposal.

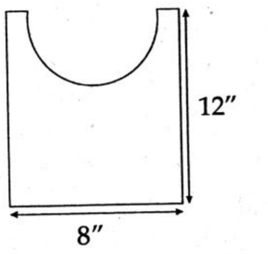
10.12 Plastics Manufacture, Sale and Usage Rules, 1999.

These rules came into force from 2-9-99 u/s 3 & 25 of the Environment (Protection) Act. 1986.

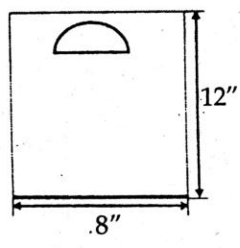
They were amended in 2003. They have 10 rules, I annexure and 2 forms.

Out of 7 definitions some are as under :

"Carry bags" means plastic bags which have a self carrying feature commonly known as vest type bags or any other feature used to carry commodities such as "T)" punched bags, as illustrated below.



Vest Type Beg



"D" Punched Bag

"Container" means flexible or rigid containers made of virgin plastics or re-cycled plastic with or without lid to store, carry or dispense commodities;

"Food-stuffs"" means ready to eat food articles and food products, fast food, processed or cooked food in liquid, powder, solid or semi-solid form;

Pollution Control Boards are prescribed authority for 'manufacture and recycling' processes and District Collector/Dy. Commissioner of the District for 'use, collection, segregation, transportation and disposal' provisions (R.3).

Rule 4 prohibits vendor to use carry bags or containers made of recycled plastics for storing, carrying, dispensing or packaging of foodstuffs. Rule does not permit to manufacture, stock, distribute or sale carry bags made of vergn or recycled plastic bag of size less than 8x12 inch (20 x 30 cm) and thickness less than 20 microns. Minimum weight of 50 carry bags shall be 105 gms ± 5% variation. (R. 4 & 8)

Rule 5 gives two conditions to manufacture plastic bags/containers :

1. Virgin plastic should be used in natural shade or white.
2. Recycled plastic used for purposes other than storing and packaging foodstuff may be used with pigments and colourants as per IS:9833.

Rule 6 allows recycling of plastics strictly as per IS:14534 entitled 'The Guidelines for recycling of plastics'.

Marking or codification also as per above IS:14534. Percentage of recycled material is also to be marked. Words 'Made of recycled material or virgin plastic' are to be printed on packets of bags (R.7).

10.13 Noise Pollution (Regulation and Control) Rules, 2000

U/s 3, 6 & 25 of the Environment (Protection) Act 1986 these rules were made. They came into force from 14-2-2000. They were amended in 2000 & 2006.

Its objective is to (1) regulate and control noise producing and generating sources and to (2) maintain ambient air quality standards in respect of noise as specified in the Schedule.

They have 8 rules and I schedule.

Rule 2 has 8 definitions including zone, court, educational institution, hospital etc.

Area within 100 mts around hospitals, educational institutions and courts may be declared as silence zone. Area categorization should be made as industrial, commercial, residential or silence zone as shown in the Schedule (R.3)

Noise levels shall not exceed levels specified in the Sch. as under (R.4)

Area Code	Category of Area/ Zone	Limits in dB (A) Leq*	
		Day Time	Night Time
A	Industrial area	75	70
B	Commercial area	65	55
C	Residential area	55	45
D	Silence Zone	50	40
Leq* = It is energy mean of the noise level over a specified period. Day time 6 am to 10 pm Nigh time 10 pm to 6 am.			

See similar table 12.8 in Chapter-12.

Written permission is necessary to use loud speaker or public address system. They cannot be used between 10 pm and 6 am except in closed premises like auditoria, conference rooms, community halls, banquet halls etc. State Govt. has power to permit use between 10 pm to 12 midnight subject to terms and conditions (R.5)

Authority has power to prohibit vocal or musical sound also if it causes annoyance, disturbance, discomfort etc to any person or public (R.8)

10.14 Ozone Depleting Substances (Regulation and Control) Rules, 2000

U/s 6, 8 & 25 of the Environment {Protection) Act 1986, these rules were made. They came into force from 19-7-2000.

They were amended in 2001, 2003, 2004 & 2005.

They have 15 rules, 12 schedule and 14 forms. There are 17 definitions u/r 20.

Ozone depleting substance means those listed in Sch. I (divided in 8 groups) existing by itself or in mixture.

No person shall produce or cause to produce any ozone depleting substance after the date specified in Sch. V unless he is registered with the authority specified in that Schedule (R.3).

Export, import and its and prohibition as per Sch. VI (R. 4 & 5) -

Sale of ozone depleting substance shall stop after the date specified in Sch V unless it is registered with the authority specified in that Schedule (R.6) Other provisions include regulation on purchase (R.7), on use (R.8), on import, export and sale of products containing ozone depleting substances (R.IO), on reclamation and destruction (R.11),on manufacture, import and export of compressors (R. 12) and prohibition on new investments with ozone depleting substances (R.9).

Monitoring and reporting requirements are 'given . inR.14&Sch.X.

Nothing in these rules shall apply to matters in Sch. VIII. '

10.15 Batteries (Management and Handling) Rules, 2001

U/s 6, 8, & 25 of die Environment (protection) Act 1986, these rules were made and brought into force from 16-5-2001.
They have 14 rules, I schedule and 9 forms.

They apply to every manufacturer, importer, reconditioner, assembler, dealer, recycler, auctioneer, consumer and bulk consumer involved in manufacture, processing, sale, purchase and use of batteries or components thereof.

There are 19 definitions u/r 3 some of which are as under -

"Battery" means lead acid battery which is a source of electrical energy and contains lead metal;

"Consumer" means a person using lead acid batteries excluding bulk consumers;

"Re-conditioner" means a person involved in repairing of lead acid batteries for selling the same in the market;

"Recycler" means an occupier who processes used lead acid batteries or components thereof for' recovering lead;

Responsibilities of manufacturer, importer, assembler and re-conditioner are stated in R.4 and those of dealer in R. 7, of recycler in R.8, of consumer in R. 10 and of auctioneer in R. II.

Importers have to register themselves (R.5 & 6). Registration procedure for recyclers is given in R. 9.

Prescribed authority is State Pollution Control Board (R.12). Duties of CPCB are mentioned in R. 13 and those of MoEF in R. 14 for records and returns.

Used batteries are to be collected back by the manufacturer and dealer and appropriate discount shall be given to the consumer. Safe transportation, no damage during storage and transportation and collected batteries are to be sent only to the registered recyclers.

Recycler shall mark 'Recycled' on lead recovered by him and create public awareness regarding hazards of lead and obligations of consumers to return used batteries only to the registered dealers or at the designated collection centres.

EXERCISE

1. Explain, State, Mention or Discuss :

1. Safety of persons inside the boiler.
2. General safety provisions under the Indian Electricity Rules 1956.
3. Statutory provisions of Refining of petroleum.
4. General provisions OR provisions of manufacture of explosives.
5. Pressure vessel and its fittings under the SMPV Rules 1981.
6. General provisions of Gas Cylinder Rules 2004.
7. Packing and labeling of pesticides.
8. Provisions of Atomic Energy Act OR that of Radiation Protection Rules.
9. Class labels for hazardous goods.
10. General-requirements of 'lifts' under the Gujarat Lifts & Escalators Rules.
11. Different Crisis Groups under the Chemical Accident (EPPR) Rules.
12. Restrictions to use loud speaker or public address system.
13. Provisions of the Ozone Depleting Substances Rules 2000.

2. Define or Explain the following terms :

1. Boiler.
2. Petroleum & its Class.
3. Cryogenic liquid.
4. Flammable compressed gas.
5. Filling density.
6. Composite cylinder.
7. Radioactive substance.

8. Dock Work.
9. Lift installation.
10. Pollution of Water.
11. Air pollutant.
12. Environment.
13. Micro-organisms.
14. Carry Bags.
15. Battery.

3. Write Short Note. on :

1. Boiler attendant.
2. Repair and Maintenance of Petroleum pipe line.
3. Hydraulic testing of mobile pressure vessel OR Transport of compressed gas by vehicle
4. Object and provisions of the Insecticides A 1968.
5. Radiographic Safety Officer.
6. Emergency Information Panel.
7. Safety Officer under the Building & Other construction Workers Rules 1998.
8. Provisions of Escalators.
9. Powers of Governments under the Environment (P) Act 1986 OR subjects of schedule under that Act.
10. Subject of Schedules under the MSIHC Rule 1989.
11. Categories of Bio-Medical Waste. L

4. Explain the Difference between :

1. Feed pipe and steam pipe of a boiler.
2. Boiler and Small Industrial Boiler.
3. Container and Tank of Petroleum.
4. Hot work and Protected work under the Petroleum Rules 2002.

5. LPG & CNG.
6. Lift and Escalator.
7. Over speed governor and Safety gear of a lift
8. Hazardous waste and Biomedical waste.
9. Re-conditioner and Recycler under the Batteries Rules 2001.

4. Comment on following explaining whether it is true or not :

1. Zone-2 hazardous area is more dangerous than zone-0.
2. Weight of explosive includes the weight of packing box.
3. Insecticides cannot be stored with flammable material.
4. Lift can also move in horizontal direction.
5. 'Threshold quantity' safety criteria require storage of quantity more than that quantity.
6. Recycled plastic can be used for packaging of food stuffs.
7. Virgin plastic carry bag can be of any colour.
8. Used batteries are to be collected back by the

CHAPTER – 29

Social Security Legislation

THEME

1 EVOLUTION AND GROWTH OF THE DOCTRINE OF SOCIAL SECURITY

With the growth of civilised societies a desire for 'Social protection~ was also grown. Security of individuals and their families was hampered because of accident, injury, disablement, disease, old age, maternity, unemployment etc. Loss of income due to any reason was (and is) considered a 'social risk' as it affects not only the wage -earner but also his / her family and dependants. Therefore during Middle Ages the search for social protection evolved within the societies.

Some help was provided by Raja (the King), public authorities, trade unions or local groups. See Part 5.1 of Chapter I for Indian origin and Kautilys's Arthshashtra. Some examples are available in Roman era and France. The French Revolution set forth the right to security, mutual assistance and relief. With the beginning of 19th century due to industrialisation in European societies, working conditions, life and multifarious risks, insecurity was increased. The trade unions in Great Britain started to give unemployment benefits.

At the end of 19th century. King Bismarck of Germany set up the first compulsory social security scheme for wage earners in industry. .The scheme included sickness insurance (1884) and disablement and old age insurance (1889). In the beginning of 20th century European countries supported the mutual benefit society by subsidies. Prior to 1919, several national legislations established non contributory pension schemes. This initial scope was limited to workers of low salary. Amounts of medical care and sickness insurance schemes were limited. Disablement pensions and old - age and survivors' benefits had just started.

The First World War awoke the need to combat social insecurity more sensitively then in the past. The establishment of ILO in 1919 supported the movement of protection of workers against the main social risk and a large number of national laws were passed i Europe, North America, Japan and Australia.

Some ILO Conventions on social security are as under :

1. Workmen's Compensation (Agriculture), Con 1921 (No. 12.)
2. Workmen's Compensation (Accidents), Con 1925 (No. 17.)
3. Workmen's Compensation (Occupational Diseases), Con. 1925 (No. 18.)

4. Sickness Insurance (Industry) Con. 1927 (No. 24.)
5. Sickness Insurance (Agriculture) Con. 192i (No. 25.)
6. Old Age Insurance (Ind.) Con. 1933 (No. 35.)
7. Invalidity Insurance (Ind.) Con. 1933 (No. 37.)
8. Survivors Insurance (Ind.) Con. 1933 (No. 39).
9. Workmen's compensation (Occupational Diseases Con. (Revised) 1934 (No. 42.)

Some earlier ILO Recommendations are as under:

1. Social Insurance (Agriculture) Rec. 1921 (No. 17)
2. Workmen's Compensation (Minimum Scale) Rec. No. 22 (Jurisdiction), Rec. No. 23 (Occupational Diseases), Rec. No. 24, all of 1925.
3. Sickness Insurance Rec. 1927 (No. 29).
4. Invalidity, Old-Age and Survivors' Insurance Rec. 1933 (No. 43)

The modern doctrine of social security evolved after the end of the Second World War. In 1935 the United States adopted a social security law. New Zealand adopted the law in 1938. Lord Beverage's report of 1942 in UK stressed radical reformation of social insurance and allied services. Atlantic Charter (1941) also extended the object in countries who signed it. The decisive step towards wider and universal protection was made in 1944 by ILO by accepting following two international. instruments:

1. Income Security Recom, 1944 (No. 67)
2. Medical Care Recom, 1944 (No. 69)

Following are some ILO conventions subsequently adopted:

1. Social Security (Minimum Standards) Con.1952 (No.l02)
2. Equity of Treatment (Social Security) Con. 1922 (No. 118)
3. Employment Injury Benefits Con. 1964 (No.l21)
4. Invalidity Old-Age and Survivors Benefits Con. 1967 (No. 128)
5. Medical Care and Sickness Benefits Con. 1969 (No. 130)
6. Maintenance of Social Security Rights Con. 1982 (No. 157)

Similarly following are some subsequent recommendations:

1. Unemployment Provision Rec. 1934 (No. 44)
2. Income Security Rec. 1944 (No. 67)
3. Medical care Rec. 1944 (No. 69)
4. Employment Injury Benefits «Rec. 1964 (No. 121)
5. Invalidity, Old-Age and Survivors' Benefit Rec. 1967 (No. 131)
6. Medical Care and Sickness Benefits Rec. 1969 (No. 134)
7. Older Workers Rec. 1980 (No. 162)
8. Maintenance of Social Security Rights Rec. 1983 (No. 167)

None of these is ratified by India till 1995.

Above convention No. 102 gave one definition of social security' that includes nine contingencies: medical care, sickness benefit, unemployment benefit, old - age benefit, employment injury benefit, family benefit, maternity benefit, invalidity benefit, and survivor's benefit.

2. SOCIAL SECURITY FOR UNORGANISED WORKERS

As published in Economic and Political Weekly dated 12-8-2006, the National Commission for Enterprises in the Unorganised Sector (NCEUS) submitted its first report on Social Security for unorganized workers to the Govt. of India on 16-5-2006.

Its objective is to provide minimum social security with legal backing to @ 30 crore unorganised workers with independent earnings.

Benefits in this proposal are as under-

Health	-	Hospitalisation upto Rs. 15000.
Insurance	-	Maternity upto Rs. 1000 per delivery.
	-	Disability allowance uptol5 days @ Rs. 50 per day.
	-	Accident death cover Rs. 25000
Life Insurance	-	Rs. 15000.
Old age	-	For Age > 60 yrs., pension
Security		Rs. 200 pm to those below poverty line. For others Provident Fund.

Contributions are as under-

Rs. 1 per 'day (Rs. 365 per year) by worker, employer and Government. Contribution of workers below poverty line to be paid by the Central Govt. Where Employers cannot be identified, their contribution to be paid by the Central and State Govt. in the ratio of 3:1.

Financing is proposed through cess or social security tax. Except the old-age security, other benefits are based on insurance model. Workers above poverty line guaranteed 10% annual return of their Provident Fund. Contributions are to be collected through post offices. This scheme has not to disturb the existing other social security schemes. All unorganised earning workers are eligible irrespective of their occupation or duration of employment. It provides a national floor level social security to all informal workers throughout the country. National as well as State level social security boards have to play proactive role for the success of the scheme.

The scheme is proposed as "Unorganised Sector Workers' Social Security Bill, 2005".

The full. text of report is available on the website http://nceuis.nic.in/.

3 SOCIAL ACCOUNTABILITY

The concept of social accountability comes from two Sources

1. ILO and
2. Article 38, 39, 41, 43 and 47 of the Constitution of India.

As mentioned in Part-1 of this chapter, the doctrine of social security has long history considering social protection, social risk, right to security and general well being or welfare of the society. ILO Conventions and Recommendations provide international guidelines for social accountability.

As directive principle of state policy. Article 38 considers state to secure a social order for the promotion of welfare of the people. The state should also strive to promote the welfare of the people by securing and protecting as effectively as it may a social order in which justice, social, economic and political, shall inform all the institutions of the national life.

Article 39 requires the state to provide equal means of livelihood to all citizens. It also requires equal pay for equal work for both men and women.

Article 41 requires the state to make effective provision for securing the right to work, to education and to public assistance in case of unemployment, old age, sickness and disablement.

Article 42 require just and humane conditions of work and for maternity relief.

Article 43 imposes liability for the state to secure, by suitable legislation or economic organisation or in any other way, to all workers, agricultural, industrial or otherwise, work, a living wage, conditions of work ensuring a decent standard of life.

Above articles create accountability of the state for social security.

The social accountability is considered for the state and union governments to provide legal protection and welfare facilities for the organised and unorganised workers in India.

Most of the Labour Laws are for organised workers. Therefore Laws for social security are also needed for unorganised workers. See part II of this chapter.

Power lies with the government and there fore it is i its responsibility to provide various types of benefits to workers and public by the necessary Act and Rules as mentioned in this chapter. For workers ESI Act and Rules, WC Act and Rules, Maternity Benefit Act and Rules etc. are provided and for public PLI Act and Rules are provided. By virtue of these statutory provisions employers are responsible and accountable to provide above benefits to their workers otherwise they become accountable and answerable under above laws.

It is the duty of political parties, social organisations (NGO) and social institutions to help to the government or to provide independently social security to the workers and the public. Such benefits should be extended to the families of the workers also.

4 INDIAN LAWS ON SOCIAL SECURITY

Some Acts and Rules are as under :

1. Workmen's Compensation Act 1923, Rules 1924 (Transfer of Money) Rules 1935, and (Venue of Proceedings) Rules, 1996.
2. Employers' Liability Act 1938.
3. Mica Mines Labour Welfare Fund Act 1946.
4. Employees State Insurance Act 1948, (Central) Rules 1950 and (Central) Regulations 1950.
5. Employees Provident Funds and Miscellaneous Provisions Act 1952.
    (1) Employees Provident Fund Scheme, 1952.
    (2) Employees Family Pension Scheme, 1971.
    (3) Employees Deposit Linked Insurance Scheme, 1976.
6. Maternity Benefit Act 1961 (1995), State Rules and (Mines & Circus) Rules 1963.
7. Personal Injuries (Compensation Insurance) Act 1963, Scheme 1965 and Rules 1965.
8. Payment of Bonus Act, 1965.
9. Limestone and Dolomite Mines Labour Welfare Fund Act 1972 and (Amendment) Act 1982.
10. Payment of Gratuity Act 1972 and (Central) Rules 1972.
11. Iron Ore Mines Labour Welfare Fund Act 1976.
12. Beedi Workers Welfare Fund Act 1976.
13. Cine - Workers Welfare Fund Act 1981.

14. Child Labour (Prohibition and Regulation) Act, 1986 and Rules 1988.
15. Public Liability Insurance Act 1991 & Rules 1995.
16. Building and other Construction Workers Act, 1995 and rules 1998.

Some abstract of Sr. No. 1, 2 and 4 are given below. For details the statute books should be referred. See Chapters 27 and 28 also.

5 WORKMEN'S COMPENSATION ACT, RULES & WORKED EXAMPLES

5.1 Workmen's Compensation Act, 1923:

This Act (8 of 1923) came into force from 1-71924. It was lastly amended by the Act 46 of 2000 w.e.f. 08-12-2000. It has 4 chapters, 36 sections and 4 schedules. The Act is made to provide compensation for accidental injury to workmen. Under Sec. 4, while calculating compensation, maximum limit of 'monthly wages' to be considered is Rs. 4000/ - if monthly wages exceed Rs. 4000. Short summary is given below:

The Act extends to the whole of India. A list of 'dependants' is given u/s 2(1) (d).

Definitions (Sec. 2):

Definition of employer is very wide and includes his managing agent; legal representative of a deceased employer, contractor etc.

'Workmen' includes employees working in railway, ship, aircraft, motor vehicle, abroad or as in Schedule-11 wherein some 48 categories are specified.

''Wages' excludes travelling allowance or concession, special expenses and contribution towards any pension or P.P.

Partial disablement (temporary or permanent) and total disablement (temporary or permanent) are defined as same in the ESI Act and the W.C. Act. See part 7 also.

Employer's Liability (Sec 3) : He is liable to pay compensation if accident arises out of and in course of employment He is not liable for injury -

1. If disablement lasts less than 3 days
2. If the workman takes drink or drugs, or
3. Wilfully disobeys any order or a rule of safety, or
4. Wilfully removes or disregards any safety guard or device provided for his safety,

but he is liable even under such conditions if injury results in death or permanent total disablement.

If a workman contracts any occupational disease (i) in Part-A of Schedule III or (ii) in Part B of Schedule III if he is in continuous service of more than 6 months or (iii) in Part C of Schedule III if he is in the service of one or more employers for such continuous period as may be specified, it shall be deemed to be an injury by accident arisen out of and in course of the employment and makes the employer(s) liable for compensation. The disease should be directly attributable to his employment.

If a workman claims or agrees to take compensation under this Act, his suit for damages in a Civil Court is not maintainable [Sec 3(5)].

Amount of Compensation (Sec. 4) :

	Type of Injury		Amount
(a)	Death	50% of monthly wages X Relevant factor based on age (from Schedule IV) or Rs. 80,000/- whichever is more.	
(b)	Permanent total disablement	60% of monthly wages X Relevant factor from Schedule – IV or Rs. 90000/- whichever is more.	
(c)	Permanent partial disablement	1	For injury in part II of Schedule I, such % of compensation payable in item (b) above as % of loss of earning capacity mentioned in Column-3.
		2	For injury not specified in Schedule – J, such % of compensation payable in item (b) above as proportionate to the loss of earning capacity (permanent) certified by the medial practitioner.
(d)	Temporary disablement (total of partial)	Half monthly payment of the sum equivalent to 25% of monthly wages till the ceasing of the disablement or 5 years whichever is shorter.	

In case of death, the funeral expenditure of Rs. 2500/- shall be deposited with the Commissioner. Maximum limit of 'monthly wages' is Rs. 4000/- in above calculation. Compare Schedule I and III of W.C. Act, Schedule II and III of ESI Act and the Schedule of the Personal Injuries (Compensation Insurance) Act, 1963. They seem to be similar.

Penalty for late payment (Sec. 4A) :Compensation shall be paid as soon as it falls due. Jf it is paid after I month simple interest of 12% or maximum bank interest is payable. If delay is not justified, penalty up to 50% of the compensation is also payable.

A show-cause notice to the employer is necessary before passing an order for penalty.

The interest and penalty both shall be paid to the workman or his dependent, as the case may be.

Distribution of compensation (Sec. 8) : Compensation payable in case of death, payable to woman or legally disable (e.g. minor) person, shall be paid through Commissioner (Court) only and not directly. Direct payment shall not be deemed compensation.

An employer can give advance up to 3 months' wages which is deductible and the Commissioner shall repay it to the employer.

The Commissioner shall give receipt to the depositor, notice to dependant(s), make inquiry and if satisfied that no .dependant exists, he shall repay the balance to the employer. If the dependant is women or legally not eligible, the same may be investigated and mode of payment during non eligibility may be directed for the welfare. In other cases direct payment is possible. The Commissioner has power to change or amend his order for investment if satisfied with the reason.

Others : Method of calculating 'monthly wages' is prescribed u/s 5. Half monthly payment can be reviewed u/s 6 and converted into lump-sum u/s 7. Compensation is protected and cannot be assigned, attached or charged (sec. 9). Claim is to be made within 2 years (sec. 10). Delay may be justified. A Commissioner can directly send a notice to an employer to furnish within 30 days information of death of his workman or his explanation (sec IOA). Reports of fatal accident or serious bodily injury shall be given to the Commissioner within 7 days (sec. IOB). An injured workman will not refuse to undergo medical examination, otherwise his compensation may be suspended for the period of his refusal, or for the period of his return if he has left the premises without examination. In case of a contract labour, the principal employer is liable if the contractor fails to pay compensation (sec. 12). Where any employer has entered into any contract with any insurer for liability to a workman, the insurer will pay to the workman as per liability accepted. The workman has to give notice to the insurer for his claim as soon as he becomes aware that his employer has become unable to pay (sec. 14). Compensation can become first charge on assets transferred by employer (sec. 14-A). Prescribed return is to be sent to authority u/s 16. Any contract or agreement of relinquishing right of compensation is null and void u/s 17. Maximum penalty for offences is Rs. 5,000/-, Limit of filing complaint is 6 months and sanction of commissioner is necessary for prosecution (see ISA).

Special provisions are made for other workmen.

Chapter-3 (sec. 19 to 31) is regarding Commissioners, their appointment, venue, power, appearance of parties, evidence, registration of agreements, appeals, recovery etc.

Chapter-4 gives rule making powers to the State and procedure (sec. 32 to 36)

Schedule I to 4 are regarding (1) Injuries and loss of earning capacity, (2) List of different, 48, workmen (3) List of Occupational Diseases and (4) Age factors to calculate compensation, respectively.

i

5.2 The Workmen's Compensation Rules, 1924 :

Under section 32 of the WC Act, these rules were notified on 26.6.1924.

Deposit of compensation (Rules 6 to 10) : In a death case the compensation shall be deposited with Form-A and in other cases with Form-AA. The receipt will be in Form-B. The statement of disbursements to be given to the employer (by commissioner) shall be in Form-C. A dependant's application for order to deposit compensation shall be in Form G.

Deposit u/s 8(2) i.e. any sum more than Rs. 10/shall be in Form-D and its receipt shall be in Form-E.

The Commissioner shall display a list of deposits received by him and invest for the benefit of dependants in Government securities or Post Office cash certificates or Post Office Savings Bank.

Reports of Accidents (Rules II &. 12) : Report of accident u/s IOB shall be in Form EE. An employer can present a memorandum of inquiry of any accident.

Medical Examination (Rule 13 to 18) : The employer shall arrange free of charge medical examination at his premises or at the workman's residence. Time will be between 6 a.m. to 7 p.m. if the workman does not consent to other time. A workman receiving half monthly payment will be examined at his residence and not more than twice in the first month or more than once in any subsequent month. After suspension of right to compensation, if the workman offers himself for examination, he shall be examined within 72 hours at the place and time fixed by the employer. Woman shall be examined by in presence of a female doctor.

Others : Chapters 5 to 8 are for procedure, transfer, appointment of representatives and memorandum of agreement (Forms K, L or M and notice to party in Form-0) respectively.

For figures of compensated injuries and amount of compensation paid under the WC Act see Table 5.11 of Chapter 5.

See IS'.3786 for injury rates and accident classification (Part 9 & 10 of Chapter 5).

Compensation for Occupational Diseases:

Compensation for occupational diseases is payable u/s 3 of the Workmen's Compensation Act, 1923. Subsections (2 to 4) provide as under :

1. Contracting of the disease peculiar to the employment and specified in Part A, B & C of Schedule III (mentioned in foregoing part 7.2.4) is to be considered as an injury by accident arisen out of and in the course of the employment.
2. For Part A diseases, compensation is payable irrespective of any length of service as the incidence rate or possibility of such diseases is high and very obvious.
3. For Part B diseases, compensation is payable provided a service of 6 months is completed, as these diseases are very specific to certain chemicals and their incidence rate is slightly lower than that of Part A diseases.
4. For Part C diseases, compensation is payable, irrespective of length of service and even if the affected worker has worked under one or more employers, as these are lung diseases and their effect is delayed i.e. visible after 5 to 10 years of service.
5. Compensation is payable for Part B & C diseases even after the cessation of the service.
6. For Part C diseases and for working under more than one employer, all the employers are liable to pay compensation in proportions decided by the W.C. Commissioner.
7. For any other disease, if it is directly attributable to a specific injury by accident arising out of and in the course of employment, the compensation is payable.
8. Compensation is not payable if any suit for damages is filed in the court or a suit for damages shall not be maintainable if a claim for compensation is filed before the W.C. Commissioner, or if any agreement is made between the workman and his employer to pay in accordance with the WC Act.
9. The doctor shall refer Schedule I while assessing percentage loss of earning capacity.
10. The maximum period of half-monthly payment for temporary disablement is 5 years, and wage limit of Rs. 4000 is not applicable in this case.

5.3 Worked Examples :

Section 4 and Schedule I, III and IV are to be seen simultaneously. Monthly wage limit is Rs. 4000.

For example, if death occurs due to any disease mentioned in Sch. Ill, payment should be as per section 4 (1) (a).

Example I : A worker of 24 years (completed) and drawing monthly wages of Rs. 3800, dies due to any disease mentioned in Part A or C or any disease in Part B if his service is of more than 6. months, amount of compensation shall be
= 0.50 x 3800 x 218.47 (Age factor)
= 1900 x 218.47 = Rs. 4,15,093 or Rs. 8,000 whichever is more..

Note : If monthly wages are more than Rs. 4000 per month, consider Rs. 4000/- only for the purpose of calculation. Age factor is derived from Schedule IV based on completed years of age.

Example 2 : A worker gets any of the permanent total disablement mentioned in Part I of Sch. I, due to occupational disease in Part III, and his age and monthly wages are 48 and Rs. 5600 respectively. Compensation will be
= 0.60 x 4000 x 159.80
= 2400 x 159.80 = Rs. 3,83,520 or Rs. 90000 whichever is more.

Example 3 : A worker loses partial vision of one eye (item 26A, part II, Sch. 1) due to occupational cataract by infrared radiation (item II, Part B, Sch. Ill) at the completed age of 40 with monthly wages Rs. 6500. Compensation shall be
= 0.10 x 4000 x 184.17
= 400 x 184.17 = Rs. 73668.

Example 4 : A worker suffering from silicosis (e.g. any lung disease) - injury not specified in Sch. I, but certified by a doctor as '80% loss of earning capacity (permanent partial disablement)' at his age of 58 and monthly wages Rs. 9600, his compensation shall be

= 0.80 x 4000 x 124.70
= 3200 x 124.70 = Rs. 3,99,040.

Example 5 : A worker's whole middle finger is amputated (item 31, Part II, Sch. 1) due to chrome ulceration and his lung damaged by 30% permanent partial disablement as assessed by the doctor, due to exposure to chromium vapours, and his age and monthly wages being 38 and Rs. 5600 respectively, his compensation shall be -

(1) For finger damage
= 0.12 x 4000 x 189.56
= 480 x 189.56 = Rs. 90988.80

(2) For lung damage
= 0.30 x 4000 x 189.56
= 1200 x 189.56 = Rs. 2,27,472

Total Rs. 90988.80 + 227472.00
= Rs. 3,18,460.80

Comparing with permanent total disablement [Sec 4(1) (C), Explanation - 1]

= 0.60 x 4000 x 189.56
= 2400 x 189.56 = Rs. 4,54,944 or Rs. 90000
whichever is more.

As amount Rs. 318460.80 does not exceed Rs. 454944, total compensation payable in this case is Rs. 318460.80.

Example 6 : A worker worked in three sugar mills in a continuous period of 16 years and it was detected that he was suffering from bagassosis due to sugarcane dust. This was found at his age of 45 and monthly wages Rs. 7800. The lung damage (permanent partial disablement) assessed by a doctor is 50%. Calculate the compensation payable by each, of the three employers.

Compensation
= 0.50 x 4000 x 169.44
= 2000 x 169.44 = Rs. 338880

As per Section (2-A), each employer may pay Rs. 338880/3 = Rs. 112960 to the worker, or in the proportion decided by the WC Commissioner depending on the facts of his case. The employer in whose sugarmill suppose the dust concentration was higher or for longer duration, may be directed by the Court to pay more proportion of the total amount.

Example 7 : A worker while handling organo phosphorous compound, undergoes toxic effect and remains absent for 3 months as per medical finding of this cause and advice. To what compensation he is entitled for this temporary disablement? He is drawing Rs. 4500 per month.

As per Section 4 (1) (d), he is entitled to a half monthly payment of 25% of his monthly wages i.e.. 0.25 x 4500 = Rs. 1125 from the 16th day from the date of disablement.

Here ceiling of Rs. 4000 per month is not applicable. It is applicable to death or permanent total disablement only [Explanation II to Sec 4 (1)].

6 EMPLOYERS' LIABILITY ACT, 1938

This Act (24 of 1938) came into force from 249-1938. It was lastly amended by an Act 51 of 1970. It is a small Act of five sections only. Its preamble declares that certain defences shall not be raised in suits for damages in respect of injuries sustained by workmen.

It extents to the whole of India and applies to all employers including contractors and agents who employ workmen-(including apprentice) under a contract which is express or implied.

Defence of common employment barred : Where personal injury is caused to a workmen because of the act or negligence or omission of the employer or of any person in service of the employer and acting in obedience or performing duty by the workman, a suit for damages by the injured workman or by his legal representative in case of his death, shall not fail by reason only of the fact that the workman was in the service (duty bound to do so and in common employment or he has accepted that risk) of the employer at that time.

Any term in contract of service or apprenticeship that excludes or limits liability of the employer in respect of personal injury caused to the workmen or apprentice by the negligence of persons in common employment with him, shall be void.

In any such suit for damages, it shall not be presumed that the workman undertook the risk attaching to the employment unless the employer proves that the risk was fully explained to and understood by the workman and that the workman voluntarily undertook the same.

This Act gives support to the claim (damages) of the worker in civil suits. Plea of the employer of 'contributory negligence by the worker or his knowingly acceptance of the risk as an integral part of his employment' is prohibited and this defence is not permitted for him. Though after fully amending ESI Act and WC Act and covering large scope of injuries and compensation, utility of this Act is diminished.

7 EMPLOYEES' STATE INSURANCE ACT & RULES

7.1 The Employees' State Insurance Act, 1948 :

This Act No. 34 of 1948 (in force from 31-31948) was modified in 1950,1956 and 1957 and amended in 1951, 1966, 1970,1975,1984 and 1989. It has 8 Chapters, 100 Sections and 2 Schedules. Chapter 4 of contributions and Chapter 5 of Benefits are more important.

Preliminary (Sec. 1) : The Act applies to the whole of India and to all factories other than seasonal factories. It can be applied to establishment industrial, commercial, agricultural or otherwise with six months' notice. Once the Act applies it shall continue even if the number of employees falls below the limit or the manufacturing process (with power) ceases.

Definitions (Sec. 2) : Contribution means the sum of money payable to the ESI Corporation by the principal employer in respect of an employee and an amount payable by or on behalf of the employee.

Dependent includes many relatives as prescribed by Sec.2 (6-A).

Employment injury means an injury to employee caused by accident or occupational disease arising out of and in course of his employment (insurable) whether the accident or disease takes place within or outside India.

Employee includes direct, contract or hired persons at main factory or establishment or its department, branch or a place for sale/purchase and also an apprentice (not under the Apprentices Act, 1961). His wage limit (excluding overtime wages) be prescribed by the Central Government.

Family is defined u/s 2(11)

Permanent partial disablement means such disablement of a permanent nature as reduces the earning capacity of an employee in every employment which he was capable of undertaking at the time of the accident resulting in the disablement (All injuries in Part II of the 2nd Schedule). .

Permanent total disablement means such disablement of a permanent nature as incapacitates an employee for all work which he was capable of performing at the time of the accident resulting in such disablement (All injuries in Part I of the 2nd schedule or from combination of injuries in Part II thereof).

Temporary disablement means a condition which requires medical treatment and makes the employee temporarily incapable of doing the work which he was doing prior to the time of injury.

Wages includes all remuneration except contribution to any pension fund or provident fund or under this Act, travelling allowance, gratuity and special expenses.

Corporation's Power for Health Measures (Sec. 19) : The Corporation may, in addition to the scheme of benefits, promote measures for the improvement of health and welfare, rehabilitation and reemployment of insured persons from the funds of the Corporation.

Purposes of the ESI Fund (Sec. 28) :

1. Payment of benefits and medical treatment to insured persons and their families.
2. Expenditure of hospitals, dispensaries, medical and ancillary services for the insured persons and their families.
3. Contribution to State Govt., local authority or any private body or individual towards cost of medical treatment to insured persons and their families, including cost of building and equipment.

4. Expenditure for improvement of health, welfare, rehabilitation and re-employment of insured or injured persons.
5. Payment of fees, salaries, allowances of the members, officers and staff.
6. Payment of cost of auditing accounts, courts set up under the Act, contract and cost of any legal or court proceedings.

Contributions (Chapter-4, Sec. 38 to 45-1) : Two types (i) Employer's contribution and (ii) Employee's contribution. Rates may be prescribed by the Central Government. Payment becomes due on the last day of the wage period. Interest 12% p.a. or more for the late payments. It is recoverable as an arrears of land revenue. The principal employer shall pay both the contributions and can recover from the employees or their immediate employer (e.g. contractor) their part. Register of- employees, contributions necessary and returns are also required.

ESI Inspectors have powers to visit factories, establishments etc. and to ask any principal or immediate employer to furnish necessary information, account books, records etc. regarding employment of persons, payment of wages etc. and can make copies also for the purposes of this Act.

Benefits (Chapter-5, Sec. 46 to 73 1) : Insured persons, their dependants or other persons mentioned can get following benefits under the Act and no similar benefits under any other Act. Though they can get similar benefits available under service conditions, customary concession, sickness leave, motor accident claims under the Motor Vehicles Act and damages/compensation for injuries due to the negligence of the employer (Judgements).

1. Sickness benefit : Periodical payments for sickness certified by a Doctor. Eligibility, rates and conditions may be prescribed by the Central Government.

2. Maternity Benefit : Periodical payments to an insured woman in case of confinement, misscarriage, sickness due to pregnancy, premature birth etc. on medical certificate. Eligibility, rates, period and conditions may be prescribed by the Central Government.

3. Disablement benefit : Periodical payment to an insured person for disablement due to employment injury and certified by a doctor.

   (a) For temporary disablement of more than 3 days (excluding the day of accident) and
   (b) For permanent disablement - total or partial - this benefit is available at the rate, period and condition prescribed by the Central Government.

   An accident shall be presumed as arisen in course of employment, in the absence of evidence to the contrary. Benefit is available for accident happening while acting inbreach of regulation or while travelling in employer's transport or while meeting emergency and acting for the employer's trade or business.

4. Dependants' benefit : Periodical payments to the dependants of an insured person who dies due to employment injury. The rates, period and conditions may be prescribed by the Central Government.

5. Medical benefit : Payment for medical, surgical and obstetric treatment for and attendance on insured persons, by the State Government or the Corporation.

6. Funeral expenses.: Payment to the family member or any other person who actually incurs expenditure on the funeral of the deceased insured person. i.

The claims should be made within 3 months of the death of the insured person.

Occupational Disease as an Employment injury : Contracting of any disease mentioned in the Third Schedule and in its

Part A -without any period in that employment,
Part B - for working more than 6 months in that employment, or
Part C -for working such period as the Corporation specifies,

Shall be deemed to be an "Employment injury arising out of and in the course of employment".

Any question regarding permanent disablement or proportion of loss of earning capacity or any such assessment, shall be determined by a Medical Board. An appeal against the decision of the medical board may lie with the Medical Appeal Tribunal. Both the Board and the Tribunal can review their decisions if satisfied by fresh evidence.

The corporation may, with the approval of the State Government, establish and maintain in the State hospitals, dispensaries, medical and surgical services for the benefit of the insured persons and their families.

The right to receive any payment of any benefit is not transferable or assignable. Disablement benefit cannot be commuted for a lump sum amount.

Sickness or disablement benefit for temporary disablement cannot be availed if the employee works on that day (of claim) or remains on leave or on a paid holiday or on strike.

Recipient of sickness or disablement benefit will observe conditions to remain under medical treatment at a place provided under this Act, to carry out medical instructions, not to leave the area, to allow himself for medical examination and not to do anything which may retard chances of recovery.

An insured person cannot get for the same period (a) both sickness and maternity benefit or (b) both sickness and temporary disablement benefit or (c) both maternity and temporary disablement benefit. When a person is entitled to more than one such benefits, he has to choose any one benefit.

The corporation has right to recover where a principal employer fails or neglects to pay any contribution, or any amount for excessive sickness arised due to in sanitary working conditions or not observing any health regulations.

If any person receives any benefit unlawfully, he shall be liable to repay to the corporation that amount.

If any person dies, any cash benefit payable to him shall be paid to his nominee/representative upto and including the day of his death.

No employer can reduce wages or benefits payable by him under service conditions because of the benefits conferred by this Act.

No employer can dismiss or punish employee during period of sickness, maternity, temporary disablement or certified illness etc. Notice of dismissal, discharge or reduction during such period shall be invalid or inoperative.

A person who misuses the benefit given under this Act, will be disentitled by the Central Government after giving him an opportunity of being heard.

Miscellaneous (Sec. 87 to 100) : The Government has power of exemptions. Rule making powers lies with the Central as well as the State Governments. The Corporation has power to make regulations. For their subjects see sections 95 to 97.

7.2 The Employees' State Insurance (Central) Rules 1950 :

They came into force from 22-6-1950. The Chapter-6, sections 47 to 62 are important as they provide further details on the subject of provident fund, wage limit, rates of contribution and benefits. Their summary is as under:

P.F. : The Corporation shall establish, maintain, and contribute to the "ESIC Provident Fund" for insured employees. It shall form a committee and regulations for its working.

Contribution period and Benefit period :

They are prescribed as under :

Contribution Period	Corresponding Benefit Period
1st April to 30th Sept.	1st January to 30th June of the year following
1st Oct. to 31st March of the year following	1st July to 31st December

Incase of a person who becomes an employee for the first time, the first contribution period for him will begin from the date he enters into insurable employment in the contribution period current on that day (i.e. the date of employment) and his corresponding benefit period will begin on the expiry of nine months from the date of such employment.

Wage Limit for Coverage : Up to Rs. 10000/ - p.m. w.e.f. 1-4-2006.

Rates of Contribution : Employer's contribution 4.75% of the wages payable to an employee. Employee's contribution 1.75% of his wages (w.e.f. 11-1997). An employee whose average daily wage is upto Rs. 50/- is exempted from paying his contribution though the employer's contribution in respect of such employee, shall continue (News, 7-9-97).

Standard benefit rate : As per Table, u/r 54. Revised with 18 entries w.e.f. 1-1-1997.

Sickness benefit : It is available if the contribution is paid for 50% of days of the contribution period. For the first two days of sickness the benefit is not available. For maximum 91 days in any two consecutive period the benefit can be available. Payment rate is the standard benefit rate u/r 54.

Maternity benefit: At least 70 days contribution during preceding two consecutive contribution periods make the insured women eligible for this benefit. For maximum 12 weeks the benefit is available. Medical proof is necessary. Payment rate is twice the 'standard benefit rate' u/r 54.

Disablement benefit: It is available for the disablement period of more than 3 days (excluding the day of accident) and for the whole period of permanent disablement or for life. Daily rate of payment shall be 40% more than the standard benefit rate u/r 54, and this rate shall be called the "full rate". For temporary and permanent total disablement, full rate is available, but for permanent partial disablement from injury specified in Part II of the 2nd schedule, at such percentage of the full rate and for injury not specified in that schedule, at proportionate to the loss of earning capacity (assessed by the medical certificate) the benefit will be available.

Dependants" benefit: To widow 3/5 of the full rate (till life or remarriage), to son 2/5 of the full rate (until he attains 18 years age), to unmarried daughter 2/5th of the full rate (until the age of 18 years or marriage whichever is earlier). If no widow or children, then, to a parent or grand parent for life 3/ 10 of the full rate, to any other male dependent till his age of 18 and to any other female dependent till the age of 18 or marriage, whichever is earlier or if widowed, until her age of,18 or remarriage whichever is earlier at 2/10 ofthe full rate. Total rate shall not exceed full rate and the amount shall be equally divided among the dependants.

Funeral expenses: Rs. 2500/- from 1-10-2001.

7.3 The Employees' State Insurance (General) Regulations, 1950 :

The corporation has made u/s 97, these regulations, w.e.f. 17-10-1950 to provide further details. Some summary is given below:

Provisions of identity card, family identity care Inspector, Insurance Medical Officer, Insurance Number, local office, regional office, regional director local committees are explained.

Registration of factories, establishments and families is required. Return of contributions, in Form No. 6, in 4 copies is to be sent to the ESI office Contributions should be paid within 21 days of the last day of the month in which it fall due. In case of permanent closure, it should be paid on the last. day of closure. For late payment, interest at 15% p.a is payable. In addition to this, damages are also payable as under:

No.	Delay Period	% P.A. damages
1.	Upto 2 months	3
2.	2 to 4 months	10
3.	4 to 6 months	15
4.	6 months and above	25

Register of employees should be in Form-7.

Benefits (Chapter 3, Regulation 44 to 95E) : For any benefit, proper claim form should be filled in Claim becomes due from the date of medical certificate and it shall be certified by the Local Office, which can ask further evidence also. Medical certificate from Insurance Medical Officer is necessary.

Benefits (first payment) are payable as under

No.	Type	To be paid within
1.	Sickness benefits	7 days
2.	Funeral expenses	15 days
3.	Maternity benefit	14 days
4.	Temporary disablement	30 days
5.	Permanent disablement	30 days
6.	Dependant’s benefit	90 days

Disablement Benefit : An employee will inform employer about accident to him. Employer will record it in an Accident Book in Form No. 15 and will report to die Local Office in Form No. 16 within 24 hours. For occupational disease specified in 3rd schedule no such notice is necessary but information required by the Local Office shall be given. Employer shall arrange for the first aid.

Dependants benefit : Death of an insured person is to be reported immediately to the Local Office and his body shall be disposed of 'after examination (and post-mortem if necessary) by Insurance Medical Officer or other Medical Officer. Death certificate in Form 17 shall be issued to the dependants. Claim for dependants' benefit will be submitted in Form 18 to the Local Office, with documents and proofs prescribed u/r 80.

Maternity Benefit : An insured woman will give notice in Form 19 and pregnancy certificate in Form 20 to the Local Office. Other Forms 21, 22, 23 are also required as per Reg. 88. She may loose benefit if refuse for medical examination by a female doctor or midwife.

Funeral expenses: Death certificate in Form 15 and claim Form 25-A are prescribed.

Medical benefit : A person receiving disablement benefit can also get medical benefit. This benefit is available after payment of contributions for 50% days of the contribution period and for a period of 3 months if he is continued in the service for 2 months or more.

Some 28 forms have been prescribed under these Regulations.

For .figures of number of factories and employees covered and benefits given under the ES. Act see Table 5.13 and 5.14 of Chapter-5.

Criticism : This ESI scheme logically and theoretically seems beneficial for well being of the workers but in its practice of more than 45 years it has gained heavy criticism because of its

1. Poor administration.
2. Incapacity to provide speedy service to thousands of workers and their families.
3. Insufficient hospitals, dispensaries, doctors, facilities and staff.
4. Rude and rigid behaviour with workers who need love and affection.
5. Complexity of forms and procedure.
6. Hardship to workers in going to limited centres and at a longer distance.
7. Poor quality of medicines and treatment.
8. No real interest in worker's welfare 'and referring him here and there.
9. More stress in collecting money than 'disbursement of benefits to workers.
10. Profit making attitude instead of charitable.

Because or above factors not only employers out employees and their trade unions have also opposed this scheme and resisted against its forceful application. Insured employees prefer to go to private doctors and hospitals for better treatment. They are loosing faith from ESI doctors, their treatment and medicines. Only poorer workers go there under compulsion.

As per one news report of 25-8-1997, even after raising the eligibility wage limit from. Rs. 3500 to Rs. 6500 per month and similar increase in employers' contributions there is no improvement in ESI medical services. On the contrary the condition is deteriorated. Despite of increase in number of employees and income of the Scheme, strength of doctors is reduced. In 1995 there were 3160 doctors which reduced to 3076 in 1996. In 1991 there was, one doctor per 2127 members While in 1996 that proportion was one doctor per 2374 members! The Government gives subsidy also. Even then the service is not satisfactory.

It is suggested in this report that the Government should give Health Insurance Policies to the members to make the Scheme more meaningful.

In another press-note of Financial Express dated 4-9-97, it is confessed that many States are giving less importance to the Scheme and the Corporation has become a silent spectator and the quality of the Scheme has gone down. The Central Administration is unable to pay full attention and therefore it is, now, decided to establish State Corporations under the control of the Central ESI Corporation.

Where ESI scheme is made applicable, a trend is noticed of increase in accidents. This may be due to a wrong approach of workers' to take benefit of accident leaves. This again adds to the loss of national production.

ESI authorities and corporation has to find and apply remedial measures to above problems.

Expansion of infrastructure, HRD training to doctors and staff, loving and charitable attitude, less contribution and higher benefit utilising full income, better hospitals, nice dispensaries, good facilities and speedy service can certainly change its present scenario.

8 THE GUJARAT PAYMENT OF UNEMPLOYMENT ALLOWANCE TO WORKMEN IN FACTORIES ACT, 1981

This Gujarat Act (No. 20 of 1981) received the President's assent on 28-5-1981. It is applicable to the State of Gujarat.

Enrolled workmen (including Badli, permanent or temporary workman) shall be paid unemployment allowance, at the rate of 50% of basic wages plus dearness allowance, for the days for which an employer fails, refuses or is unable to provide employment to them, during the specified period notified by the State Government from time to time in the Official Gazette, by reason of any restriction on consumption, use or supply of electrical energy to the factory.

Workman is not entitled to such allowance if he is entitled to any lay-off compensation or if he refuses to accept any alternative employment in the same factory.

9 GUJARAT PHYSICALLY HANDICAPPED PERSONS (EMPLOYMENT IN FACTORIES) ACT AND RULES

9.1 The Gujarat Physically Handicapped Persons Act, 1982 :

This Act received the assent of the President on 19-2-1982 and applied to the State of Gujarat from 710-1981 It has 14 sections

It is applicable to every factory employing 100 (Notification dated 7-5-2004) or more workers. A factory belonging to or managed by the Central Government is excluded. Once applied, it remains applied even if the number of workers falls below 100.

'Certifying Surgeon' and Inspector' means those appointed under the Factories Act, 1948.

'Physically handicapped person' is defined as a person who, on account of any deficiency, injury, disease or congenital deformity, is substantially handicapped in obtaining or keeping employment, or in undertaking work on his own account, of a kind which for such deficiency, injury, disease or deformity would be suited to his age, experience and qualifications. '

One percent vacancies are to be allocated for and filled in by such handicapped persons registered with an employment exchange. (S.3).

Vacancies shall be allocated for handicapped persons and it shall not be filled-in by any person other than the handicapped person. (S.3).

The handicapped person must be an adult, registered with the State Employment Exchange and having a certificate of fitness (S.4) granted by a Certifying Surgeon in Form 1. (S.5). The CS should have personal knowledge of the place and process where the physically handicapped person is to be employed.

The employer shall keep a register of such persons in Form II.

Sections 7 to 14 provide for powers of Inspectors, penalties, rule making power etc.

9.2 The Gujarat Physically Handicapped Persons (Employment in Factories) Rules, 1982 :

By Notification dated 25-2-1983, of the Labour & Employment Department, the Government of Gujarat made these rules u/s 13 of the above Act.

Rule 2 defines blind, deaf, deaf and mute, functional capacity, orthopedically handi-capped etc.

Following three Forms are prescribed by these rules:

Form I	-	Certificate of fitness to a Physically Handicapped person.
Form II	-	Register of Handicapped workers.
Form III	-	Requisition of vacancies to the Employment Exchange.

Half yearly reports standing on 1st January and 1st July are to be sent in Form II, within I month after these periods.

10 PUBLIC LIABILITY INSURANCE ACT AND RULES

10.1 Public Liability Insurance Act, 1991:

This Act (No.6 of 1991) was enacted on 22-11991 and came into 'force from 23-1-1991. As mentioned in its preamble, the Act provides for public liability insurance for immediate relief to persons affected by accident occurring while handling any hazardous substance and for matters connected therewith. The Act has 23 sections.

The statement of objects and Reasons in drafting the bill is reproduced below :

The growth of hazardous industries, processes and operations in India has been accompanied by the growing risks from accidents not only to the workmen employed in such undertakings, but also innocent members of the public who may be in the vicinity. Such accidents lead to death and injury to human beings and other living beings and damage private and public properties. Very often, the majority of the people affected are from the economically weaker sections and suffer great hardships because of delayed relief and compensation. While workers and employees of hazardous installations are protected under separate laws, members of the public are not assured of any relief except through long legal processes. Industrial units seldom have the willingness to readily compensate the victims of accidents and the only remedy now available for the victims is to go through prolonged litigation in a Court of Law. Some units may not have the financial resources to provide even minimum relief.

It is felt essential, therefore, to provide for mandatory public liability insurance for installations handling hazardous substances to provide minimum relief to the victims. Such an insurance apart from safeguarding the interests of the victims of accidents would also provide cover and enable the industry to discharge its liability to settle large claims arising out of major accidents. If the objective of providing immediate relief is to be achieved, the mandatory public liability insurance should be on the principle of "no fault" liability as it is limited to only relief on a limited scale. However, availability of immediate relief would not prevent the victims to go to courts for claiming larger compensation.

The Bill seeks to achieve the above objectives.

Definitions (S. 2):

Accident means an accident involving a fortuitous or sudden or unintended occurrence while handling any hazardous substance resulting in continuous or intermittent or repeated exposure to death of, or injury to, any person or damage to any property but does not include an accident by reason only of war or radioactivity.

Handling of hazardous substance means the manufacture, processing, treatment, package, storage, transportation by vehicle, use, collection, destruction conversion, offering for sale, transfer or the like of such hazardous substance, (vehicle means any mode of surface transport excluding railways).

See also S. 2(d) of the EP Act.

Hazardous substance means any substance or preparation which is defined u/s 2 (e) of the EP Act and exceeding such quantity notified by the Central Govt.

Liability of Owner:

Every owner shall take, before he starts handling of any hazardous substance, one or more insurance polices to ensure himself against liability to give relief as specified in the schedule given below to any person (other than a workmen, as defined in WC Act) who suffered injury, death or property damage due to any accident. The policy shall be kept renewed. It shall be for an amount more than the paid-up capital or the market value of all assets and stocks, but not exceeding 50 crore rupees. In addition to this, the owner shall also pay to the insurer, together with the amount of premium, further amount, not exceeding the premium and as may be prescribed to be credited to the Relief Fund u/s 7-A. The insurer shall remit this amount to the authority in S. 7-A within a prescribed time.

Schedule of Threshold quantities of Hazardous substance :

U/S 2(d) of the PLI Act, a schedule is notified of hazardous substances. Liability of PLI policy arises if hazardous substances are handled in quantity equal to or more than tins threshold quantity.

For the names and quantities of these hazardous substances, (179 and more) the schedule should be reffered. \Threshold quantities of some of these substances are given below from the schedule.

No.	Name of hazardous substance	Quantity
1	Arsine (Arsenic hydride)	10 kg
2	Benzidine	1 kg
3	Mthyl isocynate	150 kg
4	Phosgene (Hydrogen phosphide)	750 kg
5	Acrylonitrile	20 t
6	Ammonia	50 t
7	Bromin	40 t
8	Carbon disulphide	20 t
9	Chlorine	10 t
10	Ethylene dibromide	5 t
11	Formaldehyde (concentration < 90%)	5 t
12	Hydrogen chloride (liquefied gas)	25 t
13.	Hydrogen cynide	5 t
14.	Hydrogen fluoride	5 t
15.	Sulphur dioxide	20 t
16.	Sulphur trioxide	15 t
17	Acetylene	5 t
18	Ethylene oxide	5 t
19	Hydrogen	2 t
20	Liquid Oxygen	200 t
21	Nitroglycerine	10 t
22	Trinitrobenzene	50 t
23.	**Flammable gases** (substances which in the gaseous state normal pressure and mixed with air become flammable and the boiling point of which at normal pressure is 20°C or below;)	15 t
24.	**Highly flammable liquids** Substances which have a flash point lower than 21°C and the boiling point of which at normal pressure is above 20°C.	1000 t
25.	**Flammable liquids** Substances which have a flash point lower than 55oC and which remain liquid under pressure, where particular processing conditions, such as high pressure and high temperature, may create major accident hazards.	25 t

Schedule of Relief

1. Reimbursement of medical expenses upto Rs. 12,500 in each case.
2. For fatal accident Rs. 25,000 per person in addition to (1) above.
3. For permanent total or partial disability, injury or sickness, reimbursement of medical expenses upto Rs. 12,500 and cash relief based on percentage disablement certified by an authorised doctor, the relief for total permanent disability being Rs. 25,000.
4. For loss of wages due to disability Rs. 1000 per month upto 3 months provided the victim is above 16 years and hospitalised for at least 3 days. (S. 3 & 4).
5. Upto Rs. 6000, for damage to private property.

Relief Procedure :

The Collector shall verify the occurrence of an accident in his jurisdiction and cause publicity for inviting relief applications (S. 5). Application (in Form 1) shall be made to the Collector within 5 years of the accident. The Collector shall hold inquiry and give award of relief within 3 months of the receipt of relief application. The insurer or/and owner shall deposit the amount as directed by the Collector, within 30 days of the award. The Collector shall arrange to pay from the Environment Relief Fund established by notification of the Central Govt. In addition to relief under this Act, right to get compensation under any other law is also maintainable but in that case the owner has right to reduce (deduct) the amount paid as relief under this Act (S. 5 to 8).

Other provisions:

The Central Govt. can authorise any person to ascertain requirements of this Act and that person shall have a right of entry and inspection, search and seizure, removing hazardous substance at the cost of its owner (S. 9 to II), the Central Govt. has power to give directions to any person, officer, authority, agency etc. including the direction to prohibit or regulate the handling of hazardous substance or to stop or regulate electricity, water or any other service (s. 12), the Central Govt. or the authorised person can apply to Court for restraining owner from handling hazardous substance and in that case the Court may direct the owner to desist from such handling or authorise the applicant to implement the direction at the cost of the owner (S. 13).

Provisions are also made for offences by companies (S.16), offences by Govt. Departments (S.17), cognisance of offence by the authority or by any person who gives notice of at least 60 days of his intention to complain about the alleged offence, before the authority (S.18), power to delegate (S.19), protection of action in good faith (S.20), advisory committee (S.21), this Act has effect despite anything inconsistent therewith (S.22) and rule making power of the Central Govt. (S.23).

10.2 Public Liability Insurance Rules 1991 :

The Central Govt. u/s 23 of the Public Liability Insurance Act made these rules which came into force on 1-5-1991. They have II rules and 2 Forms. Their abstract is as under :

A relief application shall be made to the Collector in Form-1 (R.3) accompanying the relevant documents such as disability/illness certificate from an authorised physician, death and/or post-mortem certificate, birth or age certificate, proof of hospitalisation for more than 3 days, employers certificate for loss of wages, medical bills and receipts, repairing or replacement cost certificate regarding damaged property etc. (R.4).

The Collector has all the powers as prescribed in Rule 5 and shall maintain a register of claim applications, awards and payment made, shall keep it open for public and give copy on request (R.7).

All directions u/s 12 shall be in writing, the objections may or may not be invited and the proposed action may be confirmed, modified or withdrawn and the notice may be served as prescribed (R.8).

For cognisance of offence u/s 18, notice in Form-11 shall be sent to the authorities mentioned in R9.

Maximum liability of the insurer to pay relief is Rs. 5 crores (to several claimants) in case of one accident and Rs. 15 crores in case of more accidents during one year or the period of policy whichever is less. If the award amount exceeds this limit, it shall be met with from -the relief fund and in case it still falls short, the balance amount shall be payable by the owner. (R. 10).

Owner's contribution to the Environmental Relief Fund shall be equal to the premium payable to the insurer and it shall be paid alongwith the premium to the insurer. The contribution so received shall be remitted as per the scheme u/s 7-A.

Form - 1: Application for compensation (claim).

Form - II : Notice for cognisance of offence.

11. NATIONAL ENVIRONMENT TRIBUNAL ACT, 1995 :

The introductory words explaining the need of this Act are as under :

The protection and improvement of the Human Environment is a major issue which affects the wellbeing of people and economic development throughout the world; it is the urgent desire of the people of the whole world and the duty of all governments. There is growing evidence of man-made harm in many regions of the earth; dangerous levels of pollution in air, water, earth and living beings thereon, major and undesirable disturbances to the ecological balance of the biosphere; destruction and • depletion of irreplaceable resources; and gross deficiencies harmful to the physical, mental and social wealth of man, in the man-made environment, particularly in the living and working environment.

Statement of Objects & Reasons in passing this Act is reproduced below :

The principle of strict civil liability in accident cases arising from the activities involving hazardous substances has been highlighted in a case by the Supreme Court of India. An enterprise engaged in activities with potential threat to the health and safety of the persons residing in the surrounding areas of the factory owes an absolute duty to the community to ensure that no harm is caused to any one on account of hazardous and inherently dangerous nature of such activities. Cases seeking compensation for damages to human health, property and the environment, particularly contamination of sub-surface water, are increasing. There is also an increasing trend in the number of industrial disasters.

The United Nations Conference on Environment and Development held at Rio de Janeiro in June, 1992, in which India participated, has also called upon the States to develop National laws regarding liability and compensation for the victims of pollution and. other environmental damage.

It is deemed expedient to develop and codify the principle of strict civil liability in respect of all such cases where damage is caused while handling hazardous substances. It is proposed to establish a National Environment Tribunal for effective and expeditious disposal of cases arising from certain industrial accidents and disasters with a view to providing effective and expeditious relief and compensation for damages to human health, property and the environment.

The Bill seeks to achieve the aforesaid objects.

The Bill introduced in 1992 was passed by both the Houses of the Parliament in 1995, and received the assent of the President on 17th June, 1995 and became an Act of Parliament under the short title "The National Environment Tribunal Act, 1995 (29 of 1995)".

Preamble of the Act provides for strict liability for damages arising out of any accident occurring while handling any hazardous substance and for the establishment of a National Environment Tribunal for effective and expeditious disposal of cases arising from such accident, with a view to giving relief and compensation for damages to persons, property and the environment and for matters connected therewith or incidental thereto.

The Act has 5 chapters, 31 sections and a Schedule..

The words 'accident', 'handling' and 'hazardous substance' are defined as the same as defined u/s 2 of the Public Liability Insurance Act, 1991 and the word 'environment' is defined as the same as defined u/s 2 of the Environment (Protection) Act 1986 (see Part 10.5 of Chapter-28).

'Tribunal' means the National Environment Tribunal established u/s 8 by the Central Govt.

Liability to Pay (5.3) :

The Schedule u/s 3(1) gives following heads under which compensation can be claimed by any person (other than a workman) for death, injury or damage to property or environment :

1. Death;
2. Permanent, temporary, total or partial disability or other injury or sickness;
3. Loss of wages due to total or partial disability or permanent or temporary disability;
4. Medical expenses incurred for treatment of injuries or sickness;
5. Damages to private property;
6. Expenses incurred by the Government of any local authority in providing relief, aid and rehabilitation to the affected persons;
7. Expenses incurred by the Government for any administrative or legal action or to cope with any harm or damage, including compensation of environmental degradation and restoration of the duality of environment;
8. Loss to Government or local authority arising out of, or connected with the activity causing any damage;
9. Claims on account of any harm, damage or destruction to the fauna including milch and draught animals and aquatic fauna;
10. Claims on account of any harm, damage or destruction to flora including aquatic flora, crops, vegetables, trees and orchards;
11. Claims including cost of restoration on account of any harm or damage to environment including pollution of soil, air, water, land and eco-systems;
12. Loss and destruction of any property other than private property;
13. Loss of business of employment or both;
14. Any other claim arising out of, or connected with, any activity of handling of hazardous substance.

In claiming above compensation, the claimant needs not to prove any wrongful act, neglect or default of any person.

If the injury is due to several activities, operations and processes, the Tribunal may apportion the liability for compensation amongst those responsible for such activities on an equitable basis.

Application for Claim (S.4) :

The person who has sustained the injury, the owner whose property is damaged, legal representative of the deceased, duly authorised agent, any organisation recognised by the Central Govt., a local authority. State Govt. or the Central Govt. can make an application for compensation.

The Tribunal may take up the cases suo motu. The claimant can ask relief under the Public Liability Insurance Act, 1991.

Fees to be paid with the application is Rs. 1000 and time limit 5 years.

Powers (S.5 to 7) :

Procedure and powers of the Tribunal are mentioned in S.5 to 7 and in Chapter-4 (S. 19 to 24). The Tribunal can make interim orders and deduct the amount of relief or compensation paid in any other law from the compensation to be paid under this Act. Amount payable for damage to environment shall be credited to the Environmental Relief Fund under the Public Liability Insurance Act. The order of the Tribunal shall be executable as a decree of civil court. The amount shall be recoverable from the owner as arrears of land revenue or of public demand.

Appeal shall lie to the Supreme Court and shall be preferred within 90 days.

Establishment of Tribunal (S.8 to 18) :

The Central Govt. shall by notification, establish it. It shall have Chairperson, Vice Chairpersons, Judicial Members and Technical Members. A Bench shall consist of one judicial and one technical member. Their qualifications are prescribed in S. 10. Age of retirement for Member, Vice-Chairperson and Chairperson are 62, 65 and 70 respectively. Provisions are made for their salaries, allowances, powers and staff etc.

Penalty : Imprisonment upto 3 years or fine upto Rs. 10 lakh or both, for not complying an order by the Tribunal.

Section 31 gives rule making powers to the Central Government.

E X E R C I S E

1. Explain, State, Mention or Discuss :

1. History of doctrine of social security.
2. When Employer is liable to pay workmen's compensation and when he is not ?
3. Main provision of the Employers Liability Act 1938.
4. Six types of benefits available to an employee under the ESI Act.
5. Which benefits an insured person cannot get for the same period under the ESI Act?
6. Objects of Public Liability Insurance Act 1991.
7. The schedule of relief under the PLI Act.
8. The relief procedure under the PLI Act.
9. Role of District Collector under the PLI Rules 1991.
10. Statutory provisions under which any person other than a workman can claim compensation.

2. Write Short Notes on :

1. Social accountability.
2. Refusal of worker to undergo medical examination.
3. Deposit of Compensation OR Medical examination under W.C. Rules.
4. Method of calculating amount of compensation in case of death and disabilities.
5. ESI Act - its advantages and misuse.
6. Benefits for workers and their families under the ESI Act & Rules.

7. Time limit and penalty for late payment of contributions under ESI Regulations 1950.
8. Types of contributions under ESI Act.
9. Current rates of contributions under ESI Rules.
10. Sickness benefit OR Disablement benefit.
11. Dependants' benefit OR Maternity benefit.
12. Criticism, regarding ESI scheme.
13. Physically handicapped person and statutory provisions for him.
14. Gujarat Act for Unemployment Allowance to workmen.
15. Liability of Owner under the Public Liability Insurance Act 1991.
16. Statement of Objects and Reasons put before passing of National Environment Tribunal Act 1995.
17. Preamble of the National Environment Tribunal Act 1995.
18. Powers of Tribunal under the National Environment Tribunal Act 1995. 19. Purposes of the ESI fund.
20. Social security for unorganised workers.

3. Explain the Difference between :

1. Partial disablement and Total disablement.
2. Temporary disablement and Permanent disablement.
3. Contribution and Compensation.
4. Different types of Dependents.
5. 'Workman' under the WC Act and 'Employee' under the ESI Act.
6. Contributions and Benefits.
7. Disablement benefit and Medical benefit.
8. Sickness benefit and Disablement Benefit.
9. Provisions of the WC Act and those under the ESI Act.
10. 'During employment' and In course of employment'.
11. Benefits under the ESI Act and those under the WC Act.
12. Coverage of WC Act and that of ESI Act.

4. Comment on following explaining whether it is True or False?

1. In case of death of a worker, compensation can be paid to him directly i.e. out of court also.
2. Compensation payable to woman or minor should be paid through court only.
3. Six months' wages are payable in advance and subsequently deductible as compensation.
4. Accident compensation claim should be made within 1 year under W. C. Act.
5. Reports of fatal accident or serious bodily injury should be given within I month under the W. C. Act.
6. Workman's compensation is not a charge on Employer's assets.
7. A workman has right to relinquish his right of compensation under the W.C. Act.
8. Disablement benefit can be commuted for a lump sum amount.
9. If an employee is entitled to get more than one benefit, he is eligible to get them.
10. If contribution is not paid, benefit cannot be available.
11. Unpaid cash benefit cannot be given to nominee of a deceased employee.
12. For any misconduct an employee can be dismissed from service even during his period of sickness.
13. Public liability insurance amount cannot be more than the paid-up capital of the company.
14. If accident due to 'hazardous substance' is not possible, public liability insurance is not necessary.
15. Medical expenses up to Rs. 25000 and Rs. 12500 more in case of fatal accident are available as relief under the PLI Act.

16. Wage loss compensation for disability is 'available @ Rs. 2000 p.m. under the PLI Act.
17. Fine up to Rs. 10 lakh is possible for not complying an order by the Environmental Tribunal.
18. Public liability is for social security

CHAPTER – 30

Accident Case Studies

THEME

1 NEED OF ACCIDENT CASE STUDIES

We do not wish any accident, but when any accident takes place, it teaches the real lesson. Our knowledge and safety measures are tested and we are compelled to acquire the knowledge of the causes of that accident and of preventive measures to stop its recurrence. This requires thorough investigation and correct conclusion. That shows us the path of safety. Thus any accident has two effects; bad and good. The loss or injury is the bad effect and the knowledge acquired to prevent similar occurrence is the good effect. Thus we have to utilise the accident causes to raise our knowledge for the purpose of safety and this becomes possible by the case studies. A case study sharpens and tests our knowledge and arrangement and asks us why did they fail? We rethink our arrangement and management (which failed) and turn to redesign it on the bases of that real case study. That is the utility of any safety case study whether it may be an accident case or a non-accident experiment. However an accident case study gives much experience. Some typical and real cases are narrated below in brief.

2 THE WORLD SCENARIO

In the history of industrial disasters, Bhopal Gas Disaster of 1984, remains at the top because of more than 2500 fatalities and thousands of injuries and aftereffects. Before Bhopal, the world had seen many chemical disasters, but the public attention was not drawn that much.

On 21-9-1921, at Oppau, Germany, warehouse explosion took place due to dynamite being used to pry loose cracked ammonium nitrate. The deaths reported were 561 and damage upto 30 km distance.

In 1942, at Honkeiko, China, 1572 died due to coal dust explosion.

In 1944, at Cleveland, USA, LNG(Methane) storage tank exploded due to structural weakness resulting in 136 deaths and 77 injuries. In the same country on 15-4-1947 at Texas, explosion took place in a ship carrying ammonium nitrate bursting nearby styrene plant resulting in 576 deaths and some 3000 injuries.

On 29-7-1943 at Ludwigshafen, W. Germany, in BASF company, explosion took place in a road tanker containing 16 T butadiene and butylene and 57 died, 439 injured and nearby buildings collapsed. In the same company, on 28-7-1948, again explosion (overfilling and expansion due to sun heat) took place in a rail tanker containing 30 T dimethyl ether and 207 died and 3818 injured.

In 1950 at Poza Rica, Mexico, 10 died due to phosgene exposure. In 1952 at Wilsom, Germany, 7 died due to chlorine release. In 1973, at Staten Island, USA, 40 died due to LNG fire.

In 1956 at Cali, Columbia, 1100 people died in a dynamite truck explosion.

Famous Flixborough (UK) explosion occurred on 1-6-1974. In a caprolactum plant, a temporary bypass pipe was broken and vapour came out. It resulted into fire and explosion. The plant was ruined into pieces, 1821 buildings and 167 shops broken down, 28 died and 89 were injured. As a consequence, in 1985, ' CIMAH Regulations were passed in European countries.

In 1975, coalmine explosion took place at Chasnala, India, causing death of 431 people. In the same year propylene explosion took place at Beek, Netherlands causing 14 deaths and 107 injuries.

During 1976 to 1979, the Love Canel near Niagara Falls, USA, reports were published regarding effects of buried waste at this Canal. A number of birth defects and miscarriages were reported. amongst residents in the vicinity of the Love Canal. A law-suit was filed in 1979 against the Hooker Chemical Co. for its earlier use of this Canal. This drew attention of many such toxic waste sites in the USA and led to the legal exercise of 'waste minimisation approach', the 'waste audit' and the law relating to it.

Famous Seveso (Italy) accident occurred on 107-1976. In a chemical factory, a safety valve opened and some 2 kg TCDD(Tetra chloro dibenzo pera dioxene) vapour released into the atmosphere and 250 people were to be evacuated and a large area was polluted. As a consequence, safety instructions known as 'Seveso Directives' were issued. These directives required disclosure of information and drawing up of emergency plans to reduce the frequency of disasters and consequential damage.

In 1977 at Cartagena, Columbia, 30 died and 25 injured due to ammonia emission.

In July 1978 at San Carlos (Spain) propylene gas tanker (24 T) dashed into a wall and exploded. 215 people died. In the same year, at Chicago, Illinois, USA, 8 died and 29 injured due to HS exposure.

In 1979 at Novosibrisk, USSR, an accident took place in a chemical warfare plant killing some 300 people. In the same year accident took place because of water ingress in a reactor in a nuclear power plant at Three Mile Island, USA.

The year 1984 noted 3 disasters including Bhopal gas (methyl isocyanate) leak on 3-12-1984, killing some 2500 people and injuring over 20000. At Cuhato (Brazil) fire and explosion took place from a leaking Gasoline pipeline resulting into deaths over 500. At San Junico (Mexico), explosion took place at the Pemex Co., LNG storage depot on 19-11-1984, causing deaths of 542 people and injuries to more than 4000.

In 1985, LPG BLEVE occurred at Mexico city, causing 650 deaths and 2500 injuries. On 11-8-1985, at West Verginia Institute, USA, methylene chloride and aldicarb oxime mixture came out from a safety valve due to runaway reaction. 134 people were hospitalised.

On 26-4-1986, from Chernobyl Nuclear plant, USSR, atomic radiation came out killing 31 and causing radiation sickness to 203. The serious point was of the evacuation of more than 135000 people and 280 cancer deaths were predicted during next 70 years.

Every year disaster takes place at some or the other place. Therefore such list becomes long. Let us see some reported cases during last few years.

In 1993, (1) at Bangkok, Thailand, 250 killed in fire in a doll factory (2) 9 killed and 53 affected by acid fumes from a chemical plant at Shahad, Maharashtra and (3) 61 killed and 21 injured in a blast in a chemical plant at Beijing, China.

In 1994 (1) 55 miners died in a colliery at Asanol, West Bengal (2) 70 'miners died in a mine due to gas explosion by a short circuit at Beijing, China (3) 18 killed in a blast in cement factory at Hyderabad, AP (4) 26 died and 76 injured by fire crackers at a religious festival at Chikal-thana, Maharashtra (5) 34 died in explosion in a fireworks factory at Jhansi, MP (6) 132 killed in a fire in oil refinery at Cairo, Egypt and (7) 233 died and 16 injured in a fire in a dance hall at Beijing, China.

In 1995 (1) 109 died and 160 injured due to a leaking gas pipeline explosion on road at Taegu, South Korea (2) 4 killed due to methane leak from BPCL pipeline in Chembur, Bombay (3) 4 killed and 2 injured when an empty petrol tanker was being welded at Chhapra, Bihar (4) 23 killed and 9 injured in explosion in a fire cracker factory at Rohtak, Haryana (5) 40 died and 26 injured in a coal mine at Henan, China (6) 2400 T Di-methyl terephthalate (DMT) worth over Rs. 20 crore was destroyed in fire and explosion in a petrochemical plant near Pardi Naka, Nagpur (7) 375 killed by fire in a moving train (underground) at Azeri, Baku, USSR and (8) 368 died when fire broke out due to short circuit at Sirsa, Haryana.

In 1996 (1) 40 died and 57 injured by a petroleum pipe explosion at Henan, Beijing, China and (2) 26 died and some 1000 injured due to massive toxic gas leak from a tanker at Lahore, Pakistan.

In 1997 (1) 343 Haj Pilgrims killed in a fire, possibly due to a gas cylinder burst in a tent at Mecca, Saudi Arabia (2) 60 killed and over 100 injured due to asphyxiation in cinema hall by fire due to short circuit at New Delhi and (3) 60 killed in a fire and explosion in HPCL refinery at Vishakhapatnam, AP.

In 1998 (1) Over 60 died due to fire and explosion in a collision between an oil tanker and 4 other vehicles at Islamabad, Pakistan (2) 500 were burnt by petrol spilled from a burst pipeline in Nigeria, Egypt and (3) II died and 100 injured when a leaking LPG tanker exploded in Guwahati, Assam..

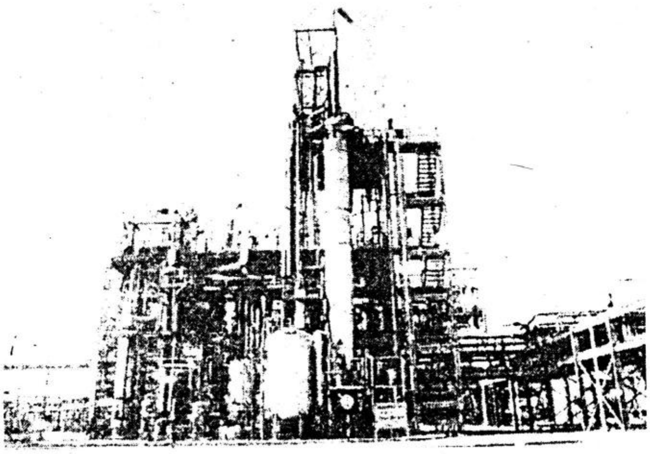
On 7-9-2006, 54 died in a coal mine in Zarkhand due to carbon monoxide after explosion.

The lessons of such world-wide ever happening disasters must be learnt very seriously and it must be determined to work hard to prevent similar recurrences. These disasters are worth studying for safety professionals and government officials to plan for disaster management.

Now some fatal accidents are narrated below in brief to explain their causes and remedial measures.

3 SOME FATAL ACCIDENTS

3.1 Bhopal Gas Disaster :



Union Carbide Plant at Bhopal

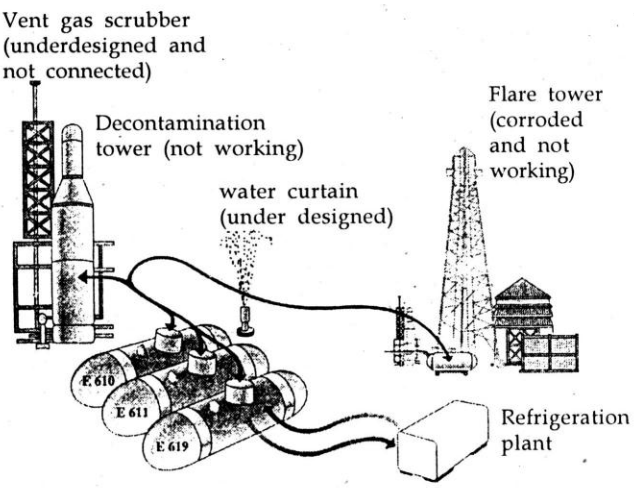
The Facts of the Accident in brief :

It was the night of 2nd December 1984 when the night shift staff of the Union Carbide Factory, Bhopal, took a round at @ II pm. There were three double walled, partly buried S.S. tanks (No. 610, 611 and 619) each of 60 tonne capacity and all containing the poisonous gas MIC (Methyl isocyanate) to be used to produce a deadly pesticide Carbaryl. At @ 11-30 pm. workers in the plant realised that there was a MIC leak some where : their eyes began to tear. A few of them went to the MIC structure and noticed a drip of liquid with yellowish-white gas, about 50 feet of the ground. They told .the supervisor who, however, decided to deal with the leak after the tea-break which ended at 1240 night. Meanwhile the events had moved very fast.

The temperature of the tank 610 had reached 25°C the top of its scale and the pressure was increased twenty times rushing towards 40 psi at which the emergency safety valve was to open. Soon the pressure gauge showed 55 psi, the top of the scale and the safety valve had opened releasing MIC With a loud hissing sound and the tremendous heat. A white cloud drifting over. the plant was. moving towards the sleeping neighbourhood.

The workers tried to operate the safety devices, but nothing seemed to work. The water jet failed to reach the top of the 120 feet stack from which MIC was escaping. The vent gas scrubber to neutralise the escaping gas did not work. The scrubber was under maintenance,, the flow meter was not indicating the circulation of caustic soda whose concentration was also not known since October. The flare tower to burn off the gas could not be 'used because its piping was corroded and not replaced. The refrigeration system, of 30 tonne capacity, to keep the MIC in liquid state at 0°C was closed down since June 1984 as an economy drive and the gas was at 15°-20°C Which was unsafe. For approximately two hours, the safety valve remained opened releasing over 50000 pounds of MIC (might also containing Phosgene, Chloroform, Hydrogen cyanide. Carbon dioxide etc.) out of 90000 pounds stored in the tank No. 610 at the time of the incident. Sometime between 1-30 to 2-30 am. the safety valve reseated as the tank pressure went below 40 psi.

The Causes of the Accident :



Condition of Union Carbied factory at the time of accident.

(A) Unsafe Conditions

From the published press reports they seem to be:

1. The refrigeration system to keep the gas cool was closed since long.
2. The vent gas scrubber was underdesigned, not repaired and not connected.
3. The corroded flare tower pipe not replaced and not connected.
4. The water curtain jests were underdesigned to reach the maximum height.
5. All the three tanks were filled in while one ought to have kept empty to use as emergency bypass.
6. The computerised pressure/temperature sensing system, a warning device to give alarm and to control the situation at the time of abnormal condition was not installed.
7. The carbon steel valves were used instead of stainless steel and the valves 'were notorious for leaking.
8. The instruments to check the valve-leakage were not available.
9. The wind direction and velocity indicator was not installed to warn the people about leakage direction and severity.
10. The neighbouring community was not told of the significance of the danger alarm and the dangers posed by the materials used in the plant.
11. Control instruments at the plant were faulty.
12. Maintenance and operational practices were deteriorated.
13. Chemical reactors, piping and valves were not purged, washed and aired before maintenance operations.
14. The blind disc to disallow the water in the tank through the valve was missing.
15. Under qualified workers were running the factory.
16. People with chemical engineering background were replaced by less skilled operators.
17. The workers' strength was reduced from 850 to 642 during preceding two years and the operators duty relieving system was suspended.
18. The operating manual was grossly inadequate, not specifying all necessary emergency procedures to control abnormal conditions.
19. At the time of accident, in the MIC control room, there was only one operator who found it virtually impossible to check the 70-odd panels, indicators and controllers.
20. A design modification of jumper line to interconnect relief valve vent header and the process vent header was defective, as it allowed the water to go into the MIC tank.

(B) Unsafe Actions:

1. The leak was not attended as soon as it was reported. Initial time passed in tea break.
2. The first information of five-fold pressure rise was dismissed in the belief that the pressure gauge could be faulty.
3. A newly recruited supervisor had asked a novice operator to clean a pipe and the blind disc was not inserted while doing so.
4. The public siren was put on around 1 am. nearly an hour after the gas leakage and that too for a few minutes.
5. The correct antidotes and medical treatments were not suggested to surrounding doctors. On the contrary confusion of MIC or Phosgene or Hydrogen cyanide was confounded.

(C) Unsafe Reactions:

Above unsafe conditions and actions lead to the violent unsafe reaction. Different hypothesis have been expounded by Carbide's scientists, Indian experts and Dr. S. Varadrajan, who lead the investigations on behalf of the Government. According to him small quantity of water reacted with Phosgene in the tank, mixed with MIC as animpurity to make it unstable. The Phosgene water reaction (hydrolysis) produced heat, CO_2, and HCI. The heat and HCI acted as the accelerators of the polymerisation, additions and degradation of MIC leading to a runaway reaction. According to others, the increased temperature of MIC (it vaporises above 38°C) generated heat, pressure and side-reactions, higher than normal amount of Chloroform in the stored MIC and an iron catalyst lead to the violet reaction. Because of the colder night of December, the escaped MIC settled down and travelled downward covering the sleeping surroundings with the blanket of death and damages.

Remedial Measures :

All the 25 major causes of this accident stated above in (A) and (B) suggest the remedial measures. To avoid repetition, all these contributing causes should be removed first and necessary steps should be taken to run the plant always safe and sound, with all the safety devices properly working. The working conditions must be improved and unsafe actions must be removed by proper policy, training and education.

Lessons of Bhopal are well described in the foreword to the IOCU (International Organisation of Consumers Union) in the following words :

".. the deadly cloud that wrought havoc at Bhopal... will continue to rear its ugly head in many forms, in many sizes and in many places. Obviously there are many lessons to be learnt about occupational health and safety, about proper sitting of production facilities, about science and technology, about access to information, about trade secrecy, about 'cover ups', about 'double standards', about medical and legal remedies, about the responsibilities of transnational corporations, governments and international agencies and most crucial of all about what ordinary people can and must do to protect themselves from the plague of such deadly clouds."

Bhopal incident opened the eyes and gave many lessons for the multinationals, for developed countries and for the developing countries.

Human life must be equally valued everywhere. No double standard for developed and developing countries. 'Right to know' and 'Obligation to tell' concepts are to be covered by legislation. Training to staff, and workers, emergency procedures, highest standards for plant operation and maintenance and safety equipment, 'worst case' study and assessment, etc. were incorporated in 1987 by the amendment of our Factories Act, 1948.

Site for Bhopal tragedy case study http://www.cdc.gov/elcosh/docs/other/com software, html

3.2 Flixborough Explosion :

At @4:53 p.m. on June 1, 1974, a huge Cyclohexane vapour cloud of about 200 m diameter and around 100 m high, rose from the Nypro Chemical plant in Flixborough, England. The base of cloud extended into the furnace area of the adjacent Hydrogen plant where it probably ignited suddenly. There was a devastating explosion of the vapours, heard 27 miles away, 28 persons were killed and over 36 injured. The 72 million dollar Nypro plant was totally destructed and varying degrees of damage to 2,488 surrounding homes, shops and factories within an eight mile radius also resulted.

The cause of the disaster was found by the Court of Inquiry to be the failure of the 20 inch bypass pipe. The failure, as per Mr. D.M. Tucker of the Fire Research Station, was a very noisy event, specially the release of the Cyclohexane from the stub pipes and the rumbling of Cyclohexane boiling in the reactors. The vapour cloud that formed exploded after 45 seconds of the leak. The Court ultimately theorised that the 20inch assembly failed in one step because of weak points in its own design. Hence, the Court of Inquiry felt that the omissions in design consideration of the temporary modification destroyed the integrity of a well designed and constructed plant. The Court of Inquiry concluded that "There was no Mechanical Engineer on the site of sufficient qualification, status, or authority to deal with complex or novel engineering problems and insist on necessary measures being taken". Nypro management recognised this lack and had arranged for consulting service on any modification that was identified as decidedly hazardous.

The primary cause of Flixborough disaster was an attempt to bypass reactor No. 5. The manner of bypassing revealed serious shortcomings in management procedures. The plant integrity was destroyed. Other weaknesses were : no detailed drawing, no stress analysis of the bypass line, not following BS 3351, the bellows and bypass assembly were not pressure tested before it was fitted and the testing of the bypass at a pressure lower than the safety valve release pressure (II bar) which were the sheer foolishness.

The three main lessons of Flixborough disaster are:

1. Management system deficiencies i.e. no skilled and qualified engineer, no standard modification procedure, no clearly defined role of safety officer etc.
2. Need to notify hazards on site to the local authorities and their guidance to the industry and
3. Restriction (licensing) on storage of hazardous chemicals on site.

This disaster led directly to the CIMAH regulations in the UK.

3.3 Toxic Release At Seveso :

In the lcmesa Chemical Co., at Seveso in North Italy, on 10-07-1976 at.-~-30 am, a reactor safety valve vented to the atmosphere, 2,3,7,8 -Tetra Chloro Dibenzo para Dioxiir(TCDD) a toxic gas. It's cloud drifted over the adjacent town and came down to earth because of heavy rain. The management tried to inform the local community but they had a communication problem. Key people in the local authority could not (be reached due to weekend and they were on holiday. When they were finally alerted and began to take action, they didn't know what to do. Some 250 people were to be evacuated. Visible casualty were not numerous but the toxic contamination of the area was not cleared even after the expenditure of some US$ 200 million.

This Seveso accident proved a landmark for the chemical industries world-wide. Then after, the release of toxic chemicals into the river Rhine from Sandoz warehouse at Berne in Switzerland was demonstrated dramatically. This issue was taken up by the ECC and after protracted deliberation, the so-called Seveso Directive(Control Of Industrial Major Accident Hazards Regulation) was issued in 1984 and duly ratified by the member governments.

The extreme toxicity of TCDD and other Dioxins was known before Seveso but didn't received publicity till then.

This accident makes it clear that the manufacturers should not be reluctant to publicise what they are doing and assess their process very carefully to ensure that there are no similar hidden hazards.

The Seveso directive was implemented in phases from 8-1-1984. The directive calls for relevant information and preparing of emergency plans to cope with 'if ' situation. Such emergency plans can help to reduce the chances of disasters and their consequential damage.

3.4 Chemobyl Nuclear Disaster :

After Bhopal disaster, the next remarkable disaster took place at Chemobyl Nuclear Power Station in the Soviet Union on 26-4-1986 and the losses reported are as under.

The accident led to 31 deaths and 203 have suffered various degrees of radiation sickness. 14 were in hospital with 80 to 90 per cent burns due to radiation. The 1,35,0100 people around Chemobyl who were evacuated to safer sites would be monitored for radiation effects. Among this group there will probably be 280 more cancer deaths than normal over the next 70 years. The Soviet scientists analysed a total population of 74.5 millions in II different regions, the most heavily populated being the urban areas of southern and eastern Ukraine for long-term impact of the radiation release. About 5,000 fatal cancer cases are likely from the release. This must be looked at in comparison with some 9,500,000 cancer cases anticipated from all other causes over the 50- year period in the same population. And an additional 1,500 deaths are predicted from thyroid cancer in people consuming contaminated milk and other foodstuffs.

The Causes of the Accident :

A detailed report is published in Front-line of October 4-17, 1986 of which a short abstract describes the causes as under.

The operating personnel at Unit 4 of the Chernobyl nuclear power station in north-western Ukraine 'had virtually invited the disaster. In a series of unauthorised and impermissible actions, the plant personnel, while trying to perform a rather banal experiment, tinkered dangerously with the reactor, triggering the calamity. The accident spread radioactivity and panic all over Europe and revived the worst fears about nuclear energy.

The Chernobyl reactor was an advanced system with a number of computerised monitoring and control mechanisms. These provided for the regular monitoring of the various parameters of the reactor, including temperature, pressure and water flow rate. There were batteries and diesel generators for back up power in case the main source failed. A system of light and sound alarms in the control room would alert the plant operators to danger. Plant conditions were printed out automatically. There were a variety of mechanisms, including an emergency core cooling system, to bring the reactor under control in case it showed signs of instability. .

The cause of the tragedy was not the absence of safety systems. The accident was due to the fact that most of these protective systems were turned off by the plant operators as they conducted a fatal experiment on April 25-26,1986.

The unit had an electrical capacity of 1000 MW and a thermal power rating of 3200 MW. The experiment was to be conducted at 25% power. Therefore the turbo generator No. 7 and the emergency core cooling system (ECCS) were switched off. The aim was to prevent a spurious triggering of the ECCS during the turbine test but it eliminated one key safety device. However the test was postponed till late in the night and the power reduction was resumed at 11 am. on April 25, in preparation for the test.

But the operators found it difficult to maintain the reactor at 700-1000 MW thermal power, the optimum level for the proposed experiment, because of the error in switching off the local automatic control of the reactor, the power level fell to I percent. By I am. on April 26 they managed to stabilise it at around 6 percent (200 MW thermal). At the same time they

After sustained operation of a reactor, xenon gas builds up, absorbing neutrons needed in the chain reaction and slowing down the rate of fission.

To counteract the xenon poisoning, the operators pulled out control rods from the core, leaving only six to eight in place instead of the stipulated minimum of 30. This perhaps was the major blunder which set the stage for the reactor running out of control.

The operators then began to introduce further disturbances in the reactor. They engaged all the eight pumps instead of the normal six, with two as reserve, to cool the reactor. This dramatically increased the water flow in the reactor. More water meant less steam and the water-steam balance in the reactor core was upset and steam pressure in the drums where steam is collected began to fall. This would have in the normal course led to .an automatic shut-down of the reactor, but the staff blocked the emergency protection signals from the steam drums. Thus one more safety device was put out in an effort to press on with the tests.

By 1:22:30 am. on April 26, the state of the reactor called for a shut-down and cancellation of the experiment. But the test began. At 1:28:04 turbo generator No. 8 was cut off from the steam. A minute earlier the operator had abruptly reduced the flow of make-up water, thus increasing the water temperature in the reactor. The switching off of both the turbo generators would have triggered an automatic shutdown but the operators blocked the reactor protection system, relying on shut-down signal from two turbo generators. This error was committed with the intention of repeating the experiment a second time.

Meanwhile as the turbine ran down, the water flow in the reactor began to fall sharply since four of the eight cooling pumps were running only on the residual energy of the turbine. Because of the water steam imbalance and the positive void coefficient the power of the reactor began to surge rapidly. Within 56 seconds, the shift manager realised that something had terribly gone wrong, and at 1:23:40 am. called for a complete shut-down of the reactor, and pressed the scram button to let the control rods down into the core, but unfortunately the rods did not reach the bottom, and an operator cut their controls hoping they would fall further on their own. But instead they got stuck, probably due to the thermal distortion already set in 'at the core as a result of the high temperature. The effort to shut down the reactor was too late. Within three seconds, power output surged from 200 MW (thermal) to more than 530 MW (thermal). By l;24 there was a huge explosion, followed by a second one., The Soviet investigators theorised that the initial blast that blew the reactor structure could have been caused by the steam explosion. As the power output surged there was intense steam formation around the fuel which in turn reduced the ability to remove heat from the fuel elements and the resulting explosion wrecked the building.

The second explosion could have due to the formation of Hydrogen. The steam in the reactor would have reacted with the zirconium enclosing the fuel elements and the graphite moderator of the reactor, generating large quantities of Hydrogen, which exploded when it mixed with air. The two explosions sent hot radioactive fragments high into the atmosphere. The debris from the explosions eventually set off about 30 fires in the plant.

Thus the issue posed by Chernobyl is the fallibility of modern technology. The disaster at Chernobyl and that of the US Challenger raise a number of questions about man-machine interface, the complexity in the management of modern technological systems,, the pressures of their routine operation, the strains on large bureaucratic organisations involved in running advanced technological systems, the external economic and political pressures on them and the like.

Preventive Measures:

The preventive measures seem to be (1) The written and approved procedure to carry out any new experiment (2) No isolation or bypassing of safety devices .(3) Presence of the most experienced senior officers in the plant instead of leaving it in the hands of operators (4) HAZOP and Consequence Analysis of new experiment on such radiation system and (5) Following safe close down procedure in case of any abnormality.

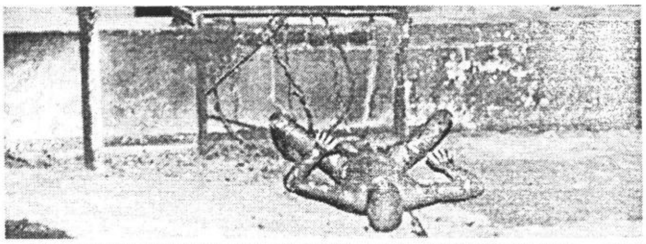
3.5 Toluene Distillation :

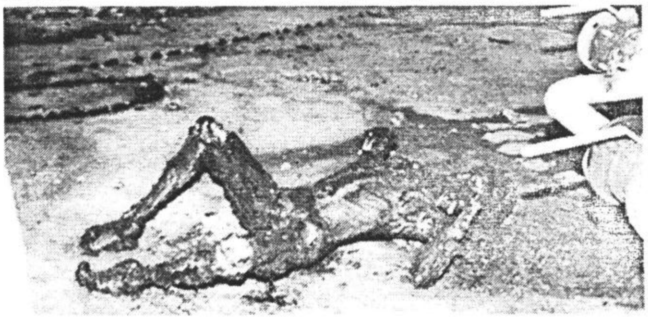
In a factory manufacturing Oxyphin butazone, the process of toluene distillation was going on. While removing choking in the bottom drain pipe, due to hammering, the pipe was broken and the toluene came out which was immediately ignited due to spark from a nearby boiler. The distillation column was also choked (this was found on internal examination) and it has created resistance and back pressure in the vessel. The steam (heating media) pressure was also suddenly increased which in turn increased the vessel pressure. All such causes led to an accident in a small factory causing deaths of 10 workers due to burn' injuries.

Safe procedure for dechoking, automatic pressure-temperature control with alarm and heat source cut off device, no source of ignition (boiler) nearby, regular cleaning of distillation assembly were all necessary.

3.6 Fire of Ethylene Oxide :

A truck-tanker of Ethylene oxide, a highly flammable liquefied and pressurised gas, was to be unloaded from the truck body. While reversing the truck by a helper (driver was not available), the main valve of the tank was struck and broken releasing the EO with high pressure. The truck engine was running and the exhaust gas was sufficiently hot and generating some spark just near the released gas, the EO ignited all of a sudden and the fire was uncontrollable. The whole factory with the truck burnt into ashes and a few workers died due to severe burn injuries.





Instead of EO tank unloading, use of a fixed EO tank and fixed pipe line transfer, spark arrester on truck exhaust, safety work permit, fixed and safe unloading bay and precaution while driving were all essential. Trained driver should drive the vehicle and not a helper.

3.7 Phosphine Exposure :

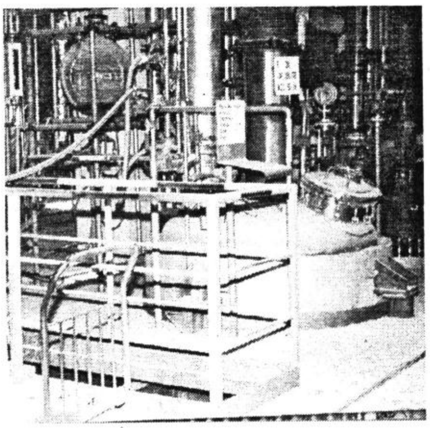
In a factory manufacturing Aluminium phosphide (pesticide), while emptying the AIP pot, a worker inhaled the phosphine gas (PH) which proved fatal. The concentration was many times more than the TLV prescribed and the worker had not worn any respirator or protective equipment. This gas is highly toxic and affects the CNS also. As it is not visible and has no smell, its regular monitoring and control are most necessary. It has fire hazard also. Local exhaust ventilation, use of personal protection and dry atmosphere are desirable.

3.8 2-4 and 2-5 Dichlorophenol :

2-4 dichlorophenol is a highly toxic chemical which caused a death within 15 minutes. Reported cases of this chemical were also indicating all deaths within 15 to 20 minutes. A worker Was filling a carboy with a rubber hose pipe of 1.5 inch outer diameter. The filling pump-motor was pushing the liquid and the house pipe end was tightly inserted into the mouth of the carboy without any air vent. The pipe was subjected to the internal pressure and as it was breakable, it was punctured all of a sudden. The worker standing nearby was sprayed by the chemical. He had not worn the PVC protective suit given to him. He took immediate water wash but could not survive while shifting to the factory dispensary. The strong metallic pipe, proper venting, use of PPE and automatic filling (avoiding manual transfer of a toxic chemical) were necessary.

In another case, a worker died due to splashes of 2-5 dichlorophenol. The chemical came out from a drain valve. The worker took bath for 10 minutes but he died within half an hour. PPE could have saved him. Drain valve in locked closed condition was the basic requirement.

3.9 Exothermic Reaction :

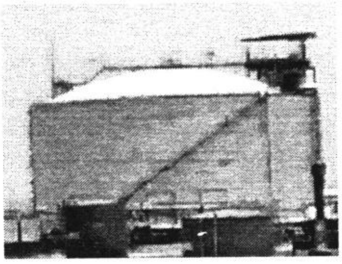


In two factories during exothermic reaction going out of control "(runaway reaction) the reactors were burst with tremendous pressure causing heavy damage to the structure of the factories and surrounding areas. In the jacket the cooling media (water) was interrupted and no alternate arrangement was available to circulate the cold water. The heat of reaction could not be controlled which accelerated the pressure to shear off the top lid and to throw it away with all its attachments.

Constant supply of cooling water and water interruption alarm, safety valve/rupture disc, reaction quenching device, standby pump and alternate power for cooling media, pressure-temperature controls, scrubber connection for toxic outbreak, condenser for organic vapour, training and supervision, automatic heat source cut-off device, drowning tank with by pass line and remote 'controls are necessary.

3.10 Hydrogen Explosion :

In a sulphuric acid plant the Oleum was stored in a big iron tank. Because of the rain water entering inside and due to the reaction of water, oleum and the iron plate of the tank. Hydrogen gas was generated and accumulated in the tank. Therefore while starting a welding work, due to the intense heat vibration or first welding spark, a great explosion took place breaking the tank top and throwing down the workers carrying out welding on it.



Work permit system and testing of H_2 or explosive air mixture with an explosimeter were desirable. Most necessary.

3.11 HCN Gassing :

One worker died and six badly affected by Hydrogen cyanide gassing in one factory. The workers were trying to remove D.P. cell of the measuring tank. At that time HCN mixed liquid came out from the nozzle and sprayed on the worker. Due to the inhalation of HCN vapour which is highly toxic the health hazard arose and resulted as above.

Work permit system, gas testing, personal protection (SBA) and removing it first before starting such work were essential requirements.

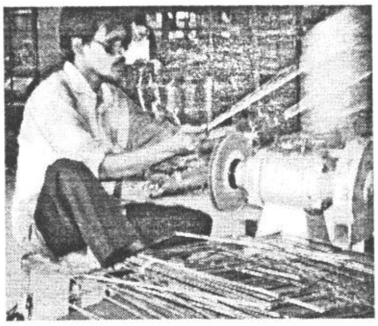
3.12 Acrylonitrile Fumes :

After emptying truck-tanker into a storage tank, some amount of acrylonitrile fumes were remained in the tanker. When the supervisor went away for some work, the truck driver tried to open the flange of the rubber hose pipe. In doing so, acrylonitrile fumes came out and one worker who inhaled much, died subsequently.

Here also work permit system of not allowing unauthorised person or work, personal verification, use of PPE and constant supervision are most necessary.

3.13 Grinding Wheel:

After changing a grinding wheel of 18 inch dia and without fitting the wheel guard, a worker started work on it. Due to over/under tightening or material defect, the revolving wheel burst and due to the severe injury by its thrown away pieces, the worker died.



The wheel guard, proper fitting and testing are the basic requirements..

3.14 Ball Digester Blunder :

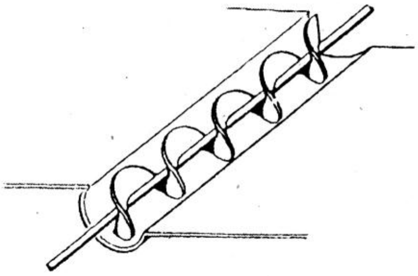
In a paper mill two workers died due to a blunder of third worker who operated the wrong switch. The big digester was filled with hot water, steam, pulp and caustic and at a pressure of @ 70 psi. It was to be discharged and therefore fitted firmly with the discharge pipe. During night, two workers were slipping near the digester. Another worker intending to start the flow pump motor, by mistake, started the digester moving motor. Due to the 10 HP force, torque, bending moment, shearing stress, hoop stress and temperature stress of the inside steam, the discharge joint sheared off from the connection. Some 20 tonnes steam and hot liquid rushed out and covered the sleeping workers who died on the spot. The electric switch should be locked in such cases.

In the same paper mill in another accident, a worker fell in to the pulper tank and cut to pieces by the revolving blades. Top fencing with interlocked feed opening and conveyer feeding were necessary.

3.15 Pug-mill Gearing :

In a pottery a worker was dragged by the unfenced gears driving the worm gearing of the pugmill. A worker working nearby, caught into the open gears and died due to crush injury. A fixed guarding or fencing on all such gearing or belting is most desirable.

3.16 Screw Conveyer Opening :



In an oil extraction plant a screw conveyer was in use to carry the oilcakes. The conveyer was underground and its feed opening was not closed when it was in motion. While walking on the ground the leg of a worker fell in the feed opening and caught by the screw conveyer. He received crush injury up to his thigh and died in hospital during treatment. Similar fatal accident also happened in a sugar mill, when the wife of a worker (came to call for a lunch) slipped from baggas heap and caught in by a moving baggas conveyer as its feed opening was not properly fenced.

The fixed grill (with small holes), fencing or the hopper is necessary on such feeding point to make them fully safe.

3.17 Unsafe Respirator Connection :

In one factory the catalyst of pyrophoric nature was to be changed and therefore this work was to be carried out in 98% nitrogen (inert) atmosphere. Five workers were doing this job in a reactor at 15" depth. While one worker was coming out, his airline of respirator was detached and started acting like air-gun inside. It was tied inside with other pipes and required quick removal. To take it out, one worker tried to enter inside. His leg slipped from a rope ladder and he fell down. His face mask was displaced and he was exposed to highly oxygen-deficient atmosphere. He was wearing a safety belt but its free end was not kept outside the vessel and in the hands of another worker. Therefore he could not be brought out immediately and died.

Safety measures suggested : No more workers inside, use of SBA with law level alarm instead of air-line respirator, use of safety belt with free end outside and in the hands of another worker, proper vessel entry permit and its strict supervision.

3.18 Fire while Ship breaking :

Many fire incidents have taken place while gas cutting of ship tankers and fatal incidence rate is also very high. In one such incident, 36 workers were working inside an empty oil tank of a ship of 17500 T capacity. Accidentally fire took place while gas cutting. All rubber gas pipes were burnt along with nine workers. Schedule 24 regarding safety from 'Gas cutting/welding' was added to the Gujarat Factories Rules as a consequence.

Safety measures necessary : Complete cleaning of flammable oil waste inside the tank, explosimeter test of inside air-gas mixture, proper lighting, ventilation and safe means of access inside the tank, safe welding torch with non-return valve and its checking before use, fire resistant gas pipes and preferably technique to cut the tank walls by remaining outside the tank and not inside (e.g. fill water inside and cut from outside proceeding from top to bottom).

3.19 Hidden Hazard :

Four workers died when the roof a phthalic anhydride storage tank burst and very hot material (at @ 150°C) came out and fell on their bodies. The tank was connected to the DCS computerised controls and many safety systems(trips, alarms, indicators, print-out and autocontrols) were built in. Owing to a welding mistake core(inner) pipe developed a hole and steam in the jacket started to enter through this hole inside the tank, reacted with phthalic anhydride, formed phthalic acid and choked the vent lines from inside. This allowed pressure built up inside due to slowly and continuously entering steam. Pressure alarms came but it was presumed that it was indicating choking somewhere and therefore for dechoking constant supply of steam was ensured inside the steam jacketed lines. This allowed more steam entry through the punctured corepipe (hidden hazard as it was not visible or detectable without opening and testing the corepipe) creating more and more pressure inside ultimately resulting into the tank roof rupture (roof joint was the weakest part) and escape of the hot material outside.

Safety measures suggested : At the first pressure alarm, a sample should be taken from the drain to ascertain whether phthalic acid has been formed or not and if it has formed, the steam lines should be completely emptied and to find out the cause of water(steam) entry inside the tank and removal of that cause. At certain pressure(below bursting pressure), pressure relief device should open automatic to transfer the pressure. But this may not be possible due to chocking of inner end of such device.

3.20 Mistake of Valve Operation

One reactor was subjected to pressure as well as vacuum process both. During vacuum process, the scrubber line valve was to be kept closed to disallow air entry but it was certainly to be kept open before starting pressure reaction. Because of shift change and operator change, a mistake took place. Next operator forgot to open the scrubber line valve and started the pressure reaction. Methyl mercapton gas was generated and accumulated inside the reactor. When the worker opened a valve for water addition, the gas came out in high concentration. As he was in cubicle(closed chamber), he inhaled more, fell down alone and kept on inhaling the toxic gas for alonger time resulting into his death.

Safety measures suggested : Preference to use a reactor either for pressure or vacuum purpose only to avoid such type of mistake. Interlocking of the reactant charging valve with the scrubber line valve so that unless the scrubber line valve is not open, the reactant charging valve will not open, thus, disallowing the gas generation possibility. Entry of the valve condition mention in the batch-sheet and personal distress alarm to a worker working alone to indicate his immobility.

3.21 Loading-arm Failure :

While filling liquid ammonia in a road tanker at 8 bar pressure through a loading arm, the threaded coupler was opened accidentally, the liquid ammonia rushed out from the detached pipeline as well as from the tanker, the operator standing on the loading platform tried to run away, but fell down, inhaled much ammonia and died on the spot.

The safety measures suggested : The loading arm coupler should be threaded as well as bolted for double safety and the threads should be regularly checked by a thread gauge. Arm joint should be of such a nature that it will stop the flow when open accidentally. The loading valve should be remotely controlled to keep away the worker. Valve should be opened gradually and very slowly. Proper respirator should be worn if exposure is possible. Wind direction should be checked while placing the road- tanker. Stair-cases should be available on both .the sides of the platform for easy run-away.

3.22 Electrical Accidents :

Many fatal accidents have been recorded because of working with portable electric equipment or electrical machines or electric line. Examples are : (1) Fall from height due to electric shock from a handheld portable drill, the insulation of live conductor was broken and that wire touched the metal stool on which the worker was standing (2) Shock due to phase wire opening and touching the metal case of an electric grinder (3) Shock, due to unearthed portable cement concrete mixture and short-circuiting of main switch (4) Touching of an open phase wire while standing on machine(metal) part and replacing a tube light and (5) Opening of insulation of phase wire due to lying on and friction with sharp edge of a vessel and touching the vessel unknowingly. In all five cases the workers died.

To prevent such common accidents it is essential that proper earthing should be ensured before starting the work, ELCB (earth leakage circuit breaker) in power supply line, use of insulated surface like wood, rubber mat, use .of electrical safety hand gloves, hanging loose wires at a height instead allowing them on the ground or resting on metallic parts, checking of broken wires and proper earthing and bonding while transferring flammable liquids.

3.23 Pesticide Poisoning :

Many fatal accidents have occurred in pesticide factories. One worker died due to inhalation of vapour of an organophosphorous compound in an agrochemical formulation factory. In other factory perchloro methyl mercaptan came out and sprayed on a worker's body. He died on the same day. Similar accident took place when because of the detachment of a pump delivery pipe, phosphamidon technical came out and touched a worker's body. Its vapour also entered through his nose and he was died. In one such factory while opening a valve in the effluent treatment plant, one worker died because of exposure to some pesticide liquid and vapour mixed with and arriving there with other effluent

Safety measures to avoid such pesticide poisoning include : Handling and fixing/ packing of pesticide material(liquid or powder) in a closed system working under vacuum and local exhaust ventilation with safe discharge, use of efficient respirator with faceshield, apron, hand gloves/sleeves, long pants and avoiding any kind of direct body contact, immediate cleaning of spillage or leakage with effective neutraliser and burning of such waste material in a safe manner, proper washing, cleaning and disposal of empty containers. Fully automatic filling, sealing, weighing and conveying machine in a closed chamber with local exhaust ventilation is most desirable. Use of conveyer belt to move filled bottles or other containers to avoid manual handling. Training to workers regarding hazards of 'pesticides and safe method of working, use of PPE and safety shower, bathing, washing, etc., constant supervision and cautionary notices, pre employment and periodical medical examination of workers (RBC & blood cholenestarace test) and it's records, keeping PAN, atropine, etc. antidotes in sufficient stock, no drinking/eating in a workroom, washing hands and mouth before and after eating, changing contaminated clothing and informing any exposure or contamination immediately.

See also Sch. 15 and 19, GFR and Part-24 of Chapter-23.

3.24 Falls are mostly Fatal :

Most of the fall accidents result into deaths and therefore fall prevention philosophy should always consider that falls will mostly be fatal.

While replacing AC sheets of roofs many workers have fallen and died. Despite of use of crawling board or cat ladder, safety belt, etc. fall accidents are continued because 'of some error somewhere. Therefore it is high time to legally prohibit the use of a fragile roof on industrial sheds. Till this is not done, the only alternative is to use crawling board or the cat ladder and any fall arrester device including a safety net firmly tied underneath of work. As length of safety belt lifeline is not permitted to be more than 2 m, it is quite inconvenient to move on wide area of the roof and very difficult to find an anchor point to tie the free end of the lifeline within a radius of2m.

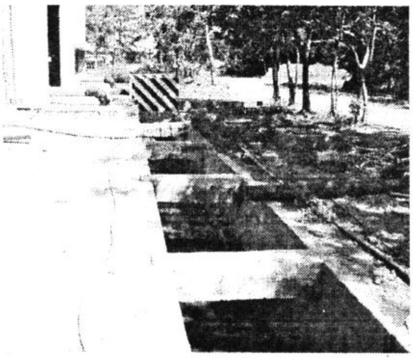
Economy in using a fragile roof should not overturn the value of human lives as far as the concept of safety is concerned. See Chapter-1 for Health v/s Wealth and a number of reported cases of loss of human lives because of unsafe conditions.

Use of corrugated metal sheets, RCC roof or tiles supported on wooden or metal frame of small openings seem to be the safer way. Modern fall arrester devices with support stands and convenient to move horizontal or vertical are also useful.

Compliance of section 32 of the Factories Act and Rule 68E, GFR, while working at height is most important. For further details see Part-5.7 of Chapter 16 and Part-5.6 of Chapter -25.

3.25 Gutter Accidents :

Networks of gutter piping of varying diameters are always laid down in most of the cities, factories, residential colonies and buildings. Many fatal accidents have taken away the lives of young workers engaged in cleaning of such gutters. Seeing an unsafe condition of one such worker while cleaning a septic tank in own house. Dr. Barnadino Ramazzini of Italy, carried out research work on health hazards to workers, published a book in 1780 and was called a father of the branch of occupational health.



Confined space of small chamber or pipe filled with dirty water, sewage, mud, sludge, filth, excretion, sticky surfaces, darkness, insects, bacteria, the worst smell, the poisonous gases like methane, HS, CO, C0,„ N, NH, and oxygen deficiency all at as time, pose the . greatest hazards to the workers who undertake the job of cleaning or dechoking such confined space. No body would prefer such work and mostly contract workers are left to such job in very pitiable condition. Fully mechanical system (e.g. gully sucker) eliminating manual labour is the only best solution.

In Surat city 14 workers died during 2 years, who were engaged for gutter cleaning. II workers died during 6 years of Sewage Disposal Works, Vadodara. Many individual and 2 to 3 workers died while drainage cleaning at many places (Issue-31, June 1996 of Worker, Occupation & Health, Vadodara).

"Bursting of a Septic Tank - a case study" is reported in Oct-Dec 1996 issue of Industrial Safety Chronicle, Mumbai. It described an explosion in a latrine block inside a large jute mill injuring 14 workers of which 7 died. The article is written by two factory inspectors, C.L. Dey and S. Chattopadhyay and provides many details.

The causes of this accident were : Design of the septic tank not as per IS:2470 and inadequate size, no cleaning of the tank since 16 months and overfilling of the working depth of the tank, blockage of gas passage to escape from the tank, methanogenesis and natural degradation reaction generating gas pressure, leakage of gases through cracks and crevices, formation of flammable gas-air mixture (explosive range of methane 5.3 to 15%), workers' habit to smoke inside the latrine and throwing lighted bidi ends here and there, to light up waste jute inside the latrine in winter season, fire due to such sources of ignition, initial vacuum due to burning of flammable gas mixture inside and air entrainment in the tank, creation of explosive gas-air mixture inside the tank and its bursting falling down the weakest wall of the tank happened chronologically. Six workers were killed on the spot under die debris while one died in hospital.

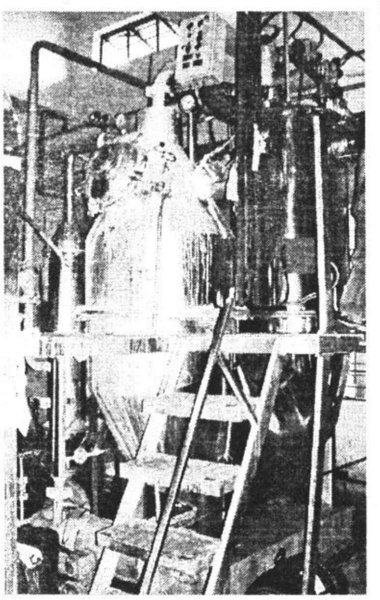
These causes suggest the remedial measures. The sewage tanks should be regularly cleaned before they choked, vent pipes should be kept clean and no source of ignition should be allowed in such area.

For gutter cleaning, first the manhole should be opened and obnoxious smell should be diluted. Other manholes on the same line should be opened to allow ventilation and fresh air. By an air blower internal gases should be sucked out. Flameproof lamp should be used to assess situation. A match stick shall never be ignited for this purpose. Oxygen content should be measured by its meter and a probe. Then level of CO and H2S should be measured by gas detection tubes or other equipment. Lead sodium acetate paper can be used to know the presence of H,S. Methane (CH) is an asphyxiant, colourless, odourless, tasteless gas with bp -161.5' °F, fp -306 °F, vd 0.6, lei 5.3%, uel 15%and it poses fire or explosion hazard when exposed to heat or flame. It is not toxic but it replaces 0 and cause' oxygen deficient atmosphere. The minimum safe oxygen level in air is 18%. Verify this level by 0 meter before signing the gutter entry permit.

Safety belt must be used while allowing a worker to enter the manhole. Its free end should be held by another worker standing outside in readiness to pull him out in case of emergency. If the measured atmosphere is oxygen deficient, the worker should wear self breathing apparatus, proper eye .goggles, hand gloves, boots etc. He should bath and change his contaminated cloths. Medical advice is also required.

3.26 Bursting of Jet -Dyeing Vessels :

In cloth dyeing factories many accidents-fatal and serious- have taken place while working on or near U-type Jet Dyeing Vessel which is a pressure vessel operating at 3 to 4 bar pressure and upto 130°C temperature. Cloth and dye-liquor are fed into it. Dye liquor is heated and cooled in a heatexchanger by steam and water. Vapour of the heated liquor (coloured water) exerts pressure. Sometimes slight air is also injected inside to maintain heating under pressure. The cloth is circulated in dye-liquor for uniform dyeing. Mostly the process is run by auto-controllers as per the programme of heating cooling time, pressure-temperature control etc. 'Safety valve, pressure cut off switch, auto depressure valve, alarm, pressure gauge etc. are provided.



Types of accidents take place include : Bursting. of the vessel killing a worker and damaging the structure, opening of bottom filter drain cover or top manhole cover and burn injury by the hot water.

Safety measures required are : Rupture disc in addition to a safety valve so that when safety valve does not operate (mostly it happens so because of inadequate size and poor maintenance) the rupture disc will release the pressure. High pressure alarm and automatic depressurising. Interlocking of the manhole cover with the manual depressure valve so that unless the pressure is fully discharged by venting, the manhole cover cannot be opened. Pressure and temperature gauge side by side, just on the vessel and in the front so that the worker can see that the inside temperature has become atmospheric and it is safer to open the manhole cover. Better hinges of bottom filter cover and big size internal diaphragm plate on filter cylinder to restrict the sudden outflow of hot water, Periodical pressure and corrosion testing of the vessel and its safety devices. Quality welding joints with radiography test and Training to workers for safe operation and maintenance. Use of soft water without salts/'chlorides and heating/cooling through heat exchanger are necessary to reduce the frequency of failure.

For further details see Part-8.3 of Chapter-21.

3.27 Explosion in Induction Furnace :

Electrical induction furnaces are used in foundries to melt metal at @ 1500 °C. In one such factory, explosion took place in molten metal in refractory crucible within the furnace and the red hot molten metal was thrown out and sprayed on the nearby workers. Six were injured of which three died. Similar accidents took place elsewhere also.

The cause of this accident was breaking of refractory lining from inside, contact of molten metal to the cooling water coil and melting of its wall causing puncture, rushing out water circulating at 60 psi pressure, entry of this water into the red hot metal at 1000 to 1500 "C, immediate steaming and flashing inside the metal resulting into its outbreak. The scenario is very dangerous.

Safety measures include : Regular checking of refractory lining before each heat for any erosion, cracks, damage etc., relining or patchwork with the best quality ramming material to cover the defect, GLD (ground leak detector) system should be provided to detect the thickness reduction or sudden failure in the lining and trip device to cut off power and to stop the cooling water, ultimately to reduce the water content, though it may damage the costly water coil in want of water when red hot metal touches it. But this can reduce the' severity of the accident. Collection pit should be provided just underneath of the furnace to catch and collect the molten material in the refractory brick work. No workers should be allowed to work in the spread zone near the furnace. This can be achieved by proper layout. Workers to tilt the furnace to unload it, should wear fire retardant helmet and clothing.

3.28 Scrapping of Worker :

An asleep worker was dragged by an urea scrapping machine, rapped with urea dust, transferred on a conveyor belt, travelled a long distance, passed through a vibrating screen along with urea and trapped in small passage of a delumper from where his dead body was found after many hours and a long search.

In a fertiliser plant, workers were engaged in urea godown (bulk storage silo) to break urea lumps and to make the surface even. Because of overtime work during night hours, a worker fell into sleep while taking rest near the wall. Urea scrapping machine was working at that time. An operator was driving this machine by sitting in its cabin at a distance However he unnoticed the sleeping worker just in front of him though at a distance. The sleeping worker unnoticed the noise of the machine slowly approaching towards him. At a moment, the revolving jaws picked up 'the asleep worker, dragged and turned him down the scrapping and moving blades, pulled a long distance and shifted him onto a conveyor belt conveying the urea in urea transfer house.

An experiment was carried out by creating the same situation to assess how it happened. A statue was created from cotton and jute of the same size and shape of the deceased worker, put at the same place where he was sleeping and the scrapper operator was told to drive the machine at the same speed and manner at the time of accident. Three trials were carried out and it became clear that it was quite possible to pull the "worker, in that condition.

When this became clearly evident, the remedial measures suggested were : Side guard on both the sides of the front revolving jaws of the scrapper machine after allowing the necessary working depth, Supervision to ensure no resting or sleeping inside the silo. No employment on overtime. Verification by the scrapper operator that nobody is sleeping, before he starts the machine. Hooter blowing before starting, keeping the machine at a safe distance when workers are working in the silo. Stopping the machine if it is unnoticed by someone. Increasing illumination level in the silo and Display of necessary notice.

3.29 Thermic Fluid Fire :

Thermic fluid heaters are now a days in use to heat and circulate hot oil (thermic fluid e.g. Dowtherm) to heat the drying machines or any heating system.

A gland of an outlet valve on hot oil line failed, the hot oil (220 °C) dripped and sprayed on the ground, lagging and insulation burnt of another line down below and fire took place. Six workers were injured of which two died.

The cause of accident was coupling failure and stopping of the oil circulating pump. The oil flow was slowed down for certain time. Therefore the oil was overheated, the gland of a valve burnt and gave way. The leakage took place and the result was a fire.

The remedial measures suggested : Alarm to fireman as soon as oil pump stops to make him alert to throw down the burning coals from fire chamber so that the heating is decreased. Temperature alarm indicating overheating and bypassing the oil from other line at a safer place. Drip collection tray underneath the valve. Checking of glands, seats, spindles etc. at a fixed interval. Standby diesel pump to restart oil circulation at the earliest possible.

3.30 HPCL Refinery Fire at Vizag:

On 14-9-1997, Sunday, a spark entered in a LPG pipeline between the port and Vizag Refinery at Vishakhapatnam, AP and caused heavy fire and explosion. Five officers of Industrial Security Force died and some 20 got burn injuries. It took 12 hours to control the fire. 4 out of 9 spheres (the cost of a new sphere is @ 8 crore) were burnt and the 5-6 km pipeline was badly damaged.

When LPG was being transferred from a tanker on jetty to the refinery pipeline, the pipe burst with explosion and heavy fire spread. 50 T foam was brought from Baroda via air route to fight the fire.

Press reports do not highlight much on causation analysis. How did LPG leak or how a spark of ignition entered the pipeline or how the static charge played its role or how any resistance, friction or cause of fire occurred in a closed pipeline are questions of investigation.

Safety measures needed are periodical testing of pipeline for its strength, joints, corrosion effect and leakage if any, earthing and bonding to eliminate static charge, good maintenance of the pipeline, seamless continuous welded pipe line and no entry to vehicle without exhaust muffler.

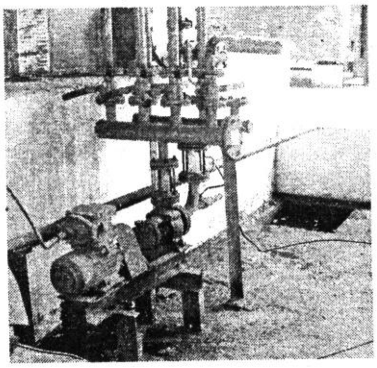
3.31 Common line hazard :

Two rectors wave connected by a common vent line. In one reactor process of toluene was going on. Another was empty and was to be cleaned. By keeping manhole open it was cleaned by hot and cold water. Air was allowed and oxygen level was measured at middle. Vessel entry permit was signed and a worker entered inside. When he sat at the bottom, he became unconscious. Another worker entered inside to bring him out but he also became unconscious and third worker entered.

Cause of accident : Through common vent line .toluene vapour entered in the empty vessel and being three times heavier than air, settled at the bottom and due to its concentrated exposure workers were collapsed.

Remedial measures : '(1) Common vent line should not be permitted. Stop valve on each reactor vent line is necessary. But it requires prompt attention to open, and close. If they are leaky, purpose is not served (2) Oxygen level should be measured at the bottom i.e. at the place of working.(3) Complete isolation is necessary when two such vessels ar(interconnected (4) Safety belt should be used while entering in the vessel.

3.32 Common Header Hazard:



One underground pit was not used since six to eight months. Supervisor told a worker to open its top cover and to put air hose line at its bottom for half an hour to make it clean. On header near wall, there were pipe lines of air, nitrogen, water and steam side by side for utility purpose. By mistake the worker connected flexible hose pipe with N_2 line instead of air line. Therefore the pit was full of nitrogen and oxygen was displaced. When worker entered inside, he died due to oxygen deficiency.

Remedial measures : (1) Clear identification of pipe lines on header (2) Verification by supervisor regarding connection of correct line (3) Air and gas measurement in the pit before allowing a person inside (4) Use of work permit.

3.33 Wrong connection of gas-cylinder:

Chemical reaction of highly flammable solvent was continued under nitrogen blanketing. N_2 cylinder was about to empty. Supervisor told a worker to bring new N_2 cylinder and to connect with the header. By mistake he brought O_2 cylinder and connected. After some time dangerous vibrations of reactor were heard and seen. Violent reaction burst the vessel and due to heavy explosion and fire two workers died and ' the whole plant ruined into pieces.

Cause was the wrong connection. Purpose of N_2 was to keep away O_2. Here O_2 cylinder itself was connected. This accelerated the explosive reaction. Spark was available by spanner and hammer while tightening the bolts which were being loosened and open.

Remedial measures (1) Before connection supervisor must ensure that the right cylinder is being connected (2) Training to workers for identification of gas cylinders. (3) High pressure alarm on reactor and auto draining, venting or safe discharge device.

3.34. Hazards of Plastic Tanks :

Iso propyl alcohol was stored in one 10 T HDP tank. Some alcohol was spilled surrounding the tank. It got spark and fire spread. HDP tank melted due to heat of fire and it gave way. 10 T alcohol was added to fire. The whole plant burnt into ashes.

Remedial measures: (1) It is not at all desirable to fill highly flammable liquid in plastic tanks which can easily melt by fire (2) Leakage and spillage of flammable material must be cleaned immediately (3) Dyke surrounding tank necessary (4) Temperature sensible water sprinklers are useful in controlling fire.

3.35 Filing Order Alteration :

Computerized auto-stop and filing order system was followed to fill benzene in to road – tankers. A rood - tanker of three compartments of 4500, 4000 and 3500 litres was given auto fill order and command to the filling pump to- fill the compartment in descending order i.e. to fill and auto stop at 4500 litres first. This was computer control.

However after starting of the pump, the helper (cleaner) pull out the filing pipe from 4500 litre compartment and put into the 4000 litre compartment. The meter stopped at 4500 litre. Therefore 500 litre benzene overflows and spilled on the road. A driver of the next truck-tanker waiting for his turn nearby, saw this and with a view to reverse his vehicle, applied key to start engine. Benzene vapour was entered in his cabin, ignited by spark from starter, loose terminal or silencer and sudden fire took place. Due to flash back, the tanker being filled also ignited and the helper on the tanker died in this fire.

Cause of accident is a human error to change the fill pipe and failure to understand that it will result in overflow.

Remedial measures : (1) Drivers/helpers must be strictly instructed not to alter the given filing order (2) This will be printed in the filling order slip also (3) Supervisors should watch that truck workers do no change the filling order (4) Benzene detector with alarm to run away in time and to stop the filling pump by a remote stop switch.

4 SAFETY MEASURES TO AVOID ACCIDENTS

To avoid the accidents as described above and others, some safety measures are suggested below :

1. Plan for safety expenditure (budget) at the earliest possible, and invest always sufficient money for safety measures.

2. BIS Handbook and booklets are available for so many standards and chemicals. Safety instructions of these booklets must be followed while storing, transporting, handling and using these chemicals. IS must be followed.

3. See part 6 to 9 of Chapter-18 and Table-4 and other Tables of Chapter-32, to identify chemicals and their hazards.

4. Some known dangerous chemicals are listed in the information of para (2) and (3) above, but 11 still there are many and we do not know the toxicity of majority of such chemicals. Therefore chemistry and toxic effects of all such chemicals must be well studied before storing/using them in your factory. Available standard books must be referred for this purpose.

5. Many factories use chlorine cylinders (tuners) and chlorine leakage may cause severe accidents. You are advised to follow detailed safety instruction given in the booklet "Safe Handling of Chlorine (A guide for consumers) by Alkali Manufacturers Association of India, Bombay." Each factory using chlorine cylinder must have ready 'emergency kit' including self breathing apparatus and the workers properly trained to use it.

6. Manual feeding (charging) of dangerous chemicals in vessels shall be replaced by mechanical means and charging device so that human contact shall be avoided. Charge separate chemicals by separate lines and use selector or header valve to allow one chemical at a time. Use charge or measuring vessel and then allow closed and controlled dropping of the chemical in the main vessel or reactor.

7. Use instruments to read, record, alarm and control various process parameters and try to eliminate human errors in control measures.

8. Use automatic gas/fume/flame detector cum warning alarm at set TLV or LEL limits to detect and warn of all toxic, flammable and explosive gas emissions and leakage in your factory. Use continuous monitoring system or manual gas detection tubes for air sampling to assess and record the contamination at various places. Keep record of this with dates, time, place, prescribed safe limit and measured value. See Form 37, GFR.

9. Prepare a list of concentration limits of toxic gases (maximum allowable exposure in ppm or mg/m^3 for 8 hour average) and combustible gases (boiling point, flash point, explosive limits in air and vapour density) of your factory and provide necessary gas and flame detectors and alarms to detect them and also the safety measures necessary.

10. Make a list of gas, fumes, vapour, mist, dust etc. being evolved, discharged, exhausted, liberated or leaked in the environment and also state their control measures taken by you. Provide efficient exhaust system, closed ducting, extractor, hood, chimney, chamber, scrubber etc. to collect, neutralise and discharge them safely. No gas, fumes, dust etc. should be allowed to fly free as far as possible. These should be collected in closed exhaust system, connected with appropriate scrubber to make them ineffective or non-injurious.

11. All pressure and exothermic reactions must be properly controlled by using proper safety valve, rupture disc, pressure regulator, temperature control, heat-source cut off device, pressure temperature alarm, closed ducting and drowning tank after the safety valve or rupture disc if the reaction mass is hazardous, scrubber if necessary and proper injecting device (valve) for quenching chemical to neutralise the reaction mass to reduce its pressure. An automatic feed and temperature control device to cut off the feed (pump) and to start the cooling media (water etc.) should be utilised for automatic safety purpose. Vent valves must be kept open when desired. Drain valve, remote control valves etc. are necessary.

12. In distillation processes, when cooling media (water) stops in the condenser, it may create back pressure and fuming discharge. To control the situation water flow stoppage alarm as well as heat Source cut off device actuated by the stoppage or interruption of cooling media should be

provided. If the fumes of distillate are toxic or flammable, the vent of receiver must be connected with appropriate scrubber or other condenser and long discharge (vent) pipe. The gauges, column, condenser, safety valve, receiver, vent scrubber/etc, must be regularly checked for good condition.

13. Appropriate scrubbers, blowers, neutralisers, incinerators, flare and safe discharge devices ' shall be provided to scrub all toxic, flammable and hazardous gas/fumes evolved or leaked during the process, storage or use etc.

All acid fumes, Cl_2 NO, NO_2 CO, SO_2, SO_3 NH_3 ZO, PH_3 P_2O_3 H_2 H_2S, HF, etc. and organic toxic or flammable gas emissions and leakage in atmosphere shall be scrubbed and discharged below their permissible safe limits (TLV, LC, LEL etc.). Their regular measurement and record shall be maintained as stated above in para (8). The continuous monitoring system to check safe discharge is most desirable.

14. Where toxic or dangerous gases/liquids are stored in big tanks, its pressure/temperature control devices, safety valve, pressure and temperature gauge, level indicators, flow meters, scrubber, incinerator, flare tower, water curtains or fountain valves, leakage or escape alarms, safe vents, gas detector with alarm etc. shall be regularly checked and maintained safe. One spare tank shall be kept ready for emergency bypass with remote operating valves. All pumps, cooling plants, flow meters. DG set etc. shall be kept ready and the operators shall be trained to control the abnormal or accidental conditions. Dangerous gases shall not be stored in much quantity. These are the lessons of Bhopal disaster.

15. Other devices for storage tanks include safety valve, breather valve, safe vent, scrubber with vent if necessary, condenser to cool organic vapour etc.; earthing, flame proof electric equipment if necessary, automatic level indicator, high level alarm or safe overflow device, bund or dike wall of proper dimensions, dump waste drain, toxic or combustible gas detector with alarm, cautionary notice in local language, name of the content with quantity, fencing wiih gate and lock, water showers, fire fighting equipment, personal protective equipment, more than one way to escape, operating instructions, safety rules etc. These shall be provided as per requirement.

16. Efficient and sufficient exhaust devices at the origin of toxic or hazardous fumes, dust etc. shall be provided and maintained properly. Necessary dust collector, cyclone separator, extractor, hood, exhaust' blower etc. shall be provided to draw dust, fumes etc. from the machine or equipment as well as the surrounding atmosphere. Fresh air feeding (ventilating) devices shall be provided for workers.

17. Water-sealing arrangement may be useful to prevent low pressure (below I bar) explosive air mixture. Then arrangement for safe discharge of explosive mixture after removal of water head - shall be necessary.

18. Water blanketing, curtain or fountains with remote valves shall be provided over chemicals of low flash point. Water showers, eye washers shall be provided near storage of acid, alkali and other corrosive materials.

19. In case of power, water and air failure, emergency alternatives shall be provided and properly maintained. By regularly checking ensure constant water supply, power supply, heating, cooling, stirring, vacuum etc. where they are constantly required and keep overhead water tank, diesel generating set, chilling plant, air compressors, alarms, pumps etc. ready for these purposes.

20. All valves, pipe lines, tanks, stairs, safety devices, plant machinery and structure shall be regularly checked and maintained in safe and sound condition. Necessary repair/maintenance shall at once be carried out.

21. By proper and constant repairs and maintenance keep all tanks, pipes, joints, vessels, equipment etc and premises fully safe and sound from leakage, breakage, escape and injury to health and property.

22. Inert gas (N_2) purging shall be carried out in vessel etc. before charging any flammable/ explosive chemical. It may be useful near grinding/crushing of flammable solids. Charging line for flammable liquid shall be extended upto bottom or made limpet coil on the inner surface of a vessel.

23. Flame traps shall be provided to prevent flashback in any closed circuit (pipe, tank etc.) of flammable gas, liquid or air mixture.

24. Steam pressure reducing valves or auto controllers shall be fitted near all pressure user points.

25. Explosive chemicals shall be stored in explosive godown. Reactive chemicals shall be put separate. Low boiling liquids shall be kept in AC godown.

26. Flame proof 'electrical fitting, motors, starters, switches, earthing etc. shall be fitted in all fireprone areas. Non sparking tools shall be utilised. Lightening arrester rod shall not be ' fitted just on the storage tank. It shall be kept at a height and safety distance from the tank. Conical range shall be maintained.

27. Proper cage with interlocking arrangement shall be used with hoist/lift to lift the materials.

28. Sources of ignition shall be kept away from all solvents and flammable materials.

29. Increase roof-height and ventilation (fresh air and exhaust) to minimise air-contamination. Isolate or segregate at far end corner the hazardous or noisy process which cannot otherwise be controlled.

30. Provide remote controls and remote operating valves where necessary. A central telemetric data logging system to give alarm when process parameters like pressure, temperature, level etc. goes beyond permissible limits will be useful. Control penal board with audio-visual alarms and other latest safety devices should be searched and applied as per requirement. All vessel thickness must be measured regularly. First aid and medical facilities including antidotes, drugs etc. must be kept ready. Emergency and disaster planning will also be useful.

31. Prepare a Safety Manual of your factory looking to your own premises, plant, machinery, layout, design, chemicals, vessels, equipment, processes, hazards, precautions and safety measures necessary for them. Include in above safety manual an Emergency Action plan containing three parts - Operating emergency. Fire emergency and Disaster emergency. In Operating Emergency part include staff and means to control small fire, failure of power, water, steam, air, feed or control of chemicals, safety controls, small leaks of gas, chemical etc. and damaging storms without the help of outside agency. In Fire-Emergency part include steps to call for special fire fighting staff for big fire not controllable by your staff alone. In Disaster Emergency part include ways and means to meet with disaster situations such as explosion, tank or line rupture, heavy leakage, flood, hurricane, storm, earthquake, sabotage, riot, strike accident etc. causing or likely to cause great damage to the factory or surrounding. See Part-7 of Chapter-19 for Onsite and Offsite Emergency Plans.

32. All gas cylinders shall be handled carefully. They shall not be thrown down. Proper ramp shall be used to move cylinder trolley. Gas Cylinder Rules shall be strictly followed. See Part 8.4 of Chapter-18 and Part-3.6 of Chapter28.

33. All chemicals shall be properly identified with names, quantity and precautions. Dangerous chemicals shall not store or pass in breakable containers. Provide labels of names, quantity and safety precautions on all chemical products and verify them on raw materials, packing and containers before using them.

34. Display notices including statutory cautionary notices in all work rooms or floors of your factory stating in brief the chemicals being used or present, their hazards, precautions, safety measures and operating instructions. This should be in the language understood by workers working there.

Keep clean, lighted, well-ventilated and in hygienic conditions sanitary blocks, all drinking water centres, lunch room,, rest room, canteen, cloak room, creche room, ambulance room etc.

35. Fire fighting equipment and personal protective equipment of IS quality, shall be kept in sufficient quantity and workers shall be trained and strictly instructed to use them.

36. All workers, chemists, operators, supervisors and Inspector of Factories shall be properly informed all hazards and their control measures in your factory. Notices of hazards in local language shall be displayed for workers.

37. Guards, fencing, interlocking of machines, safety devices and covers etc. shall be properly maintained in safe position. Safety provisions of the Factories Act and GFR, particularly Rule 54, 60, 61 and 102 (applicable schedules) shall always be strictly complied with. Test all lifting machines, pressure vessels and safety devices periodically and keep form No. 9, 10 fell upto date.

38. All statutory forms under the Factories Act and Rules shall be filled regularly after due testing of equipment and examining workers for occupational health and diseases. Their health records shall be shown to .them. Carry out periodical medical health check-ups of all the workers engaged in dangerous operations for occupational diseases and poisoning and maintain Form No. 20, 30, 32 & 33 GFR.

39. Safety Officer shall be appointed as per statutory -requirement and safety committee shall be formed including workers representatives. The committee shall take regular rounds, check working conditions, ask the workers, check the safety records and suggest necessary steps in writing and keep detailed report of all its proceedings and compliance. Welfare Officers shall also assist by meeting workers at their working places and hearing them on the points of safety, health and welfare of your workers. Their useful suggestions will be recorded and utilised.

40. Workers education on safety is most important. Improve their knowledge, training, practice, good habits and discipline to implement safety on the floor level. Arrange regular shop-floor training programme for them. Their unsafe actions shall be minimised as far as possible.

EXERCISE

1. Write in detail note on the Bhopal Gas Tragedy. Your note should highlight the various causes of the tragedy, the net result and even the plus points achieved by this tragedy in the field of future major accident hazard control in India.

2. Explain the importance of accident case studies.

3. **Write Short Notes:**

   (1) The World Scenario on industrial accidents (2) Flixborough explosion (3) The Love Canal (4) Seveso accident (5) Chemobyl Nuclear disaster (6) Fall accidents (7) Gutter accidents (8) HPCL Fire at Vizag (9) Explosion in Induction Furnace (10) Bursting of Jet Dyeing Vessels (II) Electrical accidents (12) Pesticide poisoning (13) Run away reactions (14) Unguarded machinery (15) Operation of wrong switch (16) Toxic exposure (17) Scrapping of worker (18) Common header hazard (19) Wrong connection of gas-cylinder (20) Filling Order Accident.

4. Describe the facts of the Bhopal Disaster in details. Discuss also the causes of this accident and the lessons thereof.

5. Bhopal accident caused worldwide awareness on industrial safety problems and compelled to amend many safety laws'. Comment this statement with examples.

6. State 'lessons of Bhopal' as published. Do you agree to these? Are 'Right to know' and 'Obligation to tell' concepts included in our safety laws? Give details.

7. Narrate 10 safety measures to avoid fatal accidents OR General safety measures to avoid accidents.

8. Describe in detail a fatal accident investigated by yourself. Give causation analysis and remedial measures.

9. 'Purpose of accident investigation is not to punish but to stop its recurrence'. Give your opinion on this statement citing one fatal accident investigation.

CHAPTER – 31

Road and Home Safety

THEME

The main subject of this book is industrial safety as we have seen so far in foregoing 30 chapters. But other safety areas are also connected and total safety of a person includes his safety not only in industry, but also on roads and at home. The sky or space, sea and any other environment are also other areas where safety is necessary. All such .areas are inter-related and there are many general safety principles which are equally applicable to all of them. Here, in this Chapter, we will study in brief two areas : Road and Home safety.

Average yearly deaths in USA during 1992 to 1996, as reported in 'Accident Facts -1997' are as under:

Motor-Vehicle	-	42000	-	45.16 %
Home	-	26000	-	27.96 %
Public	-	20000	-	21.50 %
Work	-	05000	-	05.38 %
		93000		100.00 %

This indicates @78% accidental deaths are due to road or vehicle and home reasons, a major part comparing with work accidents of only 5%. Cost wise also motor vehicle and home injuries incurred 271.8 billion dollars comparing with work injury cost of 121 billion dollars in 1996.

In our country some figures of accidental deaths during 1993, as reported by LPA News and National Crime Records Bureau, Govt. of India, are as under :

Out of 192357 (100%) accidental deaths -

House collapse	-	1127	-	0.6	%
Consuming liquor	-	0871	-	0.5	%
Suffocation	-	0293	-	0.2	%
Snakebite	-	4768	-	2.5	%
		7059		3.8	

If some accidents from fire, poisoning, electrocution and fall causes are added to above figure, roughly 10 to 15% accidents can be considered as 'home accidents (deaths)'.

Considering total of road and home accidents of @ 35 to 40%, this occupies a major part comparing with factory accident of only 0.3%. Error due to 'no' or 'under' reporting is considered common to all factory and non-factory accidents in our country.

This emphasises the need of safety at road and home. Therefore these two areas are highlighted in this chapter.

1. ROAD AND TRAFFIC SAFETY

This subject was so nicely presented, orally and by an article, by Shri P.M. Pant, the then Inspector General of Police, Gujarat state, Ahmedabad, at the Third Gujarat State Safety Conference at Vadodara on 1,2,3, April 1978, and it is so precise and pertaining to the Gujarat State, it is reproduced below with courtesy. Though the statistical figures are, now old, but they are just for guidance and the inference remains the same.

1.1 The Problem of Traffic Safely :

Due to large scale industrialisation and rapid urbanisation in India, number of motor vehicles in our country is increasing at a tremendous rate. This increase in motor vehicles has led to an increasing trend in the number of road accidents and casualties besides problems of traffic congestion in towns/cities. Road accidents pose a serious health problem to the present day and it will go on becoming worse if timely action to tackle this problem is not taken. Road accidents not only result in a huge drain on medical and health resources and human suffering but also to tremendous loss of property, insurance cost etc.

A study of number of persons killed and injured in India and some foreign countries have shown that, although the number of casualties in India was not much as compared to the figures in other countries, the average annual increase in casualties was high in India. The fatality rate per 10,000 motor vehicles was the highest in India i.e. 64 whereas, in most of the European countries, it varied between 5 and 15. This situation requires to be improved and timely action should be taken to arrest the rate of fatality resulting from road accidents. All the agencies. Government and non Government connected with the problem of traffic safety should take up the challenge posed by this grave situation and work earnestly and timely to take preventive measures. Here, it will not be out of place to state that when an incident of murder or that of house breaking with theft takes place there is hue and cry from the members of public and press does not lag behind, but if a death is caused due to road accident or a person looses vital limbs and is incapacitated no soul is stirred. If the road accident is of serious type in which casualties are more, there will be discussion in the press and it is to be forgotten next day. If the fruits of modernisation, increased industrialisation and urbanisation in our country are to be enjoyed the "mass killing" on the road due to motor accidents should be stopped at all cost.

In country like ours, where population of motor vehicles is increasing every year by leaps and bounds they pose a serious problem. Firstly roads, in our country may be in rural or urban areas, are fit only for pedestrian traffic, and at the most un-mechanised types of vehicles. The streets are narrow and increasing population in our country every year leads to congestion. Entry of motor vehicles on these streets aggravates the situation which leads to accident situations. Thus in our country the situation has been created that all types of vehicular (mechanised and non- mechanised) traffic and pedestrians have to use the same carriage way which leads to accidents and traffic delays leading to economic losses which developing country like ours can ill afford.

The problem of road accidents has two aspects, the study of which is required for proper appreciation of the situation namely road accidents taking place in urban areas and those occurring in rural areas including highways. It is observed that as the motor vehicles playing in urban areas are more than the rural areas, number of road accidents reported from urban area is more when compared with that of rural areas. But due to congestion on streets of towns/cities severity in casualties resulting in motor accidents is less than that of rural areas e.g. on National Highways and State Highways outside the limits of towns/cities.

In year to come vehicle population in Gujarat State will increase at a tremendous rate, looking to the rate of industrial progress and wide scale urbanisation in the State. Road mileage in the State will not be in a position to cope up with the rate of increase of vehicle population. This may lead to increase in road accidents which will result in loss of human lives and property.

Thus the problem of "Traffic Safety" is complex and it can only be solved with corporate efforts of all Government agencies connected with traffic, other non Government agencies and social organisations like Chamber of Commerce, Rotary club. Junior Chambers, Lions club etc.

See fig. 31.1 for problems of traffic safety.

1.2 Figures of Gujarat :

Now, if we take the problem as it is in Gujarat State the situation is as under :

Traffic Accidents as reported in six years are shown in Table 31.1:

Table 31.1 : Traffic Accidents in Gujarat

Year	Fatal	Serious	Minor	Total
1971	760	266	3168	4194
1972	884	2667	1529	5080
1973	970	898	4841	6682
1974	1019	926	4019	5964
1975	1106	786	4618	6510
1976	1033	1048	5033	7114

The Road Mileage (length of different types of existing roads) in Gujarat State and motor vehicle population with the rate of accidents per 1000 vehicles are given in Table 31.2.

Table 31.2 : Road Mileage, Vehicles & Accident Rate

Year	Road Milage Kms.	Motor vehicle registered in the State	Rate of accident per 1000 vehicles
1971	34364	147967	28.34
1972	34794	174452	29.03
1973	37513	204762	32.07
1974	38981	249726	23.06
1975	39575	259049	25.07
1976	39885	320186	22.02

It can be seen from the above figures, that though there is a considerable increase in vehicle population in the State and comparatively less increase in road mileage, rate of accidents per 1000 vehicles has been diminishing. However, motor accidents have been increasing every ye'ar.

The study of road accidents from 1971 to 1976 revealed that on average 37% Goods vehicles (Trucks) followed by 13% of public service vehicles (Buses), 8.1 % Auto'rikshaws and in 7.4% cases motor cycles including scooters was involved in motor accidents.

It is further seen in the above study that on average in 70% cases of accidents, the drivers of motor vehicles are at fault; pedestrians are at fault in 9.3% cases and in 5.7% cases the mechanical defects in the motor vehicles were responsible for causation of road accidents.

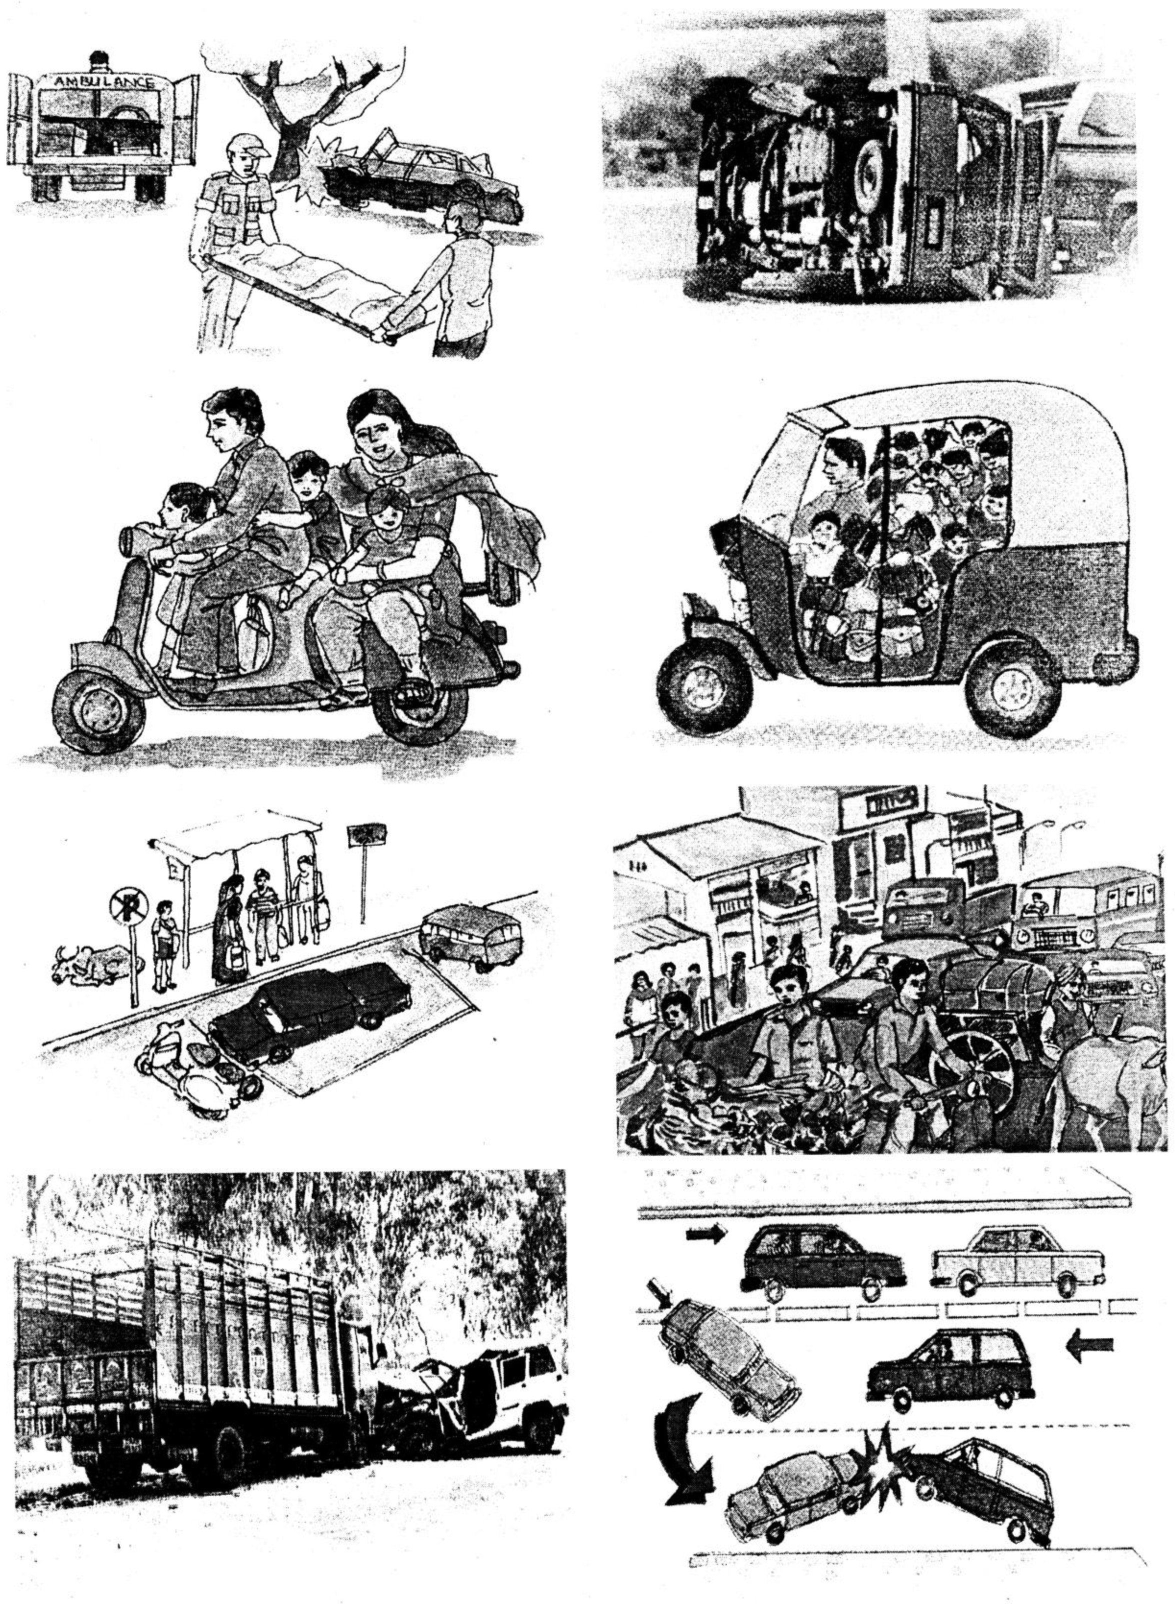

Fig. 31.1 Porblems of road accidents, over crowding, wrong parking and wrong driving.

1.3 Safety Measures:

With a view to minimise the accidents, following measures are suggested which can be classified as administrative, engineering, enforcement and educational measures.

1.3.1 Administrative Measures:

1. At present for Ahmedabad City, there is Traffic Advisory Committee which comprises of representatives of Police, R.T.O., P.W.D., Municipal Corporation; S.T., Chamber of Commerce and other social organisations to meet every quarter to discuss traffic problems arising due to rapid industrialisation and urbanisation. Traffic Advisory Committees on the same lines should be formed for cities like Vadodara, Surat, Rajkot and Jamnagar where traffic problems are likely to become acute in years to come.
2. Government of Gujarat has decided to establish development authorities for cities like Ahmedabad, Vadodara, Rajkot and Surat. They should put more stress on traffic problems of the respective cities and draw master plans to accommodate traffic need of the cities in years to come.
3. Traffic Cells should be started in Ahmedabad, Vadodara, Surat and Rajkot and one at the State level for studying traffic accidents occurring in the State. The personnel of Traffic Cell should visit the places were traffic accidents occur repeatedly and suggest remedial measures. Adequate funds should be made available for speedy implementation of the suggestions of Traffic Cell to achieve desired results.
4. S.T. Central bus stations in cites like Ahmedabad, Vadodara, Surat and Rajkot should be situated sufficiently away from busy traffic areas and local bus services should look after movements of passengers from central bus stations to other 3 localities of towns/cities.

1.3.2 Engineering Measures:

At many a times, bad road conditions are the root cause of accidents. Separate traffic cell should analyse continuously and construct traffic islands, refuges, undertake widening of the roads and removal of blind corners, strengthening of road, improving the road surface, separating pedestrian flow from the vehicular traffic by creating sub ways, pedestrian zones, sufficient foot paths, bus bays, truck terminal out side the city area, parking plots, segregating slow moving vehicles from the fast moving vehicles by cycle tracks in cities, improving road curvature, creating speed breakers on the side roads and fly-over for avoiding junction and crossing. 5

1.3.3 Enforcement Measures:

1. As the number of vehicles in the State are increasing at alarming rate year after year, accidents are likely to increase, it will be essential to augment the strength of traffic police in Ahmedabad, Vadodara, Surat, Rajkot and that of State traffic branch to curb accidents and for achieving smooth flow of traffic in the cities/ towns and on the highways which carry maximum traffic in the State.
2. From the analysis of accidents it is evident that a large number of accidents occur due to the fault of drivers of motor vehicles. This can be controlled, provided die licensing authorities take extra care before issuing the heavy duty licence. The reliability test quick and correct decision etc. of the applicant can be judged by modern instruments. Applicant should have a good knowledge of various road signs. TheR.T.O. should also ensure that the applicant possesses a valid licence for a period of at least 3 years and without any black mark.
3. Mechanical defect in motor vehicles is also one of the major cause of road accidents. Surprise checking of vehicles especially goods vehicles and public service vehicles should be carried out by the R.T.O. to eliminate un-road-worthy vehicles from the road.

1.3.4 Educational Measures:

"Traffic Safety" is not only problem of Traffic Engineering or Traffic Enforcement. Education has also to play a role in it to achieve desired results. Following measures are suggested.

1. In the curricula of primary schools and secondary schools an independent subject of road safety should be included so that children are taught lessons of road safety at an early age. This will prevent injury and fatality in children. They will also become disciplined good citizens of tomorrow.
2. Activity of R.S.P. (Road Safety Petrol) should be put on sound footing on the basis of A.C.C.; Jr. N.C. or N.S.S. so that students participate with adequate enthusiasm and pay more attention to it.
3. Social and cultural organisation like Junior Chambers, Rotary Club should come forward and take active part and render all possible assistance in the efforts of police for traffic management.
4. Traffic warden scheme which is successfully working in Ahmedabad City should be extended to other towns/cities of Gujarat State with a view to associate members of public for managing and convert it into the scheme of community welfare.
5. Leaflets and brochures mentioning various road safety measures should be distributed at all public places to inculcate better road sense in all categories of road users. Films, slides and hoarding on the subject may also be prepared for wider impact
6. Children traffic parks in cities like Ahmedabad, Vadodara, Surat and Rajkot is a must to educate children in traffic rules at an early age.

Thus it can be concluded from the above mentioned facts that in years to come problem of "Traffic Safety" is going to be acute and it requires timely action on the part of not only of police which is responsible primarily for traffic management and prevention of traffic accidents in the cities/towns and rural areas but all the Government agencies like P.W.D. Town Planning Department, R.T.O., "State Transport Authority, Municipal Corporations/ Municipalities and contribute and fulfil their obligations towards society in general and promote interests of road users who are likely to be the victims of road accidents in the years to come. The task is of such a vast magnitude that Government agencies alone will not be in a position to achieve the desired goals for traffic safety, it will need active cooperation, of other non-Government agencies and their active participation for the interests of members of public.

1.4 Accident Statistics & Trend

The IGP Shri Pant's article is over here. The figures therein are 25 to 30 years old. Let us see some subsequent scenario.

Data of 1996 Motor-Vehicle accidents in USA, are as under:

Deaths	43300 (46% of all causes deaths)
Fatal accidents	38200
Disabling injuries	2600000
Costs	$ 176.1 billion
Death rate per 108 Vehicle Miles	1.76
Death rate per 104 Registered Vehicles	2.07
Death rate per 105 Population	16.3

Further break-up is given in Table 31.3.

Table 31.3 : Road Accidents during 1996 in USA

Type of Accident	**Deaths**	**Nonfatal Injuries**
Collusion with –		
Pedestrian	6100	80000
Motor-vehicles	19300	2000000

Railroad train Pedal cycle Animal & animal Drawn vehicle Fixed object Non collision	400 800 100 12000 4600	2000 49000 9000 340000 120000
Total	43300	2600000

Source -.Accidents Facts. 1997. NSC. USA

Thus the motor vehicle fatalities has continued t be the leading cause of accidental deaths in USA. Work accident deaths are 5% and road accident deaths ai 45% i.e. nine times more!

Table 31.4 gives accidents and fatalities rates i selected countries.

Table 31.4: Rates of Accidents and Fatalities in selected countries

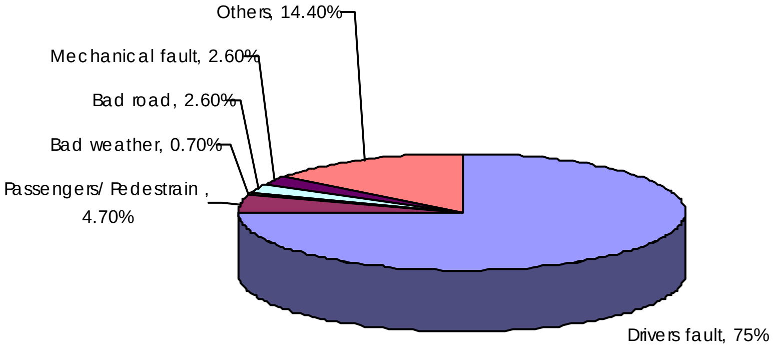
Sr. No.	Country	Accidents per thousand vehicles	Fatalities per thousand vehicles	Fatalities per thousand accidents
1	Australia	3.11	0.39	125.52
2	Brazil	1.38	0.32	229.51
3	France	8.70	0.40	50.00
4	India	13.00	2.61	200.00
5	Italy	11.50	-	31.00
6	Japan	9.80	0.20	18.00
7	Sweden	6.80	2.70	33.00
8	UK	14.00	0.39	24.00
9	USA	12.20	0.33	25.00
10	West Germany	13.30	0.61	34.00

Table 31.5 gives road accident statistics of our country.

Table 31.5 : Road Accidents in India

Year	No. of Registered Motor Vehicles ('000)	No. of Accidents ('000)	No. of Accidents per 1000 vehicles	No. of persons killed ('000)	No. of persons injured ('000)	Total 5+6
(1)	(2)	(3)	(4)	(5)	(6)	(7)
1970	1401	114.1	81.44	14.4	70.1	84.5
1971	1865	120.2	64.40	15.0	70.7	85.7
1972	1865	122.3	59.80	16.1	76.4	92.5
1973	2045	121.6	57.66	17.6	79.3	96.9
1974	2327	114.3	49.11	17.3	76.7	94.0
1975	2472	116.8	47.25	16.9	77.0	93.9
1976	2700	124.7	46.20	17.8	82.5	100.3
1977	3260	135.4	41.53	20.1	95.6	115.7
1978	3614	146.3	40.48	21.8	99.5	121.3

1979	4059	144.4	35.58	22.6	102.9	125.5
1980	4521	153.2	33.89	24.6	109.1	133.7
1981	5391	161.2	29.90	28.4	114.0	142.4
1982	6055	166.2	29.90	28.4	114.0	142.4
1983	6973	177.0	25.38	32.8	134.1	166.9
1984	7949	195.0	24.53	35.1	56.2	191.3
1985	9170	207.0	22.57	39.2	163.4	202.6
1986	10577	215.5	20.37	40.0	176.4	216.4
1987	12618	234.0	18.54	44.4	139.0	234.4
1988	14818	246.7	16.65	46.6	214.8	216.4
1989	16920	270.0	15.96	50.7	229.7	280.4
1990	19152	282.6	14.76	54.1	244.1	298.2
1991	21374	294.0	13.76	56.6	257.2	313.8
1992 (P)	23507	259.3	11.03	57.2	270.0	327.2
1993 (P)	25505	279.3	10.95	60.8	289.7	350.5
1994 (P)	27660	315.7	11.41	64.0	312.1	376.1
1995 (P)	30287	300.6	09.93	55.3	307.1	362.4
*P = Provisional						
Courtesy : Industrial Safety Chronicle						



World-wide @5 lakh people die and 15 million are injured every year in road accidents. The death toll is twice that in industrial accidents. More serious point is that mostly the age group below 25 is involved in such accidents.

It is reported that in 1997 there were 64000 deaths due to road accidents in India and it was second in this record in Asia (News 5-10-1998).

At every 12th minute one accident happens on road. As per figures collected by the Indian Orthopaedic Association, in 1996, there were 72000 deaths due to road accidents. Other figures were as under :

Year	Road Accidents	Deaths
1991	293501	56596
1992	286097	60595

The Presiuent of this Association, Dr. N.M. Lad told that poor maintenance and driving facilities have increased the road accidents (News 11-11-1997).

Figures published in 'Road Safety Digests' of LPA, Mumbai, are as under :

Vehicles Population would exceed 53 million by 2001.....

Every 2.75 minutes, one accidental death in India.....

27.2% of accidental deaths by road accidents .....

Every year @ 40 accidents occur at rail crossings.....

51855 lives lost due to road accidents in 1994.....

India, the THIRD most accident prone country in the World.....

India with traffic fatalities currently (1996) at 60000 per year tops the world in the number of road fatalities. 23 metropolitan cities account for 15% of the total road fatalities in India.

Killing rate increased to 70000 people per year in 1997. More than 3.5 lakh road accidents were reported in 1997.

The economic loss due to road accidents is over Rs.5000 crores. The social, emotional and psychological cost is immeasurable.

Therefore a Road Safety Cell in the Ministry of Surface Transport was set up in 1986 and the National Road Safety Council in 1987 to reduce these losses.

Three years' comparative figures are as under :

Year	Road Accidents ('000)	Vehicle Population ('000)	Rate of Accidents (per 1000 vehicles)
1990	282.6	19152	14.76
1991	294.4	21374	13.77
1992	275.9 (P)	23507 (P)	11.74

Figures of three metro cities, as per Traffic Police source, are as under :

Metro City	Deaths During		
	1994	1995	1996
Delhi	1379	1981	2195
Bangalore	587	678	715
Mumbai	316	372	397

Because of better road conditions and traffic sense in Mumbai, its death toll seems to be less. Even then violations of traffic rules were increased from 15 lakh in 1992 to 28 lakh in 1996 in Mumbai. A senior traffic police officer attributed the problem to the increasing number of vehicles on cit\J roads. In Mumbai, more than 70000 vehicles were registered during one year, 1996, only, the sources added (News 28-8-1997).

Total road vehicles have increased from II million in 1986 to over 21 million in 1991 and the faster growth is still continued due to liberalisation.

The Surface Transport Minister Shri H.N. Yadav told in Loksabha on 21-8-2000 that during last 50 years vehicles have been increased 130 times in the country against the road length increase of only 8 tunes during the same period. 'Every year 40 lakhs new vehicles are registered" he added (News 22-8-2000).

Figures of road accidents in Surat in Gujarat are as under :

	1994	1995	1996	1997
Deaths	115	154	123	167
Injuries	931	1507	1349	--

It is reported that in Gujarat at the time of its separation from Maharashtra, there were only 15000 vehicles. With the rise of 1 lakh vehicles every year, this figure has crossed 28 lakhs vehicles in Gujarat in 1997.

Table 31.6 indicates 10 times increase in vehicles population in Gujarat during 18 years (News 22-31999).

Table .31.6 : Increasing Vehicles in Gujarat

Type of Vehicle	1980	1990	1997	1998
Motor-cycle & Scooter	241165	1257826	2639731	3135791
Auto-riksha	31053	98917	164272	196548
Jeep	14328	33796	66368	78618
Motorcar	52817	141584	285904	338717
Other Vehicles				
TOTAL	458504	1840344	3776973	4470536

As per RTO source, 40000 new vehicles are being added every year on the roads of Surat. In the registration of new vehicles, Ahmedabad is at the top, Surat second, Rajkot third and Vadodara fourth in Gujarat. In India, first, second and third rank goes to Maharashtra, Delhi and Gujarat in this regard (News 22-9-1997).

Vehicles increase in Surat is reported as under:

Type	1984	1999
Car-Jeep	10698	59588
Autorikhsa	4684	29180
Tractor-Taxi	4891	11915
Truck-Tanker	5109	11461
Scooter-Bykes	65636	505233

Total vehicles in the city were 6,42,293 in 1999. 'New integrated public transit system will be needed to tackle the situation that may arise in 2020. (News 8-1-2000).

As per National Crime Records Bureau, there were 3.61 lacs road accidents in India in the year 2004. Average one lac people die every year in road accidents and loss of Rs. 55,000 crores incurs to the Govt. treasury (News 21-1-2008).

See Part-3 of Chapter-1 for industrialisation and road accidents.

Increasing vehicles on roads not only increase the accidents, but it also increases hydrocarbon emissions, air and noise pollution, damage to roads and their repair costs. If the costs of road accidents are combined with these figures, the total will be fantastic.

Exhaust gases from diesel vehicles contain Poly cyclic Aromatic Hydro carbons (PAH) which are capable of causing cancer. Their particle size is less than I micron reaches into lungs very easily and causes damage.

The transportation of hazardous chemicals and heaviest material (e.g. steel plate coils, cable drums, vessels, big box containers, long tankers and trailers) by road is day by day increasing. They are like mobile bombs on highways. They hamper the traffic, damage the roads heavily and in case of leakage, fire or explosion they add to more serious accidents on road.

A report of the CRRI (Central .Road Research Institute, New Delhi) team, comprising of Dr. S.M. Sarin, Dr. Nishi Mittal and Mr. B.L. Suri, published in Road Safety Digest of 1996 (Vol. 6, No. 4), highlights as under:

1. Higher human and vehicle population in 23 metros as compared to India as a whole.
2. Fast spreading cities, inadequate transport. supply and rising incomes are causing two wheeler explosion in all metro cities and accident risk is quite high: in such cities.
3. Heavy vehicles as well as fast speeding vehicles are the main culprits for causing road accidents.
4. The Non-Motorised Transport (NMT) road users consisting of pedestrians, cyclists and other slow-moving vehicle riders are the most vulnerable group involved in road traffic accidents.
5. Most productive age-group persons are killed in road accidents in Indian cities causing huge economic losses to the country and social suffering.
6. The dark hours and the early morning hours are found to be more accident-prone as compared to the day hours.
7. The traffic violations are increasing.
8. The traffic law enforcement has gradually been deteriorating during the last two decades.
9. Fear of penalty is very low in majorities of our cities. Court procedures are slow and very time consuming.
10. Accident recording and investigation work is not a part of the traffic Police function but of the general Police in most of the metro cities.
11. Road safety education is not given due emphasis and whatever little emphasis exists, it is without any scientific basis.
12. Parking problems are getting compounded due to unplanned developments leading to many safety and environmental problems.
13. Encroachment of roads and footpaths is taking place with impunity without any considerations for its adverse effects.
14. Mostly the traffic control devices like signs, signals, markings, etc. are badly lacking, incorrectly installed or ill-maintained.
15. Planning and management for handling road safety problems are poor.

1.5 More Safety Measures:

Some new safety measures to control road/rails accidents are reported as under :

1. Alarm system for unmanned level crossings has been developed by the Bharat Electronics Ltd. This unique accident prevention system switches on a red flashing light and an audio alarm when

an approaching train is 2 km away from the level crossing. The alarm system is reliable and works round-the-clock in any kind of weather.

2. Three types of Traffic Signs have been developed - Mandatory signs. Cautionary signs and Information signs.

   Motor Vehicles Act 1988 requires that a driver should drive the vehicle in conformity with the indication given by the Mandatory Signs. It is an offence not to obey these signs.

   Cautionary Signs are meant for cautioning the driver about hazards- lying ahead on the road. The driver should obey these signs for safety.

   Information Signs are erected on the road to provide information on direction, destination, roadside facilities (e.g. parking) etc. to the road user.

   Road and Traffic Engineering pays vital role in controlling accidents. It includes proper design and construction of road dividers, road surface, pedestrian way, drainage pits, road curvature and super-elevation, traffic signals & signs, road markings, street lighting etc.

3. As per TV advice to the general public. Helmets for two-wheelers and Seat Belts of cars are for the purpose of saving lives and therefore, they must be used while driving. Air bags are also used for the same purpose. Observance of safe speed limits, good maintenance of brakes, tyres, headlights, signal lights and other indicators, horns and reverse alarm, wipers in monsoon and no drug or drink habit while driving are also necessary safety measures.

   Use of cell phone while driving the car can increase the road accidents (News 8-3-1999). It is too dangerous to use it while driving a two wheeler.

4. The vision-screening test carried out by LPA on about 600 transport vehicle drivers revealed that around 45% -of them had visual acuity problems and needed spectacles. Therefore eye-examination for sight perfectness is always necessary.

5. Night driving calls for greater alertness and concentration. At night or while negotiating a tunnel a driver is likely to encounter stretches or shadows on road unlit or poorly lit. He needs time to adjust to the poor visibility and a delay of seconds may lead to a fatal accident. Checking of eye sight, dipped headlights, keeping interior lights off to avoid reflection from windscreens, carrying spare bulbs to remove one-eyed (one headlamp) condition immediately, and paying more attention while driving on built-up areas, rural roads, curves and blind spots etc., are utmost necessary.

6. Auto-dippers are compulsory for all heavy goods and passenger vehicles from March 1996 under the Central Motor Vehicles Rules, 1989. This device dips the headlights automatically.

7. Only sun control film permitting proper visibility and not the dark tinted glass should be used.

8. No child should be allowed to sit in the front seat to prevent hitting with dash-board and crushing. In western countries children in front seats are prohibited. In an auto-rickshaw, a child should not be kept in lap, it should be made to sit between two adults or at least on the right closed side.

9. Patankar Committee, set up in July 1994, in Maharashtra, suggested various measures to prevent road accidents. It includes institutional, legal and regulatory reforms and four Es, namely-
   Engineering actions for safer roads,
   Enforcement of traffic rules,
   Education for safe driving, and
   Evaluation after accidents.

   The Committee also suggested inclusion of 'road discipline' in school education.

10. Catalytic converters are now mandatory for .all new cars to reduce vehicle pollution. Main pollutants are CO, No, hydrocarbons and lead particles. 70% of new vehicles manufactured are 2 and 3 wheelers. Four stroke engines cause less pollution than two stroke and diesel fuel causes less pollution than petrol.

However warning is published in 'News, Bridgs, COEH, June 2000' that the potential health risks of exposure to diesel exhaust are Very high - higher then the health risks of many carcinogens that are already regulated in California, said Allan Smith, professor of epidemiology at UC Berkeley.

11. Regular checking of emission levels of all vehicles and to display PUC (pollution under control) certificate in the vehicle is necessary. Leaded petrol (tetraethyl lead) affects brain, CNS, baby teeth and IQ. Therefore unleaded petrol is recommended. Diesel fumes cause asthma and allergies as reported in Australia. CNG (compressed natural gas) causes less pollution and is safer. See also para 22 for CNG. Electric cars can make the pollution zero. US Clean Air Act has demanded this compliance from car makers.

12. Device to call for help automatically when a car overturns on a lonely road or midnight, is invented. This system automatically dials the emergency services and also identifies where the vehicle has crashed, using the global positioning system (GPS).

13. Electronic Cameras used by traffic police can catch speeding motorists or chit-chatting lovers in vehicles on highways. It is useful in detecting and penalising for such types of traffic violations.

14. A study carried out by the Central Road Research Institute (CRRI) in Delhi, Indore and Bhopal to know the status of compliance of statutory road safety rules revealed that –

(1) Over 50% of the drivers were illiterate or had a primary education only.

(2) 64% drivers admitted that they had no training regarding handling or transportation of hazardous materials. 36% drivers were given a training of one or two days (mostly employed by Government undertakings) and 90% of the trained drivers were not given any further training or refresher course and not satisfied with the adequacy of their training.

(3) The vehicles were not found equipped with firstaid, fire extinguishers, hand gloves, goggles and protective clothing, spark arrester for flammable material etc.

(4) Most of the drivers were unaware of the nature of risks involved, even not knowing the name of the chemical being transported by them. Emergency Information Panel (EIP) was not displayed, or was incorrect, incomplete or misleading where it was displayed.

(5) Only 24% drivers were carrying a relevant TREMCARD (Transport Emergency Card). More than 90% of the drivers were not knowing the utility of the TREMCARD.

(6) The drivers told that the traffic police were also unaware of these statutory requirements for vehicles carrying hazardous goods as they were not facing such technical inquiries.

(7) Most of the drivers frankly told that they would prefer to run away rather than take risks to inform police to avoid harassment from police or general public.

The conclusion of this survey highlights the high need of selection and training of drivers, traffic police and fire brigade personnel about transportation of hazardous materials on road. Only road worthy vehicles and competent drivers should be given licences. On-going intense drivers training programmes and awards should continue.

15. Proper reflectors help to prevent road accidents. Rule 104 of the Central Motor Vehicle Rule, 1989 has made this requirement compulsory. It was observed in one survey that 40% accidents in the night occur because of absence of proper reflectors. Vehicles, more than 6 m. long, should

have reflector area 28.5 cm2 or more and in case of other vehicles it should be 7 C1112 or more.They should be fitted at the proper position.

16. Indian Roads Congress (IRC) has published specifications and recommendations for Hoarding on roads. Some are as under :

(1) No hoarding should be placed at or within 100 m of any road junction, bridge or crossing so as to ensure safe movement of pedestrians and vehicles.
(2) On flyovers, no hoarding should be allowed within '250 m. of the road approaches on both sides.
(3) No hoarding should be allowed on footpaths, curves of roads and any other places where they are hazardous to traffic, or obstruct the path of pedestrians and hinder their visibility at crossings.
(4) The advertisements must not offend public morals and decency. Hoarding should be aesthetically acceptable and should never be obscene or vulgar. They distract the attention of the drivers and pedestrians and cause accidents, and also obscure the traffic control devices like signs and signals.
(5) Hoarding cause glare problem and impair effect of historical monuments etc. Their sizes are also prescribed.

But the survey findings show that almost 80 to 90% hoarding are unauthorised and violating above mentioned safety rules. If this trend will continue, no space will be available for effective traffic control devices. Therefore these rules must be implemented strictly.

17. Retro-reflective sheets and tapes (IS specified) can be used for vehicles, road signs, accessories, rail-road crossing barriers, poles etc. for ensuring safety and smooth flow of traffic.

18. An overhead High Speed Tram System (HSTS) and a Mass Rapid Transport System (MRTS) on railways are planned for Delhi to ease the chaotic traffic situation. Such costly alternatives will reduce the road accidents, traffic density, traffic jams, pollution and road damage all at a time.

19. Helmet Wiper is designed to keep the visor surface clean of water and dust while driving. It can work by a tiny battery operated motor or by the bike's electrical system.

20. Electronic alarm is designed to alert a driver when he falls asleep. The device operates when the frequency of eyelid blinks diminishes. Even if the sleep is not broken by the alarm voice, the device will throw a blast of menthol and lemon scented gas.

21. Malawi, a South African country, had the world highest vehicle death rate i.e. 200 deaths per 10000 motor vehicles. Main causes identified (in 1985 & 1986) with the percentage of total accidents are as under :

1.	Losing control	-	17.5
2.	Crossing without looking	-	11.7
3.	Following too closely	-	9.2
4.	Reversing negligently	-	7.0
5.	Road condition	-	5.3
6.	Overtaking improperly	-	4.9
7.	Misjudging clearance	-	4.9
8.	Failing to keep near side	-	4.6

9.	Falling from vehicle	-	4.2
10.	Excessive speed	-	4.0
11.	Animals on road	-	3.9
12.	Mechanical defect - brake	-	3.9
13.	Learner drive	-	3.3
14.	Dazzled by oncoming lights	-	2.7
15.	Non-compliance of traffic signs & signals	-	2.3
16.	Influence of drink or drugs	-	1.9
17.	Swerving	-	1.9
18.	Mechanical defect - Tyres	-	1.9
19.	Turning right without care	-	1.8
20.	Any other negligence	-	1.6

Despite lack of clear cut definition of above causes or error in exact classification, these causes are good enough to understand the causation analysis of road accidents.

A road safety programme project was undertaken by a team headed by a road safety specialist in 1992, with the following road safety areas :

1. Planning'& Programming.
2. Accident Analysis & Research. .
3. Information & Evaluation.
4. Driver Training & Licensing.
5. Traffic Law Enforcement.
6. Vehicle Testing & Control.
7. Vehicle Registration & Licensing.
8. Road Infrastructure & Environment.
9. Vehicle Overloading & Control.
10. Emergency Medical Services.

This seems to be a comprehensive road safety programme useful to any country, to reduce the road accidents. Working hours and resting time for drivers also need attention. They should be most reasonable to reduce accidents and their health effects.

22. Fuel like kerosene should not be used in automobiles. This is not only illegal but also very hazardous to travellers and the public.

LPG as fuel is permitted and LPG Gas stations are also available. But it should be handled with care. Only authorized LPG kits should be used in vehicles.

Use of CNG (compressed natural gas) must be encouraged. CNG is lead free, contains 80 to 90% methane, lighter than air and not combustible below 5% or above 15%. So the chances of its burning are much reduced. Its ignition temperature is much higher than petrol, making it difficult to" ignite. CNG is stored at 200 bar in a cylinder and can be refilled at gas filling stations (yet to develop in India). Safety valve and rupture disc are provided on the cylinder. Vapour bag carries the leaking vapour. Isolator valve disconnects the supply when engine is stopped. Operational and maintenance costs of CNG are relatively lower. CNG gives better mileage than other fuels. Thus CNG is more safer, cheaper and eco-friendly fuel. Twowheelers to multi-wheelers should use CNG to keep environment clean and safe CNG filling stations should be increased in cities and on highways.

23. High-tech new technology may be used for the smooth flow of traffic. It includes (1) A Radar Gun to record the speed and a number of an erring vehicle (2) Close Circuit Video Monitors to

record vehicles breaking signal rules and (3) A Periscope Van to see vehicles which cross the road-dividers. This system is planned for Delhi roads.

24. Crash-guard for 2-wheelers is designed by Shri BK Jha of CMRI. This device, costing onlyRs. 1000, does 3 jobs at a time on collision with an object : (1) It stops the engine (2) Works as a shock absorber to cushion the impact and (3) Activates a wheel mounted emergency stand to prevent overturning. This device can be in-built or attached as an accessory.

25. Battery powered bus is developed by BHEL to eliminate toxic emission as no oil/fuel is used.

26. Air run car can run by air pressure and not by any fuel (petrol, diesel or gas) is put in a show room in Paris, France. Know as 'City Cat' it runs with air pressure of 300 atm. It causes no pollution (News 15-11-02)

27. Auto Brakes are designed using Autonomous Intelligent Cruise Control (AICC) to prevent driving too close to the car in front, dangerous curve, fog etc. An infra-red laser constantly scans the road ahead for obstacles and passes signal for automatic application of .the brakes. The driver has to steer only. Similar other system gives audio-visual alarms in near distances.

28. Like in US, a highway fund based on motor fuel taxes, may be useful to construct multiple lane • highways to reduce road accidents and traffic problems.

29. Auto pollution figures are fantastic. An US report of 1980, stated that 60 million tonnes of CO, 6 million tonnes of NO, 12 Million tonnes of hydrocarbons and I million ton of soot were emitted by vehicles in USA. The situation is worse in India. Our Central Motor Vehicles Rules, 1989 prohibit such emission of vapour, smoke, ashes, oil mist and noise from vehicles. When we shall comply with this? Electric vehicles, CNG or lead free petrol, use of 4 stroke engines instead of 2 stroke and use of diesel or CNG vehicles instead of petrol vehicles, or use of catalytic converters can solve this problem. Delhi report says tHat the vehicles pollution alone contribute 64% of the total pollution, amounting over I million Kg daily and affecting lungs of @ 30% of Delhi's population. Therefore the Delhi Government has introduced new emission norms as under :
   (1) All vehicles having two-stroke engines will be banned.
   (2) Usage of propane in all three wheelers will be compulsory.
   (3) All diesel vehicles will have to be fitted with a diesel converter.

30. Intelligent Transport System (ITS) is under design for Asia and Pacific region. It consists of sensors embedded in the road to record every movement of the vehicle and to inform drivers about the traffic conditions ahead.

31. Active Cruse Control System uses Radar to maintain safe distance from obstructions in front. It automatically stops or slows down a moving car. It stops wrong overtaking also (News 19-2-2008)

32. Accident Reporting makes it easy to ascertain accident causes and to evolve effective road safety measures based on facts.

French experts on fertility have said that "Professional drivers become impotent, because of long driving." In 'Human Reproduction' journal of European Society of Human Reproduction and embryology, it is reported that the temperature of testis of male drivers increases because of their long sitting on stearing. This adversely affects the sperm and reduces their fertility (News 21-6-2000).

1.6 Defensive (Safe) Driving :

Above mentioned safety measures are incomplete without safety rules for defensive driving. Therefore they are summarised in this part.

As mentioned in a LPA booklet 'Defensive Driving for Safer Motoring', Defensive driving is anticipating situations/factors that can possibly lead to accidents, manoeuvring your vehicle in a way that enables you to stay out of the majority of accident prone situations. Safe driving is not a matter of luck. It requires positive efforts. It is a code of -safe practice of driving. Other abstract of the LPA booklet is as under:

1.6.1 Fundamental Traffic Rules :

1. Keep left. Allow traffic \in die opposite direction to pass you on the right.
2. Overtake only on the right.
3. Overtaking on the left is permitted only when die car in front is about to turn right.
4. Overtaking is not permissible if it is likely to cause inconvenience or danger to the other traffic or where the road ahead is not visible.
5. When being overtaken or passed by another vehicle, do not increase your speed or try and prevent the other vehicle from passing you.
6. Slow down while approaching intersections, road junctions or road corners. Enter the intersection or junction if it does not endanger anyone.
7. When entering a main road from a junction give way to the vehicles proceeding along the main road. Give way to all traffic approaching the intersection on your right hand. If there is a 'Dead slow-major road ahead' sign, yield right of way to the vehicles on your left also.
8. Drive slowly when passing a procession or when 'passing road repairs. In any case your speed should not exceed 25 km/h.
9. When turning to the left, drive close to the left hand side of the road.
10. When turning to the right, draw to the centre of the road, stop, if necessary, at the intersection, then move to the left half side of the road you are about to enter.

1.6.2 Avoidance of Drinks and Drugs :

Apart from legal problems, drinks and drugs lead to any one or all of these

1. Loss of power to judge speed of your car and speed of other vehicles.

2. Loss of power to judge safe distance for overtaking or stopping.
3. Dilation of eyes resulting in poor vision.
4. Slower reactions.
5. Replacement of normal fear of consequence by over-confidence leading to foolish chances being taken and
6. Temporary loss of knowledge of safety rules.

1.6.3 Allow right of way. Follow lane discipline & Prepare for unexpected :

1. Always Give Right of Way

Right of way is defined as a "a privilege of the immediate use of the roadway". These rules spell out who should be where, when and which vehicle should yield to another vehicle at any particular time or place. You know that you never have the right of way until another driver yields it to you.

Give right of way to all vehicles on your right at all times. When entering a road intersection, if there is a "dead-slow-major road ahead" sign, yield right of way to vehicle approaching you from your left also.

2. Follow Lane Discipline

As a defensive driver, you must follow lane discipline. Lane markings do two important things. They ensure that the available road space is used to the best possible advantage and they guide traffic on the path of safety.

Every road has lanes, whether marked or not. Where they are not marked, divide the road into appropriate lanes in your mind's eye. Plan your course so that sudden changes are avoided and never move from one lane to another without good reason. A defensive driver never weaves in and out of lanes.

3. Expect the Unexpected

Be prepared to meet all kinds of drivers during the course of a day. Their driving leaves much to be desired and they frequently confront you with an accident prone situation in which you must constantly adjust your driving to avoid an accident.

You, the defensive .driver, cannot assume that the other driver will be as considerate as you are and that he will respond to the traffic rules as you do. On the contrary, if you expect reckless, illegal and thoughtless actions from the other driver, you will be better prepared to adjust your driving so as to prevent accidents.

1.6.4 Avoid Collision:

To avoid Collision with

To avoid Collision with

Vehicle Ahead	Stay alert, Think of situation, Keep distance, Slow down early
Vehicle Behind	Give signal, Slow down & stop smoothly, Allow others to pass
Approa -ching Vehicle	Keep left, Warn by light or horn
Vehicle at Inter section	Slow down, Look both ways
Vehicle while Turning	See curves, Keep left, Don't cut right corner, Give 'turn signal', Let traffic clear, Don't permit overtaking, See into mirror
Over-taking Vehicle	Give way to pass other, Keep left, Slow down if necessary
Vehicle being over-taken	Overtake from right only, See front clear, Judge your speed to be maintained, Sound horn or give light, Accelerate & overtake quickly, Return to left after overtaking

Collisions result in serious accidents. They must be avoided. Short tips are given beloW :

1.6.5 Hints for Petrol Saving:

1. Don''t speed.

The ideal driving speed is 40 to 50 km/h. You can get 35% extra mileage at 40 km/h as opposed to 80 km/h.

2. Ensure proper maintenance

Poor maintenance may increase fuel consumption by 15% mainly due to three factors: low tyre pressure, retarded spark timing and misfire and petrol overflowing into the carburettor. Improper wheel alignment or defects in brake-system can also increase fuel consumption.

3. Maintain correct tyre pressure

A 25% decrease in tyre pressure can cost you 5% to 10% more on petrol and 25% on tyre life.

4. Use gears correctly

Incorrect use of gears can lead to increase in fuel consumption. Start vehicle in first gear only. Use higher gear for starting only if you are in a muddy patch or going downhill. Get into top gear as soon as possible.

5. Avoid rush-hour traffic

Your vehicle engine consumes double the normal fuel on a highly congested road. Take a less congested road even if it is slightly longer.

6. Anticipate stops

Driving with your foot on the brakes can increase your fuel consumption. Anticipate stops and slow down gradually.

7. Use clutch carefully

Unnecessary use of clutch leads to loss of power and petrol. Replace clutch liners immediately if they are worn out. Stop the engine when you stop your vehicle.

8. Idling wastes petrol

If your battery, dynamo, self-starter and fan belt are in good condition, you can easily switch off at halts over a minute and restart again.

9. Don't speed before warming up

While starting, warm up the engine running in neutral. Drive in low gear till the engine warms up. Don't use the choke longer than necessary. Also never park your car in such a way that you have to reverse with the cold engine.

1.6.6 Caring of Car:

The best guide to car care is the operator's manual of your car. The care of your car must not be left to others entirely.

1. Cleanliness;

Wash wheels daily. Clean lamp and other glasses, engine and car interior daily. Caked up mud and oil under chassis could add to the fuel and repair bills.

2. Nuts and Bolts :

Check the mountings of all systems and tighten nuts and bolts periodically.

3. Lubrication:

Use lubricants recommended by the manufacturer. Check lubrication personally. A missing or faulty grease nipple should be replaced. New grease should be pumped in till all the old grease comes out and the new grease peeps out. Oil changes should not be left to mechanics to decide. Check the oil for viscosity by taking a few drops between thumb and forefinger. If the oil is merely black in colour, change only the oil filter element. Many service stations never use an oil can. Insist on it. An oil spray on the under chassis is no proof that your car has really been serviced.

4. Paint:

Mud and rust can eat into metal. Holes appearing on the doors show that the water drain holes are blocked. Check floor drain holes too. Paint both sides of the floor board and the inside of the doors. Similarly radiator tanks and the petrol tank need to be painted.

5. Special Maintenance:

Engine and radiator need topping up. Brakes need adjustments and refilling of brake fluid. Batteries need distilled water and acid. Tyres need correct pressure and rotation.

Look up your car manual for a complete list.

Some parts of a car wear out very fast. The most expensive ones are tyres, tubes, batteries and brake shoes.

Filter elements, fan belts, rubber hoses, sparkplugs, copper/carbon brushes, fuses, bulbs, etc. also require frequent renewals, but cost little.

When summer comes, check all rubbers in the car and replace if required. Check tyres and tubes carefully.

For winter and rainy seasons, frequently check and clean the electrical and ignition systems.

6. Drivers' Training Programme :

4 to 6 hours drivers training programme should cover the following topics :

1. Statistics of increasing road accidents.
2. Nature and, causes of road accidents.
3. Defensive driving techniques.
4. Principles of automobile mechanism, pollution control and maintenance aspects.
5. Traffic control measures including road safety signs, symbols and lights.
6. Motor Vehicles Act and Rules.
7. Emergency response including first-aid.

1.7 Driving for less pollution

About 60% of atmospheric pollution is caused by vehicles alone. Therefore following tips are given to reduce pollution, conserve fuel, extend engine life and save money.

1. Drive less :.

In the metropolitan cities of India, maximum air pollution is caused by cars and trucks. A good way to reduce this is to drive less. Fewer trips in your car or truck will help cut air pollution. Driving less doesn't mean you have to stay home. Try combining driving with other ways of getting where you want to go: Carpool, walk or ride a cycle, shop by phone or mail, ride public transport, telecommute, combine your errands into one trip.

2. Drive smart:

Another way to reduce air pollution is to drive smart. Driving smart can reduce your car's pollution and save energy, - saving energy helps reduce air pollution: accelerate gradually, avoiding 'jack rabbit' starts, stop engine idling at signals, use the clutch to a maximum, obey the speed limits, avoid sudden braking, avoid or drive slowly on unpaved roads.

3. Be an active motorist :

Use unleaded fuel, warn your engine at idle speed before you start your journey, don't top off at the petrol pump, check with the respective oil companies for the authenticity of fuel at your regular filling stations.

4. Maintain your vehicle regularly :

Keep your car tuned and support PUC, clean or replace your car's air filter regularly, keep your tyres properly inflated, get your clutch play adjusted every time you service your car, keep all the fluid levels in the engine compartment to the maximum.

5. Use an alternate fuel :

Whenever you burn a fossil fuel, you pollute the air. Use less gasoline and diesel oil; if possible try and consider CNG conversion.

6. When buying your next vehicle :

Look for the most efficient, lowest polluting model. Always drive your newest car. New r cars generally pollute less than older models. If you are planning to purchase a brand new two-wheeler, this is the right time to do so. All two-wheeler manufacturers are trying to reach the goal of making new vehicles emission-compliant before the deadline of April 2000.

7. Speak up for clean air :

Now that you have learnt how to reduce pollution, let other people know. Support action for clean air. Report smoking vehicles - call the traffic commissioner's office.

1.8 Indian Standards :

Road traffic - lighting 1885, signals 7537, Road vehicles - breaking terminology 9268, pressure 9212, gear positions 9262, symbols for controls, indicators and tell-tables 9237, dimensions 9435, Road and street lighting luminaries 10322, Roadwork measurement method 1200, Vehicles - animal drawn 4930, 12199, 12917, Cables for motor 2465, flexible load bearing PUF components 8255, emission limits for CO 9057, Rims motorcycle 10694, Road denominations and definitions of Weights 9211, noise measurement 10399, Transport - glossary 7774, packages 7028, 7031, 9111, passengers by ropeways 5228, 5229, 5230, of liquefiable gases, steel cylinders 2872, Diesel engines - automotive purposes 10003, fuel filters 3169, fuels 1460, Diesel locomotive for use in mines 9999, Diesel vehicles - smoke emission levels 8118, electronic speed limiters 10144, Test for power take off (PTO) drive shaft guard 8265 (PTO is used for coupling the tractor PTO with the implement).

See also Part 3 of Chapter-23 for other IS.

1.9 Laws on Transportation :

For Motor Vehicles Act 1988 and Central Motor Vehicles Rules 1989 including rules for transporting dangerous goods see Part 6 of Chapter-28. See also Part 14 of Chapter-18 for Transportation of Chemicals.

2. HOME SAFETY

Variety and number of home accidents are many. Injuries going to hospitals or Police records are countable but many remain unreported and unknown. In addition to general causes like fire or burn, falling, slipping, cuts, poisoning, electric shock etc., now another dimension has been added and that is pollution indoor. Mayur Vihar in east Delhi has more polluted air than that outside on roads. SPM detected in that residential area was reported double of that found outside!

2.1 Home a type of Protection :

A man feels the best protection and peace in his home. He tells his home a happy home or slucet home and likes it very much. Generally a man spends his most of the time at two places : at the place of his work or occupation and at his home. This is generally true for most of us except few exceptions. Therefore, it is most desirable that our home should be the most peaceful and pleasant place and at the same time the most safe too. No body wishes accidents or injuries in homes. Yet they take place and make us unhappy.

According to a report of American Consumer Safety Commission, in USA, nearly 200 lakhs people meet with home accidents out of which 30,000 lose their lives and 1,10,000 lose their limbs.

USA figures of 1996 Home injury deaths are as under:

Total deaths 26500, classified as Falls 8200, Fires & Burns 2900, Suffocation 1500, Suffocation (rriech.) 600, Poison (solid, liquid) 7800, Poison (gas, vapour) 400, Firearms 800 and others 4300.

Total disabling injuries (home) were 7300000, death rate per I lakh population 10 and cogts 95.7 billion dollars.

As per the report of Velend Haise, some reasons of deaths were mistake, insecticides or pesticides, and packing without labels.

In our country every year 6 to 8 lakhs burn accidents take place causing about one lakh deaths. In Bombay, yearly burn accident toll is @ 1000. In Vadodara during 1975 to 1979, 2541 persons were admitted for burn treatment. More people die in accidents than in war. The family members and the society are put to a great loss and mental upset due to such home accidents. The reasons of home accidents and their preventive measures are explained below in brief.

2.2 Reasons of Home Accidents :

The main reasons incitide :

1. Carelessness in good housekeeping.

2. Wrong or faulty use of home appliances viz. kerosene stove, gas stove, cooking range, electric heater, pressure cooker, oven, lighter, washing machine, iron, hair drier, fans, radio, TV, tap recorder, vacuum cleaner, grinder/mixture, flour mill, cosmetic instruments, water pump-motor, sewing machine etc.
3. Leakage in gas line, "regulator, fittings etc.
4. Broken or heavily loaded electric wiring, plugs, holders etc. No proper earthing. No ELCB.
5. Broken stairs, floor and furniture.
6. Un-plated vessel causing food poisoning.
7. Non-hygienic or contaminated food.
8. Use of insecticides, drugs etc.
9. Non-earthed electric equipment and damaged switches, plugs etc.
10. Non-maintenance, or wrong use of pressure cooker.
11. Use of breakable glass crockery and putting them in unsafe conditions.
12. Slippery surface in bathroom and elsewhere.
13. Hanging cloths on electric or telephone wires.
14. Keeping poisonous chemicals anywhere within the reach of children.
15. Keeping the eatables open.
16. Not cleaning or sweeping dirt, dust etc. regularly from each room.
17. Keeping flammable substances or source of ignition within the reach of children.
18. Carelessness while cooking and heating.
19. Use of acid and other chemicals in home.
20. Children's play and rushing unsafely or taking anything in mouth, ear, nose etc. or playing with tame animals like dog, cat etc. or flying kites or firing crackers on festivals.
21. Not taking care or first aid in minor injury or unnecessarily avoiding it.
22. Wind and storm. Outside air pollution (e.g. fly ash and gases from factories and vehicles on neighbouring high ways) entering the homes.
23. Rain, flood and swimming.
24. Playing with knife or sharp .edges.
25. Always hurrying or making haste while calling some one or going for buying.
26. Mental disorder or disease.
27. Fighting for toys or games.
28. Tense atmosphere or always under mental tension due to any reason.
29. Wrong layout of office furniture, open drawers, broken chairs, slippery floor, flammable wastes, awkward positions etc.
30. Flying fireworks like rockets, havai and unsafe playing with them.

It is reported that the Central Government has prohibited the production, sale and use of such fireworks (mostly atom bombs) which create noise of more than 125 dB within 4 mt from the point of their firing. In addition to noise pollution fire crackers also pollute the environment (News 20-12-1999).

A list of such home-accidents may be very long and most of us know these reasons. Now the only necessary step is to be conscious and aware to prevent such accidents. Let us determine not to allow such accidents. A little care, teaching and training to family members (particularly to ladies and children) will be most useful.

To prevent food contamination or poisoning due to inferior recycled plastic carry bags or containers, the Central Government has made rules known as 'Recycled Plastics Manufacture & Usage Rules 1999' effective from 2-9-1999. For details see Part 2.38 of Chapter-28.

2.3 Preventive Measures :

2.3.1 General:

Preventive measures include:

1. Use of water and early medical treatment in all cases of burns.
2. Checking electric lines, gas lines and their fittings by a qualified and competent person. Providing ELCB in electric supply.
3. Keeping floors non- slippery and safe.
4. Maintaining good house-keeping. Insist for quick cleanliness. Use vacuum cleaners.
5. Keeping flammable and dangerous things safely and out of the reach of children. Playing fireworks safely.
6. Using all electric, gas and pressure equipment of IS mark with full safety and precautions. Insulated handles of electric home appliances.
7. Avoiding haste and acting calmly.
8. Maintaining full safety in kitchen and bathrooms,
9. Eat always fresh food and do not store it for a longer time for reuse.
10. Identify all drugs and medicines by proper labels and keep them in safe cupboard. Destroy their empty containers.
11. Take medical advice for any disease.
12. Avoid quarrel, friction and tension in day to day life.
13. Develop good habits and safe practices in daily life and general behaviour.
14. Foresee the risks in specific house hold arrangement, find out the means to remove them and apply them.
15. Spread this message of home safety to others also, so that totality of such accidents can be reduced.

2.3.2 Gas Work :

'Safety guidelines to Customers' issued by the Gujarat Gas Co. Ltd. (GGCL) are reproduced below :

Precautions For Daily Operation

1. Before igniting the hot-plate, ensure that there is no gas smell & also ensure that windows of the kitchen are open.
2. Ensure that the rubber tube is in good condition and it is properly fixed with the hot-plate and gas tap.
3. Open the gas tap first, then the knob of hot-plate and ignite the burner immediately.
4. Protect the rubber tube from hot utensils/ hot items.
5. After cooking make a practice to close the gas tap in addition to the knob of hot-plate.

Use of Main Control Valve

1. Main control valve is installed on the pipeline in your premises before meter and regulator. Closing of this valve will stop gas supply into your gas connection.
2. Operate this valve at least three times in a week to prevent possibility of leakage from valve.
3. Close this valve, when your house is to remain closed for more than a day.
4. Before opening this main control valve, ensure that the gas tap in the kitchen is on closed position.

Safe Use of Gas Geyser

1. Proper ventilation in the bathroom is a must.
2. For more safety, first take out hot water and after switching off the geyser, enter into the bathroom to avoid headache, discomfort, unconsciousness etc.

In Case of Gas Smell/Leak in Your Premises

1. Close the main control valve.
2. Do not ignite the hot-plate or any other items.
3. Do not operate electrical switches. Let them remain in as it is position to prevent chances of spark.
4. Do not start any vehicle or equipment in your premises. Cordon the area and alert the people around.
5. Keep open all windows and doors, if the gas smell/leak is inside your house.
6. Inform GGCL immediately and get the gas line checked/repaired by GGCL representative if necessary.

Safeguard Your Gas Installation

1. Do not excavate the soil above the pipeline laid underground in your premises.
2. In case renovation or modification is necessary in the house, get the guidance of GGCL to ensure safety of gas installation.
3. If any modification/extension/replace-ment of gas installation is required; get it done through GGCL only.
4. Do not tie-up anything with gas pipeline and protect it being hit by any object.
5. In case of an unfortunate fire incident at your house, inform GGCL immediately. If main valve is accessible, close it.

Other Information

1. All GGCL representatives have identity cards. Please ensure that the card is checked before allowing entry into your premises.
2. Get the receipt against any payment given to GGCL personnel.
3. Following Annual services are provided by GGCL.
    - Replacement of rubber tube under use once in a year.
    - Painting/reclamping of pipeline as per requirement.
    - Checking of the gas line installation.

Gas Geyser Safety:

Fatal accidents have been reported due to the unsafe use of a gas geyser. In a confined, space of a bathroom, if fresh air inlet ventilation is insufficient and geyser gas outlet pipe is also opening inside the room or it is open flue type, it causes double harm. Oxygen is rapidly consumed by the flame of the gas (e.g. NG or LPG) and its proportion less than 10% (oxygen deficiency) becomes dangerous to life. Also due to gradually diminishing .oxygen, the combustion becomes incomplete and gives rise to carbon monoxide (CO) generation and its level above 2000 ppm (TCL, 650 ppm/45 min) may soon prove fatal. CO is a silent killer. CO, in flue gases helps to increase oxygen deficiency.

If LPG is directly leaking in the bathroom, it accumulates at lower level (vapour density 1.2) and if spark is available it causes fire.

If NG (natural gas) is used, on leaking it goes upward (vapour density 0.6) and escapes from upward ventilation. Thus NG is safer than LPG.

Therefore to avoid both these adverse effects, toxic & fire, it is utmost necessary that

1. Bathroom should be of greater size and have sufficient fresh air ventilation. Ventilators at bottom and top are desirable.
2. Gas-geyser fresh air inlet and flue gas outlet pipes both should open outside the room and at the height possible. Such 'Balanced Flue type Gas Geyser' is more safe.
3. Gas connections should be maintained leak proof.
4. Water should be heated before bath and while bathing the geyser should be kept off or at the lowest gas flow burning rate.
5. In a gas- geyser bathroom, electric fitting should be flameproof.
6. Before bathing the bathroom should be kept open at least for 15 minutes.
7. If you feel breathing trouble, uneasiness or headache .while bathing, immediately open the door and come out in the fresh air.
8. Never open water valve prior to opening of a gas tap. First open the gas tap, ignite the flame and then open the water valve.

2.3.3. Kitchen Machines:

Some safety precautions for commonly used kitchen machines are as under:

(1) Washing Machine:

1. Top cover on the rotating spin tub should be interlocked i.e. the tub should not start rotating till the top cover (lid) is not closed and it should be stopped as soon as the top cover is opened.
2. Hand should not be, put in rotating spin tub or washing tub when the pulsator is moving. Hand should not be inserted under the machine • when it is operating
3. Burning object or flame should not be brought near the machine. It may cause deformation or fire.
4. Do not use hot water (>50°C) directly inside the tub.
5. Prevent kids to climb on the machine and to bow inside.
6. Solvent like benzene, thinner, petrol or acid should never be used for wash/spin process.
7. Water should not be splashed on electric switches. Avoid machine to move here and there.
8. Use 5 amp, 3 pin socket only for 240 V, AC 50 c/s supply. Ensure proper earthing. ELCB more preferable. Plug should fit firmly without loose connection. Supply cord should be pinched by the machine legs or a heavy material. Switched off the supply after use.
9. Fill water till marking only. Use soft water. Do not overload the machine. Keep the buzzer on. Drain properly. Remove coins and metal parts from pockets before putting clothing inside the machine. Keep the floor dry and clean. Wear rubber slipper or use rubber matting to avoid electric shock.
10. Follow manufacturer's instruction strictly.

(2) Freeze (Refrigerator):

1. Keep the plug and earth connection tight, not allowing loose connection. Switched off when not in use. Keep the floor dry and clean. Keep the supply cord in safe condition. Keep the machine position fixed and most convenient to avoid frequent movement.
2. Clean the freeze completely every week or at least monthly by unplugging and defrosting fully and cleaning internally and externally by a mild soap solution and making it fully' dry before restarting.

(3) Mixer - Grinder and Flour Mill :

1. Do not run the machine for a longer time otherwise overheating may damage the motor or electric parts.
2. Supply cable should be kept safe, uncrushed and unbroken. Three pin socket and good earthing are necessary.
3. Moving cutter, pulley-belt, grinding stone or wheel etc. should be fully enclosed.
4. Keep the supply switch off after every use so that children cannot start it.

(4) Toaster:

1. Do not use the toaster for a longer time. Use i after some rest (cooling).
2. Clean the toaster weekly internally anc externally and remove bread-crushings if any
3. Moisture and water damage the heating coil Therefore keep it open for some time after even use.

(5) Microwave Oven :

1. Keep the oven on a wooden table and well earthed to avoid electric shock. Keep it away from water and moister.
2. Use the baking dish and tongs available with the oven. Never use a metal tongs or pair of pincers to put or take the material inside the operating oven. Never put metal dishes inside.
3. Switch off the power before opening the oven and keep the door open after its use to allow natural cooling.
4. Clean inside thoroughly and follow the manufacturer's instructions strictly.

2.3.4. Earth quake :

Preventing measures for earth - quake are difficult as it being an 'Act of God' like cyclone, high tide etc. But preventive measures for damage due to earth - quake are certainly possible. 26 January 2001, at created history. Devastating damage of thousands of deaths, collapse of buildings and communication systems at Bhuj, Ahmedabad, Surat and other parts of Gujarat created worldwide effects. Help from all over the world was reached and need of disaster management was widely discussed. TV, newspapers and all media were full of earth- quake news for day together.

National Earthquake Information Centre of USA measured the gravity of earth quake as 7.9 Rihter (it was initially reported as 6.9) and explained the 'elastic rebound theory' or 'plate striking theory' as a cause of this earth-quake. As it was reported, 23.10 km under the earth, a rock plate was slipped making Bhuj of Gujarat as centre. The shock waves travelled upto Nepal by 3.16 minutes and reached Atlantica by 15.45 minutes.

The most sever effect was on houses and human beings. Homes were collapsed like playing cards. More than 20,000 people were buried under debris and more than that were injured. Reports regarding casualties, injuries and losses were widely varying. One such report of Central Govt. published on 4-2-2001 gives following figures:

People injured	55573
Death	15076
People affected	3.5 Crores.
Property losses	Rs. 13500 Crores
Damage to industries	Rs. 5000 Crores.
Fully broken buildings	73142
Partially broken buildings	142180
Talukas affected	49
Villages affected	949
People engaged in rescue	

activities	25000
Medical aid sent	Rs. 5.7 Crores
Helping countries	38
Help from World Bank	300 million dollars
Help from Asian Development Bank	350 million dollars

The revised report published on 17-2-2001 changed some figures as:

Deaths-18602, People injured-1,66,385. Animals dicd-20712 and estimated loss Rs. 21262 Crores.

The State Government is report published on 72-2001 including following figures:

Fully broken buildings	2,28,906
Partially broken buildings	3,97,538

Thus the gravity of earth-quake is difficult to assess soon and the loss figures 90 on changing for a longer time.

(1) Safety of Buildings against Earth-quake :

Above mishap draws our attention toward home safety. Civil and structural engineering, including stability of buildings and tall structures, is one of the oldest branch of engineering and is fully capable of guiding us for safety in design, construction and maintenance of buildings against earth-quake phenomena. Details should be searched out from it. Some basic precautionary safety measures are stated below:

1. Foundation should be designed after Richterscale reported in past and experts' advices.
2. Load bearing columns, beams and structural members should be properly designed and placed one' over the other to give fully support to each other and withstand vertical and horizontal shock waves due to earth quake.
3. Over head water tanks and other load should be so placed that the load will be uniformly transmitted on foundation. Vibrating machinery or such material will not be kept upstairs.
4. Stair-cases will be of sufficient width, having hand railings and properly designed steps. Emergency exits will be available where required.
5. Early vibration sensors and audio-visual alarm should be provided to detect deep and invisible vibration (ultra sound) in structure. A hanging bell in a bed-room is the simplest device. A vibration sensor attached with foundation wall or ceiling may give first vibration. A few second early detection and alarm can save many lives.
6. Parking pillars should have deep and sound foundation, sufficient section, well reinforcement and good factor of safety to withstand the initial earth waves.
7. Good quality of building material (cement lime, sand, brick, stone, wood, standard, steel etc.) should be used. It should never be used in quantity and proportion less than required. Water cement ratio clean water without salts, proper mixing and proportion of material; curing, settlement and drying time, proper joints and supports ... all are important.
8. National Building Code, Indian Standards, statutory safety rules (See Chapters 22, 27 &28), other rules, regulations and by-laws of the local authority must be followed of drawings and construction, various testing certificates, completion certificate, living permission etc.
9. For high rise or multi-storey building, soil testing before excavation and foundation work and rules regarding limits of height, load and other criteria should be followed.

10. For tall and heavy structure, special design of underground shock absorbers or vibration dampers, detection probe to detect underground deep vibrations and to give alarm, indication of the weakening of the deeper soil etc. should be considered.
11. Earth-quake factors must be considered while constructing heavy chemical or atomic plants, storages, pipelines etc. in quake - prone areas. This will avoid cascading effect i.e. not allowing to mix earth-quake emergency with the emergency as a consequence.
12. Building should be designed and to withstand not only vertical forces but also horizontal forces due to earth-quake.
13. For the stability of the building, weight and volume (area) both should be decreased by 10% with each floor. Such pyramid design keeps the centre of gravity well balanced.

    Water tank on the top should not be too big and should rest on foundation columns or load bearing members.
14. Emergency rescue ladders (viz. rope ladders) must be kept ready at each floor like fire hose reds and nozzles to use them to come down when it becomes impossible to use the regular stair-case or lift etc.
15. As a long-term planning. Disaster Management Organization should be planned to deal with all types of natural disasters (acts of God) like earth-quake. Cyclone, heavy rainfall, famine, massive epidemic etc. This may be at national or state level and should include preparedness activities, disaster-time control activities and post disaster activities. It should be an exclusive organization for this task. It is criticised that such disaster management organization of state or national level will be idle for most of the time and therefore be highly expensive. Equipment and other things may become non-useful after a long time, and heavy budget may be required for updating every thing and maintaining large manpower. It should be kept busy in regular rehearsal.

(2) Some tips for Safety at quake time :

Some common tips for people at home are as under:

1. Inform every family member about safe and unsafe part in every room. Keep the exit ways without obstructions.
2. Don't put heavy articles on top of the cupboards or shelves.
3. Each member should be given telephone numbers of near relatives and friends.
4. Cupboard doors should be kept fastened so that they may not open and inside things may not fall out due to quake.
5. At the time of earth quake do not stand under heavy beam, slab, fan, glass articles or any thing or structure likely to fall down.
6. Keep flammable and toxic material (e.g. pesticides) on floor, at safe corner and away from reach of children.
7. Go to top floor or ground' floor which ever is nearer. Don't use lift. Don't jump from unsafe height.

2.4 Indian Standards :

Domestic pressure cookers 2347, Rubber gaskets for pressure cookers 7466, Domestic LPG installation, Safety Code 12011, Specification for LPG 4576, Safety ' devices for gas cylinders 5903, rubber hose for LPG 9573, flexible 'rubber tubing for LPG 10908, LPG leak detector 13432, Domestic LPG gas stoves 4246, Oil pressure stoves 1342, Safety requirements for high' chairs 6185, for push chairs 6618, Safety requirements for toys 9873, Selection of toys 9849, Abdomen guards for sports use 6974, Safety requirements for household electrical appliances 302, Code of practice for earthing 3043, Safety requirements for mains operated electronic and related apparatus for household and general use 616, Safety and physical planning of computer complexes 11713 (Part 2), Guide on human safety in design, manufacture, use and maintenance of electronic equipment 11743, Safety requirements for floor and wall openings, railing and toe boards 4912, Pictorial markings for handling and labelling of dangerous goods 1260 (Part 1), Safety requirements in electro-heat installations 9080, Guide for handling cases of pesticide poisoning, first aid and treatment 4015, Requirements for packing of pesticides 8190, First-aid dressings 11163, Fire appliance 2190.

Scissors for general purposes 989, LPG cylinders 3196 (Part I to 3), condoms 3701, hair clippers 3743, metal hooks, clips and eyes 4066, snap fasteners for dresses 4108, 4741, paraffin wax 4654, safety pins 4798, skin powder for infants 5339, needles 6321, hair dyes - liquid 8481, powder 10350, plastic potable, water bottles 1988, press button 9719 to 9721, lipstick 9875.

E X E R C I S E

1. "Road accidents are much more than the factory accidents". Discuss this statement with relevant statistics.
2. 'Road safety needs more attention than the industrial safety, even than more laws and more efforts are visible for industrial safety. Give your comments.
3. Who is the proper authority for road safety? RTO, Police or both? Discuss the roles of RTO, Police and NGOs to minimise the road accidents.
4. What is the role of the general public to save themselves from road accidents?
5. 'Self discipline, self control and compliance of law by the drivers is the only best remedy'. Discuss the statement.
6. Discuss the safety points of driving vis-a vis safety points of vehicles.
7. What are the hazards due to vehicles running on roads? What are their remedial measures?
8. 'Vehicles on road contribute highest not only to accidents and fatalities but also to the air pollution.' Discuss in details.
9. 'Problem of road safety is day by day worsening'. Comment with reasons and remedies.
10. What could be the effective action plan to control road accidents at district, state and national level?
11. Discuss the problem of traffic safety.
12. Discuss the types of safety measures to minimise the road accidents.
13. Discuss any four new inventions as road safety measures.
14. Write Short Notes :

    (1) Road safety problem. (2) Engineering measures for road safety. (3) Statistics on road accidents and its conclusion. (4) Educational measures for road safety. (5) CRRI Report on status of road safety problems. (6) Traffic Signs (7) Night driving. (8) Auto-dippers. (9) Catalytic converters. (10) Unleaded petrol. (II) Patankar Committee's Report. (12) Electronic Camera. (13) Reflectors. (14) Hoarding obstruction. (15) Road safety areas suggested by Malawi Report. (16) Crash-guard for 2-wheelers. (17) Auto alarm for railway crossing. (18) Auto brakes. (19) Automobile Pollution. (20) Defensive Driving.
15. State the fundamental traffic rules for defensive driving.
16. State important provisions of the Motor Vehicles Act & Rules for the road safety.
17. Narrate the driving rules to avoid collision.
18. Discuss points of petrol saving or for caring of car.
19. You area teacher for drivers. Please give the topics that you should include in your drivers' training programme.
20. Discuss the problem of Home Safety.
21. Give any 10 reasons of home accidents.
22. Discuss with details on 'Reasons of home accidents and remedial measures'.
23. Give general preventive measures for home accidents OR Discuss the safety points of a gas use in a home.

24. Give details of hazards and remedial measures of 'Gas Geyser'.

25. Write Short Notes:

(1) ELCB for electrical safety. (2) Precautions while using a gas geyser. (3) Pressure Cookers. (4) LPG gas stoves. (5) Electric grinder-mixer. (6) Microwave ovens. (7) Kerosene stoves. (8) Pesticide poisoning. (9) Safety requirements for household electrical appliances. (10) Hair dye. (11) Use of cosmetics. (12) safety from crackers. (13) Plastic carry bags. (14) Kitchen safety.

Some miscellaneous safety tables not included in other chapters and still useful for safety purpose are included in this chapter. They furnish some useful data. Their references are also given in the foregoing chapters.

Table-1 : Elements and Radicals

Some Common Elements :

Aluminium Al	Antimony Sb	Argon As
Arsenic As	Batrium Ba	Beryllium Be
Bismuth Bi	Boron B	Bromine Br
Cadmium Cd	Calcium Ca	Carbon C
Chlorine Cl	Chromium Cr	Cobalt Co
Copper Cu	Fluorine F	Gold Au
Helium He	Hydrogen H	Iodine I
Iridium Ir	Iron Fe	Lead Pb
Lithium Li	Magnesium Mg	Manganese Mn
Mercury Hg	Neon Ne	Nickel Ni
Nitrogen N	Oxygen O	Phosphorus P
Platinum Pt	Potassium K	Radium Ra
Silicon Si	Silver Ag	Sodium Na
Sulphur S	Tin Sn	Titanium Ti
Tungsten W	Uranium U	Vanadium V
Xenon Xe	Zinc Zn	Zirconium Zr

Some Radicals and Functional Groups :

Inorganic :

Aluminate AlO_3	Amino / Amido Group NH	Ammonium NH_4
Azide N_3	Bicarbonate HCO_3	Tetraborate B_4O_7
Bromide Br	Carbide C	Carbonate CO_3
Chlorate ClO_3	Chloride CI	Chromate CrO_4
Di/Bi Chromate Cr_2O_7	Dio/Peroxide O_2	Dithionite (hydrosulphite) S_2O_4
Fluoride F	Hydrosulphide HS	Hydroxxide OH
Hypochlorite OCl	Iodide I	Nitrate NO_3
Nitrite NO_2	Nitrosyl ON	Oxide O
Perborate BO_3	Permanganate MnO_4	Phosphate PO_4
Ortho Silicate SiO_4	Disulphide S_2	Thiocyanate SCN
Metasilicate SiO_2	Sulphuryl SO_2	Thiosulphate SO_3
Sulphate SO_4	Penta Sulphdie S_5	Titanate TiO_3
Silica SiO_2	Sulphide S	Sulphite SO_3
Zeolite $AlSi_2O_6$		

Organic

Acetyl CH_3CO	Acetate CH_3COO
Acid helide RCOX	Acyl RCO
Alkane C_nH_{2n+2}	Alkene C_nH_{2n}
Alkyne C_nH_{2n-2}	Alkyl C_nH_{2n+1}
Alkoxy RO	Allyl CH_2CHCH
Amide $CONH_2$	Amino NH_2
Amyl (Pentyl) C_5H_{11}	Anilino C_6H_5NH
Aryl C_6H_5	Benzoate C_6H_5COO
Benzoyl C_6H_5CO	Benzyl $C_6H_6CH_2$
Benzylidene C_6H_5CH	Benzylidyne C_6H_5C
Boranes BnHn+$_2$	Bromide BR
Butyl C_4H_2	Butyryl $CH_3\ (CH_2)_2CO$
Carbomoyl NH_2CO	Carbonyl CO
Carboyxl COOH	Cyanate CNO
Cyanide CN	Cyclamate $C_6H_{11}NHSO_8$
Ethoxy C_2H_5O	Ethyl C_2H_5
Glyceryl $CH_2\ (CH)\ CH_3$	Glycly NH_2CH_2CO
Hexyl C_6H_{13}	Hydrazo HNNH
Hydroxyl OH	Isocyanate NCO
Ketenes RCCO	Ketones RR_1CO
Lauroyl $CH_3\ (CH_2)\ CO_{10}$	Malonul $OCCH_2CO$
Mesyl CH_3SO_2	Methoxy CH_3O
Methyl CH_3	Methylol $HOCH_2$
Naphthoyl $C_{10}H_7CO$	Nephthyl $C_{10}H_7$
Nitro O_2N	Nitroso ON
Octyl C_8H_{17}	Oleoyl $C_{17}H_{33}CO$
Palmitoyl $C_{15}H_{31}CO$	Phenyl C_6H_5
Phenylene C_6H_4	Propyl C_3H_7

Sterate $C_{18}H_{35}O_2$	Stearoyl CH_3 $(CH_2)_{16}$ CO
Sulpho $HOSO_2$	Sulphones RSO_2R^1
Sulphonyl SO	Thio ethers RSR^1
Thiols RSH	Toluoyl $CH_3C_6H_4CO$
Tolyl $CH_3C_6H_4$	Uranyl UO_2
Ureido NH_2CONH	Ureylene NHCONH
Vanadyl VO_2	Vinyl CH_2CH
Vinylene CHCH	Vinylidene CH_2CH
Xylyl $CH_3C_6H_4CH_2$	Xylylene $H_2CC_5H_4CH_2$
Zirconyl Zro	

Table – 2 : Branches of Chemistry

Chemistry is the study of the composition and behaviour of substances, and of their effects upon one another. The main branches are inorganic, organic and physical chemistry.

Inorganic and Organic Chemistry is the study of the elements and their components. It includes the study of elemental carbon, its oxides, metal carbonates sulphides, while all other carbon compounds belong to the study of organic chemistry. Some other branches are as under-

Analytical Chemistry is the study of the process of determining the composition of a substance viz. calorimetric, gravimetric, qualitative, quantitative, spectrographic and volumetric. -

Physical Chemistry is the study of the physical changes associated with chemical reactions and the dependence of physical properties on chemical composition.

Cryochemistry or cryogenics is the study of materials and phenomena at temperature close to absolute zero.

Electrochemistry is the study of the processes involved in the inter conversion of electrical energy and chemical energy.

Radiochemistry is the study and application of chemical techniques to the purification of radioactive materials and the formation of compounds containing radioactive elements.

Thermochemistry is the branch of physical chemistry dealing with the quantities of heat absorbed or evolved during chemical reactions.

Photochemistry is the branch of physical chemistry concerned with the effects of radiation on chemical reactions.

Cytochemistry is the chemistry of living cells.

Stereochemistry is the chemistry involving consideration of the arrangement in space of the atoms in a molecule. It sees possibilities of stereoisomerism or space isomerism.

Stoich(e)iometry is the part of chemistry dealing with the determination of combining proportions or chemical equivalents.

Chemical Engineering is the design, operation and manufacture of plant or machinery used in industrial chemical processes.

Chemical Technology is the science of chemistry which studies methods and processes for transforming naturally occurring raw materials into items of consumption and means of chemical production. Processing method denotes the group of operations to which a raw material is subjected an enroute to becoming a product. It is described, as a sequence of operations carried out in corresponding apparatus or machines. Such a sequence is known as a technological scheme of flow diagram.

Table-3 : Concise Glossary Of Chemical Terms

Acid	A compound which yields hydrogen ions in solution.
Activity	Ease of undergoing chemical change.
Alloy	Metallic solid resulting from dissolving two or more molten metals in each other, possessing properties different from any of its constituents.
Amalgam	An alloy of a metal and mercury.
Analysis	The determination of the composition of a substance; the decomposition of a substance.
Atom	The smallest quantity of an element that enters into chemical combination. It has a very small, dense nucleus, positively charged. Negative particles called electrons rotate around the nucleus.
Base	The hydroxide of a metal. An alkali.
Boiling Point	The temperature at which the pressure of the vapour of a substance equal that of its surrounding, atmosphere.
Crystals	A solid in which the particles (molecules, atoms, ions) are arranged in a definite patter in space.
Decomposition	The process of breaking down a substance into a simpler one.
Deliquescence	The absorption of water from the air by a substance to the extent that the substance is dissolved in the absorbed water.
Desiccant	Drying agent absorbs moisture from its surroundings.
Distillate	The condensed liquid obtained by a distilling process.
Electrode	The plate or terminal of an electric system.
Electrolyte	A substance which will conduct a current when melted, or in solution. A substance decomposable by an electric current.
Electron	A constituent of an atom possessing a unit negative electrical charge and having negligible mass from a chemical point of view.
Element	The simplest form of matter.
Energy	The ability to do work. All changes involve loss or gain of energy.
Equation	A concise statement of a chemical reaction using the symbols and formula of the reactants and products.
Equilibrium	Condition in which two processes proceed simultaneously in opposite Directions at the same rate.
Filtrate	The liquid obtained after filtration.
Flux	Material which permits another substance to melt more easily.
Formula	The composition of a substance indicated by symbols of each element present and subscript numbers showing the number of each type of atom involved.
Freezing Point	Temperature at which a liquid changes to a solid.
Ion	An atom which has acquired an electrical charge as a result of the

	gain or loss of electrons; a charged atom or radical.
Isotopes	Atoms of an element having the same chemical properties but differing in mass number are different isotopes of the element.
Metal	Element which readily loses electrons to form positive ions; conductor of electricity.
Metalloid	Element possessing characteristics of both metals and non-metals
Mixture	A combination of substances held together by physical rather than by chemical means.
Molecule	Smallest particle of a compound capable of having the properties of the compound.
Non-metal	Element which readily gains electrons to form negative ions; nonconductor of electricity.
pH.	Logarithm of the reciprocal of the I molar concentration of the hydrogen ion; a scale indicating the acidity of a solution; if pH is less than 7 solution is acidic, if pH is 7 solution, is neutral, if pH is greater than 7 solution is alkaline.
Physical change	An alteration of the properties of a substance without affecting the substance itself.
Precipitate	A solid which forms in and settles out from a solution.
Products	The substances formed as a result of a chemical change.
Radical	A group of elements bonded together which behave chemically as a single atom.
Radioactivity	The breakdown of the nucleus of an atom through the emission of alpha, beta and gamma rays.
Salt	Compound which ionises, but which produces neither hydrogen nor hydroxide ions in solution.
Solubility	The extent to which a solute can dissolve in a solvent; the concentration of a saturated solution of a given solute
Solution	Homogeneous, non-setting mixture of two ingredients, solute and solvent.
Solvent	The medium in which a substance is dissolved.
Stable	Relatively inert; hard to decompose.
Synthesis	The formation of a compound by combining elements or more simple compounds.
Volatile	Forms a gas with case.

Other Terms :

Absolute humidity	The amount of water vapour present in the atmosphere, defined in terms of number of kilograms (or grams) of water in one cubic metre of air. The relative humidity is usually expressed as a percentage, the ratio of the pressure of the water vapour actually present in the atmosphere to the pressure of the vapour that would be present if the vapour was saturated at the same temperature.
Activated Carbon	Charcoal treated to remove hydrocarbons and to increase its powers of absorption. Used in many processes for recovering valuable materials out of gaseous mixtures, as a deodorant, and in & as masks.
Acute Effect	Immediate effect (Acid burn, Ammonia or Chlorine inhalation)
Addition compound	A chemical compound formed by the addition of an atom to a; molecule, e.g. phosgene $Co+Cl_2 = CoCl_2$.

Aero metal	A casting alloy of AI, Zn and Cu.
Affinity	Chemical attraction, the force binding atoms together.
Alkali	A soluble hydroxide of a metal, particularly the alkali metal. Alkali metals-univalent metals lithium, sodium, potassium, rubidium, and caesium (Group IA of the periodic table). Alkaline earth metals bivalent metals beryllium, magnesium, calcium, strontium, barium and radium (Group 2A of the table).
Alcoholates	Metallic salts of alcohol, formed by replacement of hydrogen atoms in, the hydroxyl groups of the latter by metals e.g. sodium ethanolate C_2H_5ONa.
Alcohol	A class of organic compounds derived from the hydrocarbons, one or more hydrogen atoms in molecules of the latter being replaced by hydroxyl groups - e.g. ethanol C_2H_5OH
Aldehydes	A class of organic compounds of the type R.CO.H where R is an alkyl or aryl radical.
Alicylic compound	A type of organic compound that is essentially aliphatic, although it, contains a saturated ring of carbon atoms.
Aliphatic compounds	Organic compounds containing open chains of carbon atoms, in contradistinction to the closed rings of carbon atoms of the aromatic compounds.
Aromatic compounds	The original concept of aromatic compounds as derivatives of benzene has been extended to certain other organic compounds.
Alkaloids	A group of basic organic substances of plant origin, containing at least one nitrogen atom in a ring structure in the molecule. Many have important physiological actions and are used in medicine, e.g. codeine, cocaine, nicotine, quinine, morphine.
Alkanes	A homologous series of saturated' hydrocarbons having the general formula $Cn_{2n+2.}$ They are chemically inert, stable and inflammable. The first four members of the series (methane, ethane, propane, butane) are gases at ordinary temperatures, the next eleven are liquids and form the main constituents of paraffin oil, the higher members are solids.
Alkenes	Olefins, A homologous series of unsaturated hydrocarbons having .the general formula CnH_2n.
Alkynes	A homologous series of unsaturated hydrocarbons having the general formula CnH_{2n-2} and containing a triple bond between two of the carbon atoms in the molecule, e.g. acetylene.
Aklylarene	An arene (e.g. benzene) with one or more hydrogen atoms in the I molecule replaced by alkyl groups, e.g. ethylbenzene.
Amides	A group of organic compounds formed by replacing hydrogen atoms of ammonia NH_3 by radicals, e.g. acetamide CH_3CONH_2. The general formula is $RCONH_2$ where $CONH_2$ is the amide group.
Amines	Compounds formed by replacing hydrogen atoms of ammonia NH_3 by organic radicals. Classified into primary amines of the type NH_2R_1 secondary NHR_2 and tertiary NR_3.
Amorphous	Non-crystalline, having no definite ;form or shape.
Amphoteric	Chemically reacting as acidic for strong bases and as basic towards strong acids, e.g. amphoteric oxide, zinc oxide, gives rise to zinc salts of strong acids and zincates of the alkali metals.
Anhydride	The anhydride of a substance is that which when chemically

	combined with water, gives that substances. A basic anhydride is the oxide of a metal and forms a base with water (Na_2O+H_2O = 2NaOH), and acidic anhydride is the oxide of a nonmetal and forms an acid with water (SO_2+H_2O)=H_2SO_4).
Anhydrite	A naturally occurring form of calcium sulphate
Anhydrous	Without water, often applied to salts without water of crystallization.
Base metals	In contradistinction to the noble metals, metals that corrode, tarnish or oxidise on exposure to air, moisture or heat.
Binary compound	A chemical compound of two elements only. Denoted by the suffix-ide, e.g. calcium carbide CaC_2.
Boiling	Ebullition. The state of a liquid at its boiling point when the maximum vapour pressure of the liquid is equal to the external pressure to which the liquid is subject, and .the liquid is freely converted into vapour. Boiling point is the temperature at which the liquid boils freely under standard atmospheric pressure i.e. 760 mm of Hg.
Carbocyclic Compounds	A class of organic compounds containing closed rings of carbon atoms in their molecules. It includes alicyclic (e.g. cyclohexane) and aromatic (e.. benzene) compounds.
Carbohydrates	A large group of organic compounds composed of carbon, hydrogen and oxygen only with general formula C_x ($H_2O)_y$.
Carcinogen	A substance capable of producing cancer (carcinoma).
Caustic	Corrosive towards organic matter (but not applied to acids), e.g. caustic soda, caustic alkali-sodium or potassium hydroxide, caustic potash - KOH, caustic soda - NaOH.
Celluloid	A thermoplastic material made from cellulose nitrate and camphor.
Cellulose	A polysaccharide that occurs widely in nature in fibrous form as the structural tissue in the cell walls of plants.
Chemical change	A change m a substance involving an alteration in its chemical composition, due to an increase, decrease or rearrangement of atoms within its molecules.
Chemical energy	That part of the energy stored within an atom or molecule that can be released by a chemical reaction.
Chloracne	A disfiguring skin disease that is caused by certain chlorinated aromatic hydrocarbons. It can result from contact, ingestion or inhalation of the chemicals.
Chromophore	Any chemical group, such as the azo group, that causes a compound to have a distinctive colour.
Chronic Effect	Effect after prolonged exposure (poisoning due to lead, chromium, j mercury etc.)
Coalgas	Fuel gas manufactured by the destructive distillation of coal in closed iron retorts, often' supplemented with watergas or natural gas. Coal-tar is a thick black oily liquid obtained as a by-product of coal-gas manufacture. Coke is a greyish porous brittle solid i containing @ 80% carbon. Obtained 'as a residue in the manufacture of coal-gas (gas-coke), also made specially in coke ovens, in which the coal is treated at lower temperatures ;than in pas manufacture.
Corrosive Liquids	Acid, Alkalis, Ammonia liquor, iCarbamate solution, caustic solution, amines etc.
Critical pressure,	Critical pressure is the pressure of the saturated vapour of a substance

temperature and volume	at the critical temperature, above ; which a gas cannot be liquefied by pressure alone. Critical volume is 'the volume occupied by unit mass of a substance at its critical; temperature and critical pressure.
Critical Velocity	The velocity at which the flow of a liquid ceases to be streamlined and becomes turbulent.
Cryostat	A vessel in which a specified low temperature may be maintained.
Culture medium	A preparation used for growing and cultivating micro-organisms for experimental purposes.
Deliquescent	Having the property of picking up moisture from the air to such an extent as to dissolve in it, becoming liquid on exposure to air.
Density	The mass of unit volume of a substance, e.g. kg/m^3.
Derivative	A compound derived from (but not necessarily prepared from) some other compound, usually retaining the general structure of the parent compound, e.g. nitrobenzene $C_6H_5NO_3$ is a derivative of benzene C_6H_6, one hydrogen atom in the molecule of the latter being replaced by a nitro group.
Detergents	Cleaning agents, products used in solution for washing or cleaning by action other than simple dissolution, usually with the aid of surface-active agents. Unlike soaps, they are effective in hard water and do not form a scum.
Diazo Compounds	Like azo compounds, diazo compounds contain two adjacent nitrogen atoms which may form and azo group, but only one is attached I to a carbon atom e.g. diazomethane CH_2=N
Diazonium Compounds	Organic compounds of the general formula RN_2X, where R is an aryl radical, RN_2 is a cation and X is an anion.
Dihydric	Containing two hydroxyl groups in a molecule, e.g. a diol.
Dyes	Coloured substances that can be fixed firmly to a material to be dyed so as to be more or less fast to water, light and soap. Types - acid Idyes, azo dyes, direct dyes, mordents, vat dyes.
Emulsion	A two-phase system in which the disperse phase consists of minute droplets of liquid
Enthalpy	Heat content H. A thermodynamic property of a substance given by H, == U+pV, where U is the internal energy, p the pressure, and V the volume.
Entropy	S. A quantity introduced in the first i place to facilitate the calculations and to give clear expression to the! results of thermodynamics.
Enzyme	A large group of proteins produced by living cells, which act as catalysts in the chemical reactions upon which life depends.
Ergonomics	The engineering aspects of the study .of the relation between human workers and their working environment.
Esters	Organic compound's corresponding to inorganic salts, derived by replacing hydrogen of an acid by an organic radical or group e.g. ethyl acetate $CH_3COOC_2H_5$ is the ethyl ester of acetic acid CH_2COOH.
Ethers	A group of organic compounds with the general formula R-O-R' formed by the condensation of two alcohol molecules.
Explosion	A violent and rapid increase of pressure in a confined space. It may be caused by an external source of; energy (heat) or by an internal exothermic reaction in which: relatively large volumes of gases are

	produced.
Explosives	Substances that undergo a rapid chemical change with production of gas on being, heated or struck
Fatigue of Metals	The deterioration of metals owing to repeated stresses above a certain critical value, it is accompanied by changes in the crystalline structure of the metal.
Fertilisers	Materials put into 'the soil to; provide compounds of elements essential to plant life more I particularly nitrogen, phosphorus and potassium.
Fire	A chemical reaction accompanied by the evolution of heat, light and flame (i.e. a glowing mass of gas). It is generally applied to the chemical combination with oxygen 'of carbon and other elements' constituting the substance being burnt.
Flammable	Substances with flash point < 80 °FJ i Those having P.P. > 80 °F are called' combustibles.
Flash Point	The lowest temperature at which a I substance gives off sufficient inflammable vapour to produce a momentary flash when a small flame is applied.
Flue Gas	The gaseous products of combustion from a boiler furnace consisting predo-minantly of CO_2, CO, O_2, N_2 and steam. Analysis of the flue ~ gases is used to check the efficiency of the furnace.
Fluid	A substance that takes the shape of the shape of the vessel containing it, a liquid or gas.
Fuel	A substance used for producing heat energy, either by means or the release of its chemical energy by combustion or its nuclear energy by nuclear fission.
Fungicide	A substance capable of destroying I harmful fungi, such as moulds and mildews.
Gas	A substance whose physical state (the gaseous state) is such that it always occupies the whole of the ; space in which it is contained.
Gas Mask	Respirator a device for protecting the face and breathing organs against poisonous gases.
Germicide	A substance capable of destroying bacteria.
Halide	A binary compound of one of the halogen elements (fluorine, chlorine, bromine or iodine), a salt of the hydride of one of these elements.
Heat	Energy possessed by a substance in the form of kinetic energy of atomic or molecular translation, rotation or vibration. The heat contained by a body is the product of its mass, temperature and specific heat capacity. It is expressed in joules, calories or B.Th. U. Heat is transmitted by conduction,; convection and radiation. Its physical effects are rise in temperature, change of state from solid to liquid (melting), solid to gas (sublimation), liquid to gas (evaporation), boiling, expansion and electrical effects.
Heat exchanger	Any device that transfers heat from one. fluid to another without allowing the fluids to come into contact with each other.
Heat of reaction	The quantity of heat given out (exothermic) or absorbed in (endothermic) a chemical reaction usually per mole of reacting substances.

Herbicides	Substances that kill plants or inhibit their growth. Selective herbicides affect only particular plant types, making it possible to attack weed growing among cultivated plants.
Heterocyclic compounds	Organic compounds containing e compounds ring structure of atoms in the molecule, the ring including atoms of elements other than carbon e.g. C_5H_5N.
Homocyclic compounds	Organic compounds the molecules compounds of which contain a ring structure of atoms of the same kind (usually carbon), e.g. benzene C_6H_6.
Homologous Series	A series of chemical compounds of uniform chemical type, showing a regular gradation in physical [properties and represented by a general molecular formula, the! molecule of each member of the series differing from the preceding one by a definite constant group of atoms, e.g. the alkanes. Members of the same homologous series are called homologous, e.g. methane CH_4, and ethane C_2H_6.
Hydrocarbons	Organic compounds that contain only carbon and hydrogen. They are classified as either aliphatic or aromatic compounds (or a combination of both). Hydrocarbons may be either saturated or unsaturated compounds.
Imide	Imido compound , a compound derived from ammonia, containing the imido group. NH, in which the two hydrogen atoms of ammonia are replaced by non acidic organic radicals.
Inert or noble gases	Rare gases, helium, neon, argon, gases krypton, xenon, radon. They are all chemically inactive, though some compounds have been reported.
Insecticide	A substance used for killing insect pests.
Isomerism	The existence of two or more chemical compounds with the same molecular formula but having different properties owing to a different arrangement of atoms within the molecule, e.g. ammonium cyanate NH_4CNO and urea $CO(NH_2)_2$ are isomers.
Latent heat	The quantity of heat absorbed or released in an isothermal transformation of phase.
Liquid	A state of matter intermediate between a solid and a gas, in which the molecules are relatively free to move with respect to each other but are restricted by cohesive I forces to the extent that the liquid maintains a fixed volume. Liquids assume the shape of the vessel containing them, but are only slightly compressible.
Local effect	Effect confined to affected part (chemical burn, dermatitis)
Malleability	The ability to be hammered out into thin sheets.
Matter	A specialised form of energy that has the attributes of mass and extension in space and time.
Melting point	The constant temperature at which the solid and liquid phase of a substance are in equilibrium at a given pressure. Melting points are normally quoted for standard atmospheric pressure.
Monomer	A chemical compound consisting of single molecules, as opposed to a polymer, the molecules of which are built up by the repeated union of monomer molecules.
Noble metals	Metals such as silver, gold and platinum, that do not corrode or tarnish in air or water and are not easily attacked by acids.

Pesticides	Substances that kill pests. They include insecticides.
Petrochemicals	Chemical substances derived from petroleum (or natural gas).
Petroleum	Mineral oil. A natural mixture of hydrocarbons and other organic compounds. Fractional disti-llation yields petrol, paraffin oil, lubricating oil, petrolatum and paraffin wax.
Plasticizer	(1) A non-volatile liquid added to I paints and varnishes to prevent brittleness of the dried film. (2) A liquid or solid substance added to synthetic or natural resins to modify their flow properties.
Polymerisation	The chemical union of two or more molecules of the same compound to form larger molecules, resulting in the formation of a new compound of the same imperial formula but of greater molecular weight, e.g. Paraldehyde (CH,CHO), is formed by the polymerisation of acetaldehyde CH,CHO monomer. It includes addition polymerisation, condensation polymerisation and copolymerisation. Many important products such as plastics and textile fibres consist of polymeric substance, either natural (e.g. cellulose) or synthetic (e.g. nylon).
Pressure	The force per unit area acting on a surface. Absolute pressure is the pressure measured with respect to zero pressure. Gauge pressure is the pressure measured by a gauge in excess of the pressure of atmosphere.
Reducing agent	A substance that removes oxygen from, or adds hydrogen to, another substance.
Refrigerant	A fluid used in the refrigerating cycle of a refrigerator, usually of a liquid that will vaporise at a low temperature, e.g. freon or ammonia.
Relative density	Specific gravity. The ratio of the density of solid or liquid at a specified temperature (often 20°C) to the density of water at the temperature of its maximum density (4°C).
Skin Poisons	Cause dermatitis and ulcer to skin (Chromates, Naphtha, Amines, Aniline etc.,)
Soda	Washing soda Na_2CO_3, backing soda, $NaHCO_3$, caustic soda NaOH.
Soda ash	The common name for anhydrous Na_2CO_3.
Soda lime	A solid mixture of NaOH and $Ca(OH)_2$
Specific heat capacity	Specific heat capacity divided by mass. The quantity of heat required to raise the temperature of unit mass of a substance by one degree.
Systemic effect	Effect on one complete or more than one systems, (exposure to CO, H_2S, Benzene, Aniline, Methanol etc.)
Temperature	Temperature is a measure of hotness of a body. It can be defined as a property determining the rate at which heat will be transferred to or from it. Temperature is thus a measure of the kinetic energy of the molecules, atoms or ions of which matter is composed.
Thermo-dynamics	The study of the general laws governing processes that involve heat changes and the conservation of energy.
Toxic	Poisonous, toxicology - the study of poison, toxin-poison.
Toxic dusts	Dust of asbestos, silica, coal, cotton, iron, lead, sugarcane hay can cause lung diseases.
Toxicity	Ability of a chemical to cause internal or external injury on human body.
Vapour	A substance in the gaseous state that can be liquefied by increasing the pressure without altering the temperature. A gas below its critical

	temperature.
Vapour density	A measure of the density of a gas or vapour, usually, given relative to Oxygen or hydrogen or air.
Vermicide	A substance used to kill worms.
Viscosity	The property of a fluid whereby it tends to resist relative motion within itself.
Water gas	A fuel gas obtained by the action of steam on glowing hot coke. It consists of CO and H.

Table-4 : Dangerous Properties of Some commonly used Chemicals

Sr. No.	Substance	Sp. Gravity	Vap. Density	Boiling Point °C	Melting Point °C	Flash Point °C	Explosive Limits %	TLV ppm	Solubility in Water
1	**2**	**3**	**4**	**5**	**6**	**7**	**8**	**9**	**10**
1	Acetaldehyde CH_3CHO	0.78	1.52	21	-124	-38	4-57	100	Highly soluble
2	Acetic acid CH_3COOH	1.05	2.1	118	1.7	43	4-16	10	Highly soluble
3	Acetone CH_3COCH_3	0.79	2.0	56	-94	-18	3-13	750	Highly soluble
4	Acetylene C_2H_2	0.91	0.9	-83	Volatile	-18	3-82	-	Less Soluble
5	Acrolein CH_2CHCHO	0.84	1.9	53	-87	-26	3-82	0.1	Highly soluble
6	Acrylonitrile CH_2CHCN	0.81	1.8	77	-83	0	3-17	2	soluble
7	Allyl chloride CH_2CHCH_2CI	0.94	2.6	45	-136	-32	3-11	1	In-soluble
8	Ammonia (gas) NH_3	0.77	0.59	-33	-78	-	16-25	25	Highly soluble
9	Aniline $C_6H_5NH_2$	1.02	3.22	184	-6	70	1-3	2	Soluble
10	Benzene C_6H_6	0.88	2.8	80	5.4	-11	1.4-8	10	Less Soluble
11	Boron Trifluoride BF_3	2.99	-	-99	-127	-	-	1	Highly soluble
12	Bromine Br_2	3.1	5.5	59	-7	-	-	0.1	Less Soluble
13	Carbon disulfide CS_2	1.26	2.6	46	-112	-30	1-44	10(4)	Less Soluble
14	Carbon monoxide CO	0.81	0.97	-192	-207	Flammable	12.5-74	50(35)	Less Soluble
15	Caustic Soda NaOH	2.13	-	1390	315	-	-	0.2 mg/m3 STEL 1 (0.5)	Less Soluble
16	Chlorine Cl_2	2.48	2.49	-34	-101	-	-	1 (0.5)	Less Soluble

17	Chlorine dioxide ClO_2	3.09	2.3	9.9	-59	Explosion	-	0.1	Less Soluble Decompose
18	Chlorobenzene C_6H_5Cl	1.11	3.9	132	-56	29	1.3-7.1	75	In-soluble
19	o-Dinitobenzene $C_6H_4(NO_2)_2$	1.31	5.8	319	118	150	Explosive	0.15	Less soluble
20	Dioxane $C_4H_8O_2$	1.04	3.0	101	10	12	2-22.2	100 (25)	Highly soluble
21	Ethane C_2H_6	0.57	1.04	-89	-183	-	3-12.5	-	In-soluble
22	Ethanol C_2H_5OH	0.79	1.59	79	-114	12	3.3-19	1000	Highly soluble
23	Ethyl acetate $CH_3COOC_2H_5$	0.90	3.04	77	-84	-4.4	2-18.9	400	Less soluble
24	Ethyl amine $C_2H_5NH_2$	0.80	1.56	17	-81	-18	3.5-14	10	Highly soluble
25	Ethyl chloride C_2H_5Cl	0.92	2.2	12	-139	-50	3.6-15.4	1000	Less soluble
26	Ethylene C_2H_4	0.001	1.0	-104	-169	Flammable	2.7-36	-	Less soluble
27	Ethylene oxide $(CH_2)_2O$	0.87	1.49	11	-111	-18	3-100	-	soluble
28	Ethyl ether $C_2H_5OC_2H_5$	0.71	2.55	34	-123	45	1.85-48	400	Less soluble
29	Fluorine F_2	1.1	1.7	-188	-218	-	-	1 (0.1)	Decompose
30	Formaldehyde HCHO	0.82	1.08	-19	-92	-	7.0-73	2	Soluble
31	Formaline (37% formaldehyde, 15% methanol)	-	-	101	-	50	-	-	Soluble
32	Formic acid HCOOH	1.22	1.59	101	8.2	69	18-57	5	Highly Soluble
33	Hexane $CH_3(CH_2)_4CH_3$	0.66	2.97	68	-96	-22	1.1-7.5	50	In-soluble
34	Hydrochloric acid HCl	1.19	1.3	-85	-115	-	-	5	Soluble
35	Hydrocyanic acid HCN	0.69	0.93	26	-14	-18	6-41	10	Highly soluble
36	Hydrofluoric acid HF-	1.0	0.71	20	-83	-	-	3	Highly soluble
37	Hydroge-n H	0.09	0.069	-253	-259	-	4-75	-	Less soluble
38	Hydrogen sulphide H_2S	1.19	1.2	-60	-83	-	4.3-46	10	Highly soluble
39	Kerosene	0.81	4.5	170-300	-46	38-696	0.7-5	-	-
40	Lead Pb	11.3	-	1744	327	-	-	0.05 mg/m^3	In-soluble
41	Maleic	0.9	3.4	202	58	102	1.4-7.1	0.25	Decompose

	anhydride $(COCH)_2O$								
42	Mercury Hg	13.6	-	357	-39	-	-	0.1 (0.01) mg/m^3	In-soluble
43	Methane CH_4	0.42	0.6	-161	-183	-306 ^oF	5-15	-	Less soluble
44	Methanol CH_3OH	0.79	1.11	65	-98	12	6-36.5	200	Highly soluble
45	Methyl acetate $CH_3CO_2CH_3$	0.97	2.55	57	-99	-9	3.1-16	200	Highly soluble
46	Methyl bromide CH_3Br	1.73	3.27	4	-95	-	10-16	20 (5)	In soluble
47	Methyl chloride CH_3Cl	0.98	1.8	-24	-98	-	10.7-17.4	50	Less soluble
48	Methyl isobutyl ketone CH_3COCH_2 $CH (CH_3)_2$	0.80	3.5	117	-85	23	1.4-7.5	50	Less soluble
49	Methyl isocyanate CH_3NCO	0.92	2.0	39.1	-45	-6.6	5.3-26	0.02	Reaction
50	Methyl mercaptan CH_3SH	0.87	1.66	5.96	-121	-18	3.9-21.8	0.5	Less soluble

90	Zinc oxide ZnO	5.47	-	-	1975	-	-	5 mg/m^3	Less soluble

Table-5 : Rating Form for Activity Standards

A. Organisation and Administration

Sr. No.	Activity	Rating 'Excellent' when
1	Statement of Policy and Responsibilities assigned	Safety & Loss Control Policy is written and reviewed every year. Responsibility for safety and Loss prevention and accountability is clearly defined in supervisory performance evaluation.
2	Safe Operating Procedures (SOPs)	When all hazardous operations are covered by a procedure, posted at the job location, with an annual documented review to determine adequacy.
3	Employee Selection and Placement	When safety attitudes and record is taken into account while employees are considered for selection & promotion.
4	Emergency and Disaster Control	When all types of emergencies are covered with written procedures and responsibilities are clearly defined with back up provisions.
5	Direct Management Involvement	When safety & loss control problems are treated as other operational problems in staff meetings.
6	Plant Safety Rules	When plant work & safety rules are firmly enforced and updated at least annually.

B. Industrial Hazard Control :

Sr. No.	Activity	Rating 'Excellent' when
1	Housekeeping, storage of materials	When housekeeping, storage of materials etc. are

	etc.	ideally controlled.
2	Machine Guarding	When machine hazards are effectively controlled to the extent that injury is unlikely and safety of operations given prime consideration at the time of process design.
3	General Area Guarding	When the hazards are effectively controlled to the extent that injury is unlikely.
4	Maintenance of Equipment, Guards, Hand tool etc.	When a good preventive maintenance system is programmed for hazardous equipment and devices.
5	Material Handling	When adequate measures prevail to avoid conflict between workers and materials being moved.
6	Personal Protective Equipment, Adequacy and Use	When us of such equipment is recognized as an employment requirement.

C. Fire control and Industrial Hygiene

Sr. No.	Activity	Rating 'Excellent' when
1	Chemical Hazard Control	Hazard data sheets are posted and regularly updated. Additional standards when promulgated are discussed with employees involved.
2	Flammable and Explosive Materials Control.	When storage facilities comply fully with fire regulations, containers are always labeled and a strong policy exists with respect to handling, storage and use of flammable materials.
3	Ventilation- Fumes, Smoke and Dust Control	When the equipment is properly selected and maintained close to its maximum efficiency.
4	Skin Contamination Control	All workmen are informed about skin irritants. Provided with approved protective equipment or devices and regular medical checks are maintained to ensure that there is no ill effect.
5	Fire Control Measures	When a well trained fire crew is organized and trained in emergency procedures and in the use of fie fighting equipment.
6	Waste, Trash Control	When 'waste disposal hazards' are effectively controlled and Air /Water / Land Pollution potential is minimal

D. Supervisory Participating, Motivation and Training :

Sr. No.	Activity	Rating 'Excellent' when
1	Line Supervisor Safety training	When regular specialized sessions are conducted on specific problems
2	Indoctrination / Safety Induction of New Employees	When a formal indoctrination programme to orient new employees to Safety and Loss Prevention is in effect.
3	Job Hazard Analysis	When Job Hazard Analysis is performed on a regular basis and safety procedures are written and posted for all operations.

4	Training for specialized operations for trucks, grinding, press brakers, punch press, solvent handling, etc.	When regular evaluation is done (at least annually) to determine training needs.
5	Internal self inspection	When senior managers are invited in inspection programmes and follow up and the programme is measured by results i.e. reduction in accidents and cots.
6	Safety Promotion & Publicity	When special display cabinets programmes of slogans, posters, etc. regularly arranged.
7	Employer / Supervisor Safety Contact	When the supervisors regularly review job safety requirements with each worker and contact at least one employee daily to discuss the safe job performance.

E. Accident Investigation, Statistics and Reporting Procedures :

Sr. No.	Activity	Rating 'Excellent' when
1	Accident investigation by line personnel.	When every accident is investigated within 24 hours of occurrence and reports are reviewed by Dept. Manager and plant Manager.
2	Accident cause and injury location analysis & Statistics.	When accident causes & injuries are graphically illustrated to develop the trends and evaluate performance. Management is kept informed on status.
3	Investigation of property damage.	When management requires a vigorous investigation effort on all property damage incidents.
4	Proper Reporting of Accidents	In addition to reporting & investigation of all accidents, all staff is kept informed of all accident findings & recommendations for accident prevention.

Courtesy : Quantitative & Qualitative Measurement of Industrial Safety Activity, ASSE Journal 1970.

Table-6 : ILO Checklist for Good Housekeeping

How to use this Checklist:

1. Fill in the General Information Sheet by interviewing appropriate persons.
2. Define the work area to be checked. In the case of a small enterprise the whole production area can be checked. In the case of a larger enterprise, particular workplaces can be defined for separate checking.
3 Go through the items and determine which measure should be taken according to the following procedure :

    (a) If the measure is not needed (meaning the improvement need not be considered because it is already available or not applicable), put a check in the box under NOT NEEDED.

(b) If the measure is "needed" (meaning the improvement is necessary), put a check in the box under NEEDED. If the .measure has already been taken but needs further improvement, this box (NEEDED) should also be checked.

(c) If the measure is needed and is urgently important, check the space under HIGH PRIORITY.

(d) The space under REMARKS should be used to note down any information or comments related to the measure in question. Comments about the nature of the improvements needed or the particular work sites requiring such improvements should be given. If the measure has already been successfully applied, it may be cited as a good example.

4. Before finishing, make sure that :

(a) for all measures listed, either NOT NEEDED or NEEDED is checked.

(b) for some of the items rated as NEEDED HIGH PRIORITY is checked.

General Information Sheet

1. Name and address of enterprise : ____
____

2. Main products : ____

3. Number of employees
Office : ________________ (male : __________________ female : __________________)
Production : _____________ (male : __________________ female : __________________)
Total : __________________ (male : __________________ female : __________________)

4. Work Schedule

		No. of Employees	Timings
A.	Office :	______	From __________ To ___________
B.	Production		
	Day shift:	______	From __________ To ___________
	Afternoon shift:	______	From __________ To ___________
	Night shift:	______	From __________ To ___________

5. Break periods for production workers.:
A. Morning Break : _____ minutes
B. Lunch Break : _____ minutes
C. Afternoon Break: _____ minutes

Name of Checker : ______________________________ Date : __________________

Make four columns : (1) Not needed. (2) Needed. (3) High Priority (4) Remark, against each of the following items and write your finding against each of them.

Premises and Facilities :

These items concern the factory building itself: its floors and exits, general lighting, ventilation, and available facilities.

Floors and Exits:

1. Provide at least two unobstructed escape exits for every floor or every big room.
2 Provide barriers (e.g. bars, covers, grills) for flooi openings and handrails for stairways.
3 Change positions of partitions or walls or raise the ceiling to provide adequate workroom space.
4 Make floor surfaces smooth and even, and eliminate places where it is necessary to step up or down or over obstacles. Provide toe guards.
5 Keep oil spills and waste water off the floor by splash guards, well sealed containers, drainage or frequent clean- up.

Lighting and General -Ventilation

6. Improve daylight conditions by properly locating windows or skylights.
7. Paint ceilings white and walls light colours and keep them clean.
8. Provide general artificial lighting adequate for the type of work done by adding light sources, installing reflectors, or repositioning existing lights.
9. Increase natural ventilation by having more openings, windows or open doorways.
10. Provide adequate numbers of ventilators, electric fans or air conditioners.
11. Insulate or screen furnaces, heated metal or other sources of heat.

Welfare Facilities :

12. Provide an adequate supply of cool, potable water in all workplaces.
13. Provide sufficient sanitary facilities close to the work area, including soap for washing and separate toilets for man and women.
14. Ensure that washing and toilet facilities are regularly cleaned and properly maintained.
15. Provide a separate, comfortable and hygienic place for meals.
16. Provide storage for clothing, bicycle or other personal belongings.
17. Provide space and supplies for games, sports or other recreational activities.

Workstations:

These items concern arrangements for individual work places, often called ergonomics.

Working Postures :

18. Change work methods so that the workers can alternate standing and sitting while at work.
19. Provide good chairs for standing workers for occasional sitting.
20. Use Jigs, lifts, levers, pulleys or other mechanical measures to avoid long-lasting unnatural working postures such as bending, twisting or scinatting.
21 Avoid bending postures for standing workers by raising the height of equipment, controls or work surfaces.
22 Avoid work requiring high hand positions for standing workers by providing foot stands or platforms.
23 Provide work tables of suitable height for seated workers so that too high or low hand positions are avoided.
24 Provide chairs or benches of correct height.
25 Provide all chairs, stools and benches with a comfortable backrest.

Workstation Arrangements:

26 Put switches, controls and materials within easy reach of workers.
27 Make different switches and controls easily distinguishable from each other by changing positions, sizes and shapes.
28 Choose tools which are easy to grip and handle.
29 Make sure that tools are maintained and repaired properly and that no worn-out tools are used.

30 Place the most important displays (signals, gauges, etc.) where they are easy to see from the normal work position.
31 Add labels or colour markings to make control positions (e.g. on, off) or displays easily recognisable, especially for emergency switches.
32 Eliminate glares which strain the workers' eyes by avoiding naked or semi-shielded lamps, highly light reflecting surfaces or too bright light from windows.
33 Provide local lighting or adjustable lamps, especially for precision work.

Specific Work Hazards :

The items below concern some common occupational injury and disease hazards. There will also be legal requirements relating to these and other hazards which should be followed.

34 Provide enough fire extinguishers within easy reach.
35 Attach proper guards to dangerous moving parts of machines and power transmission equipment.
36 Ensure that all machinery guards are securely fastened to the machine or to the floor, wall or ceiling.
37 Use safety devices which prevent operation of machines while the workers' hands are in danger.
38 Eliminate irregular or entangled or octopus wiring connections.
39 Eliminate frayed or exposed electrical wires and connections.
40 Enclose or isolate as completely as possible the source of noise.
41 Reduce noise reflection by raising the ceiling or using sound absorbing materials in walls, ceiling or machine covers.
42 Enclose or isolate dust-producing machines or sources of gases or vapours.
43 Introduce or improve local exhaust ventilation at the workplace.
44 Provide adequate numbers and appropriate types of protective goggles, face shields, masks, earplugs, safety footwear, helmets or gloves.
45 Instruct and train workers about proper use and maintenance of personal protective equipment and regularly monitor its use.
46 Use posters .and notices to inform about accident risks and health hazards.
47 Provide first aid equipment and train a qualified first-aider.

Work Organisation

These items relate to arrangements for storage, materials handling and production flow as well as the ways work is allocated and scheduled.

Work Space and Storage

48 Arrange machines, equipment, material stocks or work positions to provide sufficient space to move around.
49 Provide appropriate markings .on aisles and passageways to keep them clear for movement of people and materials.
50 Assign daily. or more frequent responsibility for clearing specific areas to specific workers.
51 Provide enough waste receptacles or containers of adequate size.
52 Provide convenient storage racks for tools, raw materials, parts and products.
53 Ensure that materials, tools, products and scrap are not kept on the floor.
54 Make sure that tools are put in a clearly marked place when not in us.

Materials Handling

55 Use specially designed pallets to hold and move raw materials, semi-finished goods and products through work areas.
56 Minimise lifting of heavy loads by using appropriate platforms, low-loading trolleys, tongs and other aids.
57 Use carts, movable racks, cranes, conveyors or other mechanical aids when moving heavy loads.
58 Train workers about proper weight lifting postures using bent knees rather than a bent back..

Work Content and Scheduling

59 Rearrange layout in the order of operations to improve production flow and inventory control and to rationalise handling.
60 Combine task or establish group work stands to reduce handling operations and machine paced or repetitive work.
61 Promote communication and feed back by ensuring that workers can see and talk with each other while working.
62 Use workers' innovative capacity by establishing suggestion schemes or quality circles.
63 Establish flexible starting and finishing times using a suitable method of record keeping.
64 Insert frequent short breaks in addition to a long break for meals.

Courtesy : International Labour Organisation.

Table-7 : Classification of Pollutants

Major Classes	Subclasses	Typical members of subclasses
Particulates	Solid, liquid.	Dust, smoke, fumes, fly ash, mist, spray.
Organic Gases	Hydrocarbons Aldehydes and Ketones Other organics	Hexane, benzene, ethylene, methane, butane, butadiene, Formaldehyde, acetone, Chlorinated hydrocarbons, alcohols.
Inorganic Gases	Oxides of carbon	Carbon monoxide, Carbon dioxide
	Oxides of sulphur	Sulphur dioxide, sulphur trioxide
	Other inorganics	Hydrogen, sulphide, hydrogen fluoride, ammonia.

Table-8 : Industrial Emissions and Control Summary

Industry or process	Source of emission	Particulate matter	Method of control
Iron and steel mills	Blast furnaces, steel-making furnaces, sintering machines	Iron oxide, dust, smoke.	Cyclones, bag-houses, electro-static precipitators, wet collectors
Grey iron foundries	Cupolas, shakeout making	Iron oxide, smoke, oil dust, metal fumes, oil grease.	Scrubbers, dry centrifuge, collectors
Non-ferrous metallurgy	Smelter and furnaces	Smoke, metal fumes, oil, grease.	Electro-static recipitators, fabric filters.

Petroleum refineries	Catalyst regenerators sludge incinerators	Catalyst dust, ash from sludge.	Cyclones, electrostatic precipitators scrubbers, bag houses.
Portland cement	Kilns, dryers, material-handling systems.	Alkali and process dust	Fabric filters electrostatic precipitators mechanical collectors.
Kraft paper mills	Recovery furnaces, line kilns, smelt tanks.	Chemical dust	Electrostatic precipitators, venture scrubbers
Acid manufacture phosphoric sulphuric	Thermal processes, rock acidulating griding.	Acid mist, dust	Electrostatic precipitators mesh, mis eliminators.
Coke manufacture	Oven operation, quenching materials handling	Coal and coke dust, coal tars.	Meticulous design, operation and maintenance.
Glass and fiberglass	Furnaces, forming and curing, handling.	Acid mist, alkaline oxides, dust, aerosols.	Fabric filters, afterburners.

Table-9 : Health Effects of Particulate Matter

Concentration $\mu g/m^3$	Accompanied by	Time	Effect
750	715 $\mu g/m^3$ SO_2	24-h average	Considerable increase in illness
300	630 $\mu g/m^3$ SO_2	24-h average	Acute worsening of chronic bronchitis.
200	250 $\mu g/m^3$ SO_2	24-h average	Increased absence of industrial workers.
100-130	120 $\mu g/m^3$ SO_2	Annual mean	Children likely to experience increases incidence of respiratory disease.
100	Sulfation rate above 30 $mg/cm^2/mo$	Annual geometric mean	Increased death rate for those over 50 likely.
80-100	Sulfation rate above 30 $mg/cm^2/mo$	2-yr. geometric mea	Increased death rate for those 50 to 69 yrs.

Table-10 : Pollutants, their TLVs and Health Effects

Name of Pollutant	TLV ppm	Health Effects	Main Source
Ammonia (colourless gas with pungent odour)	25	Irritates all parts of respiratory system. Irritates eyes severely.	Ammonia manufacturing plants. Fertiliser plants.
Sulphur dioxide (colourless gas with distinctive odour)	2	Irritates respiratory system. Causes bronchitis.	Boiler flue gas, sulphuric acid manufacturing plants, fuel burning processes, metallurgical industry
Formaldehyde	1. Ceiling 0.3 ACGIH	Irritates all parts of	Petrochemical industry.

(Colourless with Pungent odour)		respiratory systems. Irritates the eyes severely	Organic chemical manufacturing plants
Chlorine (greenish-yellow gas with irritating odour)	1 0.5 ACGIH	Seven lung irritation, irritates the eyes.	Chlorine manufacturing plants Hydrochloric acid plants.
Bromine (Colourless gas with pungent odour)	0.1	Irritates all parts of respiratory systems. Irritates the eyes severely	Petrochemical industry. Organic chemical manufacturing plants
Bromine (dark reddish brown fuming liquid)	0.1	Irritates all parts of respiratory systems. Severely irritates the eyes	Dye-stuff industry, Pharmaceutical industry.
Nitrogen dioxide (red brown gas)	3	Sever irritation of respiratory system. It's danger lies in delay before it's full effect upon lungs is felt.	Nitric acid manufacturing, Nitration processes, combustion processes.
Phosgene (colourless gas with musty smell)	0.1	Severe pulmonary oedema. There may be delay of several hours before effect develops.	Pesticide, insecticide, manufacturing plants.
Carbon monoxide (colourless, odourless gas)	50 25 ACGIH	Deprives body cells of oxygen. Causes unconsciousness. Carbon monoxide combines with haemoglobin.	Combustion processes, metallurgical industries.
Hydrogen sulphide (colourless gas with offensive odour)	10	Respiratory paralysis, causes, immediate unconscious ness. In low concentration causes irritation of all parts of respiratory system.	Petroleum refineries, dyestuff industries, viscose rayon plants.
Hydrogen cyanide (colourless gas with faint odour)	10 Ceiling 4.7 ACGIH	Prevents oxygenation of body cells, shortness of breath, paralysis.	Pesticides, insecticide industry.
Benzene (colourless volatile liquid with characteristic odour)	10 0.5 ACGIH	Causes dizziness leukaemia. In low concentration caused headache.	Petrochemical industry, organic chemical manufacturing plants.
Phenol(colourless to pink crystalline substance with distinctive odour)	5	Irritates respiratory system, affects blood, irritates eyes.	Petrochemical industrial, organic chemical manufacturing plant.
Carbon disulphide (Liquid with unpleasant	10	Produce narcotic effects nerve poison, causes	Rayon manufacturing plant, pesticide industry.

odour)		unconsciousness.	
Methyl alcohol (colourless volatile liquid)	200	Causes dizziness, stupor nerve poison.	Petrochemical industry, organic chemical manufacturing plant.
Mercury (heavy silvery liquid)	0.01 0.05 0.1 mg/m^3	High poisonous, leaves metallic taste, causes nausea.	Caustic soda manufacturing plant, pesticide industry.
Hydrogen fluoride (colourless fuming gas or liquid)	3 Ceiling 3 ACGIH	The gas irritates severely the eyes.	Phosphate fertilizer industry, fertilizer industry.
Hydrocarbons	100 to 1000	Affects central nervous system	Petrochemical industry.
Sodium hydroxide (Colourless sticks)	2 mg/m^3 Ceiling 2 mg/m^3 ACGIH	Causes severe burns	Caustic soda industry, pulp and paper, soap textiles.

Table-11 : Tolerance Limits for Effluents Discharge (See also Table – 14)
(Indian Standards for Disposal of Industrial Effluents and Sewage)

Sr. No.	Characteristics	Into Inland surface waters (IS : 2490) CHD12	Into public sewers (IS : 3306) CHD12	On land for Irrigation (IS : 3307) CHD12	Into Marine Coastal Areas (IS : 7968 CHD12)	Tolerance Limits for sewage effluents discharge into Inland surface waters (IS : 4764) CHD12
1	2	3	4	5	6	7

xxviii	Percent Sodium Max.	-	60*	60	-	-
xxix	Pesticides					
	a) Organo-phosphorous compounds (as P), mg/1, Max.	-	-	-	1.0	-
	b) Chlorinated hydrocarbons	-	-	-	0.02	-

		(as Cl), mg/1, Max.				
xxx	Radioactive materials Alpha emitters, µc/ml.max.		10^{-7}	10^{-7}	10^{-9}	10^{-8}	-
	Beta emitters µc/ml. Max.		10^{-6}	10^{-6}	10^{-6}	10^{-7}	-

a = relaxable to 750 by the local authority

b = For process waste waters

For cowling water effluent - Total suspended matter content of effluent cooling water plus 10 percent

c = Subject to relaxation on tightening by the local authority relaxable to 50 by the local authority when secondary treatment of sewage is carried out

* = These requirements shall apply when after treatment, the sewage effluent is disposed of for irrigation and on land.

Note : IS:3306, 3307 and 7968 are withdrawn. See also Sch. VI u/r 3A of the Environment (Protection) Rules 1986 for standards of discharge into inland surface water, public sewers, land for irrigation and marine coastal areas. (See Table 14 in this Chapter).

Table-12 : Minimum National Standards (MINAS) (Sch. I, Environment(P) Rules 1986)

Some major parameters of effluent are tabulated below. For full details Rule 3, Schedule-1 of the Environment (Protection) Rules 1986 should be referred. These standards should not be exceeded.

Sr. No.	Industry	pH	SS mg/1	BOD mg/1 3 days at 27°C	Oil & Grease mg/l	PM mg/m^3	Others (* Footnote at end) mg/l

* Footnote :

SS = Suspended Solids
PM = Particulate Matter
P = Phosphate
CN = Cyanides
Cu = Copper
Pb = Lead
Zn = Zinc

DS = Dissolved Solids
Ph = Phenol
Hg = Mercury
Cl = Chlorides
Cr = Chromium
N = Nitrates
Cd = Cadmium

BOD = Biological Oxygen Demand
COD = Chemical Oxygen Demand
S = Sulphide
F = Fluorides
As = Arsenic
TOCL = Total organic chloride
Phos = Phosphorous

\# Sr. No. 79 to 98 have been added by subsequent amendment. For the latest MINAS, the last amended law should be referred.

Table-13 : National Ambient Air Quality Standards (NAAQS)
Schedule VII Rule (3B) of the Environment (Protection) Rules

Pollutant	**Time Weighted Average**	**Concentration in Ambient Act, μg/m^3**			
		Industrial area	**Residential, Rural & other area**	**Sensitive Area**	**Method of Measurement,**
1	**2**	**3**	**4**	**5**	**6**
Sulphur Dioxide (SO_2)	Annual average 24 hours	80 120	60 80	15 30	- Improved west and Gaeke method - Ultraviolet fluorescence
Oxide of Nitrogen as NO2	Annual average * 24 hours **	80 120	60 80	15 30	- Jacab & Hochheiser modified (Na-Arsenite) Method Gas phase chemiluminescence.
Suspended particulate matter (SPM)	Annual average * 24 hours **	360 500	140 200	70 100	-High volume sampling -[Average flow rate not less than 1.1 m^3/ minute]
Respirable particulate matter less than 10 μm) (RPM)	Annual average * 24 hours **	120 150	60 100	50 75	Respirable particulate matter (size sampler)
Lead (Pb)	Annual average * 24 hours **	1.0 1.5	0.75 1.00	0.50 0.75	- AAS method after sampling using EPM 2000 or equivalent filter paper.
Carbon monoxide	8 hours** 1 hour	5 mg/mt^3 10 mg/mt^3	2 mg/mt^3 4 mg/mt^3	1 mg/mt^3 2 mg/mt^3	-Nondisbersive infrared specroscopy.

* Annual Arithmetic mean of minimum 104 measurements in a year taken twice a week 24 hourly at uniform interval.

** 24 hourly/ 8 hourly values shall be met 98% of the time in a year, 2% of time, it may exceed but not on two consecutive days.

Note ; 1. National Ambient Air Quality Standard : the levels of air quality necessary with an adequate margin of safety, to protect the public health, vegetation and property.

2. Whenever and wherever two consecutive values exceed the limit specified above for the respective category, it shall be considered adequate, reason to institute regular / continuous monitoring and further investigations.

Table-14 : General Standards for Discharge of Pollutants

Schedule VI u /r 3A of the Environement (P) Rules is reproduced below for some of the standars only.

See also guidelines of Annex. I & II therein.

Part A : Effluents, limit mg/lit for inland surface water	
Colour & odour – Minimum	pH – 5.5 to 9.0
Suspended solids – 100	Temp - <5°C above the receiving water temp.
Size of suspended solids – to pass 850 micron IS sieve	Oil & grease – 10
Chlorine – 1.0	Free Ammonia – 5
Ammonical nitrogen – 50	BOD (3 days at 27°C) 30
Kjeldahl nitrogen – 100	COD – 250
Arsenic – 0.2	Mercury – 0.01
Lead – 0.1	Cadmium – 3.0
Total chromium – 2.0	Zinc – 5.0
Selenium – 0.05	Nickel – 3.0
Cyanide – 0.2	Fluoride – 2.0
Phosphates – 5.0	Sulphide – 2.0
Phenolic compounds – 1.0	Manganese – 2.0
Iron – 3.0	Vanadium – 0.2
Nitrate Nitrogen – 10 Bio- assay test – 90% survival of fish after 96 hrs. in 100% effluent.	Radioactive materials : (a) Alpha emitters 10^{-7} micro curie / ml (b) Beta emitters – 10^{-6} micro curie/ml

Part D : General Emission standards in mg/Nm^3	
Particulate matter (PM) – 150	Total fluoride – 25
Asbestos – 4 fibres /cc and dust < 2mg/ Nm^3	Mercury – 0.2 Chlorine – 15
HCl vapour & mist – 35	H_2SO_4 mist - 50
CO – 1% max. (V/V)	Lead – 10

Stack Height limit in Mt.		
Power	- 500 MW & more	-275
Generation	- 200 to 500 MW	-220
Capacity	- less than 200 MW	- $H = 14 (Q)^{0.3}$
H = Height in mt.	Q = SO_2 emission rate kg/ hr.	

Table-15 : Permissible levels (TLV & STEL) of certain Chemicals in Work Environment

(2nd Schedule under the Factories Act, as revised by Notification dated 22-7-1988)

	Substance	Permissible exposure			
		Time Weighted Average (TWA) concentration (8 hrs)		Short – term exposure limit (STEL) (15 Min)

	Fume	-	5	-	10
	Dust (Total dust)	-	10	-	-
116	Zirconium compounds (As Zr)	-	5	-	10

Ppm : Parts of vapour or gas per million parts of contaminated air by volume at 25 ^{o}C and 760 toor (mm of mercury)

Mg/m^3 : milligram of substance per cubic metre of air.

$$\text{Mg/m}^3 = \frac{\text{Molecular weight}}{24.45} \times \text{ppm}$$

* Not more than 4 times a day with at least 60 min. interval between successive exposures.

** lint – free dust as measured by the vertical elutriator cotton dust sampler.

C : ceiling limit.

Skin : potential contribution to the overall exposure by the cutaneous route including mucous membrane and eye.

C.S. : suspected human carcinogens.

H.C. : confirmed human carcinogens.

Substance	Permissible time- weighted average concentration (TWA Hours)
Silica, SiO2	
(a) Crystalline	
(i) Quartz	
(1) In terms of dust count	$\frac{10600}{\% \text{ Quartz} + 10}$ mppcm
(2) In terms of respirable dust	$\frac{10}{\% \text{ respirable Quartz}}$ mg/m^3
(3) In terms of total dust	$\frac{30}{\% \text{ Quartz} + 3}$ mg/m^3
(ii) Cristobalite	Half the limits against quartz
(iii) Tridymite	Half the limits given against quartz
(iv) Silica, fused	Same limits as for quartz
(v) Tripoli	Same limit as formula in item (2) given against quarts
(b) Amorphous	10 mg / m^3 Total dust
Silicates Asbestos (H.C.)	# 2 fibres / ml. greater than 5 µm is length and less than 3 µm in breadth.
Portland cement	10 mg/m^3 total dust, containing less than 1% quartz.
Coal Dust	2 mg/m^3 respirable dust fraction containing less

		than 5% quartz.

mmpcm – Million particles per cubic metre of air, based on impinger samples counted by light field techniques.

#As determined by the membrane filter method at 400-450 X magnification (4 mm objective) phase contrast illumination.

Respirable Dust – Fraction passing a size – selector with the following characteristics :

Aerodynamic Diameter (µm) (Unit density sphere)	**% passing selector (µm)**
2	90
2.5	75
3.5	50
5.0	25
10	0

Table-16 : Merits and Demerits of some Waste Disposal Methods.

Method	**Advantages**	**Disadvantages**
Conventional landfill	Low cost	Unsuitable for hazardous wastes
	Ease of operation	Ground and surface water pollution potential.
Secure (chemical) landfill	Availability of existing sites	Hazardous to landfill operators
	Moderate cost	Public opposition
	Relatively cost	Dewatering and/or other pre-treatment
	Waste contaminate	Unsuitable for liquids & flammable materials
	Low ground and surfaces water pollution potential	Uncertain long-term durability of lines need for perpetual care, High land consumption, High cost.
Incineration (and other treatment processes)	Detoxification	Air Pollution potential
	Volume reduction	Residues are often hazardous
	Lowland requirement	Variable performance
	Potential for energy	Requires skilled operation
	Flexibility	Auxiliary fuel sometimes required
Waste treatment (chemical, physical, biological)	Detoxification	High capital and operational costs
	Volume reduction	High sludge production need for ultimate solid disposal
	Proven technology	High land requirement
	Acceptability	Some processes solid disposal
Land application (effluents, sludge)	Moderate cost	High land requirement
	Resource recycle	Uncertain fate of some materials in soil.
	Zero stream discharge	Water pollution potential

	Land may remain in agricultural use	Limited by suitable soils, geology, site conditions, climate
Deep well injection	Moderate cost	High risk of ground water contamination
	Low land requirement	Highly dependent on favourable geology.
	No short term impacts or long term care	Discouraged by many regulatory agencies.
Ocean disposal	Moderate cost	Unacceptable by regulatory agencies.
	No onshore impacts	Marine aquatic life endangered
Resource recovery (Materials, energy)	Resource conservation	Market uncertainties
	Lower ultimate disposal requirement	Unproven technology for some wastes
	Potential economic benefits	Possible economic disadvantages recovered / recycled resources Vs other virgin sources
	Acceptable to public and regulatory agencies.	

Table-17 : Scrubbing / Neutralising / Inactivating Media

Sr. No.	Chemical	Scrubbing, Neutralising or Inactivating media	Material of Construction
Gases			
1	Phosgene $COCl_2$	Caustic Soda solution.	Water scrubber of FRP followed by Caustic scrubber of MSRL (or Caustic scrubber alone)
2	Chlorine Cl2	Caustic / lime	MSRL/PP backed by FRP.
3	Sulphur dioxide SO_2	Caustic soda solution	Polypropylene backed by FRP up to their thermal unit or SS scrubber
4	Ammonia gas NH3	Water	MS
5	Hydrochloric acid HCl	Caustic / lime	MSRL / PP backed by FRP
6	Nitrous acid fumes	Caustic / Thiosulfate solution / Urea.	FRP.
7	Hydrogen fluoride HF	Water/ Caustic	Teflon.
8	Hydrocyanic acid HCN	Water incineration	MSRL / PP backed by FRP
9	Ehtyl chloride C_2H_5Cl	Water (poor solubility)	-
10	Ethylene oxide CH_2-O-CH_2	Water spray or pond	MS Tower
11	Hydrogen sulphide H_2S	17% Monoethanol amine and 83% water or Caustic.	MSRL
12	Hydrogen H_2	Ignite, use back flame arrestor.	MS

13	Propylene $CH_2 - CH = CH_2$	- do-	
14	Ethylene $CH_2 = CH_2$	- do-	
15	Organic gases	- do -	
16	Fluoride, $SiF4$ from acidication of phosphate rock	Water spray	
Liquids (Acids)			
17	Sulphuric acid H_2SO_4	Lime / Caustic / Water	MSRL
	Hydro-chloric acid HCl	Lime / Caustic / Water	MSRL
	Nitric acid HNO_3	Lime / Caustic / Water	MSRL
(Alkalis)			
18	Sodium hydroxide NaOH	Water	MS
	Potassium Hydroxide kOH	Water	MS

Note : At appropriate places heat exchangers will be required in circulating system depending on the concentration of gases and absorbing liquor.

See part 8.1 of Chapter 18 for further selection of Material of Construction.

Table-18 : Guide for Selection of Dust Collectors

		Industry & Operations	**Particle size**		**Collector type used**
1	**Ceramics**				
	a	Raw product handling	Fine	1	Wet Collector
	b	Fettling	Fine to Medium	2	Fabric arrester
2	**Chemicals**				
	a	Material handling	Fine to medium	1	High efficiency cyclone
	b	Crushing, grinding	Fine to Coarse	2 3	Wet collector Fabric arrester
3	**Foundry**				
	a	Shake out	Fine	1	Wet Collector
	b	Sand handling	Fine to Medium	2	Wet collector
	c	Abrasive cleaning	Fine to medium	3	Fabric arrester
4	**Grain Elevator, Flour and Feed mills**				
	a	Grain Handling	Medium	1	Fabric arrester
	b	Flour dust	Medium	2	High efficiency cyclone.
	c	Feed mill	Medium	3	Fabric arrester
5	**Metal Working**				

	a	Grinding, brushing and abrasive cut off operations	Coarse	1 Low pressure cyclone 2 High efficiency cyclone
	b	Portable and Swing frame Grinder	Medium	1 High efficiency cyclone 2 Wet collector
	c	Buffing	Fine Medium Coarse	1 Cyclone 2 Wet collector
	d	Tool room	Fine	1 Cyclone 2 High efficiency cyclone 3 Wet collector 4 Fabric arrester
6	**Pharmaceutical and Food products**			
	a	Mixer, grinding weighing, blending, bagging, packing	Medium	1 High efficiency cyclone 2 Wet collector 3 Fabric arrester
	b	Coating pan	Fine to Medium	1 Wet collector 2 Fabric arrester
7	**Wood working**			
	a	Wood working machines	Fine Medium coarse	1 Low pressure cyclone 2 Fabric arrester
	b	Sanding operations	Fine	1 Low pressure cyclone 2 Fabric arrester
	C	Waste conveying systems	Fine Medium Coarse	Low pressure cyclone

Dust category :

Fine - 50 percent of dust particles are less than 5 micron size.
Medium - 50 percent of dust particles are between 5 to 15 micron size.
Coarse - 50 percent of dust particles are 15 micron on larger in size.

Table-19 : General Factors of Safety for Some Construction Materials

	Material	Steady Load	Load varying from Zero to maximum in		Suddenly Varying loads and shocks
			One Direction	Both Directions	
1	Wrought iron	4	6	8	12
2	Steel	5	6	8	12
3	Cast iron	6	10	15	20
4	Wood	8	10	15	20
5	Brick	15	20	25	30
6	Stone	15	20	25	30

Courtesy : Accident prevention manual for industrial operations, NSC, USA.

Table-20 : Load Bearing Capacity of Soils

	Natural of Soil	Safe Bearing Capacity

		Ton/ Ft^2
1	Soft clay	1
2	Fine loose and	1-2
3	Medium clay, stiff but capable of being spaded	2-4
4	Loose, medium and coarse sand, fine compact sand	1.5-4
5	Gravel, coarse sand, in natural thick beds	4-5
6	Hard clay, requiring picking for removal	4-5
7	Compact sand and gravel requiring picking of removal	4-6
8	Soft rock, disintegrated ledge, in natural ledge difficult to remove by picking	5-10
9	Hardpan, cemented sand and gravel, difficult to remove by picking.	8-10
10	Sound shale or other medium rock requiring blasting for removal	10-15
11	Solid ledge of hard rock, such as granite, trap etc.	25-100

Courtesy : Accident Prevention Manual for Industrial .Operations, NSC, USA.

Table 21 : Angle of Repose of Some Soils

Angle of repose or critical slope is the minimum angle of plane along which coarse particles in the material begin to fall due to gravity. It suggests safe stacking. –

Material	Slope Ratio Horizontal : Vertical	Angle of Response in Degree
Ashes : coal	1.0:1	45
Cinders : coal	1.0:1	45
Clay : dry : damp	1.3:1 2.0:1	38 27
Coal : broken	1.4:1	36
Earth : dry Damp	1.3:1 2.0:1	38 27
Gravel : round Angular	1.7:1 1.3:1	30 38
Rock : broken : Soft Hard	1.5:1 1.3:1	34 38
Rock : weathered : residual	1.5:1	34

Table 22 Conservation Factors :
Distance

1 inch	=	2.54 cm
1 foot	=	0.3048 mt.
1 mt	=	3.28 foot
1 km	=	0.6213 mile
1 mt	=	10^9 nanometer
1 nonometer	=	10^9 mt
1 mile	=	0.8690 nautical mile (Sea)
	=	1.6092 km

1 nautical mile	=	1.1508 mile
	=	1.8532 km
1 mt^2	=	10.7639 ft^2
1 ft^2	=	0.0929 mt^2
1 mt^3	=	35.31 ft^3
1 ft^3	=	0.0832 mt^3
1 centimeter	=	0.01 meter
	=	0.03281 feet
	=	0.3937 inches
	=	0.00001 kilometer.
	=	0.00000621 mile
	=	10000 microns

Pressure

1 atm	=	1.033 kg/cm2
	=	760mm of Hg
	=	14.696 Ibs/sq.inch (14.7)
	=	101.325 Killo Pascals
	=	0.101325 Mega Pascals
	=	29.92 inches of Hg at 0°C
	=	33.9 feet of water at 4°C
	=	10.33 meters of water
	=	1.013 bar
1 kg/cm^2	=	0.9678 atm
	=	735.5 mm of Hg
	=	0.9806 bar
	=	98.06 Killo Pascals
	=	0.098 Mega Pascals
	=	2048 lb/f^2
	=	14.22 lb/ $inch^2$
1 bar	=	0.9869 atm
	=	750mm of Hg
	=	14.502 Ibs/sq.inch '
	=	1.02Kg/ cm^2
	=	100 Killo Pascals
	=	0.1 Mega Pascals
	=	29.53 inches of Hg at 0^oC
	=	33.45 feet of water at 4°C
1 lb/ft^2	=	0.0004882 kg/cm^2
1 lb/ $inch^2$	=	0.07031 kg/cm^2
1 Pascal	=	1 $Newton/m^2$
1 Torr	=	1 mm of Hg at 0^oC

Mass

1 kg	=	2.205 lb
	=	1000 grams
1 lb	=	0.4536 kg
1 miligram	=	1000 microgram
	=	0.001 gram
1 gram	=	1000 milligram
	=	10^6 microgram
1 microgram	=	10^6 gram

	=	0.001 milligram

Volume

1 CC	=	0.06102 cu-inch
1 cu-inch	=	16.39 CC
1 cu-mt	=	35.31 cu-foot
	=	219.97 U.K. gallon
	=	264.18 U.S. gallon
	=	1000 It
1 cu – foot	=	0.02832 cu-mt
	=	6.2290 U.K. gallon
	=	7.4805 U.S. gallon
	=	28.317 Liters
1 ltr	=	0.001 cu-mt
	=	0.2642 gallon
1 gallown	=	3.785 It
1 Barrel (oil)	=	35 U.K. gallons
	=	42 U.S. gallon
	=	5.615 ft^3
	=	0.159 m^3

Area

1 cm^2	=	0.001076 ft^2
1 ft^2	=	929 cm^2
1 ft^2	=	0.0929 mt^2
1 mt^2	=	10.76 ft^2
1 km^2	=	0.3861 $mile^2$
1 $mile^2$	=	2.59 km^2
1 mt^2	=	1.196 $yard^2$
1 $yard^2$	=	0.8361 mt^2
1 acre	=	0.001563 $mile^2$
1 $mile^2$	=	640 acre
1 acre	=	0.004047 km^2
1 km^2	=	247.1 acre
1 hectare	=	0.01 km^2
1 km^2	=	100 hectare

Speed

1 cm/sec	=	1.969 ft/min
1 ft/ min	=	0.508 cm /sec
1 km / hr	=	0.6214 mile/ hr
1 mile / hr	=	1.609 km/hr

1 Mile (nautical)/ hour = 1 knot.

Temperature

1°C	=	33.8°F
1°F	=	-17.22°C
1°C	=	274.1°Kelvin
1°Kelvin	=	272.1°C

1 Centrigrade (°C) x 1.8 + 32 + Faharen height (°F)

$0^oC = 273.16^o$ Kelvin = 459.17 Rankine

Power

1 hp	=	0.7457 kw = 745.7 watts.
1 kw	=	1.341 hp
1 lb-foot /sec	=	0.3241 calorie / sec
1 Calorie / sec	=	3.085 lb- foot /sec
1 BTU / hr	=	0.01667 BTU / min
1 BTU / min	=	60 BTU / hr

Work Energy

1 BThU	=	1.055 KJ
	=	0.252 K. Cals
	=	0.0002928 KWH.
1 K. Cal	=	4.186 KJ
	=	3.968 Btu
	=	0.001162 KWH
1 K Joul	=	0.0002777 KWH
	=	0.2388 K. Cals
	=	0.9478 Btu
1 Ton of refrigeration	=	12000 BTU / HR
	=	3024 Kcal/ Hr
	=	3.516 KWH / Hr.
1 Therm	=	100,000 BTU.

Flow

1 lt / Sec	=	2.119 foot^3/mt
1 foot^3/mt	=	0.4719 lt/sec
1 lt/sec	=	951 gallon /hr
1 gallon/hr	=	0.001052 lt/sec
1 mt^3/hr	=	0.2778 lt/sec
1 lt/sec	=	3.6 mt^3/hr

Density

1 lb /ft^3	=	16.02 kg/mt^3
1 kg/mt^3	=	0.06243 lb/ft^3
1 gm/cm^3	=	0.03613 lb/inch3
1 lb/inch^3	=	27.68 gm/cm^3

Light

1 foot-candles	=	10.76 lux
1 lux	=	0.0929 foot-candles
1 meter-candles	=	1 lux

Others

1 million	=	1000000 = 10 lakhs
1 Billion	=	1000 Million = 100 crores.

Surface area and Volume

R = radius of circle, d = diameter of circle, Π = 3.1416, Circumference of circle = Πd = $2 \Pi R$, area of circle = $\Pi d^2/4 = \Pi R^2$., Volume of sphere = $\Pi d^3/6 = 4/3 \Pi R^3$.

If a altitude, b = base, Area of a triangle = ab/2.

CHAPTER – 33

History of Science and Safety Movement

Some historical part of Indian and foreign origins of the safety movement is already given in Part5 of Chapter-1, Part-1 of Chapter-7 and Part-1 of Chapter-27. Some more scientific and safety historical events are given below in a chronological order. This explains us how the scientific inventions were evolved and incidental safety concept was developed.

Vedkal	Yajurved, Rugved, Upnishads etc. Old concept of science and safety in nation. Our ancient heritage.
BC 3500	Medhatithi of Bharat discovered decimal system.
BC 3000	The Ebers Papyrys and the Edwin Smith Papyrus, the first written document on health and safety.
BC 2000	Chanakya Kautilya's Arthshastra dealing many subjects including safety. See Part-5.1 of Chapter-1.
BC 2000	Babylonian code of Hammurabi of some 280 paragraphs covering bodily injuries and workers' compensation laws.
BC 1500	Ramses III hired Physicians to care for mine and quarry workers.
BC 1000	Acharya Dhanvantari invented 'Pharmacy' and Sushrut 'surgery'. Bhrugu shilp Sahitya on many branches of Engineering.
BC 800	Bodhayan's Shalvasutra - Principle of right angle.
BC 680	Invention of 'atom' by Kanad muni.
BC 427-347	Pleto's teaching of mathematics and globe shapes of all planets.
BC 400	Hippocrates, known as the father of medicine described tetanus.
BC 384-322	Philosophy of science by Aristotle.
BC 320	Indian sword gifted to Alexander.
BC 287-212	Displacement of water, buoyancy and specific gravity by Archimedes.
BC 200	The effects of lead poisoning were described by the Greek poet and physician Nicander.
BC 100 to 2nd Century	Various Roman writers described the plague of Athens, the ill effects of their environment on mine workers and unhealthful effects of lead for water piping and wine containers.
100-178	Ptolemy who told that the Sun moves around the earth. His book, 'The Great Treatise of Astronomy'. He gave mathematical models.
650	Aryabhatttoid thatSun'shines themoon and earth rotates. This results in day and night;
Fifth Century	Aryabhatt's contribution in Mathematics. His discovery of D (22/7), sine, cosine etc.
Eight Century	Nagarjun's book 'Ras ratnakar' on Chemistry.
700-800	In Lombardy, King Rothari codified the laws in 388 chapters on principles of compensation for injury. Bhaskaracharya's 'Lilavati Ganit' i.e. Algebra and Law of Gravitation.
1456	First printing press in Germany by Gutenberg.
1473-1543	Nicolas Copernicus told that the Sun is the centre and the Earth and other planets move around it. This was told by Aryabhatta many years ago in 650. .
1473	Ulrich Ellen bag, an Austrian physician warned about hazards of metal burning.

1561	George Agricola's book described air venting in mines and use of gloves, leggings and masks.
1564-1642	Galileo who discovered equal speed of falling bodies, telescope and reaffirmed Copernicus' Sun-centered principle.
1567	Paracelsus published On the 'Miners' Sickness and other Miners' Diseases, distinguishing acute and chronic poisoning.
1571-1630	Kepler who stated the elliptical motion of planets around the Sun.
1642-1727	Issac Newton. Principles of gravity, rules of light, optics, calculus etc.
1701-1800	Industrialisation (Mills) started in Britain and spread to the Continent and USA.
1732	First spinning machine by Richard Arcright. Pioneer of industrial revolution.
1749-1838	John Stevance, Father of American Railways.
1761-1828	Nicolas Lui Rober, pioneer of paper industry.
1764	Discovery- of spinning jenny.
1765	Steam engine by James Watt.
1765-1825	Aley Whitney produced sewing, washing and other machines.
1768-1835	Sernual Sletor, Father of American cloth industry.
1771-1852	David Wilkinson, Father of machine tools industries.
1784	Discovery of powerlooms.
1792	Discovery of cotton gins.
1796	Dr. Edward Janner, Small Pox vaccination.
1800-1860	Charls Goodyear, Father of rubber industry.
1801-1874	Gail Borden, Father of modern dairy technology.
1804	President Thomas Jefferson delivered his safety message to Captain Merriwether Lewis.
1806-1873	John Stuart Mill, the great contributor in philosophy of science.
1807	Steam ship by Robert Fulton.
1809-1884	Sirus Hall McCormick, Father of agriculture industry.
1813-1818	Sir Henri Bessimer, Father of steel industry.
1814	Locomotive engine by James Watt.
1819-1880	Edwin L. Derek, Father of Petroleum industry.
1825	Railway usage began.
1830-1850	First attempt to legislate the working hours of women and children in Great Britain.
1831-1879	James Clerk Maxwell, Electromagnetic waves which led us to Radio and TV.
1832-1891	Nicholas August Auto discovered internal combustion engine. Father of automobile industry. Great contribution to industrial revolution.
1833	England, Govt. Factory Inspectorate established.
	George Stephenson suggested use of a steam whistle on locomotives.
1834	England, law enacted to provide fencing for mill gears and shafts. Lord Ashley's Great Factory Act.
1844-1929	Karl Benz made first motor car and called Father of motor car industry.
1845-1923	Wilhelm Rontgen, discovery of X-ray. First Nobel Prize winner in 1901.
1847-1922	Alexander Greham Bell discovered Telephone. Called Father of telecommunication.
1847-1931	Thomas Alva Edison, Father of electrical industry.
1847-1937	Gugli Eimo Marconi discovered wireless telegraph and called father of wireless telegraphy.
1855	Insurance Protection against boiler explosions was afforded in England.
1858-1913	Rudolf Diesel discovered diesel fuel and called father of diesel industry.
1858-1932	Dr Jagdish Chandra Bose. Sensation of plant. Cresco graph to view enlargement of plant movement.

1863-1914	Charles Martin Hall obtained pure aluminum and called father of aluminum industry.
1864	First accident insurance policy in North America.
1865	Benzene ring structure.
1866	National Board of Fire under-writers.
1867	Massachusetts had begun to use factory inspectors.
	Boiler and machinery insurance, started in USA.
1869	Germany-Acts passed providing that all employers furnish necessary appliances to safeguard health and life of employees. Massachusetts (USA) established, the first state bureau of labour statistics in order to determine the kinds and causes of accidents.
	Periodic Table of elements by Mendelif.
1870	Westing house airbrake adopted by the railroads.
1872	First electric automatic signal installed on the Pennsylvania rail board.
1873-1961	Lee De' Forest discovered radio and called father of radio industry.
1874	France, Law enacted providing for special inspection service of workshops.
1876-1920	Willis Havilland Carrier discovered airconditioning and called father of airconditioning industry.
1877	Massachusetts. Law passed compelling guarding of dangerous moving machinery.
1879-1955	Albert Einstein. Quantum theory and principles of relativity.
1879	Electric bulb by Thomas Alva Edison.
1880	American Society of Mechanical Engineers.
1881	American National Red Cross.
	First Indian Factories Act.
1885	Germany Alabama, passed employers' liability law.
	Germany, Bismarck prepared and enacted the first Compulsory Compensation Act for workers. This Act covered only sickness.
1887	Massachusetts passed an employers' liability law.
	Ervin Schrodinger - wave mechanics.
1890	First international conference in Berlin of 15 European States to draw up international conventions on labour regulations.
	Establishment of International Association for the Legal Protection of Workers, the forerunner of the ILO which was established in 1919.
1892	Safety Department of the Joliet Works of the Illinois Steel Company formed. This has been called "The birthplace of the American industrial accident prevention movement". The first safety order was the inspection of all engine flywheels.
1893	Federal Safety Appliance Act required use of standard safety equipment on railroad.
1896	National Fire Protection Association (NFPA), USA.
	Radioactive elements by Cury couple.
1900	US Census of 1900 showed 1750178 working children between 10 to 15 years. Quantum theory by Mex Planck. First safety periodical 'Safety Maintenance' published by Alfred M. Best company.
1901	National Bureau of Standards.
1903	First steel passenger car constructed. Demands of industrial workers were considered in Russia.
1905	Extension of Quantum theory by Einsteine.
1907	Quarterly of the National Fire Protection Association published by NFPA.
1908	Transportation of Dangerous Explosives Act passed.
1909	Aeroplane by Orvil and Vilbar Right brothers.
	First National Conference on Industrial Diseases held.

1910	The oldest large Occupational Health Institute "The Clinica del Lavoro" in Milan.
1911	New Jersey First State Workmen's compensation law passed.
	California passed the first American law for the compulsory reporting of occupational diseases.
	American Museum of Safety.
	Ernest Rutherford - Concept of Nucleus and electron in atom; alpha, beta and gamma rays and many inventions on atomic energy.
1912	Discovery of Thorium, Polonium and Radium by Madam Curry.
1913	Bureau of Labour Statistics.
	'Safety' published by the American Museum of Safety.
	Atomic structure, Nuclear structure and Atomic Model by Nisbohr.
	National Safety Council was founded in USA.
1914	The first World-War started accelerating industrialization and need of safety.
	The first safety of life at sea convention held in London.
1915	American Society of Safety.
	Elliptical motion of electrons by Summerfield.
1918	Air Mail Service started.
1919	National Railroad Accident Prevention Drive inaugurated.
	National Safety News published by the National Safety Council. Then many other publications-started in the subsequent years by NSC (USA).
	International Labour Organi-sation (ILO) was established at Geneva, Switzerland. Hours of Work (Industry), ILO Con.l, Unemployment Con.2, Recom 1, Maternity Protection Con.S, Night Work (Women) Con:4, Minimum Age (Industry) Con.5, Night Work of Young Persons (Industry) Con.6, Anthrax prevention Recom 3, Lead ' Poisoning Recom 4, .Labour Inspection Recom 5, White Phosphorous Recom 6
1921	ILO at Geneva set up a safety service. White Lead, ILO Con. 13, Weekly Rest (Industry) Con. 14.
1922	Greenburg and Smith introduced the impinger, a dust sampling device, which resulted in the impinger method becoming the standard for the US Bureau of Mines and the Public Health Service.
1923	Labour Inspection ILO Recom 20
1925	Workmen's Compensation ILO Con. 17 to 19 and Recom 22 to 25.
1926	Bensol, Poisoning study.
	4:1 accident cost ratio presented by H.W. Heinrich.
	First rocket fly.
1927	A study of the relation between safety and production was made by the American Engineering Council in 1926 and 1927.
1928	First National Aromatic Safety Conference held in America.
	American Standards Association.
	Functioning of International Commission on Radiological Protection (ICRP).
1929	The US Load Line Act passed to prevent overloading of cargo under various conditions.
	The foundation of a major injury ratio 30029-1 indicated by H.W. Heinrich. Peniciline by Alexander Flemming.
	Prevention of Industrial Accidents ILO Recom 31
	Power driven machinery, ILO Recom 32
1930	First Greater New York Safety Conference held in New York city. It was a one day session with 900 attendence.
1930-1934	The ILO published its first Encyclopedia "Occupation and Health", the value of which was widely recognized.

1934	Bureau of Labour Standards.
	Workmen's Compensation revised, ILO
1908	The Air Hygiene Foundation was created to conduct scientific studies to prevent occupational diseases and industrial health. 40 Hours Week, ILO Con. 47.
1936	Holidays with Pay, ILO Con. 52, Recom 47.
1937	Automotive Safety Foundation.
	National Committee on Films for Safety. Safety Provisions (Building), ILO Con.62, Recom 53 to 56.
1938	Centre for Safety Education.
	Nuclear Fission of Uranium by Farmy and Han.
1939	American Industrial Hygiene Association. Labour Inspectorates, ILO Recom 59.
1940-150	Inclusion of Modern Defense Equipment viz.. Radar, jet aircraft, missiles, atom bomb, computer etc.
1941	Industrial Hygiene Departments set up in 33 States (USA).
	The Accident Cause Code was completed by USA. This code introduced an era of accident cause standardization in USA overcoming a weakness in industrial accident prevention that had long existed. National Bureau for Industrial Protection (USA).
1944	Medical Care, ILO Recom 69.
1945	Solid State Transistor by Bell Telephone Laboratories of America. Ultimately this solid state electronics has now come upto the stage of microelectronics using silicon chips and integrated circuits.
	America threw atom bombs on Hiroshima and Nagasaki of Japan causing @ 1,20,000 deaths and more injuries in Aug 1945.
	Tata Institute of Fundamental Research in atomic energy at Bombay.
	DGFASLT. i.e. Directorate General. Factory Advice Service and Labour Institute was set up at Delhi. It was shifted toBomba) (the CLI building) in 1966.
	Foundation of International Air Transport Association (IATA) in Switzerland.
1946	Medical Examination of young person? (Industry & Non-industry), ILO Con.77-79 and Recom 79.
	The oldest Occupational Health Service ii France. Then in Japan in 1947.
1947	Establishment, of International Organisation for Standardi-sation (ISO) by ILO on 24-2-1947. ISO, work is carried out through some 2000 technical bodies and 100000 experts from all over the world More than 4000 International Standard have been published in some 30000 pages Labour Inspection, ILO Con. 81,85, Recom 81, 82.
	ILO conference adopted the first International Standards Concerning the organisation of labour inspection. Atomic Energy Commission (USA).
1948	Declaration of Industrial Policy for small scale industries and public sectors on 6-41948.
	Atomic Energy Commission.
1949	The first national Ergonomics Research Society in UK.
	The ILO published a model code of Safety Regulations for Industrial Establishments for the guidance of Governments and Industry.
1950-60	Establishment of Indian Institutes of Technology at Kharagpur, Bombay, Madras, Delhi and Kanpur, Defense organization. Council of Scientific and Industrial Research and Department of Technology in our country.
1952	Pesticides manufacturing started in India. Social Security (Minimum Standards) ILO Con.102
1953	Protection of workers health, ILO Recom 97 (It includes technical as well as medical measures and compulsory notification of occupational diseases).

1954	Atomic battery (giving crores of electrons per second on transistor wafer) by USA. Atomic Energy Centre was established at Trombay in Bombay. This was renamed as Bhabha Atomic Research Centre in 1967.
1955	Dr. Bhabha was selected as President of the conference on the Peaceful Uses of Atomic Energy at Geneva.
1956	Our first nuclear reactor 'Apsara', the first in Asia also. Welfare facilities, ILO Recom 102
1957	Sputnic the first satellite in the sk/ by Russia. Formation of International Committee for Lifts Regulations (CIRA) in Switzerland. International Atomic Energy Agency (IAEA) came into existence on 29-7-1957 by the statute of United Nations.
1958	Defense Research and Development Organisation. Approval of National Policy on Scientific Research and Development by the Parliament on 4-3-58.
1959	Occupational Health Service, ILO Recom 112. Birth of International Ergonomics Association (IEA) on 6-4-1959 in Oxford. International Occupational Safety and Health Information Centre (CIS) was set up by the ILO Office in May 1959 to collect, disseminate, co-ordinate and distribute world-wide information on occupational safety and health. The service was computerised since 1974. Direct access to CIS data via display terminals and variety of publications are available.
1960	The Regional Labou" Institute (RLI), Madras was set up. Radiation Protection, ILO Con.llS, Recom 114.
1961	The Central Labour Institute (CLI) started in a rented building in 1961 and shifted to its Sion-Bombay premises in 1966.
1962	The Regional Labour Institute (RLI), Kanpur was set up.
1963	Guarding of Machinery, ILO Con.ll9, Recom 118.
1964	Hygiene (Commerce & Offices) ILO Con.l20, Recom 120. Employment Injury Benefit ILO Con. 121 Recom 121.
1965	The Regional Labour Institute (RLI), Calcutta was set up. Formation of International Agency for Research on Cancer by WHO. Medical examination of young persons (underground work) ILO Con. 124.
1966	The National Safety Council (NSC) was established on 4th March 1966, at CLI Building, Sion, Bombay-22. In this remembrance, 4th March is celebrated as the National Safety Day in our country. Electronics Committee at the Chairmanship of Dr. Vikram Sarabhai. First tidal electric plant in France giving 5000 Kwh electricity per year. Foundation of the International Radiation 1978 Protection Asso-ciation (IRPA) in France.
1967	Maximum Weight, ILO Con.l27, Recom 128.
1968	Two conventions on Road Traffic and Road Signs and Signals in Vienna. Agreement on the International Transport of Dangerous Goods by Road (ADR) came into force on 29-1-1968 at Geneva.
1969	Atomic Power Station at Tarapur in Maharashtra. Apollo - II landed on the moon with three scientists, on 21-7-69.. DAE-NASA Satellite - I TV experiment. Report of the National Commission of Labour, India, 1969. Medical care and Sickness benefits, ILO Con. 130, Recom 134. A meeting of editors and users of occupational safety and health periodicals from 21 countries at Geneva on 7-8 July 1969.
1970	Establishment of International Nuclear Information System (INIS) by the IAEA started in 1957.

1971	Electronics Commission under the President ship of Dr. Menon. The Division of Nuclear Safety and Environment Protection started as a division of IAEA. Starting of programme of evaluation of chemical carcinogenic risk to humans. Starting of Science and Technology Department by the Central Government. Benzene, ILO Con.l36, Recom 144.
1972	Foundation of International Association of Labour Inspection (IALI) in Switzerland.
1974	Atomic explosion (experiment) in the desert of Rajasthan. Occupational Cancer, ILO Con.139, Recom 147.
1975	Combination of two space shuttles Apollo (USA) and Soyuz (USSR) in the sky.
1976	Landing of Viking-1 & 2 (USA) on the Mars. Launching of PIACT (International Programme for the Improvement of working conditions and environments). Legislation - The Toxic Substances Control Act 1976 (TSCA) in USA. International Occupational Safety and Health Hazard Alert System was adopted by the International Labour conference.
1977	Gujarat Safety Council was registered on 52-1977 at Vadodara. Working Environment (Air pollution, Noise and Vibration) ILO , Con.148, Recom 156.
1978	International conference on primary health care sponsored by WHO & UNICEF on 129-78. Labour Administration, ILO Con.150, Recom 158. Identification of 4039907 chemical compounds by the American Chemical Society's Chemical Abstract Service (CAS).
1979	Occupational Safety & Health, Dock Work, ILO Con.l52, Recom 160, Hours of Work & Rest Periods (Road Transport) ILO Con.l53, Recom 161. Publication of Initial Chemical substances inventory listing 44000 chemicals, by USA.
1980	The International Programme on Chemical Safety (IPCS) became operational in June 1980, at WHO Head quarters. It is a cooperative venture by UNEP (United Nations Environment Programme), ILO and WHO.
1981	Occupational Safety & Health, ILO, Con.l55, Recom 164.
1982	Maintenance of Social Security Rights, ILO Con.l57. Recom 167.
1985	Labour statistics, ILO, Con.l60. Recom 170. 1996 Occupational Health Services, ILO Con. 161, Recom 171, World Environment (1985), a brochure published by Loksabha, warned about environmental problems. 'Tlie State of India's Environment 1984-85, i.e. the Second Citizen's Report' also threw light on tremendous loss of environment and 1997 human health in our country (see Chap-1).
1986	Asbestos, ILO Con.l62, Recom 172. The Environment (Protection) Act, 1986.
1987	Vital amendments in the Factories Act, 1948 owing to Bhopal disaster.
1988	Safety and Health in Construction, ILO Con.l67, Recom 175.
1990	The Chemicals, ILO Con.l70, Recom 177. Night Work, ILO Con. 171, Recom 178.
1993	Prevention of Major Industrial Accident, ILO Con.l74, Recom 181.
1995	Safety & Health in Mines, ILO Con.l76 Recom 183. Vital amendments in the Gujarat Factories Rules, 1963, in consequence to the 1987 amendment in the Factories Act.
1996	'Down to Earth' report of 15-10-96, warned about environmental losses, air and water pollution and danger to human health (see Chap-1).

'Greenpeace international' report of 10-12-96 threw light on unsafe conditions of our industries and dangers due to chemicals. 3

1997	Landing of arobotic spacecraft. Pathfinder on 4-7-1997, on the red planet Mars by the NASA, USA.
	Launching of a Satellite IRS-ID by ISRO on 29-9-1997.
1998	IS:14489 - Code of Practice on Occupational Safety and Health Audit.
1999	Launching of a Commercial Telecom Satellite INSET-2E by ISRO on 3-4-1999.
2001	Safety and Health in Agriculture Con. 184, Recom 192.
2002	List of Occupational Diseases, Recom 194.
2004	HRD Recom 195.
2006	IS : 15656 Hazard Identification and Risk Analysis.
